This section specifies providing new ducts, manholes and handholes for electrical and communications facilities.

- A. Related Work Specified Elsewhere:
 - 1. Grading, excavating and backfilling: Section 02320.
 - 2. Support of excavation: Section 02260.
 - 3. Maintenance, support and restoration of utility facilities: Section 02270.
 - 4. Grounding and bonding: Section 16060.
 - 5. Concrete formwork: Section 03100.
 - 6. Concrete reinforcement: Section 03200.
 - 7. Cast-in-place structural concrete: Section 03300.
 - 8. Structural precast concrete: Section 03400.

- B. Definitions:
 - 1. Conduit: Individual raceway.
 - 2. Ductbank: Assembly of conduits in configurations shown, with concrete encasement, with or without reinforcement.

1.02 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings:
 - 1. Drawings for each cast-in-place manhole and handhole.
 - 2. Drawings for each size and configuration of precast manhole and handhole with details of accessories and joints.
 - 3. Diagrams showing dimensioned locations for openings and knockout panels for ductbank penetrations of manhole and handhole walls.

- B. Documentation:
 - 1. Submit calculations to demonstrate compliance with required load-bearing capacity, certified by a professional engineer registered in the jurisdiction where the work is to be installed.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. AASHTO: H15-44, H20-44.
 - 3. ANSI: C80.1.
 - 4. ASTM: A36, A48, A123, A185, A615, C33, C109, C173, C231, D570, D638, D790, F512.

5. NEMA: TC-14.
6. UL: 6.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Transport those materials supplied by utility companies from companies' storage facilities to construction site.
- B. Protect materials stored on site from damage prior to incorporation into work and during handling.

1.05 JOB CONDITIONS:

- A. Coordination with Utility Companies:
 1. Arrange with the Engineer to contact utility companies early enough to allow sufficient time for them to accomplish work they are required to perform, giving special consideration to lead times required for cable work.
 2. Establish liaison with utility companies furnishing materials for the work in order to determine availability, locations, methods of storage and care of materials prior to incorporation into work.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Concrete Formwork: Section 03100.
- B. Reinforcing Steel: Section 03200.
- C. Concrete:
 1. Cast-in-place: Section 03300, Class 3500 or as required by the power company for its facilities.
 2. Precast: Section 03400, Class 5000, unless otherwise shown on the drawings.
- D. Materials Supplied by Utility Company: As listed.
- E. Conduit and Fittings:
 1. PVC conduit and fittings: ASTM F512; modulus of elasticity, 500,000 psi.
 2. Concrete encased: Schedule 40.
 - a. Direct burial: Schedule 80 heavy wall.
 - b. Solvent cement: As recommended by conduit manufacturer.
 3. Galvanized rigid steel conduit and fittings: UL 6 and ANSI C80.1.
 4. Fiberglass conduit and fittings:
 - a. Rigid fiberglass reinforced epoxy conduit, UL 1684, IPS (Iron Pipe Size) based conduit.
 - b. Rigid fiberglass-reinforced epoxy, filament wound with minimum fiberglass content of 65 percent by weight and no fillers.
 - c. Type SW (Standard Wall) of IPS based standard conduit with nominal wall thickness of .09 inch for five-inch nominal conduit size, and nominal wall thickness of 0.07 inch for two through four-inch nominal conduit size.
 - d. Conduits, elbows and fittings manufactured from the same material and using the same manufacturing process.

- h. Conduit, elbows and fittings shall be suitable for encasement in concrete below grade and conform to UL 1684, and listed and labeled by UL, meeting the requirement of NEC Article 347 for Rigid Nonmetallic Conduit and its use.
 - i. Conduit for above ground surface mounted duct systems shall pass the UL1684 mandatory flame test (UL 1684, Section 5.12.1) and be certified by the manufacturer as such.
 - j. Each piece of the straight length conduit and each piece of the elbow and other bend made from and for use with such conduit is to be labeled with the following information, marked clearly legible and durably every 10 feet or as recommended by the manufacturer:
 - a. "Reinforced Thermosetting Resin Conduit", "RTRC", or equivalent wording such as "FRE" (Fiberglass Reinforced Epoxy) conduit.
 - b. Nominal size: (IPS)
 - c. Manufacturer's name and trademark.
 - d. Temperature range for conduit application.
 - e. "Above ground", "AG", "Below ground", "BG", or equivalent wording.
 - f. "FT4" when flame test is required for above ground conduit.
5. Conduit seal fittings:
- a. To provide watertight seal between concrete and conduit where it penetrates wall, floor or ceiling.
 - b. Size as shown or necessary.
 - c. Materials: Body and pressure clamp of malleable or cast iron with a neoprene sealing grommet and PVC-coated or galvanized-steel pressure rings, oversized sleeve of PVC or galvanized steel.
 - d. Seal between conduit and concrete to withstand pressure from 50-foot head of water without leakage.
- F. Channel Inserts: Stainless steel, size and shape as shown, 12-gauge minimum thickness, with 7/8-inch slot; surface-mounted; slotted-base channel with 9/16-inch by 3/16-inch nominal mounting slots on eight-inch centers.
- G. Cable Pulling Eye: Fabricated of plain steel reinforcement bar, ASTM A615, Grade 60; welded; size as shown. Hot-dip galvanized after fabrication, ASTM A123. Pulling tension: 5,000 pounds.
- H. Manhole Frame and Cover:
- 1. Authority manhole: Cast-iron, ASTM A48, Class 30, with METRO logo.
 - 2. Utility company manhole: Manhole frame and cover furnished as part of the Contract or furnished by the utility as shown on the drawings.
 - 3. Rust-resistant cast iron or rust-resistant malleable cast iron.
 - 4. True to pattern in form and dimensions, free from pouring faults, sponginess, cracks, blowholes and defects affecting strength.
 - 5. Fillets at angles in casting with arises sharp and perfect.
 - 6. Sandblasted to effectively remove scale and sand, presenting smooth, clean and uniform surfaces. Coated with bituminous coating.
 - 7. Covers to receive paver tile:
 - a. Omit bituminous coating.
 - b. Provide positioning lug and lug receptor as a permanent part of the cover and frame rim so that the cover can only be installed (flush) in one position.
- I. Manhole Steps:
- 1. ASTM A48, cast-iron, Class 30A.
 - 2. Molded rubber or plastic on cast-iron or reinforcing steel core.
- J. Handhole and Manhole: Option of cast-in-place or precast.

1. Cast-in-place concrete handhole and manhole: As shown and specified.
2. Precast concrete:
 - a. Shape shown. If precast manholes are selected and size shown is not standard, use nearest larger standard precast unit; where added size will conflict with other utilities or structures, use cast-in-place unit.
 - b. Designed for AASHTO H20-44 truck loading.
 - c. Manhole: Include lifting rings, manhole steps, pulling eyes, sump, hole through floor for ground rod, and seal or sealant for sealing joints between sections, precast extensions included where required by utility.
3. Precast concrete handhole: Compressive strength 3,500 psi, air entrainment six-percent minimum, ASTM C173 or ASTM C231; Section 03300 and Section 03400 and in accordance with the following:
 - a. Box: Concrete formed with closed bottom and sides and recess at top of box or at edge of cover to provide mating surfaces to prevent lateral movement of flush-mounted cover. Knockouts provided to accommodate conduits as shown on the drawings..
 - b. Cover:
 - a. Material same as for box. Use of metallic cover and cover frame prohibited.
 - b. Metro Type "B" logo with 3-1/8 inch by 4-inch envelope and service designation recessed in center of cover.
 - c. Non-protruding provisions provided for lifting.
 - c. Reinforcement:
 - a. Sidewalk and landscape locations: Welded-wire fabric, ASTM A185.
 - b. Areas subject to vehicular traffic: Deformed steel bars, ASTM A615.
 - d. Loading:
 - a. Sidewalk and landscape locations: AASHTO H15-44.
 - b. Areas subject to vehicular traffic: AASHTO H20-44.
 - e. Hardware: Stainless steel.
 - f. Size: As shown or next available larger size.

- K. Precast composite material handhole: Sand and gravel bound together with a polymer and reinforced with continuous woven glass strands and in accordance with the following:

Physical Properties	Values	Methods
Compressive strength	11,000 psi	ASTM C109
Tensile strength	1,700 psi	ASTM D638
Flexural strength	7,500 psi	ASTM D790
Water absorption (24 hours)	0.5 percent	ASTM D570

1. Box: Gray-color material formed with closed bottom and sides and flange with recess at top of box to accommodate flush-mounted cover.
2. Cover:
 - a. Material same as for box.
 - b. Skid-resistant top surface with minimum 0.5 coefficient of friction.
 - c. Metro Type "B" logo with 3-1/8 inch by 4-inch envelope and service designation recessed in center of cover.
 - d. Secured to box with bolts.
 - e. Non-protruding provisions provided for lifting.
 - f. Loading:

- g. Sidewalk and landscape locations: AASHTO H15-44.
 - h. Areas subject to vehicular traffic: AASHTO H20-44.
 - i. Hardware: Stainless steel.
 - j. Size: As shown or next available larger size.
- L. Aggregate for Subgrade Foundation: ASTM C33, coarse aggregate No. 4 and No. 67.
 - M. Spacer: As shown or recommended by conduit manufacturer.
 - N. End Bells: Flared, smooth-surfaced fittings of same material as conduit; if of different material, include adaptor for connection to conduit.
 - O. Grounding: Section 16060.
 - P. Brick: Section 04215.
 - Q. Mortar: Section 04050.

PART 3 - EXECUTION

3.01 EXCAVATING AND BACKFILLING:

- A. Excavating and backfilling: In accordance with Section 02320.
- B. If ducts and manholes are to be installed on backfill over subway structure, place and compact backfill up to grade shown for ductbanks, conduits, manholes and handholes; compact as specified in Section 02320; ensure the manhole sets level. Schedule completion of backfilling to allow sufficient time for installation of ductbanks, conduits, manholes and handholes.
- C. Where shown for subgrade foundation, use layers of coarse aggregate No. 4 and No. 67 in combinations and proportions determined by field conditions.

3.02 PAVEMENTS, SIDEWALKS, CURBS AND GUTTERS:

- A. Remove pavements, sidewalks, curbs and gutters where necessitated by construction of ductbanks, manholes and handholes in accordance with Section 02220.
- B. Place temporary bituminous pavement in accordance with Section 02740, when necessary because of sequence of operations.
- C. On completion of construction, replace pavements, sidewalks, curbs and gutters in accordance with Section 02205.

3.03 INSTALLATION:

- A. General:
 - 1. Use size, type, general routing and locations of ductbanks, conduits, manholes and handholes as shown and specified.
- B. Ductbanks:
 - 1. Place conduits in ductbanks on spacers or construct concrete base prior to placing bottom row of conduits.
 - 2. Use spacers to provide conduit spacing and support as recommended by conduit manufacturer.

3. Make conduit joints watertight by complying with recommendations of conduit manufacturers and as follows:
 - a. PVC conduit: Use solvent cement to join conduits, elbows and fittings.
 - b. Galvanized steel rigid conduit: Use lead-free conductive anti-seize compound on threaded conduit joints.
 - c. Fiberglass conduit: Use adhesive to join conduits, elbows and fittings for water tightness and pull out strength. Follow instructions of conduit manufacturer for using adhesive during periods below the recommended temperature range. Use of rubber sealing gaskets and interference type joints is prohibited.
4. Use Schedule 40 PVC conduit for underground ductbanks except as follows:
 - a. Use galvanized steel rigid conduit only in specific locations as shown.
 - b. Use fiberglass conduit only for providing utility company's 13.8 kv electric services.
5. Place and compact concrete around conduits in accordance with Section 03300.
6. Where shown, install reinforcing steel in concrete encasement in accordance with Section 03200.
7. Bends:
 - a. Unless otherwise shown or specified, install conduit bends in accordance with reference codes.
 - b. Install bends in buried conduit in accordance with the following:

Size of conduit in inches	Minimum radius of factory-bend in inches	Minimum radius of field-bend in inches
3	18	24
4	24	30
5	48	48
6	48	48
 - c. Total bends in each conduit run for traction-power cable: 225 degrees maximum.
 - d. Bend conduit so that field-made bend is free from cuts, dents and other surface damage.
 - e. Field-made bends in fiberglass conduits are prohibited.
8. Support conduit during construction using compatible conduit supports and spacers to maintain positions of conduit during placement of concrete and to ensure independent support.
9. Install conduit so that it drains to adjacent manhole or handhole.
10. Prevent concrete and other foreign materials from entering, obstructing or deflecting conduit. Cap or plug conduit ends prior to pouring concrete.
11. Remove burrs from conduit ends, clean and dry before applying solvent cement to PVC conduit joints or adhesive to fiberglass conduit joints.
12. Pull approved test mandrel and swab through each conduit after installation. Cap or plug conduit ends. If mandrel cannot be pulled through conduit, replace conduit.
13. Leave approved nylon or polyester pull-line in each conduit.
14. At the ends of each conduit, use corrosion-resistant metallic tags with stamped markings to establish identification in accordance with designations shown. Install tags securely to permanent structure near each conduit as approved by the Engineer.
15. Install caps at empty conduit ends for future use.

C. Conduits Without Concrete Encasement:

1. Use Schedule 80 for direct-buried train control conduit.
2. Install caps on ends of empty train control conduits and identify locations of conduit ends with stakes.

3.04 CONSTRUCTION OF MANHOLES AND HANDHOLES:

- A. Provide drainage facilities for manholes and handholes where shown. If connection is made to existing sewer line, install connection in accordance with applicable local regulations
- B. Erect formwork in accordance with Section 03100.
- C. Place reinforcing in accordance with approved shop drawings.
- D. Provide for location of ductbank entrances and inserts in walls as shown.
- E. Place concrete as specified in Section 03300.
- F. Install conduits of material shown.
- G. Install end bells on conduits where ductbanks terminate in manholes and handholes.
- H. Build ductbank formation into walls of manholes and handholes and seal around opening.
- I. If location of manholes and handholes openings will be obstructed, so inform the Engineer.
- J. Install frame and cover, adjusting to finished grade, building brick chimney as specified in Section 02535.
- K. Seal conduit openings with approved conduit plugs.
- L. Install cable pulling eyes and steps as shown. Test pulling eye for compliance with specified pullout load rating.
- M. Install ground rods, 2-inch by 1/4-inch by 12-inch long ground bus bar and insulated grounding conductors where shown. If soil conditions prevent driving rod to required depth, install alternative grounding system as approved. Provide grounding for personnel protection as specified in Section 16060.
- N. When installing sections of precast manholes and handholes, prevent damage to joints seals.
- O. Provide full-height stainless steel channel inserts approximately two feet on center along interior walls, spaced to clear ductbank entrances and steps. Use expansion bolt anchors to secure channel inserts to walls. Install and test channel inserts in accordance with Section 16130.

3.05 INSTALLATION OF HANDHOLES:

- A. Bury precast concrete or composite material handholes with cover mounted flush with finish grade or pavement. Comply with installation procedures furnished by manufacturer.

3.06 CLEAN UP:

- A. Remove debris from manholes and handholes and ensure complete installation is left in neat and finished condition.

3.07 FIELD QUALITY CONTROL:

- A. Arrange with the Engineer for inspection and approval of conduits in ductbank and cast-in-place manholes and handholes prior to concrete placement.
- B. Arrange with the Engineer for a representative of the utility company to inspect and approve service conduits for Authority facilities, relocated utility conduits, manholes and handholes prior to concrete placement.
- C. Arrange with the Engineer for inspection and approval of direct-buried conduits for future train control circuits, prior to backfilling.

END OF SECTION

SECTION 02635

STORM SEWER

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies installing storm sewers, roadway drains, roadway underdrains, ditch lining and slope protection.
- B. Related Work Specified Elsewhere:
 - 1. Section 02320 Grading, excavating and backfilling
 - 2. Section 02270 Maintenance, support and restoration of utility facilities
 - 3. Section 13110 & 13115 Stray current and cathodic protection
- C. Definitions:
 - 1. Granular bedding required by WSSC is equivalent to aggregate for pipe cradle as specified.
 - 2. WSSC: Washington Suburban Sanitary Commission.
 - 3. WASA: District of Columbia Water and Sewer Authority.

1.02 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings:
 - 1. Drawings for each size and configuration of precast manhole with details of accessories and joints.
 - 2. Diagrams showing dimensioned locations for openings in precast concrete manhole walls.
- B. Documentation:
 - 1. Submit calculations for modified or special designs to demonstrate compliance with required load-bearing capacity, certified by a professional Authority Representative registered in the jurisdiction where the work is to be installed.
- C. Samples:
 - 1. Sewer brick: Ten.
 - 2. Manhole brick: Ten.
 - 3. Slope protection materials:
 - a. Concrete blocks: Ten each.
 - b. Paving bricks: Ten each.
 - c. Riprap: 1.5 cubic yards.
 - d. Gabions: Two each, complete.
 - 4. Geotextile filter fabric: Two, 12 inches long by 12 inches wide, minimum.
- D. Certification.
- E. WASA Documentation:

1. Submit two copies of records of inspection of new and relocated sewers, one copy to WASA and one copy to the Authority Representative. Include video-tape cassette of television inspections and logs, photographs and other records specified by WASA for visual walk-through inspections.
2. Obtain and submit a written approval and acceptance from WASA.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
1. Comply with codes and regulations of the jurisdictional authorities.
 2. Building Stone Institute: Stone Catalog.
 3. CISPI: HSN 85.
 4. WSSC: AASHTO: M33, M36, M153, M175, M176, M190, M252, M288, T85, T96, T104.
 5. WASA: AASHTO: H20, M33, M36, M153, M175, M176, M190, M252, M288, T85, T96, T104.
 6. ANSI/ASME: B16.1.
 7. ACI: 318.
 8. WSSC: ASTM: A36, A48, A53, A74, A167, C14, C32, C33, C76, C144, C150, C207, C361, C425, C443, C478, C507, C700, D698, D1682, D3034, D5034, D5035.
 9. WASA: ASTM: A36, A48, A53, A74, A167, C14, C32, C33, C76, C144, C150, C207, C361, C425, C443, C478, C700, D698, D1682, D3034, D5034, D5035.
 10. MS: MIL-P-23236.
 11. SSPC: SP-6.
 12. WSSC: General Conditions and Standard Specifications.
- B. Source Quality Control:
1. Ditch lining and slope protection materials:
 - a. After approval, do not change source.
 - b. Replace defective material.
- C. Allowable Tolerances:
1. Subgrade: Plus-or-minus 1/2 inch of elevation shown.
- D. WASA : Inspection:
1. Prior to paving or other construction over new or relocated sewers, conduct visual walk-through inspection of sewers larger than 36 inches in diameter and of associated structures and internal television inspection of sewers 36 inches and smaller in diameter.
 2. Employ the services of a sewer inspection company which has been regularly engaged in television sewer inspections and which is acceptable to WASA to perform preconstruction and post-construction inspections of sewers 36 inches and smaller in diameter.
 - a. Submit to WASA for prior approval one sample of the cassettes to be used.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Formwork: Section 03100.

- B. Reinforcing Steel: Section 03200.
- C. Portland Cement Concrete: Section 03300, Class 3500, unless otherwise shown.
- D. Aggregate for Subgrade Foundation: ASTM C33, coarse aggregate, No. 4. Where shown use layers of No. 4 and No. 67 in combinations and proportions determined by field conditions and as approved.
- E. Aggregate for Pipe Cradle: ASTM C33, coarse aggregate No. 67.
- F. Concrete Pipe:
 - 1. 10-inch diameter and smaller:
 - a. ASTM C14, Class 2, nonreinforced concrete pipe.
 - b. Bell-and-spigot type.
 - c. Joints fabricated in accordance with ASTM C361. Physical characteristics for rubber gaskets in accordance with ASTM C443.
 - 2. 12-inch diameter and larger:
 - a. ASTM C76, bell-and-spigot or tongue-and-groove, Class IV, unless otherwise shown.
 - b. Radius (bevel) pipe, with drop between two pipe sections not exceeding the common wall thickness.
 - c. Rubber gasket joints, when required, fabricated in accordance with ASTM C361. Physical characteristics for rubber gaskets in accordance with ASTM C443.
 - d. Acceptance tests as specified in ASTM C76 form basis of acceptance for concrete pipe in accordance with the following:
 - 1) 72-inch diameter and smaller: Acceptance on the Basis of Plant Load Bearing Test, Material Tests and Inspection of Manufactured Pipe for Visual Defects and Imperfections.
 - 2) Larger than 72 inches in diameter: Acceptance on the Basis of Material Tests and Inspection of Manufactured Pipe for Defects and Imperfections.
 - e. Minimum laying lengths: Four feet.
 - f. WSSC: Rubber gaskets: ASTM C361.
 - g. WASA: Rubber gaskets: ASTM C443.
 - h. Jointing mastic: Elastic, water-resistant, formulation of plastic bituminous materials, nonflammable solvent and inert fillers so combined that:
 - 1) When applied to a vertical metal surface and heated to 120F, jointing mastic will neither slump nor lose plasticity.
 - 2) When applied directly from container without further fixing, jointing mastic can be applied in even, adherent coat within temperature range of 20F to 100F.
 - i. WSSC: Reinforced concrete elliptical pipe: ASTM C507.
 - 3. Perforated nonreinforced concrete pipe: AASHTO M175, Type 1 or 2, bell-and-spigot or tongue-and-groove type.
 - 4. Porous concrete pipe: AASHTO M176, tongue-and-groove.
- G. Plastic Pipe:
 - 1. Polyvinyl chloride (PVC) pipe: ASTM D3034, SDR-35.
 - 2. Polyethylene corrugated pipe: AASHTO M252.

- H. Bituminous-Coated Corrugated Metal Pipe: AASHTO M190, Type A or C, with connecting bands, AASHTO M36.
- I. Vitrified Clay Pipe: ASTM C700; Joints, ASTM C425, using plastic materials.
- J. Cast-Iron Soil Pipe and Fittings: ASTM A74, extra-heavy (XH), with hub and spigot ends so constructed that joints may be made with gaskets conforming to CISPI Designation HSN 85 and the requirements of the relevant plumbing codes.
- K. Lubricant for Rubber Gasket Pipe Joints: Vegetable oil soap.
- L. Mortar Materials:
 - 1. Portland cement: ASTM C150, Type I.
 - 2. Sand: ASTM C144, natural sand.
 - 3. Lime: Pressure-hydrated, ASTM C207, Type S.
 - 4. Water: Potable.
 - 5. Pigment: As approved.
- M. Brick: ASTM C32; solid brick; Grade MS for manhole brick, Grade SS for sewer brick; 2-1/4 inches by 3-3/4 inches by eight inches.
- N. WSSC: Precast Concrete Manhole Sections:
 - 1. ASTM C478.
 - 2. Joint entry seal gasket: A-LOK as manufactured by Atlantic Precast Concrete, Inc.; A-LOCK gaskets, manufactured by A-LOK Products Corporation, Trenton, N.J.; DURAC-SEAL gaskets, manufactured by DURA-CRETE, Inc., Dayton, Ohio; or equal.
- O. WASA: Precast Concrete Manholes:
 - 1. Cylindrical, eccentric and conical: ASTM C478.
 - 2. Other configurations: ACI 318, AASHTO H20.
- P. Manhole Steps:
 - 1. Cast iron: ASTM A48 Class 30 A.
 - 2. Rebar: No. 4 reinforcing bar with molded polypropelene or rubber encasement.
- Q. Manhole Frame and Cover; Inlet Frame and Grate; and Ballast Screen;
 - 1. Authority manhole: Cast-iron, ASTM A48, Class 30, with METRO logo.
 - 2. *Rust-resistant cast iron or rust-resistant malleable cast iron.*
 - 3. *True to pattern in form and dimensions, free from pouring faults, sponginess, cracks, blowholes and defects affecting strength.*
 - 4. *Fillets at angles in casting with arises sharp and perfect.*
 - 5. *Sandblasted to effectively remove scale and sand, presenting smooth, clean and uniform surfaces. Coated with bituminous coating.*
 - 6. *Covers that receive paver tile:*
 - a. *Omit bituminous coating.*
 - b. *Provide positioning lug and lug receptor as a permanent part of the cover and frame rim so that the cover can only be installed (flush) in one position.*
- R. Metal Water Seals for Basin Connections: Neenah Foundry Model No. R-3707 or equal.
- S. Structural Steel Members: ASTM A36.

- T. Steel Pipe: ASTM A53, black finish, extra strong wall class.
- U. Stainless Steel Angle: ASTM A167, Type 304.
- V. Jute for Caulking: Good quality jute, free from tar, oil, or grease and dry when installed.
- W. Preformed Expansion Joint Fillers: AASHTO M153, Type I, Type II or Type III.
- X. Bituminous Expansion Joint Filler: AASHTO M33.
- Y. Galvanizing: Section 05120.
- Z. Ditch Lining and Slope Protection:
 - 1. Riprap: Material meeting the following requirements:
 - a. Hard, durable and free of fractures; angular in shape; weather-resistant; and free from overburden, spoil, shale and organic material.
 - b. Size: Weight distribution of pieces provided in accordance with the following:
 - 1) Class I: From 50 to 150 pounds with 60-percent minimum weighing 100 pounds or more; approximately 10 percent may weigh 50 pounds or less.
 - 2) Class II: From 150 to 500 pounds with 50-percent minimum weighing more than 300 pounds; approximately 10 percent may weigh 150 pounds or less.
 - c. Quality:
 - 1) Water absorption: 3.0-percent maximum when tested in accordance with AASHTO T85.
 - 2) Specific gravity: 2.5 minimum when tested in accordance with AASHTO T85.
 - 3) Resistance to abrasion: Grade B maximum when tested in accordance with AASHTO T96.
 - 4) Soundness: Loss 20-percent maximum when tested in accordance with AASHTO T104.
 - 2. Aggregate filter:
 - a. Coarse aggregate, ASTM C33, Size 357.
 - b. Use only tough, durable materials free of thin, flat, elongated or soft friable particles and free of organic matter.
 - 3. Granite block facing: Type 4, quarry split finish on face and edges.
 - 4. Sand cushion for concrete block: Section 03300, fine aggregate.
- AA. Geotextile Filter Fabric: AASHTO M288 and the following additional requirements:
 - 1. Woven or non-woven pervious filter fabric weighing approximately 0.03 to 0.05 pounds per square foot; free of defects.
 - 2. Fabric: Long chain synthetic polymer composed of at least 85 percent by weight of propylene, ethylene, ester, amide or vinyl-chloride and with stabilizers or inhibitors to make fabric resistant to deterioration due to ultraviolet and heat exposure.
 - 3. Fabric formed or treated so that filaments retain their positions relative to each other.
 - 4. Edges selvaged.
 - 5. Physical strength:
 - a. Tensile strength: 200-pound minimum in each direction, ASTM D1682.
 - b. Elongation at failure: 10 to 30 percent, ASTM D5034 and D5035.
 - c. Puncture strength: 70-pound minimum, ASTM D5034 and D5035.
 - 6. Percent of open area: Not less than five percent nor more than six percent.

7. Equivalent opening size (E.O.S.): 70-100 US Standard Sieve, CW-02215-77.
8. Securing Pins: As recommended by manufacturer of filter fabric.

BB. Gabions:

1. Wire mesh: Galvanized steel wire 0.105 minimum diameter, 60,000 pounds per square inch tensile strength, galvanized at rate of 0.80 ounces per square foot. Wires twisted to form nonraveling hexagonal openings of uniform size, not to exceed 4-1/2 inches in length nor eight square inches in area of mesh opening. Horizontal dimension uniform, not to exceed 36 inches. Gabion dimensions not to vary more than three percent from manufacturer's stated size.
2. Tie devices: Malleable iron or steel, producing frictional force of 160 pounds per foot of spacing. Sized to conform to requirements of jurisdictional agency.
3. Stone: Durable, free from cracks and seams, unweathered, weighing between four pounds (four-inch average diameter) and 30 pounds (eight-inch average diameter) except five percent may vary more or less and 50 percent to exceed 10 pounds.
 - a. Stone size:

Basket Thickness (Inches)	Size of Stones (Inches)
6	3 to 5
9, 12, 18	4 to 7
36	4 to 12

CC. Coal-Tar Epoxy Coating:

1. Two-component.
2. Chemically cured.
3. Conforming to MS MIL-P-23236 (Ships), Type I, Class 2.
4. Thinner: As recommended by manufacturer of coating and as approved.

DD. WSSC: Pipe Supports:

1. Pipe: Three-inch diameter, ASTM A53, Weight B, Class 1.
2. Flanges: ANSI/ASME B16.1, 125-pound Class, galvanized after fabrication.

EE. Prince George's County: Underdrain Filter Material: ASTM C33, Size 57.

2.02 MORTAR AND GROUT MIXES:

A. General Requirements:

1. Mix dry in specified proportions by volume. Control and maintain accurate measurement throughout progress of work.
2. Add sufficient water as specified to produce approved consistency.
3. Do not mix in amount exceeding that which can be used within one hour after introduction of water.
4. Do not retemper mix that has begun to set nor use such mix in the work.
5. Where shown, specified or directed, mix pigment into dry mix to attain color selected by the Authority Representative. Pigment not to exceed 10 percent of dry batch weight of cement.

B. Proportions:

1. Mortar: One part portland cement, 2-1/2 parts sand and water sufficient to produce stiff workable mix.
2. Grout: One part portland cement, 2-1/2 parts sand and water sufficient to produce plastic flowable mix.
3. Mortar for setting and pointing granite: One part portland cement, four to five parts sand, one part lime and water sufficient to produce approved consistency.
4. Mortar for setting granite paving and grouted granite blocks: One part portland cement, four parts sand, with water sufficient to produce approved consistency.

PART 3 - EXECUTION

3.01 EXCAVATION FOR SEWER AND DRAINAGE STRUCTURES:

- A. Perform excavation for sewers and drainage structures to line and grade shown in accordance with Section 02320 and the following additional requirements:
 1. Excavate test pits sufficiently in advance of construction of sewers and drainage structures so that reasonable changes in line and grade can be made where location of existing structures varies from that shown.
 2. Excavate below horizontal plane extending two feet above top of sewer or drainage structures to maximum width of trench pay width shown. Where dimensions are not shown, make maximum horizontal width of excavation 18 inches from outside of sewer or drainage structure and minimum six inches. Where approved, excavation above such plane may exceed specified dimensions.
 3. If excavation exceeds permissible dimensions, encase pipe or install pipe of higher strength.
 4. Where necessary to place backfill or embankment so that trench can be excavated, extend backfill or embankment full depth laterally at least 2-1/2 times diameter of pipe on each side measured from centerline of pipe.

3.02 GEOTEXTILE FILTER FABRIC:

- A. Prepare surface to receive fabric to relatively smooth condition free of obstructions, depressions, debris and soft or low density pockets of material.
 1. Place fabric with long dimension parallel to centerline of trench and lay smooth and free of tension, stress, folds, wrinkles or creases with sufficient excess to allow for minimum overlap of 12 inches.
 2. Place strips in trench to provide minimum width of 12 inches of overlap for each joint.
 3. Insert securing pins with washers through both strips of overlapped fabric at not greater than 3-foot intervals along a line through the midpoint of overlap at joints.
 4. Where this method of placement conflicts with manufacturer's instructions, the manufacturer's instructions prevail.
- B. At time of installation fabric to be rejected if it has defects, rips, holes, flaws, deterioration or damage incurred during manufacture, transportation, storage or handling.
- C. Place fabric in manner and at location shown.

3.03 PIPE CRADLE:

- A. Place pipes on cradle of aggregate or concrete where shown.

- B. Place aggregate so as to avoid segregation; compact to maximum practicable density so that pipe can be laid to required tolerances.

3.04 LAYING PIPE:

A. General Requirements:

1. Excavate to lines and grades shown in accordance with Sections 02320 and herein. Excavate depressions for bells.
2. Protect pipe and fittings during handling to prevent damage.
3. Place, shape and compact bedding material to receive barrel of pipe. Type and thickness of bedding material as shown.
4. Start laying pipe at lowest point; lay true to line and grade shown.
5. Install pipe to bear on bedding material along entire length. Shape bedding material to fit bells and flanges.
6. Install perforated pipe with perforations downward.
7. Install pipe so that bells and grooves are on upstream end.
8. Align each section of pipe with adjoining section with uniform annular space between bell and spigot and so as to prevent sudden offsets in flow line.
9. As each section of pipe is laid, place sufficient backfill to hold it firmly in place.
10. Keep interior of sewer clean as work progresses. Where small pipe size makes cleaning difficult, keep suitable swab or drag in pipe and pull through each joint immediately after jointing is completed.
11. Keep trenches and excavations free of water during construction and until backfilled. Each day, excavate only as much trench as needed to lay pipe.
12. When work is not in progress, securely plug ends of pipe and fittings to prevent trench water or other substances from entering pipes and fittings.
13. Where length of stub is not shown, install four-foot length and seal free end with brick masonry bulkhead or approved stopper.
14. Have work approved prior to covering pipe.
15. Where shown, place additional aggregate filter around and over pipe in lifts not exceeding six inches loose. Compact each lift before placement of next lift.
16. Backfill in accordance with Section 02320.
17. Accomplish compaction by method that will avoid damage to pipe and will not disturb its alignment and grade. The use of vibratory rollers is prohibited until compacted cover over pipe has reached three feet or half the pipe diameter, whichever is greater.
18. Where cathodic protection is shown, apply coal-tar epoxy coating.

B. Vitrified Clay Pipe:

1. Nonperforated pipe:
 - a. Use pipe hoist, crane or other approved device when laying pipe greater than 18 inches diameter.
 - b. Prevent damage to premolded joint rings or attached couplings.
 - c. Clean joint contact surfaces immediately prior to jointing. To complete joint, use lubricants, primers or adhesives as recommended by pipe or joint manufacturer
2. Perforated pipe:
 - a. Firmly position spigot in bell of preceding pipe. Saturate jute gasket in cement grout and caulk into annular space. Ensure that jute is long enough to reach entirely around pipe and is of such thickness to bring pipe sections to same grade.
 - b. After pipe sections have been caulked and centered, fill annual space with cement mortar.

- c. After mortar joints have set, place additional aggregate filter material as specified.
- C. Concrete Pipe:
 1. Bell-and-spigot joints:
 - a. Lay bell-and-spigot joint pipe as specified for vitrified clay pipe.
 2. Tongue-and-groove joints:
 - a. Clean groove end of preceding pipe with wet brush and apply soft mortar to lower 1/4 of groove. Clean tongue end of succeeding pipe with wet brush and position it. Remove mortar from interior surface if squeezed out of joint.
 - b. Complete mortaring interior and exterior portions of joint for entire circumference, extending from previously placed mortar. Perform final exterior mortaring of joints three lengths of pipe behind laying.
- D. Plastic Pipe:
 1. Perforated pipe:
 - a. Use sleeve couplings designed to hold pipe in alignment without use of sealing compound or gaskets.
 - b. Place additional aggregate filter material as specified.
 - c. Cap open ends of underdrains.
 2. Nonperforated pipe:
 - a. Join sections of pipe with couplings recommended by pipe manufacturer.
- E. Corrugated Metal Pipe:
 1. Perforated pipe:
 - a. Place additional aggregate filter material as specified
 2. Nonperforated pipe:
 - a. When pipe is shown to be bituminous paved, place paved area on bottom.
 3. Connections for corrugated metal pipe:
 - a. Join sections of pipe with coupling bands arranged to fit corrugations accurately.
 - b. Do not damage protective coating when tightening bolts.
 - c. After final tightening of connection bolts, apply brush coat of bituminous paint to bands and bolts.
- F. Porous Concrete Pipe:
 1. Fill joints with mortar as specified for tongue-and-groove joints of concrete pipe.
 2. After pipe joints have been made, place additional filter material as specified.
- G. WASA: Inspections Of Sewers:
 1. Perform all work in accordance with current requirements of WASA.
 2. Perform inspections on new or relocated storm sewers installed by tunneling or jacking under active yard tracks, as follows:
 - a. Make inspections upon completion of tunneling and cut-and-cover operations, but prior to paving.
 - b. Obtain video-tape television inspection records of sewers 36 inches and smaller in diameter.
 - c. By means of visual walk-through inspection, obtain coordinated logs, photographs and other records specified by WASA of sewers larger than 36 inches in diameter and of associated structures.
 3. Coordinate all television and walk-through inspection field operations with WASA. All such work to be performed in the presence of a WASA representative.

3.05 BACKFILL:

- A. Perform backfilling only after inspection and approval of pipe laying.
- B. On completion of construction, backfill excavation in accordance with Section 02320.

3.06 JOINTS FOR CONCRETE STORM SEWER 12 INCHES TO 33 INCHES:

- A. Use cold applied jointing mastic for joints of storm sewer 12 inches to 33 inches in diameter.
- B. Bell-and-Spigot Joints:
 - 1. Clean interior surface of bell and fill lower portion with mastic of sufficient thickness to make inner surfaces of abutting sections flush.
 - 2. Install spigot end of adjoining pipe into bell so that sections are closely fitted and aligned.
 - 3. Apply sufficient jointing mastic to fill remaining void in joint.
 - 4. Remove excess mastic from interior of pipe.
- C. Tongue-and-Groove Joints:
 - 1. Clean groove. Apply mastic to lower half of groove.
 - 2. Clean tongue of next pipe and apply layer of mastic to upper half.
 - 3. Fit tongue into groove until pipes are closely fitted and aligned and mastic covers inner and outer surfaces.
 - 4. Remove excess mastic from interior of pipe.

3.07 JOINTS FOR CONCRETE STORM SEWER 36 INCHES AND LARGER.

- A. Where not prohibited by jurisdictional agencies, Use mortar for joints of storm sewers 36 inches diameter and larger.
- B. Bell-and-Spigot Joints:
 - 1. Where pipe cradle is aggregate, place shallow bed of mortar under joint.
 - 2. Thoroughly wet bell and fill lower half with mortar.
 - 3. Thoroughly wet spigot and uniformly fit into bell so that sections are closely fitted and aligned.
 - 4. Fill remaining annular space in bell with mortar sufficient to form bead around outside of spigot end of pipe.
 - 5. Remove excess mortar from interior of pipe and finish exterior and interior to smooth surfaces.
- C. Tongue-and-Groove Joints:
 - 1. Thoroughly wet groove; apply mortar to lower half of groove.
 - 2. Thoroughly wet tongue of next pipe and apply a layer of mortar to top half.
 - 3. Fit tongue into groove until pipes are closely fitted and aligned and mortar covers inner and outer surfaces of the joint.
 - 4. Clean inner surface of pipes at joint and point up outside with bead of mortar.

3.08 Not Used

3.09 JOINTS FOR VITRIFIED CLAY PIPE:

- A. Immediately before joining vitrified pipe, liberally coat bell with lubricant and fit spigot with gasket.
- B. Join pipes using equipment designed for purpose.

3.10 JOINTS FOR CAST-IRON SOIL PIPE AND FITTINGS:

- A. Immediately before joining cast-iron soil pipe and fittings, liberally coat hub with lubricant and fit spigot with pipes using equipment designed for purpose.

3.11 CONNECTIONS WITH EXISTING SEWERS:

- A. Make connections with existing public sewers in accordance with requirements of the jurisdictional authority.
- B. Do not connect existing sewer to sewer under construction unless approved.

3.12 TUNNELING AND JACKING:

- A. Perform tunneling and jacking by approved methods.
- B. Where open cut is specified and the Authority Representative permits the work to be done by tunneling or jacking, perform such work as specified and as approved.
- C. Cost of material substitutions required by change of methods will be borne by the Design-Builder.
- D. Make horizontal borings necessary to lay pipe lines true to line and grade.
- E. When sewers are laid in borings, completely fill void between outside barrel of pipe and boring with cement grout pumped into place.
- F. When drainage pipes are laid in borings, completely fill void between pipe and boring with sand, using water pressure to ensure that voids are filled.
- G. Methods of boring and filling of voids between pipe and boring are subject to approval.

3.13 CAST-IN-PLACE CONCRETE CONSTRUCTION:

- A. Conform to applicable requirements of Sections 03100, 03200 and 03300. Section designer to specify the type of cement to be used. The type of cement will vary depending upon the jurisdiction where the work is performed.
 - 1. Cement: Meet requirements of applicable jurisdiction.
- B. Construct concrete support systems where shown. Section designer to specify the type of mortar to be used. Mortar type will vary depending upon jurisdiction in which the work is performed.
 - 1. Mortar and cement: Meet requirements of applicable jurisdiction.

3.14 BRICK CONSTRUCTION:

- A. Perform brick construction as specified in Section 04215, with the following additional requirements:
 - 1. Use sewer brick wherever brick construction is exposed to flow; otherwise, use manhole brick.
 - 2. Lay sewer brick on edge so that 2-1/4 by 8-inch side is exposed to flow.
 - 3. Lay manhole brick so that every sixth course is a header course.
 - 4. Where practicable, lay each course with a line. For curved courses or those in nonparallel planes, use bonded-and-keyed construction.
 - 5. Do not exceed joint thickness of 3/8 inch in straight courses in parallel planes; for courses curved or in nonparallel planes, make thickest part of joint as thin as practicable.
 - 6. Rack or tooth uncompleted brick construction and parge unexposed surfaces with 1/2 inch of mortar.

3.15 MANHOLES:

- A. Construct manholes of precast sections, cast-in-place concrete or brick as shown.
- B. Provide base of precast or cast-in-place construction. Make watertight connection between base and risers.
- C. Unless otherwise shown, place axes of manholes directly over centerlines of pipes.
- D. Construct appropriate flow channels in bottom of manholes.
- E. Where necessary, build connections for public and residential sewers into manholes. Cut pipe flush with inside wall of structure. Do not build pipe into wall; provide mortar joint between pipe and structure.
- F. Install manhole steps and cast iron frame and cover for each manhole; adjust frame and cover to proper grade by brick construction.
- G. WSSC: Install joint entry seal gaskets in openings in the walls of 48-inch precast manholes with O-ring joint.

3.16 CATCH BASINS AND INLETS:

- A. When grading has been substantially completed as approved, construct catch basins of cast-in-place concrete using Class 3500 concrete and steel reinforcement as shown, precast sections or brick as shown.
- B. Cut pipe flush with inside wall of structure. Provide mortar joint between pipe and structure or install water seal as shown.
- C. Install cast iron frame and grate or cover and adjust to proper grade.
- D. WSSC: Install pipe supports as shown. Fill with concrete after installation.

3.17 DITCH LINING AND SLOPE PROTECTION:

A. Slope Preparation:

1. Excavate or fill slopes to the required cross section, lines and grades.
2. Compact earth slopes to not less than 95 percent of the maximum dry density for a depth of not less than 12 inches, as specified in Section 02725.
3. Where lining or protection is to be applied to rock surfaces, clean off mud, debris and loose fragments.
4. Construct toe or cut off walls where shown.
5. Remove loose material and buried debris protruding from subgrade.
6. Placement of aggregate filter:
 - a. Place filter aggregate where shown to depth shown.
 - b. Compact each layer of aggregate filter in accordance with ASTM D698, Method D, to 100 percent at plus-or-minus one percent of optimum moisture content.

B. Ungrouted Riprap:

1. Place aggregate filter as specified.
2. Place riprap by machine to full course thickness in one operation upward from bottom of slope. Prevent displacement of underlying materials. Dumping of riprap is prohibited.
3. Fill spaces between larger stones to produce nearly even surface with minimum of voids. Manually supplement machine placement of stone to choke in voids.
4. Rearrange individual stones as necessary to ensure that finished configuration conforms to lines, grades and thickness shown.

C. Bituminous Concrete Paving:

1. Place bituminous concrete where shown to the lines, grades, thickness and shapes shown.
2. Give base course prime coat of medium-curing, cutback asphalt and allow to cure before hot bituminous concrete is placed.
3. Place hot-mix bituminous concrete by hand or by machine.
4. When hand methods are used, place mixture by means of hot shovels or forks and spread with hot rakes to thickness required to obtain specified compacted thickness. Thoroughly rake loose material throughout its depth, to eliminate honeycombing. Use screed boards of width equal to required thickness of lining.
5. After spreading, compact until specified compacted thickness is obtained.
6. Place mixture as continuously as practicable to eliminate joints. Where joints are required at end of a day's work or when the placing is discontinued for such period of time that material becomes chilled, form joints as specified.

D. Cast-in-Place Concrete:

1. Use Class 3500 concrete unless otherwise shown.
2. Use wood or steel forms.
3. Place reinforcing steel or wire mesh as shown.
4. Provide and install dowel bars where shown in accordance with Section 02750.
5. Locate expansion and contraction joints where shown in accordance with Section 02750.
6. Unless otherwise shown, give surface wood float finish.
7. Protect and cure concrete in accordance with Section 03300.

- E. Concrete Masonry Units:
1. Place two-inch layer of sand cushion on previously prepared slope.
 2. Set units firmly by hand in sand cushion with long dimension parallel to base of slope so as to produce even surface.
 3. Lay blocks with open 3/8-inch joints and with joints staggered as shown.
 4. Completely fill joints with mortar.
 5. Protect and cure newly laid blocks for seven days using wet cotton mats or wet burlap.
 6. Lay blocks when the temperature is 40F or above.
- F. Paving Brick:
1. On the previously prepared slope, place concrete base of thickness shown.
 2. Give concrete smooth screed finish.
 3. Clean base, dampen and lay one-inch thick mortar bed.
 4. Lay bricks with long dimension parallel to base of slope, with open 3/8-inch joints and with joints staggered.
 5. Bed bricks firmly in mortar bed so as to produce even surface free from depressions or high spots.
 6. Fill joints completely with mortar.
 7. Protect and cure newly laid brick for a period of seven days using wet cotton mats or wet burlap.
- G. Sodding: Section 02920.
- H. Concrete Pavement:
1. Lay plastic pipe as shown.
 2. Place aggregate filter as specified.
 3. Place concrete base in accordance with specified requirements for cast-in-place concrete.
- I. Concrete with Granite Block Facing:
1. Lay plastic pipe as shown.
 2. Place aggregate filter as specified.
 3. Place concrete base in accordance with specified requirements for cast-in-place portland cement concrete.
 4. Installation of granite block facing:
 - a. Set granite blocks in bedding course, one-inch minimum depth with 3/4-inch joint width.
 - b. Slope bedding to true surface parallel to finished surface of blocks; strike off bedding until true alignment is attained.
 - c. After final sloping, do not disturb bedding prior to laying blocks.
 - d. Lay blocks on bedding course in successive courses with quarry split finish up.
 - e. Align each course, lay true and even and bring to true grade by use of wood mallets or similar tools.
 - f. Lay blocks in continuous sequence.
 - g. Lay no more mortar than can be covered with blocks before end of work day.
 - h. Point voids in joints with preshrunk mortar. Do not point when ambient temperature is 50F and falling. After pointing, scrub surfaces with soap solution and remove stains. Rinse immediately with clean water. Leave work in first class condition, free from mortar stain and other defacement as approved.

- J. Gabions:
1. Prepare ground surface smooth and even where gabions will be installed.
 2. Assemble gabions and tie together in accordance with manufacturer's instructions.
 3. Fill gabions in lifts of 12 inches maximum. Install tie devices in all units with exposed faces, spaced in accordance with requirements of jurisdictional agency.
 4. Ensure stone fill is placed without voids larger than approximately smaller stones. Hand-place stones in exposed faces.

3.18 CONCRETE HEADWALLS AND WINGWALLS:

- A. Excavation:
1. Excavate for foundations and walls to lines and grades shown in accordance with Section 02320.
- B. Formwork and Reinforcement:
1. Erect formwork and install reinforcement as shown and in accordance with Sections 03100 and 03200.
- C. Concrete Work:
1. Place concrete of class shown and protect and cure in accordance with Section 03300.
- D. Backfilling:
1. Backfill and compact in accordance with Section 02320.

3.19 COATING APPLICATION AND REPAIR:

- A. Preparation of surface: Perform the following in order given:
1. Clean surfaces contaminated with oil or grease using naphtha or xylol.
 2. Remove rust and mill scale from surfaces by dry abrasive blasting to commercial finish in accordance with SSPC SP-6.
 3. Coat surfaces within 24 hours and before dew point is reached.
 4. Apply coating only to surfaces which are dry and free of contaminants. Whip blast surfaces not coated within specified time limit.
 5. Application of coating:
 - a. Mix coating in quantity which can be applied within its pot life if in accordance with manufacturer's recommendation. Thin only with approval.
 - b. Apply coating to exterior surfaces of pipes and fittings in accordance with recommendations of coating manufacturer and as follows:
 - 1) Two coats of equal thickness.
 - 2) Total dry film thickness: 20 mils.
 - 3) Pretreat first coat as required prior to application of second coat.
 - 4) Apply second coat before first coat has dried tack-free but not later than 24 hours after application of first coat, unless otherwise recommended by coating manufacturer.
 - 5) Inspect coating prior to burial. Repair damages in accordance with recommendations for field corrections by coating manufacturer.
 6. Test cathodic protection as specified in Section 13115.

3.20 Not Used

3.21 FIELD QUALITY CONTROL:

- A. Maximum Surface Variation Tolerances:
 - 1. Grouted riprap: 1-1/4 inches in four feet from true plane.
 - 2. Bituminous concrete: Plus-or-minus 1/4 inch from specified grade in 25 feet.
 - 3. Cast-in-place concrete: Plus-or-minus 1/4 inch from specified grade in 15 feet.
 - 4. Precast concrete block: Plus-or-minus 1/2 inch from specified grade in 25 feet.
 - 5. Paving brick: Plus-or-minus 1/2 inch from specified grade in 25 feet.

- B. Obstruction Tests:
 - 1. Perform field tests to verify that installed storm systems are free from obstructions.
 - 2. Remove obstructions by excavating at the apparent obstruction and repairing or replacing the defective pipe as directed by the Authority Representative.

3.21 Not Used

3.21 ABANDONED STORM SEWERS:

- A. Meet requirements of Section 02270.
- B. Fill abandoned sewer with sand.

END OF SECTION

SECTION 02636

STORMWATER MANAGEMENT, SEDIMENT AND EROSION CONTROL, AND WETLANDS MITIGATION.

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies installing ditch lining, slope protection, stormwater management, wetlands mitigation, and low impact development strategies where appropriate and applicable, and sediment and erosion controls.
- B. All work shall be constructed in accordance with the applicable sections and requirements of the following jurisdictional agencies:
 - 1. The Maryland Department of the Environment
 - 2. The Maryland State Highway Administration
 - 3. The District of Columbia Department of Health, Environmental Health Administration, Bureau of Environmental Quality, Watershed Protection Division
 - 4. The U. S. Army Corps of Authority Representatives
 - 5. Prince Georges County Department of Environmental Resources
 - 6. Montgomery County Department of Environmental Protection

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. All materials shall conform to the requirements of the applicable jurisdictional agency.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. All work shall be performed in conformance with the requirements of the applicable jurisdictional agency.
- B. All inspections and testing shall be accomplished in conformance with the requirements of the applicable jurisdictional agency.

END OF SECTION

THIS PAGE NOT USED

SECTION 02725
BASE FOR PAVEMENTS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies furnishing, placing, shaping and compacting aggregate base on previously constructed subgrades.
- B. Related Work Specified Elsewhere:
 - Section 02320 Grading, excavating and backfilling
 - Section 02740 Bituminous pavement
 - Section 02750 Concrete pavement

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ASTM: D1241, D1557.
- B. Source Quality Control:
 - 1. Not less than 10 days prior to the beginning of work, inform the Engineer of source of material to be used.
 - 2. Once approved, do not change source of supply.
 - 3. Do not construe approval as approval of the entire location but as approval only insofar as material continues to conform to specified requirements.
 - 4. Cooperate with the Engineer so that the Engineer may take samples and make tests as often as he deems necessary.
 - 5. The Engineer has the right to reject material at the job site by visual inspection, pending sampling and testing.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Aggregate Base Materials:
 - 1. ASTM D1241.

2. Grading requirements:

Sieve Designation	Percentage By Weight Passing Square Mesh Sieves
2-1/2 inches	100
1 inch	85 - 100
1/2 inch	50 - 92
Size 10	35 - 65
Size 40	15 - 45
Size 200*	3 - 15

*Fraction passing the Size 200 sieve to be not greater than 2/3 of the fraction passing the Size 40 sieve.

PART 3 - EXECUTION

3.01 EQUIPMENT:

- A. Place material using equipment designed for the purpose. Use equipment of size and weight necessary to shape material as shown and to compact material to specified minimum density.
- B. Provide sufficient equipment to achieve specified compaction at rate consistent with rate of placement of base material.
- C. Obtain approval of equipment prior to use on the work.
- D. Maintain equipment in first class operating condition while in operation.

3.02 PLACING MATERIAL:

- A. Subgrade Preparation: In accordance with Section 02320.
- B. Place material in its final location so as to provide uniformity of grading throughout work.
- C. Use graders for touching up and for working materials into areas which do not permit use of other equipment providing there is continuing conformance to specified requirements and providing approval is obtained.
- D. Place material in uniform layers so that each layer has compacted lift thickness of six inches maximum and three inches minimum.
- E. Where thickness is shown or specified is more than six inches, place material in two or more layers of equal thickness so that specified requirements are met.

3.03 COMPACTION:

- A. During placing and compacting, obtain moisture content and dry density within the allowable tolerances specified.
- B. Compact each layer to required density before placing next layer.
- C. Compact areas not accessible to rollers to required density by means of approved mechanical tampers.
- D. Puddling or jetting is prohibited.
- E. Density:
 - 1. Compact material under curbs and gutters, gutters, curbs and pavement to 98 percent of maximum density at proper moisture content.
 - 2. Compact material under sidewalks to 95 percent of maximum density at proper moisture content.

3.04 FIELD QUALITY CONTROL:

- A. Allowable Tolerances:
 - 1. Construct base to the following tolerances:
 - a. Thickness of base: Plus zero or minus 3/8 inch.
 - b. Surface of base:
 - 1) Plus 1/8 inch or minus 3/8 inch of elevation shown.
 - 2) Deviation not more than 1/2 inch from steel straightedge as specified in Section 02750.
 - 2. Maintain moisture content within two percent of optimum moisture content.
- B. Tests: Determine optimum moisture content and maximum density in accordance with ASTM D1557.

3.05 MAINTENANCE:

- A. Throughout placing and compacting, and until the placing of the succeeding pavement course, maintain base for pavement in specified condition.

3.06 DEFICIENT BASES:

- A. Where directed, repair or remove and replace, with new material, pavement base that does not meet requirements.

END OF SECTION

THIS PAGE NOT USED

SECTION 02726

SUB-BALLAST

PART 1 - GENERAL

1.01 DESCRIPTION:

This section specifies furnishing, placing and compacting sub-ballast on previously constructed subgrade.

1.02 QUALITY ASSURANCE:

Quality Assurance/Quality Control shall be in accordance with the Design-Builder's Construction Quality Management Plan.

- A. Codes, Regulations, Reference Standards and Specifications:
1. Comply with codes and regulations of the jurisdictional authorities.
 2. Comply with reference standards:
 - a. ASTM C88 - Standard Test Method for Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate
 - b. ASTM C117 - Standard Test Method for Materials Finer than 75 Micro Meter (No. 200) Sieve in Mineral Aggregates by Washing
 - c. ASTM C127 - Standard Test Method for Density, Relative Density (Specific Gravity), and Absorption of Coarse Aggregate
 - d. ASTM C131 - Standard Test Method for Resistance to Degradation of Small-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine
 - e. ASTM C136 - Standard Test Method for Sieve Analysis of Fine and Coarse Aggregates
 - f. ASTM C142 - Standard Test Method for Clay Lumps and Friable Particles in Aggregates
 - g. ASTM C702 - Standard Practice for Reducing Samples of Aggregate to Testing Size
 - h. ASTM D75 - Standard Practice for Sampling Aggregates
 - i. ASTM D698 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft³ (600 kN-m/m³))
 - j. ASTM D1556 - Standard Test Method for Density and Unit Weight of Soil in Place by the Sand-Cone Method
 - k. ASTM D2922 - Standard Test Methods for Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth)
 - l. ASTM D3017 - Standard Test Method for Water Content of Soil and Rock in Place by Nuclear Methods (Shallow Depth)
- B. Testing:
1. Except for gradation QC testing, sampling and testing shall be performed by an independent testing laboratory approved by the Authority Representative. The independent laboratory shall prepare the test report.
- C. Source of Materials, Qualification:
1. The source of the sub-ballast material shall be qualified and approved by the Authority Representative prior to commencing sub-ballast delivery to project site.

- a. Sample and test sub-ballast source material as specified herein for sub-ballast material.
 - b. To qualify and to be approved, source materials shall meet requirements specified herein.
 - 2. If the source of sub-ballast material is changed, the new source shall be qualified and approved before delivering sub-ballast from the new source.

- D. Gradation Quality Control:
 - 1. Prior to shipment, the Design-Builder shall sample and prepare a gradation QC report for each 2,000 tons of sub-ballast being loaded for shipment.
 - a. The sample shall be representative of the sub-ballast being loaded for shipment.
 - b. The sample shall be taken in accordance with ASTM D75.
 - c. The sample size shall be in the quantities listed in ASTM D75 for gradation testing.
 - d. The gradation report shall be prepared for each sample and shall include the following information.
 - 1) Identification of the source material.
 - 2) Date of sample.
 - 3) Sample number.
 - 4) Shipment number.
 - 5) Sieve analysis.
 - 2. In the event any two individual samples fail to meet the specified gradation requirement, immediate corrective action shall be taken to restore the production process to the specified gradation. The Design-Builder shall advise in writing the Authority Representative of the corrective action being taken.
 - 3. In the event of repeated failures, i.e., two or more samples failing in two successive shipments, the Authority Representative reserves the right to reject the shipment.

- E. Sub-Ballast Quality Control.
 - 1. QC samples shall be taken at the project site from every 15,000 tons of sub-ballast delivered. Samples shall be representative of sub-ballast delivered. Samples shall be tested and shall meet the specified requirements.

- F. Inspection:
 - 1. The Authority Representative has the right to stop delivery of sub-ballast to the job site based on visual inspection pending sampling and testing.
 - 2. If sub-ballast loaded, being loaded or installed does not conform to specified requirements, the Authority Representative will reject the sub-ballast and no further delivery will be accepted until the deficiency is corrected.

- G. Field Quality Control of Placement and Compaction:
 - 1. Allowable Tolerances:
 - a. Construct surface of sub-ballast to the following tolerances:
 - 1) Within 0.1 foot of elevation shown.
 - 2) Deviation not more than 1/2 inch from 10-foot straightedge.
 - b. During compaction maintain moisture content within two percent of optimum moisture content.
 - 2. Tests:
 - a. Determine optimum moisture content and maximum dry density in accordance with ASTM D698.

- b. Determine in-place density in accordance with ASTM D2922 or ASTM D 1556 and moisture content in accordance with ASTM D3017.
 - 1) Only one method, ASTM D2922 or ASTM D 1556, shall be used through out the project.
- H. Defective Sub-Ballast and Workmanship:
 - 1. Remove from site and replace defective sub-ballast.
 - 2. Remove from and replace sub-ballast placed on muddy or frozen subgrade or subgrade with standing water.
 - 3. Reshape sub-ballast to the specified compacted thickness, shape and elevation.
 - 4. Re-compact while maintaining optimum moisture content until specified compaction is achieved.
- I. Subsequent Work:
 - 1. Subsequent work such as placing or storing ties, ballast, rail, etc. done on top of the sub-ballast before the sub-ballast placement, shaping and compaction has been completed, tested and approved shall be temporary work and shall be removed to replace defective sub-ballast, to repair defective workmanship, and to complete shaping, compaction and testing of the sub-ballast.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Independent Testing Laboratory: The following data shall be submitted and approved prior to required sampling and testing is performed.
 - 1. Name of laboratory
 - 2. Address (location) of laboratory
 - 3. Telephone number
 - 4. Name of Owner or Principal with Authority
 - 5. Key Technical Personal with resumes
 - 6. Laboratory resume with qualifying work experience
- B. Certification: The following certifications shall be submitted in a timely manner and shall be approved before final subsequent work on top of the sub-ballast is started.
 - 1. Qualification of source material.
 - a. Qualification samples were taken from and are representative of the material from the source that will be used to furnish the sub-ballast.
 - b. Qualification tests were performed as specified on the qualification samples by the approved independent laboratory.
 - c. Qualification test reports are the test results from the qualification tests performed on the qualification samples.
 - d. Reported test results meet the specified requirements.
 - 2. At time of delivery.
 - a. With each delivery, submit certificates attesting that sub-ballast furnished is typical of the qualified material and submit gradation QC reports for the delivered ballast.
 - 1) Gradation QC samples were taken from 2,000 tons of sub-ballast being loaded for shipment.
 - 2) Sieve analysis was performed on the gradation QC samples.

- 3) Gradation QC reports are the test results from the sieve analysis performed on the gradation QC samples.
3. QC of sub-ballast delivered to site.
 - a. QC samples were taken from sub-ballast delivered to the site at the specified frequency.
 - b. QC tests were performed as specified on the QC samples by the approved independent laboratory.
 - c. QC test reports are the test results from the QC tests performed on the QC samples.
 - d. Reported test results meet the specified requirements.
 4. Field QC of placed and compacted sub-ballast
 - a. Sub-ballast was placed as specified.
 - b. The compacted final shape, thickness and elevation meets the tolerances specified.
 - c. Field QC tests were performed as specified on the placed and compacted sub-ballast by the approved independent laboratory.
 - d. Field QC test reports are the test results from the field QC tests.
 - e. Reported test results meet the specified requirements.
 5. Defective sub-ballast and workmanship
 - a. Discovered defective sub-ballast has been removed from site, replaced, shaped and compacted as specified.
 - b. Sub-ballast improperly placed on muddy or frozen subgrade or subgrade with standing water has been removed from site, replaced, shaped and compacted as specified.
 - c. Sub-ballast discovered not meeting the compacted shape, thickness and elevation requirements has been reshaped to the specified compacted shape, thickness and elevation requirements.
 - d. Sub-ballast discovered not meeting the compaction requirements has been re-compacted and the specified compaction has been achieved.
- C. Samples and Documentation:
1. Qualification: Submit samples, source of supply, test results and report, and certification sufficiently in advance to obtain approval not less than 30 days prior to date of commencing delivery.
 - a. If material or source is to be changed, then submit samples, source of supply, test results and report, and certification sufficiently in advance to obtain approval not less than 30 days prior to date of commencing delivery of sub-ballast from the new material or source.
 2. Gradation QC Reports: Certified Gradation QC Reports shall be prepared and submitted with each sub-ballast delivery.
 3. QC of sub-ballast delivered: Certified QC Test Reports shall be prepared and submitted in a timely manner.
 4. Field QC: Certified Field QC Test Reports shall be prepared and submitted in a timely manner.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Sub-Ballast: Crushed stone free of vegetable matter and other deleterious substances, with the following additional requirements:

1. Samples shall be secured, reduced, shipped and identified in accordance with ASTM D75 and ASTM C702.
2. Gradation: ASTM C136 and ASTM C117 with the following additional requirements:

Sieve Size	Percent Passing By Weight
1 inch	100
3/8 inch	50 to 85
4	35 to 65
10	25 to 50
40	15 to 25
200	5 to 15

- a. Fraction passing the Size 200 sieve less than two thirds of fraction passing Size 40 sieve.
3. Clay lumps and friable particles: ASTM C142, 0.5 percent maximum.
4. Wear: ASTM C131, 40 percent maximum.
5. Absorption: ASTM C127, 0.5 percent maximum.
6. Soundness: ASTM C88, weighted average loss 15 percent maximum after five cycles of magnesium sulfate tests.

PART 3 - EXECUTION

3.01 PLACING MATERIAL:

- A. Immediately prior to placing sub-ballast, subgrade shall conform to the subgrade compaction and shape requirements.
- B. Do not place sub-ballast on subgrade that is muddy, rutted or frozen or has standing water.
- C. Prior to placing sub-ballast, repair subgrade using sub-ballast and remove loose or extraneous material.
- D. Place sub-ballast to provide uniformity of grading throughout work.
- E. If subgrade is dusty, sprinkle it prior to placing sub-ballast.
- F. Deliver sub-ballast as uniform mixture and spread sub-ballast without causing segregation.
- G. Sub-ballast shall be kept free and clean of foreign material during delivery, placement and shaping.
- H. Install sub-ballast to shape shown and to a minimum compacted thickness of 8 inches. Place sub-ballast in two or more layers of equal thickness of not more than six inches each.

1. Measure and verify that the compacted sub-ballast is at specified minimum thickness and shape.

3.02 COMPACTION:

- A. During placing and compacting, maintain moisture content within specified tolerance.
- B. Compact sub-ballast for its full depth to 100 percent of maximum dry density.
 1. Measure and verify specified compaction has been achieved.

END OF SECTION

SECTION 02727

BALLAST

PART 1 - GENERAL

1.01 DESCRIPTION:

This section specifies furnishing mineral aggregate for use as ballast for ballasted track construction.

1.02 QUALITY ASSURANCE:

Quality Assurance/Quality Control shall be in accordance with the Design-Builder's Construction Quality Management Plan.

A. Codes, Regulations, Reference Standards and Specifications:

1. Comply with codes and regulations of the jurisdictional authorities.
2. Comply with reference standards.
 - a. ASTM C88 - Standard Test Method for Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate
 - b. ASTM C117 - Standard Test Method for Materials Finer Than 75 Micro Meter (No. 200) Sieve in Mineral Aggregates by Washing
 - c. ASTM C127 - Standard Test Method for Density, Relative Density (Specific Gravity), and Absorption of Coarse Aggregate
 - d. ASTM C136 - Standard Test Method for Sieve Analysis of Fine and Coarse Aggregates
 - e. ASTM C142 - Standard Test Method for Clay Lumps and Friable Particles in Aggregates
 - f. ASTM C535 - Standard Test Method for Resistance to Degradation of Large-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine
 - g. ASTM C702 - Standard Practice for Reducing Samples of Aggregate to Testing Size
 - h. ASTM D75 - Standard Practice for Sampling Aggregates
 - i. ASTM D4791 - Standard Test Method for Flat Particles, Elongated Particles, or Flat and Elongated Particles in Coarse Aggregate
 - j. ASTM E11 - Standard Specification for Wire Cloth and Sieves for Testing Purposes
 - k. AREMA - Manual for Railway Engineering

B. Testing:

1. Except for gradation QC testing, sampling and testing shall be performed by an independent testing laboratory approved by the Authority Representative. The independent laboratory shall prepare the test report.

C. Source of Materials, Qualification:

1. The source of the ballast material shall be qualified and approved by the Authority Representative prior to commencing ballast delivery to project site.
 - a. Sample and test ballast source material as specified herein for ballast material.

- b. To qualify and to be approved, source materials shall meet requirements specified herein.
2. If the source of ballast material is changed, the new source shall be qualified and approved before delivering ballast from the new source.

D. Gradation Quality Control:

1. Prior to shipment, the Design-Builder shall sample and prepare a gradation QC report for each 1000 tons of ballast being loaded for shipment.
 - a. The sample shall be representative of the ballast being loaded for shipment.
 - b. The sample shall be taken in accordance with ASTM D75.
 - c. The sample size shall be in the quantities listed in ASTM D75 for gradation testing.
 - d. The gradation report shall be prepared for each sample and shall include the following information.
 - 1) Identification of the source material.
 - 2) Date of sample.
 - 3) Sample number.
 - 4) Shipment number.
 - 5) Sieve analysis.
2. In the event any two individual samples fail to meet the specified gradation requirement, immediate corrective action shall be taken to restore the production process to the specified gradation. The Design-Builder shall advise in writing the Authority Representative of the corrective action being taken.
3. In the event of repeated failures, i.e., two or more samples failing in two successive shipments, the Authority Representative reserves the right to reject the shipment.

E. Ballast Quality Control.

1. QC samples shall be taken at the project site from every 4,000 tons of ballast delivered. Samples shall be representative of the ballast delivered. Samples shall be tested and shall meet the specified requirements.

F. Inspection:

1. The Authority Representative has the right to stop delivery of ballast to job site by visual inspection, pending sampling and testing.
2. If ballast loaded, being loaded or installed does not conform to specified requirements, the Authority Representative will reject the ballast and no further delivery will be accepted until the deficiency has been corrected.

G. Defective Ballast:

1. Remove from site and replace defective ballast.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Independent Testing Laboratory: The following data shall be submitted and approved prior to required sampling and testing is performed.
 - 1. Name of laboratory
 - 2. Address (location) of laboratory
 - 3. Telephone number
 - 4. Name of Owner or Principal with Authority
 - 5. Key Technical Personal with resumes
 - 6. Laboratory resume with qualifying work experience

- B. Samples and Documentation:
 - 1. Qualification: Submit samples, source of supply, test results and report, and certification sufficiently in advance to obtain approval not less than 30 days prior to anticipated date of commencing delivery.
 - a. If material or source is to be changed, then submit samples, source of supply, test results and certification sufficiently in advance to obtain approval not less than 30 days prior to date of commencing delivery of ballast from the new material or source.
 - 2. Gradation QC Reports: Certified Gradation QC Reports shall be prepared and submitted with each ballast delivery.
 - 3. QC of ballast delivered: Certified QC Test Reports shall be prepared and submitted in a timely manner.

- C. Certification: The following certifications shall be submitted in a timely manner.
 - 1. Qualification of source material.
 - a. Qualification samples were taken from and are representative of the material from the source that will be used to furnish the ballast.
 - b. Qualification tests were performed as specified on the qualification samples by the approved independent laboratory.
 - c. Qualification test reports are the test results from the qualification tests performed on the qualification samples.
 - d. Reported test results meet the specified requirements.
 - 2. At time of delivery.
 - a. With each delivery, submit certificates attesting that ballast furnished is typical of the qualified material and submit gradation QC reports for the delivered ballast.
 - 1) Gradation QC samples were taken from 1,000 tons of ballast being loaded for shipment.
 - 2) Sieve analysis was performed on the gradation QC samples.
 - 3) Gradation QC reports are the test results from the sieve analysis performed on the gradation QC samples.
 - 3. QC of ballast delivered to site.
 - a. QC samples were taken from ballast delivered to the site at the specified frequency.
 - b. QC tests were performed as specified on the QC samples by the approved independent laboratory.
 - c. QC test reports are the test results from the QC tests performed on the QC samples.

- d. Reported test results meet the specified requirements.
- 4. Defective ballast.
 - a. Discovered defective ballast has been removed from site and replaced.

1.04 PRODUCT DELIVERY, HANDLING, AND STORAGE:

- A. Deliver, handle, and store the ballast by methods that prevent damage, fouling and segregation.
 - 1. Ballast shall be loaded only into rail cars or trucks that are tight enough to prevent leakage and are clean and free from rubbish and other foreign substance that would foul the ballast.
 - 2. Ballast shall be unloaded as close as possible to the point of use t minimize the amount of handling.
- B. The following are prohibited:
 - 1. Storage of ballast in cone-shaped piles.
 - 2. Subjecting ballast to repeated passes of equipment over same levels in stockpile area.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Ballast: Crushed stone shall be from diabase rock and shall be hard, strong, angular, durable, free from injurious amounts of vegetable matter and other deleterious substances, with the following additional requirements:
 - 1. Ballast samples shall be secured, reduced, shipped and identified in accordance with ASTM D75 and ASTM C702.
 - a. Minimum sample size: 200 pounds.
 - 2. Ballast shall be graded in accordance with ASTM C136 using wire-cloth sieves conforming to ASTM E11. Gradation shall meet the following requirements:

SIEVE SIZE	PERCENT PASSING BY WEIGHT
	AREMA SIZE 5 Yard
2 inches	-
1-1/2 inches	100
1 inch	90 to 100
3/4 inch	40 to 75
1/2 inch	15 to 35
3/8 inch	0 to 15
Size 4	0 to 5

3. Fine particles - Material finer than Size 200 sieve, ASTM C117, one percent by weight maximum.
4. Flat and elongated particles - Use dimension ratio of 1:3 - ASTM C4791, five-percent by weight maximum.
5. Clay lumps and friable particles - ASTM C142, 0.5-percent maximum.
6. Wear - ASTM C535, 40-percent maximum.
7. Absorption - ASTM C127, 1.5-percent maximum.
8. Soundness - ASTM C88, 10-percent maximum loss after five cycles of the sodium-sulfate test.

PART 3 - EXECUTION

3.01 INSTALLATION:

Install ballast in accordance with the ballasted trackwork construction requirements of Section 05652.

END OF SECTION

THIS PAGE NOT USED

SECTION 02740

BITUMINOUS PAVEMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing bituminous pavement.
- B. All bituminous pavement work in Greenbelt Yard, Shady Grove Yard and Brentwood Yard, shall be designed and constructed in accordance with all requirements of the Maryland State Highway Administration (SHA) and in accordance with the latest Maryland SHA Standard Specifications for Construction and Materials.

PART 2-PRODUCTS

2.01 MATERIALS:

- A. All bituminous pavement materials for Greenbelt Yard, Shady Grove Yard and Brentwood Yard, shall conform to the applicable requirements of the Maryland State Highway Administration (SHA) and in accordance with the latest Maryland SHA Standard Specifications for Construction and Materials.
 - 1. Section 904.02 Performance Graded asphalt Binders - PG 64-22.
 - 2. Section 904.04 - The Contractor shall develop a Superpave mix design in conformance with ASSHTO M-323-04, and shall design for a thirty (30) million Equivalent Single Axle Loading (ESAL).

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. All pavement work in Greenbelt Yard, Shady Grove Yard and Brentwood Yard, shall be performed in conformance with the requirements of the Maryland State Highway Administration (SHA) and in accordance with the latest Maryland SHA Standard Specifications for Construction and Materials.
- B. All inspections and testing in Greenbelt Yard, Shady Grove Yard and Brentwood Yard, shall be accomplished in conformance with the requirements of the and in accordance with the Maryland State Highway Administration (SHA) and in accordance with the latest Maryland SHA Standard Specifications for Construction and Materials.

END OF SECTION

THIS PAGE NOT USED

SECTION 02750
CONCRETE PAVEMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing portland cement concrete pavement, plain or reinforced or both, in conformance with the sections, lines and grades shown.
- B. Related Work Specified Elsewhere:
 - Section 02725 Base for pavements
 - Section 03200 Concrete reinforcement
 - Section 03300 Cast-in-place structural concrete

1.02 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings: Joint devices.
- B. Certification: As specified in Section 03300, including design mixes.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. AASHTO: M33, M74, M81, M148, M153, M171, M182, M194, M220, M227, T51, T148.
 - 3. FS: TT-P-86, TT-S-00227.
 - 4. ASTM: A185, A370, A615, C33, C294, C920, D3405.
- B. Concrete: Conform to quality assurance requirements as specified in Section 03300 and this section.
- C. Testing: Subject concrete for pavements to test procedures specified in Section 03300.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Aggregates and Cement: As specified in Section 03300.

1.05 JOB CONDITIONS:

- A. Environmental Requirements:
 - 1. Do not place concrete on frozen soil base.
 - 2. Apply joint sealer when the air temperature is 50F or higher.

- B. Refrain from placing concrete while the temperature is lower than 40F or when by the National Weather Service forecast it may be expected to reach 40F or lower during the 24-hour period following placement of concrete.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Subgrade Paper: AASHTO M74.
- B. Polyethylene sheet and tape: AASHTO M171, white opaque for curing.
- C. Wire Fabric: Welded steel-wire fabric, ASTM A185.
- D. Bituminous Paint: AASHTO M81, Grade RC-250.
- E. Joint Devices:
 - 1. Tie bars: ASTM A615, Grade 60.
 - 2. Tie rod assemblies: Tensile requirements of AASHTO M227, Grade 80 based on measured cross-sectional area of unthreaded portion of bar when tested in assembled condition in accordance with ASTM A370.
 - 3. Dowels:
 - a. Plain round bars, AASHTO M227, Grade 80 coated with paint, FS TT-P-86, Type I.
 - b. Dowel sleeves in accordance with the following:
 - 1) Snug fit with dowel bar.
 - 2) Closed end.
 - 3) Limit stop for dowel approximately one inch from closed end.
 - 4) Sufficient rigidity to prevent entry of fresh concrete and collapse during construction.
 - 4. Hook bolt:
 - a. Material: As specified for dowels.
 - b. Fabrication: As shown.
- F. Grease for Dowels: Approved water-resistant grease.
- G. Expansion Joint Materials:
 - 1. Preformed expansion joint fillers:
 - a. Bituminous: AASHTO M33.
 - b. Cork: AASHTO M153, Type II.
 - c. Preformed joint seals: AASHTO M220.
 - 2. Expansion joint sealing compounds:
 - a. Hot-poured: ASTM D3405 and when tested in accordance with AASHTO T51 having ductility not less than 40 centimeter and flow at 140F not greater than one centimeter. Use of ground rubber scrap is prohibited.
 - b. Cold-applied: Single-component type, ASTM C920.
 - c. Elastomeric: FS TT-S-00227, Type 1, Class A.
- H. Burlap: AASHTO M182, Class 3 or 4.
- I. Waterproof paper: AASHTO M171.

- J. White burlap-polyethylene sheet shall conform to AASHTO Designation M171.
- K. Liquid Membrane Forming Curing Compounds: AASHTO M148, Type 1, resin base, wax-free.
- L. Concrete: Section 03300, Class 3500, air-entrained, with the following additional requirements:
 - 1. Portland cement: Type I.
 - 2. Minimum cement content: Six bags per cubic yard of concrete.
 - 3. Maximum water content: Water/Cement ratio of 0.45 by weight.
 - 4. Air content: 6-1/2 percent plus-or-minus 1-1/2 percent by volume.
 - 5. Slump: 2-1/2 inches plus-or-minus 1/2 inch.
 - 6. Water reducing admixture: AASHTO M194, Type A or D as directed.
 - 7. Coarse aggregate:
 - 8. Size: ASTM C33 and as follows: 57; 67; 57 and 67; 57 and 4; 67 and 4; or 57, 67 and 4.
 - 9. Deleterious materials: Maximum amount of soft fragments, 2.0 percent by weight; maximum amount of coal and lignite 0.25 percent by weight; and material passing Size 200 sieve 0.5 percent by weight.
 - a. Maximum abrasion loss: 40 percent by weight.
 - 10. Fine aggregate:
 - a. Deleterious material: Maximum amount of friable particles, 0.5 percent by weight; maximum amount of coal and lignite 0.25 percent by weight; material passing Size 200 sieve three percent maximum by weight.
 - 11. For bridge decks and bridge sidewalks: Use only crushed trap rock aggregate, trap rock to be diabase rock, ASTM C294.
- M. High-Early-Strength Concrete: As specified for concrete and modified to produce high-early-strength concrete by one or a combination of the following methods.
 - 1. Substitution of Type III or Type I cement in approved mix.
 - 2. Addition of Type I cement to the approved mix, but so that the total cement does not exceed eight bags per cubic yard of concrete.
 - 3. Addition of an approved accelerating admixture to approved mix as specified in Section 03300.

PART 3 - EXECUTION

3.01 EQUIPMENT:

- A. Provide appropriate equipment in sufficient quantity and sizes to perform work as specified and shown.
- B. Maintain machinery and equipment on site in first class working condition. Provide necessary tools and supplies for maintenance.
- C. Straightedges and Templates:
 - 1. Use metal straightedges, 10 feet long, rigidly constructed so as to prevent vertical deflection exceeding 1/32 inch and fitted with handles for ease of use.
 - 2. Use templates, constructed so as to extend from form to form and to ride on form, having adjustable tines spaced at six-inch intervals and rigidly constructed so as to prevent vertical deflection exceeding 1/32 inch.

3.02 BASE:

- A. Check previously placed base for grade and crown with templates and straightedges for compliance with tolerances specified in Section 02725.
- B. Correct deficiencies in grade, contour and compaction.
- C. Obtain approval of base prior to placing forms and impervious material.

3.03 SETTING FORMS:

- A. Unless concrete is placed against abutting structures, use steel forms to maintain concrete within required tolerance and to support paving equipment.
- B. Use flexible steel forms for curve radii less than 250 feet. For small radius curves and non-standard closures, use approved wood forms. Provide properly drilled forms to accommodate tie rod assemblies.
- C. Set forms accurately and firmly to line and grade throughout entire length of approved base.
- D. Set forms sufficiently ahead of other work to avoid conflict during operations.
- E. Concurrent with setting of forms, cover base with layer of impervious material of either subgrade paper or polyethylene sheet.
 - 1. Subgrade paper: Overlap adjacent strips at least four inches and ends not less than 12 inches.
 - 2. Polyethylene sheet: Overlap sides at least 12 inches.
 - 3. Maintain cover intact until concrete is placed.
- F. Apply one coat of bituminous paint to contact areas of abutting structures and previously placed slabs.

3.04 FIELD QUALITY CONTROL:

- A. Allowable Tolerances:
 - 1. Joints and joint devices: Maximum deviation of 1/4 inch from position shown and 1/8 inch from ten-foot steel straightedge.
 - 2. Dowels: Aligned to tolerance of not more than 1/8 inch in 12 inches.
 - 3. Fabric reinforcement:
 - a. Clearance from vertical surfaces and joints: Minus 1/4 inch or plus 1/2 inch.
 - b. Clearance from top and bottom surfaces: Plus-or-minus 1/4 inch.
 - c. Clearance from top surface of additional reinforcing at penetrating structures: Plus-or-minus 1/8 inch.
 - 4. Top surface of concrete: Maximum deviation of 1/8 inch from ten-foot steel straightedge and within plus-or-minus 1/8 inch of the required elevation.
 - 5. Grooves for joints: Within minus 1/16 inch or plus zero inch of dimensions shown.
 - 6. Thickness of concrete pavement: Within minus 1/8 inch of the thickness shown, in accordance with AASHTO T148.
- B. Testing of Concrete:
 - 1. Conform to requirements specified in Section 03300.

3.05 JOINT DEVICES:

A. General:

1. Place and secure joint devices to ensure that deviation does not exceed specified tolerances. Finish joints to such tolerances.
2. Provide acceptable means of splicing.
3. Provide satisfactory gages for checking position of joint devices.
4. Where joints are to be completed after placing concrete, mark location of joint devices so as to permit installation of joint to tolerances specified.
5. Where options for construction are permitted, use approved method.
6. Do not disturb joint devices. Do not permit workers to step on joint devices. Realign devices immediately if displaced.
7. Hold initial installation of devices firmly in place by tap bolts installed in holes drilled in forms. If holes in forms have been formed by method other than drilling, use steel washers in addition to tap bolts. After removal of forms replace tap bolts until adjoining subgrade is ready for concrete placement. Remove tap bolts and install remainder of tie devices prior to placing adjoining slab. Apply heavy coating of bituminous paint prior to placing concrete for adjacent slab.

B. Construction Joints:

1. Make transverse construction joints at locations shown; use joint device applicable to particular type of joint.
2. Install dowels at transverse construction joints, spaced as shown but clearing pavement edges and longitudinal joints by a minimum of six inches. Align dowels both vertically and horizontally to tolerance specified.

C. Contraction Joints:

1. Provide longitudinal contraction joints between previously placed slabs and new slabs and between slabs and abutting curbs and gutters.
2. Tie longitudinal contraction joints together by installation of 1/2-inch tie rods or tie-rod assemblies 30 inches long placed across longitudinal contraction joint and spaced as shown. Do not install tie rods or tie-rod assemblies closer than 18 inches to transverse joints.
3. Make groove for contraction joints by formwork or using an approved joint tooling device. When latter method is used saw joint to one third depth of slab within 24 hours of concrete placement.

D. Expansion Joints and Joint Filler: Make grooves for expansion joints by forming. Where grooves are made by device, use approved device of such design that work can be properly performed.

1. Prepare preformed expansion joint filler in greatest length possible and no less than ten feet.
2. Cut filler for joints transverse to the slab in a single piece of the required shape.
3. Cut pieces for curb and gutter as directed to exact size, from larger pieces.
4. When splicing joint filler, butt tightly to prevent penetration of concrete between adjacent strips of joint filler.
5. For longitudinal joints, except at curb and gutter sections, use preformed tongue and groove filler as shown.
6. Where dowels or other approved load-transfer devices have to penetrate joint filler, properly locate and drill holes of correct size or diameter through filler at required intervals to receive bars and to achieve tight fit.
7. Make groove for cement pavement for surface course by forming, sawing or leaving preformed joint in place.

- 8. Protect preformed joint filler during placing of concrete.

3.06 PLACING REINFORCEMENT:

- A. Install welded steel wire fabric in flat sheets where shown in accordance with Section 03200.
- B. Unless otherwise noted, use wire fabric as follows:

Depth of Slab/Inches	Pounds Per 100 Square Feet
6	30
8	50
10	61

- C. Place wire fabric to clear vertical surfaces and joints by two inches and within tolerances specified. Lap sheets distance equal to spacing of wires and tie securely.
- D. Place two layers of wire fabric in concrete pavements over trench cuts, each layer to be of weight and type as specified for thickness of concrete. Position each layer two inches clear of top and bottom surfaces of slab and within tolerance specified. Extend each layer nine inches beyond sides of trench.
- E. Where other structures, such as manholes, penetrate concrete pavements, place wire fabric on one inch centers in each direction so that there is a minimum of two feet of fabric extending horizontally around perimeter of structure. Install layer of fabric one inch clear of top surface of slab and within tolerance specified.
- F. In surface courses, place wire fabric two inches clear of top surface of slab and within tolerance specified.
- G. Install layer of wire fabric to serve as top layer over trenches. Install additional fabric around penetrations.
- H. Except for pavements over trench cuts and around penetrations, do not place wire fabric in base course.

3.07 PLACING CONCRETE:

Supply and place portland cement concrete as specified in Section 03300, with the following additional requirements:

- A. Place concrete only during daylight unless otherwise approved. If placement is authorized during darkness provide adequate lighting system.
- B. Prior to placing concrete around poles, manholes or other structures projecting through pavement, coat such structures heavily with bituminous paint.
- C. Place concrete to the full thickness, deposited in successive batches for full width of slab by means of discharging device which does not cause segregation of materials.

- D. Compact concrete thoroughly during placement.
- E. When spreading by hand, employ sufficient work force for leveling, spading and spreading concrete in front of screed. Do not use rakes for handling concrete.
- F. Deposit concrete as near as practicable to joints but not touching expansion and contraction joint devices. Shovel concrete to height approximately two inches more than depth of the joint. As soon as forms are removed, clean ends of expansion joints of concrete and expose full width of preformed joint filler for full depth of slab. Place concrete against previously constructed slabs only after ends of preformed joint filler have been so cleaned and ends of performed joint filler in slab being poured have been neatly and firmly butted.
- G. Where wire fabric is required, place concrete in layers so that wire fabric may be properly placed. Requirements for machine placing and for vibration apply for each layer. Place layers and wire fabric, large wires running in longitudinal direction in such rapid sequence that monolithic slab will result.
- H. Compact concrete both by internal and surface vibration. Vibrators may be combined with spreading and finishing machines. Compact concrete adjacent to forms, joints, existing concrete or other structures by use of spud vibrator. Insert vibrator in concrete and work along entire length. Avoid contact with joint devices or underlying base. Evidence of honeycomb or lack of compaction constitute basis for rejection of concrete pavement as deficient.
- I. Construction Joints:
 - 1. Form construction joints where it is necessary and approved to stop concreting for 30 minutes or longer, by staking in a bulkhead and finishing the concrete to the bulkhead.
 - 2. If, due to an emergency, concreting must be stopped within less than ten feet of a previously formed joint of any type, remove the concrete to the joint prior to resuming the placing of the slab.

3.08 INITIAL FINISHING, FLOATING AND FINAL FINISHING:

- A. Give concrete initial finish by use of finishing machines operated so as to minimize formation of laitance and to give required uniformity of surface and compaction. Remove laitance in approved manner.
- B. Avoid prolonged operation over a given area. Operate the machine over each area of pavement as directed and only as many times and at such intervals as required to give the proper compaction and uniformity of surface.
- C. Keep tops of forms clean to permit true and accurate movement of machine.
- D. On completion of screeding, bring surface to smooth finish by use of floats, eight inches wide and a minimum of four feet long, with handles at least four feet longer than width of slab and not less than 16 feet long.
- E. Operate float transversely with combined longitudinal and transverse motion for sufficient number of passes to smooth ridges and fill depressions.

- F. On completion of floating operations, screed top surface of concrete with deviation not exceeding 1/8 inch from straightedge and within tolerance specified for required elevation. Correct deficiencies by handwork if approved.
- G. After floating and verifying that surface is within specified tolerances, drag surface in longitudinal direction with longitudinal and crosswise motions using burlap so to prevent edges digging into surface of concrete or working crown out of pavement.
- H. Brooming:
1. Upon completion of burlap dragging, broom finish top surface of pavement. Use street brooms made for the purpose with split bamboo bristles or metal bristles
 - a. Broom width: 14 inches.
 - b. Broom handle: At least one-half slab width.
 2. In general make brooming perpendicular to centerline of paving unless otherwise shown. Prior to brooming, obtain the Engineer's approval of the direction of brooming for each area.
 3. Pull broom gently over surface of pavement from edge to edge walking back and forth on bridge over pavement, holding handle almost vertical and allowing broom to drag lightly over surface without interruption, leaving slight ridges in concrete perpendicular to centerline of pavement.
 4. Overlap ridging. Ridging not more than 1/8 inch in depth with corrugations of uniform character and width.
 5. Complete brooming before rounding edges of pavement and joints.
- I. Round joints and edges to radius shown.
- J. To form flow line for gutters, trowel smooth 12-inch width of pavement adjacent to curbs unless otherwise shown.
- K. Joint Work and Edging: Where there is an option of method for doing joint work, secure approval for the method elected and use only that method.
1. Perform joint work and edging when condition of concrete permits.
 2. Ensure that joints are within tolerances specified and that there is no perceptible lip or depression other than rounding.
 3. Prepare clean grooves rounded to 1/4-inch radius with smooth even walls.
 4. Make grooves for expansion joints by forming. See requirements above for expansion joints.
 5. For joints to be sealed with poured sealer, prepare grooves with dimensions as shown and within tolerance specified. For joints to be sealed with preformed elastomeric seals, leave grooves of dimensions and within tolerances shown. Provide suitable gauges for checking dimensions.
 6. Where joints in surface course are sealed with cold-poured joint sealer, break bottom bond by placing polyethylene tape full width of groove, laid flat along top of preformed joint filler prior to joint sealing.
 7. When using hot-poured or cold-applied joint sealer, use only equipment designed for purpose. Hand-pouring pots are prohibited. Maintain material within temperature range recommended by manufacturer. Apply sealer when air temperature is as specified. Construct so that resulting stripe is straight, neat, of uniform width and joint is filled to 1/4 inch from top surface of pavement.
 8. When placing elastomeric joint seals, use equipment and methods recommended by manufacturer.

3.09 CURING:

- A. Allow finished concrete to cure by one of the following methods for seven days or until concrete has developed flexural strength of 500 psi:
 - 1. Wet burlap: Cover pavement with double thickness of thoroughly wet burlap, overlapping adjacent sheets by at least six inches. Maintain burlap in saturated state by sprinkling until it is removed. Use only clean material free from holes.
 - 2. Waterproof paper, polyethylene sheet or white burlap-polyethylene sheet: Place material so that adjacent sheets overlap by at least 12 inches. Secure material along side and ends so as to maintain reasonably airtight seal.
 - 3. Use approved liquid-membrane curing compounds as recommended by manufacturer, using equipment designed for purpose.

3.10 REMOVAL OF FORMS:

- A. Remove forms as soon as condition of concrete permits, but in no case sooner than 12 hours after placement.
- B. When the temperature is below 40F, leave forms in place for at least 48 hours or as directed.

3.11 COLD WEATHER CONSTRUCTION:

- A. Whenever, by the National Weather Service forecast for the locality, the temperature may be expected to reach 50F or lower during the 24-hour period following placement concrete mix, include an approved accelerating admixture in the concrete mix as specified in Section 03300.
- B. Place concrete when temperature conditions are as specified, unless otherwise directed. If placing of concrete is so directed, in addition to adding an accelerating admixture heat aggregates, water or both, so that mix when placed is not less than 55F nor more than 90F. Do not exceed 140F for mixing water and 150F for aggregates.
- C. As soon as concrete has hardened sufficiently to prevent marring, cover pavement surface and edges with dry burlap, building paper or other approved material and subsequent layer of at least six inches of dry hay, straw or other approved material. Maintain such protection for at least three days or until field tests indicate that concrete has attained required strength.
- D. During low temperatures, install truck-mixed concrete immediately upon delivery.
- E. When temperature by National Weather Service forecast will be 40F or lower during the 72-hour period following placement of concrete, do not use membrane curing compound.

3.12 HOT WEATHER CONSTRUCTION:

- A. When by National Weather Service forecast, temperature will be 90F or higher during the 24-hour period following placement of concrete, cover pavement by wet-burlap method for first 24 hours, after which curing may be completed by one of the specified methods.

3.13 PROTECTION OF CONCRETE PAVEMENT:

- A. Obtain approval prior to permitting use of completed pavement by public and construction traffic.

3.14 DEFICIENT PAVEMENT:

- A. Where directed, remove and replace with new materials or correct concrete pavement that does not meet requirements.

END OF SECTION

SECTION 02765
PAVEMENT MARKINGS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing pavement markings and striping.

1.02 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Samples:
1. Paint: One quart of each color.
 2. Spheres: Two pounds.
 3. Thermoplastic compound: Ten pounds of each color.
 4. Preformed plastic markings: Five each of plain and reflective, each three inches wide by one-foot long.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
1. Comply with codes and regulations of the jurisdictional authorities.
 2. AASHTO: M249-79.
 3. USDOT/FHWA: Manual on Uniform Traffic Control Devices for Streets and Highways.
 4. Federal Test Method Standard 141.
 5. FED STD: 595.
 6. FS: TT-P-85, TT-B-1325.
 7. ASTM: D638.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver materials in factory-sealed containers plainly marked as follows:
1. Manufacturer's name and address.
 2. Location of plant.
 3. Material.
 4. Color of material.
 5. Amount of contents.
 6. Date of manufacturer and lot number.

1.05 JOB CONDITIONS:

- A. Environmental Requirements:
1. Traffic zone paint:
 - a. Apply only when ambient air temperature is above 40F and temperature of surface to be painted is above 45F.
 - b. If pavement is wet, allow surface to dry for eight hours minimum after surface appears dry.
 - c. Do not apply glass spheres in strong windy conditions.

2. Extruded thermoplastic compound:
 - a. Apply by extrusion at 400F minimum, 440F maximum, when air temperature is more than 35F and pavement temperature is above 50F.
 - b. If pavement is wet, delay application until the pavement has been exposed to at least two hours of direct sunlight after surface appears dry.
 3. Preformed plastic traffic markings:
 - a. Apply on dry pavement when ambient temperature and temperature of pavement surface is above 60F.
 - b. When temperature of pavement surface is less than 60F and when approved, apply surface heating to degree necessary for application of plastic marking.
- B. Protection:
1. Provide traffic protective devices and methods of protection to comply with requirements of the jurisdictional authorities.
 2. Provide and maintain traffic cones, barricades, lights and other protective devices necessary to protect traffic, workmen and completed pavement marking and striping. Remove such devices when marking and striping, including painted sections of curbing and raised traffic bars, have sufficiently cured for intended use.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Traffic Zone Paint:
1. Primer: If recommended by paint manufacturer or required by jurisdictional authorities, type as recommended by paint manufacturer.
 2. Paint: Traffic, FS TT-P-85, white and yellow.
- B. Glass Beads: Retroreflective glass spheres, FS TT-B-1325, with the following additional gradation requirements:

US Sieve Size	Percentage Passing
40	100
50	80 - 100
80	35 - 80
100	20 - 50
200	0 - 15

- C. Extruded Thermoplastic Compound: Hot-applied alkyd thermoplastic per AASHTO M249-79 and as follows:
1. Thermoplastic compound:
 - a. Mixture of thermoplastic resins and other substances compounded for use in traffic markings which, when extruded hot in place and cooled to ambient temperature, will produce stark white or yellow reflective marking stripe.
 - b. Permanently white or yellow, without blemish or discoloration, with straight, clean cut, sharply defined, parallel edges and of uniform cross section.
 - c. Shaped to minimize tire impact and adhere permanently to road.
 - d. Set to solid, non-tacky, non-slippery line of sufficient elasticity to resist cracking and chipping caused by weather and temperature changes, traffic

- e. action, as well as pavement crawl and lift in freezing weather.
 - f. After curing, does not react with nor deteriorate in contact with snow removal chemicals, oil and other substances common to roadway surfaces.
 - g. Chemically stable and emitting no dangerous fumes.
 - h. Especially compounded for traffic markings, with no change in color and brightness characteristics after prolonged exposure to sunlight.
 - i. No breakdown or deterioration when held at plastic temperature for extended periods of time nor when repeatedly reheated to plastic temperature.
 - j. No change in temperature versus viscosity characteristics through repeated reheatings and from batch to batch.
2. White thermoplastic compound:
- a. Pure white, free from dirt or tint after drying.
 - b. Maximum allowable compound deviations from magnesium oxide standard when tested by standard color difference meter, Gardner Color Difference Meter, Gardner Laboratories, Inc. Bethesda, Maryland or equal, with the following minimum requirements:

Scale	Definition	Magnesium Oxide Standardized	Sample
Rd	Reflectance	100	70 minimum
a	Redness - Greenness	0	Minus five to plus five
b	Yellowness - Blueness	0	Minus 10 to plus 10

- c. The white compound pigment containing not less than six-percent titanium dioxide (TiO₂).
3. Yellow thermoplastic compound:
- a. After drying, yellow, FED STD 595, Color 33538, tested in accordance with Federal Test Method Standard 141, Method 4252.
 - b. Pigmented binder well dispersed and free from skins, dirt, foreign objects or ingredients that will cause bleeding, staining or discoloration and consisting of mixture of non-drying synthetic resins at least one of which is solid at room temperature.
 - c. Total binder content of thermoplastic compound: 15-percent minimum, 35-percent maximum by weight.
 - d. Filler incorporated with resins or binder: White calcium carbonate with compressive strength of 5,000 psi.
- D. Preformed Plastic Traffic Markings:
- 1. Composed of preformed plastic, smooth on top surface, undersurfaces factory-coated with pressure-sensitive adhesive coating overlaid with protective paper, polyethylene or other suitable material which remains in place until plastic is ready for application to pavement.
 - 2. Plain or reflectorized.
 - 3. White or yellow.
 - 4. Composition:
 - a. Nonreflectorized plastic material: Consisting of basic plastic and plasticizers, 50-percent minimum by weight.
 - b. Reflectorized plastic material: Consisting of 40-percent minimum by weight

of basic plastic and plasticizer and 30-percent minimum by weight of clear, reflective glass spheres, thoroughly and uniformly dispersed throughout plastic.

5. Pigmentation:
 - a. White plastic markings: Pure white, free from tint and containing not less than six-percent titanium dioxide.
 - b. Yellow plastic markings: Yellow, FED STD 595, Color 33538, Federal Test Method 141, Method 4252.
 - c. Uniform coloring throughout cross section of plastic.
6. Low-temperature stress resistance: No indication of breaking, chipping or cracking when sample of specified thickness is abruptly bent to right angle after being immersed in water at 32F for 30 minutes.
7. Resistance to wear: Endure not less than 2,500 cycles of a Taber Abraser, using CS-17 wheels under a load of 1,000 grams, when each 0.001-inch thickness of plastic is tested at 21C.
8. Tensile strength: Nonreflectorized markings not less than 1500 psi; reflectorized markings not less than 750 psi when tested in accordance with ASTM D638.
9. Bond strength: Withstand 50-pound static shear load for 15 seconds average at 21C before complete parting of bond when pair of two-inch wide strips are overlapped two inches and adhesive faces placed together.

PART 3 - EXECUTION

3.01 FIELD QUALITY CONTROL:

- A. Layout of Work:
 1. Lay out lane widths, parking spaces and crosswalks in accordance with regulations of jurisdictional authorities and as shown.
- B. Letters and Symbols:
 1. Unless otherwise shown or specified, apply letters, directional arrows and other pavement markings of size and configuration in accordance with referenced USDOT/FHWA Manual on Uniform Traffic Control Devices for Street and Highways.
 2. Apply letters, directional arrows and other markings in color shown.
- C. Width and Color of Lines for Pavement Striping:
 1. Apply lines for pavement striping as follows:
 - a. Width:
 - 1) Continuous centerline striping and parking space markings: Four inches.
 - 2) Dashed lane striping: Four inches.
 - 3) Solid crosswalk lines: Six inches.
 - 4) Solid stop lines: Twelve inches.
 - b. Lines:
 - 1) Dashed lane lines: White stripes nine feet in length separated by 15 feet of unmarked surface.
 - c. Color:
 - 1) Stripes:
 - a) Solid centerline stripe: White or yellow as shown.
 - b) Lane striping, parking space marking, crosswalk and stop lines: White, unless otherwise shown.
- D. Allowable Tolerances:

1. Traffic-zone paint:
 - a. Width of lines not to vary from specified width by more than 1/8 inch in each linear foot.
 - b. Lengths of skip or lane lines and unpainted surface between skip lines not to vary by more than three inches from specified length.
 - c. Coverage rate maximum: 100 square feet minimum and 110 square feet maximum of surface coverage per gallon of paint, yielding wet-film thickness of 0.015 inches minimum.
 - d. Coverage rate of glass spheres: Ten pounds per gallon of paint minimum.
2. Extruded thermoplastic compound:
 - a. Thickness of stripe: 90 to 125 mils.
 - b. Rate of application of binder-sealer: Between 800 linear feet and 1,000 linear feet per gallon for four-inch wide lines. For lines of other widths, apply in proportion based on such rate.
3. Preformed plastic traffic markings:
 - a. Thickness: 0.095 inch, minus 0.005 inch or plus 0.010 inch.
 - b. Width: Four inches, plus-or-minus 1/8-inch per 12-inch length.
4. Painting of curbing and raised traffic bars:
 - a. Wet-film thickness: 0.015 inches minimum.

3.02 APPLICATION:

A. Traffic Zone Paint:

1. Equipment:
 - a. Use equipment suitable for mechanical application of paint and glass spheres.
 - b. Apply paint with atomizing spray machines designed for striping to apply stripes of uniform cross section, and thickness, at specified coverage with clean-cut edges permitting easy and accurate adjustment of width and rate of application as well as immediate shutoff.
 - c. Use automatic mechanical equipment designed and constructed to distribute glass spheres in uniform pattern and at prescribed coverage regardless of variation in speed of travel. Equipment may be integral part of striping machines or self-contained unit designed for attachment to striping machines, so that glass spheres will be applied immediately following application of paint. Use equipment designed and constructed to permit adjustment of coverage rate.
2. Method of application:
 - a. Schedule marking and striping operations to permit paint to set and harden before roadway is opened to traffic.
 - b. Allow hot laid bituminous material to cool, prior to beginning striping operations.
 - c. Remove foreign matter from surfaces prior to painting.
 - d. Apply pigmented binder and glass spheres, mix and thin pigmented binder in accordance with manufacturer's recommendations.
 - e. Apply glass spheres uniformly, immediately following application of paint. Do not premix paint and spheres.
 - f. Apply pavement markings accurately with straight, clean-cut, sharply defined parallel edges and of uniform cross section.
 - g. Clean striping machines as often as necessary to ensure application of markings of specified quality and physical requirements.

- B. Extruded Thermoplastic Compound:
1. Equipment:
 - a. Master kettle:
 - 1) Minimum capacity: 800 pounds of melted compound.
 - 2) Double oil jacket.
 - 3) Thermostatic controls.
 - 4) Approved heating device.
 - 5) Temperature gauges for oil and compound.
 - 6) Integrally mounted chopping device to chop and drop solid compound into kettle.
 - b. Liner:
 - 1) Use liners with self-contained heat source, such as propane heater, capable of maintaining compound at drawing temperature of not less than 420F as well as radiant heater installed over die for same purpose.
 - 2) For installation of crosswalk lines, stop lines and solid center lines, use liner with capacity of approximately 150 pounds and automatic sphere dispenser capable of distributing reflective spheres on surface of line while still plastic.
 - 3) For centerline and lane line installation, use mobile unit equipped to automatically install dashed lines in combinations of line and skip up to 40 feet and for application of reflective spheres as specified for smaller liner.
 - 4) Provide for varying die widths in liner to produce specified line widths, including shaping die cutoff device to provide clean, square ends at beginnings and ends of lines.
 2. Application of binder-sealer:
 - a. Before applying binder-sealer or thermoplastic compound, prepare roadway surface by buffing and cleaning or other appropriate method.
 - b. Where thermoplastic stripe is to be installed, spray surfaces with binder sealer consisting of two parts epoxy and one-part hardener-catalyst immediately prior to installation of compound.
 - c. Mix binder-sealer fresh each day. Do not premix.
 3. Application of thermoplastic compound:
 - a. Apply compound in colors shown and at locations shown.
 - b. Do not use pans and aprons to control width of lines.
 - c. Use equipment including extrusion dies capable of maintaining compound at specified extrusion temperature and density and capable of producing stripe of specified width.
 4. Application of glass spheres:
 - a. Perform reflectorizing of thermoplastic compound by immediate application of glass spheres to specified density.
 - b. Perform reflectorizing so that completed line registers not less than 55 on Hunter Nite Visibility Meter.
- C. Preformed Plastic Traffic Markings:
1. Prepare roadway surface by removing dirt, dust, oily substances and other foreign matter before installing plastic markings.
 2. Do not install plastic marking on wet or damp pavement.
 3. Make installations in neat, workmanlike manner with ends and edges of successive strips of material even.
 4. Position center and lane markings using chalk as guides.

5. Installation on sheet-asphalt surfaces:
 - a. When plastic markings are to be installed on new sheet-asphalt surfaces, install while asphalt is still hot and immediately before final rolling is performed.
 - b. As part of final rolling operation, position and embed plastic marking into surface.
 - c. To install plastic markings on existing sheet asphalt, accurately locate and press marking into place and obtain final bond by at least two longitudinal passes of ten-ton roller.
 6. Installation on asphaltic-concrete surfaces:
 - a. Install as specified for sheet-asphalt surfaces except apply prime coat recommended by manufacturer of plastic markings to pavement surface prior to installation of markings.
 7. Installation on portland-cement concrete pavement:
 - a. Seal surface of concrete pavement with quick-setting primer to reduce capillary action and improve bond between marking and pavement surface.
 - b. Otherwise install as specified for sheet-asphalt pavement.
- D. Painting of Curbing and Raised Traffic Bars:
1. Paint curbing and raised traffic bars with traffic-zone paint.
 2. Clean surfaces to be painted of dirt, dust, laitance, oil or other foreign substances.
 3. Allow 14 days minimum after installation of portland-cement concrete before painting.
 4. Curbing:
 - a. Paint top and front of curbing in locations shown with one coat of nonreflectorized traffic-zone paint as specified.
 5. Raised traffic bars:
 - a. Paint surfaces, except bottom of raised traffic bars with one coat of white traffic-zone paint and apply glass spheres before paint has hardened.
 - b. Apply paint and glass spheres as specified.

END OF SECTION

THIS PAGE NOT USED

SECTION 02772

CURBS, GUTTERS AND WALKS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing curbs, gutters, curb and gutters and walks.
- B. Related Work Specified Elsewhere:
 - Section 02320 Grading, excavating and backfilling
 - Section 02725 Base course for pavements
 - Section 02750 Concrete pavement
 - Section 03200 Concrete reinforcement
 - Section 03300 Cast-in-place structural concrete

1.02 SUBMITTALS: Not used.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ASTM: C979.

1.04 Not used

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Concrete: Section 02750 and as specified in this section.
- B. Carbon Black:
 - 1. Emulsified: At least 25 percent by weight standard carbon-gas black colloiddally dispersed in liquid medium so that when one part of product is stirred into ten parts of water, resulting liquid, after standing undisturbed for 72 hours, is uniformly colored and contains no fillers nor other material that would adversely affect quality or appearance of concrete.
 - 2. Powder:
 - a. Concrete grade carbon black, meeting the requirements of ASTM C979.
 - b. Carbon black powder to disperse in water without floating and to be capable of uniform dispersion in plastic concrete.
- C. Joint Devices: In accordance with Section 02750, with the following additional requirements:
 - 1. Dowels: 14 inches long, 3/4-inch diameter for curb and gutter and 1/2-inch diameter for sidewalk.
 - 2. Plates for construction joints and planes of weakness: 14-gauge galvanized sheet metal cut to section as necessary.

- D. Expansion Joint Materials: In accordance with Section 02750, with the following additional requirements:
 - 1. Preformed joint filler for stone curb, 1/4-inch thick; otherwise, 1/2-inch thick, subject to specified construction requirements.
- E. Polyethylene Tape: Section 02750.

2.02 MIXES:

- A. Mix exposed aggregate surface course concrete comprising by volume, one part portland cement to three parts granite aggregate or gravel, crushed gravel or crushed stone aggregate as shown, with sand added to form workable mix.
- B. Where concrete walks are shown to be darkened, add 1/2 pound of emulsified carbon black or 1/3 pound of carbon powder per bag of portland cement.

2.03 FABRICATION AND MANUFACTURING: Not used.

PART 3 - EXECUTION

3.01 FIELD QUALITY CONTROL:

- A. Allowable Dimensional Tolerances:
 - 1. Concrete surfaces constructed in accordance with the following:
 - a. Plus-or-minus 3/16 inch of elevation shown.
 - b. Deviation: 1/8-inch maximum from steel straightedge as specified in Section 02750.

3.02 BASE:

- A. Ensure that previously placed base is satisfactorily compacted and free from loose material.
- B. Have base approved prior to placing forms and base covering.
- C. Correct deficiencies in grade, contour and compaction.

3.03 FORMS:

- A. Place forms as specified in Section 02750.

3.04 JOINT DEVICES AND CONTRACTION JOINTS:

- A. General Requirements:
 - 1. Place joint devices and contraction joints as specified in Section 02750.
 - 2. Where work abuts concrete pavement, adjust spacing of joints so that joints of same type coincide with transverse joints of concrete pavement.
 - 3. Width of preformed expansion joint filler: Same as thickness of concrete pavement minus 3/4 inch.
 - 4. Concrete curb, gutter and curb and gutter:
 - a. Place two dowels in each joint between eight and twelve inches apart; for curb and gutter place one of the dowels four inches from back of curb. For curb and gutter abutting concrete pavements, complete partial tie rod

- assemblies in slab. Place preformed expansion joint filler in single piece depressed 1/2-inch below finished surface.
- b. For curves of 100 feet radius or less, space expansion joints equally at intervals of approximately 15 feet; for radii greater than 100 feet space expansion joints at intervals of 45 feet, with contraction joints at intervals of 15 feet. Form contraction joints, with plates left in place, depressed 1/2-inch below finished surface.
 - c. Where placed in curves of 100 feet radius or less, stop reinforcing steel two inches clear of expansion joints.
5. Sidewalk:
- a. Place 1/2-inch preformed expansion joint material between sidewalks and curb where sidewalks are constructed between permanent structure and curb.
 - b. Place transverse expansion joints at intervals of 45 feet.
 - c. Provide dowels in expansion joint spaced at two-foot intervals, clearing edges of sidewalk by one foot. Where sidewalks intersect, place expansion joints in each sidewalk for full width along extension of back edges.
6. Uniform Joint Spacing: For the entire length of each straight or curved run of sidewalk or curb to be placed, lay out the work and adjust joint spacing to provide intervals of equal dimension between joints, including grooves, unless otherwise shown.

3.05 CONCRETE AND WIRE FABRIC:

- A. Place concrete and wire fabric in accordance with applicable requirements of Section 02750 except that top layer of fabric over trench-cuts to clear top surface by 1-1/2 inches, plus-or-minus 1/4-inch tolerance.
- B. Place pipe for weep holes through curbs for rain leaders from building downspouts where shown.

3.06 STONE CURB: Not used.

3.07 FINISHING CONCRETE CURB, GUTTER AND CURB AND GUTTER:

- A. Remove curb and face forms as soon as condition of concrete permits and perform finishing work on exposed surfaces.
- B. Finish face edge of curb to one-inch radius. Finish other edges to 1/4-inch radius.
- C. Provide steel troweled finish followed by brushing with fine-hair brush.
- D. Remove other forms when condition of concrete permits, but no sooner than 12 hours after placing. Rub surfaces with carborundum stone where necessary.

3.08 FINISHING SIDEWALK:

- A. Work on Authority Property:
 - 1. Strike off and screed top surfaces so that resulting surface is smooth and within specified tolerances.
 - 2. As soon as condition of work permits, perform joint work, edging and marking.
 - 3. Finish edges to 1/4-inch radius.

4. Scoring pattern: Unless otherwise shown, as follows:
 - a. Expansion joints: Install on 45-foot centers. For the entire length of each straight or curved run of sidewalk to be placed, layout the work and adjust joint spacing to provide intervals of equal dimension between joints, including grooves, unless otherwise shown.
 - b. Contraction joints: Make transverse grooves 1/3 depth of the concrete at approximately nine-foot equal intervals between expansion joints perpendicular to longitudinal grooves.
 - c. Control joints: Make transverse grooves 1/2-inch deep at approximately three foot equal intervals between contraction joints perpendicular to longitudinal grooves.
 - d. Make longitudinal grooves 1/2-inch deep at approximately three foot equal intervals between and parallel to sides of sidewalk.
5. Finish surface with final light broom finish with fine-hair broom.
6. Construct wheel chair ramps at locations shown.
7. Remove forms when condition of concrete permit, but no sooner than 12 hours after placement. Rub surfaces with carborundum stone where necessary.

B. Non-Authority Work:

1. In accordance with codes and regulations of the jurisdictional authorities.

3.09 CURING:

- A. In accordance with Section 02750, except that liquid membrane curing compounds not to be used on curb of curb and gutter when temperatures tend to go lower than 40F within 24 hours after application.
- B. Do not use liquid membrane curing compounds on exposed aggregate concrete or darkened concrete surfaces.

3.10 SEALING JOINTS:

- A. Immediately prior to sealing joints, place polyethylene tape width of groove flat on preformed expansion joint filler.
- B. Seal expansion joints in concrete curb, gutter and curb and gutter with poured joint sealer in conformance with Section 02750. Do not seal expansion joints in sidewalk and stone curb.

3.11 HIGH EARLY STRENGTH CONCRETE:

- A. Use high-early-strength concrete in accordance with Section 02750 when approved.

3.12 CORES:

- A. Where directed, provide test cores in accordance with Section 02750.

3.13 PROTECTION OF THE WORK:

- A. Protect new work in accordance with Section 02750.

3.14 DEFICIENT WORK:

- A. Remove and replace with new materials or correct as directed work which does not meet specified requirements.

END OF SECTION

SECTION 02820

FENCING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing chain-link fencing, gates and fan guards.
- B. Related Work Specified Elsewhere:
 - Section 03300 Cast-in-place Structural Concrete
 - Section 16060 Grounding and Bondings

1.02 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings:
 - 1. Manufacturer's product data and installation instructions for fence, posts, fabric, gates, hardware and accessories.
 - 2. Site plan with fence showing locations of bracing, fan guards, gates, ground rods, depression closures and other special fence construction.
 - 3. Details of gates, depression closures and other special construction showing fabrication and installation.
 - 4. Details for installation of accessories.
- B. Samples:
 - 1. Chain link fabric: One of each width and type, each 24 inches long.
 - 2. Posts, railing, braces, gate frames: One of each size and type, each 24 inches long.
 - 3. Truss rod and turnbuckle: One each.
 - 4. Tension wire: One, 24 inches long.
 - 5. Barbed wire: One, 24 inches long.
 - 6. Tension bar: One, 24 inches long.
 - 7. Gate corner assembly: One.
 - 8. Fabric ties: Four each.
 - 9. Rail and brace ends and post caps: Two each.
 - 10. Barbed wire extension arms: One each.
 - 11. Other materials and accessories: One each.
- C. Certification.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. AWS: D1.1.
 - 3. MS: MIL-P-21035.

4. FS: FF-T-791, RR-F-191/2D, RR-F-191/3D, RR-F-191/4D.
5. ASTM: A121, A392, A413, C1107, F668.

1.04 JOB CONDITIONS:

- A. Right of Access to Adjacent Private Property: As shown.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Fabric:
1. Steel, hot-dip galvanized after weaving, ASTM A392; Class 2 coating, two-inch mesh, No. 9 gauge wire, height shown, both top and bottom selvage twisted and barbed unless otherwise indicated on Contract Drawings.^{**}
 2. PVC-coated steel: ASTM F668 Class 2b; two-inch mesh, 0.148-inch diameter zinc-coated steel core wire, height as shown, black color PVC; top and bottom selvages twisted and barbed, unless otherwise shown on Contract Drawings.
- B. Posts, Top Rails and Braces: FS RR-F-191/3D, with the following additional requirements:
1. Posts: Class 1, Grade. Size in accordance with Table I unless otherwise shown.
 2. Top rails: Class 1, Grade A; Size SP1.
 3. Bracing: Class 1, Grade A; Size SP1.
 4. Color coating: Where PVC-coated fabric is specified, provide matching PVC color ASTM F668 Class 2b coating.
- C. Accessories: FS RR-F-191/4D, with the following additional requirements:
1. Hot-dip galvanized, unless otherwise specified.
 2. Wire ties:
 - a. Fabric: No. 9-gauge steel.
 - b. Tension wire: No. 11-gauge steel.
 3. Tension wire: No 7-gauge Steel. ^{**}
 4. Color coating: Where PVC-coated fabric is specified, provide matching PVC color ASTM F668 Class 2b coating.
- D. Barbed Wire: ASTM A121, Chain Link Fence Grade, 12-1/2 gauge steel wire with 14-gauge, four-point round barbs, five inches on center.
- E. Turnbuckle: FS FF-T-791, Type 1, Form 1, Class 8, Size 3/8 by six, hexagonal heads, UNC threads, hot-dip galvanized. Where PVC-coated fabric is required, provide matching PVC color coating thermally fused to the galvanized steel substrate.
- F. Latch: Plunger bar full height of gate, to engage stop at double gates.
- G. Security Chain: ASTM A413, Grade 43 High Test Chain, case-hardened carbon-steel, 3/8-inch diameter; hot-dipped galvanized at exterior locations.
- H. Padlock: Corbin Russwin, Catalog No. PL5090 IC high security or equal.
1. Removable interchangeable core; with two keys, keyed and master-keyed as directed.

2. Body: Solid extruded brass.
 3. Six-pin tumblers.
 4. Shackle: Hardened steel, zinc-plated, 2-5/8 inch shackle length, ball bearing locking heel and toe.
- I. Concrete: Section 03300, Class 3500, air-entrained
 - J. Grout: Non-shrink, in accordance with ASTM C1107.
 - K. High Zinc-Dust Content Paint: MS MIL-P-21035.

2.02 SWING-TYPE GATES:

- A. Provide swing-type gates, size as indicated on the Contract Drawings, complete with latches, stops (if required by the manufacturer), keepers, hinges and three strands of above the fabric (if shown on the Contract Drawings).
- B. Conform to Federal Specifications RR-F-191/2D, Single Swing Type I, Double Swing Type II, and as follows:
 1. Hot-dipped galvanized.
 2. Fabrication:
 - a. Fabricate gate perimeter frame from Class 1, Size SP2 pipe per Federal Standard RR-F-191/3D.
 - b. Fabric: Same fabric as used on the fence. Attach fabric securely to the gate frame at intervals not exceeding 15 inches.
 - c. Barbed wire: As specified in 2.1. D above.
 - d. Fan Guard: Materials and fabrication as specified for fencing.
 3. Hardware:
 - a. Hinges: Two or more galvanized steel or malleable iron, to suit the gate size: non-lift type, offset to permit 180 degrees opening.
 - b. Latch: Galvanized steel or malleable iron, combination type with provision for padlock.
 - c. Gate stops and center rest: Manufacturers' standard.

2.03 CANTILEVERED SLIDE GATE:

- A. Conform to Federal Specification RR-F-192/2D, Type III.
- B. Barbed Wire: As specified in 2.01 D. above.

PART 3 - EXECUTION

3.01 FENCE INSTALLATION:

- A. Perform necessary clearing, grubbing, excavation and filling to provide clear line-of-fence runs.
- B. Set posts in concrete footings, sized as shown.
- C. Extend concrete to two inches above ground line at posts and slope to drain away from posts. Form top 12 inches of footing, with remainder poured against excavated hole.

- D. Space posts at 10 feet maximum and eight feet minimum on centers. Place additional posts at each abrupt change in grade.
- E. Where rock is encountered, drill holes two inches deeper than depth shown and two inches greater than outside diameter of post. After post is placed as shown and specified, and supported, fill remaining void with one-to-three grout mixture of cement and sand.
- F. Where fence is located on concrete structure, weld post to base plate, thickness and size as shown on Contract Drawings. Erect fence post truly vertical, where necessary using shims of approved alloy. Secure to structure with anchor bolts; number, diameter and length as shown on Contract Drawings. Fill void under base plate with non-shrink grout. Bolts, base plate and weld to be hot-dipped galvanized.
- G. Space pull posts at approximately 500-foot intervals for straight runs and at each vertical angle point. Install corner posts at each horizontal angle point. Provide corner, end and pull posts with horizontal braces and tie rods on each side of posts extending to and connecting to adjacent line posts.
- H. After posts are installed and grout has set, install top rail or tension wire and securely anchor at ends and to line posts before hanging fabric.
- I. Secure ends of fabric by tension bars threaded through loops in fabric and secured to posts by bands with bolts and nuts or other approved devices.
- J. Attach fabric outside framing system, away from Authority property. Stretch fabric by securing one end and applying sufficient tension by mechanical fence stretchers. Fasten fabric to line posts, tension wire and top railing with tie wires at spacing shown.
- K. Hold bottom of fabric as uniformly as possible to, but in no case to exceed, two inches above finished grade.
- L. Provide barbed wire where shown. Install support arms at 45 degrees upward and outward from Authority property; extend corner, gate and end posts as shown. Stretch barbed wire to remove kinks and sags and secure to bracket arms, using tension bands for attachment to posts.
- M. Install gates, gate stops and fan guards as shown.
- N. Set gate stops in concrete accurately so that plunger can be fully engaged.
- O. Furnish one chain with one padlock for each gate.
- P. Grounding: Section 16060.

3.02 GATE INSTALLATION

- A. Install gates plumb, level and secure for full opening without interference. Install ground-set items in concrete for anchorage, as detailed on the Contract Drawings. Adjust the hardware for smooth operation and lubricate where necessary.

- B. Attach barbed wire as shown on the Contract Drawings.

3.03 DEFECTIVE WORK:

- A. Remove and replace fencing which is improperly located and is not true to line and grade, and posts which are not plumb.
- B. Repair damaged galvanizing by thoroughly wire brushing damaged area to remove loose and cracked zinc coating, and paint with two coats of high zinc-dust content paint. Allow first coat to dry thoroughly before applying second coat.

END OF SECTION

THIS PAGE NOT USED

SECTION 02845

TRAFFIC CONTROL DEVICES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing vehicular traffic barriers and raised concrete traffic bars.

1.02 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Certification:
1. Certificates from guardrail element manufacturer and pressure preservative-treatment plant stating that materials furnished meet specified requirements.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
1. Comply with codes and regulations of the jurisdictional authorities.
 2. AWPA: C1, P8.
 3. AASHTO: T68.
 4. ASTM: A36, A123, A153, A307.
 5. FS: TT-P-641.
- B. Allowable Dimensional Tolerances:
1. Steel guardrail elements fabricated to width and depth tolerance of minus 1/8 inch.
 2. Dimensions of concrete posts and raised concrete traffic bars: Plus-or-minus 1/8 inch of dimensions shown.
 3. Dimensions of timber posts and bracket blocks: Plus-or-minus 1/2 inch of dimensions shown.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Guardrail:
1. Steel posts and brackets:
 - a. Structural steel: ASTM A36.
 2. Wood posts and bracket blocks:
 - a. Number 1 Dense SR southern pine, minimum stress-grade 1400f.
 - b. Well-seasoned, sound and free from splits, cracks and other defects.
 - c. Pressure treated in accordance with AWPA Standard C1 using pentachlorophenol preservative in light petroleum solvent conforming to AWPA Standard P8.
 3. Concrete posts:
 - a. Concrete reinforcement: Section 03200.
 - b. Concrete: Section 03300 and 03400.

4. Rail elements and terminal sections:
 - a. Rail elements and terminal sections fabricated from open-hearth or electric-furnace steel of thickness shown. Sheet shaped into beam with longitudinal corrugations forming section 12 inches minimum width and three inches minimum depth.
 - b. Fabrication:
 - 1) Edges of rail element straight and smooth.
 - 2) Steel sheet subject to standard mill tolerances for gauge.
 - c. For steel-beam type guardrail installed on curves having radius of more than 20 feet and less than 150 feet: Rail elements convex or concave as shown.
 - d. Elongation of two-inch specimen of sheet steel used for rail elements: 12-percent minimum when tested in tension in accordance with AASHTO T68.
 - e. Comply with the following:
 - 1) Tensile strength of specimen of full size of rail element, including a splice at center of specimen: 70,000-psi minimum.
 - 2) Post connections to withstand 5,000-pound side pull in both directions.
 - 3) Section of rail with traffic face up, freely supported at both ends of 12-foot span, to support concentrated load of 2,000 pounds at center of span with maximum deflection of two inches.
 - f. Rail elements and terminal pieces hot-dip galvanized after fabrication.
5. Hardware:
 - a. Bolts and nuts: Steel, ASTM A307, Grade A.
 - b. Post and splice bolts machined, button-head, shoulder bolts with roll threads, Class 2A fit before galvanizing. Shoulder or neck to have an oval shape as shown. Hexagon nuts for rail connections to be machined American Standard heavy-type with recess to accommodate shoulder on bolts.
 - c. Bolts and nuts for offset steel brackets: American Standard heavy-type.
 - d. Plate washers fabricated from steel conforming to requirements specified for rail elements and terminal connections.
 - e. Hot-dip galvanized after fabrication.
6. Galvanizing:
 - a. Steel posts, post anchors, brackets, rail elements and terminal sections hot-dip galvanized after fabrication in accordance with ASTM A123.
 - b. Hardware hot-dip galvanized after fabrication in accordance with ASTM A153. Zinc coating: Two ounces per square foot minimum.
 - c. Replace components on which galvanizing is damaged with new material having properly galvanized surfaces.
7. Primer coating: FS TT-P-641.
8. Non-shrink grout: Section 03300, shrinkage compensating.
9. Welding: Section 05120.

B. Raised Traffic Bars:

1. Formwork: Section 03100 or 03400.
2. Reinforcing steel: Section 03200.
3. Concrete: Section 03300, Class 3000, air-entrained.
4. Portland-cement grout: Section 03300.
5. Adhesive for attaching traffic bars to pavement: Polyvinyl acetate or asphaltic emulsion. If asphaltic emulsion is used, do not use clay or similar substances as emulsifying agents. Consistency of adhesive suitable for heavy trowel application at prevailing ambient temperature.
6. Anchor pins: Section 03200, concrete reinforcing rods.

2.02 FABRICATION AND MANUFACTURE:

- A. Steel Posts, Brackets and Post Anchors:
 - 1. Cut ends square. Punch or drill posts and brackets as shown.
 - 2. After being cut to length and punched or drilled, hot-dip galvanize posts and brackets separately before bolting.
 - 3. On end steel posts and adjacent posts weld steel channel anchor, 15.3 pounds per linear foot and one-foot three-inches long minimum.
 - a. Weld anchors to posts and hot-dip galvanize.
 - b. Welding: Section 05120.
 - 4. Replace components on which galvanizing is damaged with new material having properly galvanized surfaces.

- B. Wood Posts and Bracket Blocks:
 - 1. Cut ends square. Drill posts and bracket blocks as shown.
 - 2. After cutting to length and drilling, saturate cut ends and holes with same preservative as that used for pressure treatment.

- C. Concrete Posts:
 - 1. Precast concrete, Class 5000, in accordance with Section 03300, eight inches square by five feet-nine inches.
 - 2. Reinforcement as shown and in accordance with Section 03200.
 - 3. Cure in accordance with Sections 03300 and 03400.

- D. Traffic Bars:
 - 1. Apply shop mark on each raised traffic bar with water-resistant paint showing the following:
 - a. Date of manufacture.
 - b. Identifying mark of manufacturer.

PART 3 - EXECUTION

3.01 EQUIPMENT:

- A. Where posts are to be set in drilled holes, use mobile auger.
- B. Where steel posts are to be driven in place, use mobile drop hammer equipped with leads and mounted on track or on crawler treads. Protect heads of posts with driving cap designed to fit section of post being driven.

3.02 POSTS IN DRILLED HOLES:

- A. Drill holes plumb, accurately positioned and of diameter and depth shown.
- B. Position posts in hole to alignment shown; brace in position until remainder of hole has been backfilled with excavated material or concrete as shown.
- C. Place backfill in layers six inches maximum and compact in accordance with Section 02320.
- D. Dispose of surplus excavated material in accordance with Section 02320.

- E. In unpaved areas, carry backfill to height of two inches above surface of ground and slope to drain away from post.
- F. When holes in paved areas are shown to be backfilled with excavated material, place and compact backfill to bottom of pavement. Where pavement is portland-cement concrete pavement, fill remainder of hole with concrete to surface of pavement. Where pavement surface is asphaltic concrete, stop concrete fill two inches below final grade and fill remainder of hole with asphaltic concrete of same type as existing surface. Tamp asphaltic concrete well and slope to drain away from post.
- G. Where shown to be encased in concrete, compact concrete well and carry it to height of two inches above natural ground and slope to drain. Trowel finish surface.

3.03 POST DRIVEN IN PLACE:

- A. Ensure that posts are plumb and located as shown. Remove and re-drive posts which are not in compliance.
- B. Drive steel posts before offset bracket is attached.
- C. After driving, top of posts to have substantially same cross-sectional dimensions as body of posts and be free of bends and damage to galvanizing coat. Remove posts not in compliance and drive new replacement post.
- D. Drive posts carefully to prevent damage to utility facilities; if such facilities are encountered, relocate posts. Repair facilities damaged by construction operations.

3.04 POST SET ON CONCRETE PAVEMENTS AND DECK SLABS:

- A. Where steel-beam guardrail is installed on existing portland-cement concrete pavement or deck slabs, fabricate steel post assembly as shown. Anchor assembly to pavement or deck slab with through-bolts or four-unit expansion anchors as shown.
- B. Clean pavement or deck surface area where base plate is to be installed. Set post with base plate over bolts; plumb and shim posts to proper grade and alignment with metal shims.
- C. Work nonshrink grout under plate to ensure full contact of bearing area. Remove shims as soon as concrete has hardened sufficiently to support weight of post. Finish edges true and smooth.

3.05 INSTALLATION OF STEEL-BEAM GUARDRAIL:

- A. Install brackets and blocks on roadway side of posts. Tighten bolts after rail elements have been attached and entire assembly adjusted to line and grade.
- B. Erection of Rail Elements and Terminals Sections:
 - 1. Erect rail elements and terminal sections on posts and post brackets previously set to produce smooth continuous rail to line and grade shown. Install rail with double-corrugation face toward traffic.
 - 2. Bolt edges and center corrugation fully.
 - 3. Make vertical adjustment at posts by use of oversize bolt holes in posts and brackets as shown. If oversize holes do not permit sufficient adjustment, reset post until

- guardrail is properly aligned.
4. After rail has been correctly aligned, tighten bolts. Check or burr threads projecting beyond nut to prevent removal.
 5. Where steel beam-type guardrail is shown anchored to bridge piers or terminating at concrete parapet walls, punch slotted bolt holes in rail elements terminating at such locations and make connections as shown. Flame-cutting is prohibited.
- C. Where approved, repair damaged zinc coating by wire brushing damaged area to remove loose or cracked zinc coating and applying two coats of primer.
 - D. Punching, drilling, reaming, cutting or welding rail elements or terminal pieces in the field is prohibited except as approved.

3.06 INSTALLATION OF RAISED TRAFFIC BARS

- A. Install raised traffic bars at locations shown.
- B. Before adhesive is applied, remove dirt, dust, grease, oil and other foreign matter that would adversely affect bond of adhesive.
- C. Apply adhesive to surfaces in such quantity that firm even bearing is obtained throughout entire contact area. Remove excess adhesive.
- D. Where use of steel pins is shown, drill holes through pavement, before adhesive is applied.
- E. After adhesive has been applied and bars properly positioned, drive steel pins in place with top of pin two inches below top of bar. Firmly press bar into adhesive, fill pin holes with portland-cement grout flush with top of bar.
- F. Where traffic bars extend across pavement joints, cut bars and make open joint of same width as joint in pavement.
- G. Painting: In accordance with Section 02765.
- H. Installation of traffic bars which are chipped, cracked or otherwise defective is prohibited.
- I. Protect completed installation until final acceptance.

3.07 FIELD QUALITY CONTROL:

- A. Top of post: Plus-or-minus 1/4 inch of elevation shown.
- B. Location of post: Plus-or-minus 1/4 inch of location shown.

END OF SECTION

MARKERS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing markers.
- B. Related Work Specified Elsewhere:
 - Section 03200 Concrete reinforcement
 - Section 03300 Cast-in-place concrete
 - Section 03400 Precast Structural Concrete

1.02 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Product Data:
 - 1. Manufacturer's construction details showing materials, dimensions and profiles for each individual component.
- B. Shop Drawings:
 - 1. Plans, elevations and sections detailing fabrication and erection. Show anchors, reinforcements, accessories, layout, installation details, colors and finish treatments.
 - 2. Message list including wording and lettering layout. Include full-size details of special graphics.
 - 3. Setting drawings, templates and directions for installation of anchors to be installed as work in other sections.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications.
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. FS: QQ-B-654, WW-T-791.
 - 3. ASTM: B36, B135
- B. Survey Certification:
 - 1. All Right-Of-Way markers shall be set by a surveyor registered in the area where the work is to be performed.
 - 2. The following certification statement or a similar statement is required and shall be placed on all approved Mylar sepia as-built Right-of-Way drawings:

"I hereby certify to the best of my knowledge that the Right-Of-Way markers shown on this as-built drawing have been set in accordance with the coordinate information provided by WMATA as shown on the Contract Documents."

(seal)
Registered Surveyor in the State of Maryland

(seal)
Registered Surveyor in the District of Columbia

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Precast Concrete: Section 03400.
- B. Concrete: Section 03300, Class 3500, air-entrained.
- C. Concrete Reinforcement: Section 03200.
- D. Bronze Discs:
 - 1. 3 ½ inch diameter domed survey marker forged from solid unleaded bronze in accordance with ASTM B98-98 with a classic 3 inch long and 5/8 inch diameter split-style tapered stem designed for use in concrete or rock (the Corp of Engineers Type 1 disc). Like or equivalent to the Berstsen C-1 Bronze 3 ½ inch domed marker #C35DB.
 - 2. Refer to Standard Drawings ST-C-3 and ST-C-19 for additional details on bronze discs and installation.
- E. Epoxy Hilti

2.02 FABRICATION AND MANUFACTURE:

- A. Markers and Monuments:
 - 1. Legend:
 - a. Apply legend shown for various markers and monuments using characters of size and type shown. Clearly indicate use.
 - 2. Bronze disc markers:
 - a. Bronze discs as specified with imprinted or stamped legend.
 - 3. Precast-concrete markers and monuments:
 - a. Four inches square by length shown, with 1/2-inch chamfered edges.
 - b. Precast concrete.
 - c. One 29-inch long, No. 4 steel-reinforcing bar centered in casting.
 - d. With lettering, when shown, incised v-shaped, 1/4-inch wide and 3/16-inch in depth.

PART 3 - EXECUTION

3.01 BRONZE DISCS FOR MARKERS AND MONUMENTS:

- A. Except as shown, form discs into convex shape 3/16 inch in depth with edges free from burrs and blemishes.
- B. Press legend into the upper surface of disc so that surface is not raised. Ensure that legend conforms to that shown for markers and monuments.
- C. Do not place letters closer than 1/8 inch to outer rim of marker. Letters in outer ring of legend, 1/2-inch high; medium-sized letters, 7/32-inch high. Place letters along radius of disc. Imprint legend symmetrically about center of disc.
- D. When bronze-disc markers are set in concrete pavements and roadways, set stem in drilled hole and secure with approved epoxy cement, like or equivalent to Hilti HIT Hy 150.
- E. At other locations, set bronze-disc markers into tops of markers and monuments as specified; set markers and monuments in ground at locations shown.

3.02 PRECAST-CONCRETE MARKERS AND MONUMENTS:

- A. Install precast-concrete markers and monuments at locations and to elevations shown or as directed.
- B. Set markers and monuments as shown. Compact bottom of excavation to prevent settlement.

END OF SECTION

THIS PAGE NOT USED

SECTION 02920

TOPSOIL, SEEDING AND SODDING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing and maintaining seeding and sodding, including grass, crownvetch and lespedeza.
- B. Related Work Specified Elsewhere.
 - Section 02320 Site grading
 - Section 02205 Removal and restoration of existing facilities
 - Section 02930 Landscaping
- C. Definitions:
 - 1. UMPC: University of Maryland, College Park
 - 2. Numerical fertilizer analysis: Three-digit number indicates nitrogen, phosphoric acid and potash percentages by weight. Thus, 3-25-25 means three-percent nitrogen, 25-percent phosphoric acid and 25-percent potash by weight.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications: Keep always available at the work site a copy of each of the cited references.
 - 1. Codes and regulations of the jurisdictional authorities.
 - 2. USDA-SCS.
 - 3. UMPC: Current publication of Agronomy Mimeo #77 (Turfgrass Cultivar Recommendations for Maryland).
 - 4. ASTM: C51.
- B. Personnel Qualifications:
 - 1. Superintendent: Use a Superintendent with previous knowledge and verifiable experience in supervising seeding and sodding work of similar size and scope. Have the Superintendent present whenever work is being performed and have the Superintendent responsible for controlling the quality of work and inspecting completed work to ensure that Contract requirements are met. The Superintendent is the primary contact person with the Engineer regarding seeding and sodding work.
 - 2. Workers: Have the work performed only by experienced workers, who through related training and verifiable previous on-the-job experience, are familiar with the technical aspects of seeding and sodding, and with the materials and equipment used for each operation. Have each worker abide by the code of ethics or professional conduct established by the Landscape Contractors Association MD-DC-VA.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Samples and Certification:

1. Submit in accordance with Table 02920-1 and as follows:
 - a. Seed: Each seed bag bearing the following upon delivery:
 - 1) Analysis tag.
 - 2) Certification tag.
 - 3) Maryland or Virginia State tags where applicable.
 - b. Inoculant: Sample packet of inoculant, viable bacteria, true to legume strain required and listing source.
 - c. Sod: Maryland or Virginia State-Certified, each delivery bearing a Maryland or Virginia certification tag and label as required by law.
 - d. Topsoil: Submit supplier's name and address and source of topsoil. Submit certified report of soil laboratory test results listing textures, pH, P and K nutrients, soluble salt, organic matter and mechanical analysis as to percentage of sand, silt and clay. Do not deliver topsoil to site until approved. Approval does not constitute final acceptance.
 - e. Fertilizer: Labeled with manufacturer's name and address, guaranteed analysis, including nutrient and its derived source and listing of potential acidity.
 - f. Limestone and acidifying agent: Labeled with manufacturer's name and address, chemical analysis, oxide content and size gradation of each used.
 - g. Mulch and mulch binder: Labeled with manufacturer's name and address, material components, trademark, chemical analysis, species, size, age and source.
 - h. Herbicide: Labeled with manufacturer's name and address and chemical analysis. Include in submittal the Material Safety Data Sheet, with copies to the Engineer and Contractor's Safety Officer.
2. Usable samples will be returned.

B. Documentation:

1. Personnel qualifications: A list of the qualifications and experience of the workers, and qualifications and experience of the Superintendent, as attested by knowledge and experience in supervising contracts of similar size and scope in the past.
2. Soil tests for crownvetch and lespedeza areas: Submit certified report of soil tests *made by a local state agricultural experiment station or agricultural laboratory recommended by U.S. Department of Agriculture*. Test for pH, P and K nutrients, soluble salt, organic matter and mechanical analysis as to percentage of sand, silt and clay; and include recommended quantities of soil amendments to be added to produce the target pH value and to produce optimal growing conditions for the target crop.
3. Furnish one test for each 500 square feet of each crownvetch and lespedeza planting area, and not less than one test for each area.
4. Equipment list: A list of the equipment anticipated for use, including the make and model, year manufactured.

1.04 PRODUCT INSPECTION, DELIVERY, STORAGE AND HANDLING:

- A. General: Materials and supplies are subject to inspection and sampling for testing. Allow no seed, sod, fertilizer, straw or other agronomic materials or supplies on site other than those for the project
- B. Seed: Deliver with labels and tags.
- C. Inoculants: Store inoculant containers below 70F until used. Keep containers sealed until

contents are used in their entirety. Use inoculants before expiration date shown on packet. Using inoculants exposed to temperatures of 70F or greater is prohibited.

- D. Sod: Deliver sod with labels and tags.
 - 1. Deliver sod to job within 24 hours after being cut; place sod within 36 hours after being cut.
 - 2. Prior to and after delivery during wet weather, allow sod to dry to the extent that will prevent tearing during handling and laying. During dry weather, water sod to ensure its vitality and prevent dropping of the soil in handling.
- E. Topsoil: During hauling operations, keep walkway and roadway surfaces clean. Promptly remove fallen material.

1.05 JOB CONDITIONS:

- A. Conduct seeding and sodding only under favorable seasonal conditions throughout the period of the Contract as determined by the Engineer. Install no work during adverse weather or during periods when soil conditions are unfavorable as determined by the Engineer. Do not plant or lay sod during freezing weather, when planting area is muddy or frozen, nor when sod is frozen.
- B. Protection: During progress of operations, protect walls, walks, curbs, benches, established lawn areas, plant material, and other site improvements by adequate means acceptable to the Engineer.
 - 1. Weight Restrictions: Do not overload entrance paving, sidewalks and curbs.
 - 2. Pollution: Take necessary and adequate measures to prevent soil erosion, air pollution and water pollution by the materials and equipment used during construction.
 - 3. Repairs: If damage by the Contractor should occur, it is the Contractor's responsibility to repair or replace per the Engineer's direction, as acceptable to concerned parties, and at no additional cost to the Authority. Perform work so that damaged areas make smooth, satisfactory, and imperceptible transitions to existing adjacent work. Use materials and methods conforming to current standards for the area damaged, matching adjacent materials in appearance, and meeting approval of jurisdictional authorities and the Engineer.
- C. If, at any time, the Engineer determines that work is unsatisfactory or being conducted in an unsafe manner, immediately cease such work activities upon notification.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Seed: Free of quack grass, timothy, bentgrass, clover, dock, annual bluegrass, cheat, chess, chickweed, crabgrass, plantain, black medic and, except where specified in Table 02920-2, Canada Bluegrass. Kentucky Bluegrass and red fescue free of tall fescue.
 - 1. Grass Seed: Dated material from last available crop, with date of test not more than nine months before date of sowing; listed as Proven Cultivars in the latest Agronomy Mimeo #77 (Turfgrass Cultivar Recommendations for Maryland), *published by UMPC*; and as specified in Table 02920-2 below.
 - 2. Crownvetch Seed: Dated material from last available crop, with date of test not more than nine months before date of sowing. Germination portion consisting of minimum 35-percent normal sprouts, maximum 35-percent hard seed and as specified in Table

02920-4.

3. Appalow Sericea Lespedeza Seed: Germination portion consisting of minimum 35-percent normal sprouts, maximum 35-percent hard seed and as specified in Table 02920-5.

B. Inoculant: Adaptable culture of live nitrogen-fixing bacteria true to legume strain used.

C. Sod:

1. Well-rooted Maryland or Virginia State-Certified sod, at least 18 months old. Varieties, identical to one of the following, or as approved:
 - a. Seed mixture specified in Table 02920-3.
 - b. Proven Cultivars in the latest Agronomy Mimeo #77, published by UMPC, certified 90-percent Turf-type Tall Fescue and 10-percent Kentucky Bluegrass.
2. Sod and attached soil free from noxious weeds such as Bermuda grass, quack grass, garlic, Johnson grass, Canada thistle and other turf weeds.
3. Mowed in production field to height of not more than 2-1/2 inches within five days prior to lifting.
4. Machine cut in sections not less than 2-1/2 feet in length nor less than 12 inches in width and to a depth equal to growth of fibrous roots, uniform soil thickness of 3/4 inch, plus-or-minus 1/4 inch. Measurement for thickness to exclude top growth and thatch.
5. Cut in sections or strips strong enough to support its own weight and retain size and shape when suspended vertically from firm grasp on upper 10 percent of section. Small, irregular or broken pieces of sod are prohibited. Sod on Beck Roll is permitted.

D. Topsoil: Weathered surface soils or natural friable loam obtained from approved sources, free of subsoil, hard fragments and stones larger than one-inch across greatest dimension, objectionable salts, noxious weeds and plants, debris and other materials inferior to surface soils or that would be toxic or harmful to growth; containing not less than 1.5-percent organic matter as determined by Walkley-Black Method; capable of sustaining normal, healthy growth and development of seed and sod scheduled and specified. Seed shall not be placed in topsoil which has been treated with soil sterilants until sufficient time has elapsed to allow for the dissipation of toxic materials.

1. Grading analysis:

Sieve	Minimum Percent Passing
2 inches	100
1/2 inch	90
1/4 inch	80
No. 10	70

2. Test and analysis of proposed topsoil material: Performed by local state agricultural experiment station or agricultural laboratory recommended by the U.S. Department of Agriculture, including recommendations for fertilizer and pH adjustment for target crop, and meeting the following requirements.
 - a. Acidity range: pH 5.5 to pH 7.5, inclusive. When topsoil pH is not within pH 5.5 - pH 7.5, modifications to correct topsoil pH shall be made according to the recommendations of the soil test lab, or the applicable State Cooperative Agricultural Extension Service.

- b. Salinity by electrical-conductivity measurement: 500-ppm soluble salt maximum.
 - c. Fertility: Rated high in natural nutrients in pounds per acre based on the standard soil test in laboratory.
 - d. Texture: Classification consisting of 5-percent to 25-percent clay, 20-percent to 60-percent sand and 15-percent to 45-percent silt as determined by hydrometer or pipette method. Sand, silt and clay as defined by USDA-SCS.
- E. Fertilizer:
 - 1. For grass seeded and sodded areas: Commercial fertilizer of standard quality, recommended by approved soil test report; 10-22-22.
 - 2. For crownvetch seeded areas: Use both of the following:
 - a. Commercial fertilizer of standard quality; 0-20-20 or 3-25-25.
 - b. Blue Chip Nitroform, slow-release nitrogen, granular form, of standard quality; 38-0-0.
 - 3. For appalow-sericea-lespedeza seeded areas: Commercial fertilizer of standard quality, recommended by approved soil test report; 10-22-22.
- F. Limestone: ASTM C51, Dolomitic, Agricultural Grade.
 - 1. Capable of neutralizing soil acidity and containing not less than 85 percent calcium and magnesium carbonates
 - 2. Sieve analysis: 95-percent passing No. Eight sieve and 40-percent passing a No. 100 sieve. For hydroseeding, use pulverized limestone.
 - 3. Containers labeled to show chemicals.
- G. Acidifying Agent: As approved per soil analysis recommendations and seeding method.
- H. Mulch:
 - 1. Wood-cellulose fiber: Containing no growth or germination-inhibiting factors and dyed green.
 - a. Properties:
 - 1) Fiber length: Approximately 3/8 inch.
 - 2) Diameter: Approximately 1/32 inch.
 - 3) Acidity range: pH 4.0 to 8.5, inclusive.
 - 4) Ash content: 1.6-percent maximum.
 - 5) Water-holding capacity: 90-percent minimum.
 - b. Packaging: Furnish fibers air-dry in packages not exceeding 50 pounds gross, with net weight shown on package.
 - c. Source: Conwed Hydro Mulch by Conwed Corp., St. Paul, MN 55101 or equal.
 - 2. Straw: Wheat, barley, oat or rye straw, threshed, air-dried and free from Canada thistle, dock, Johnson grass and other foreign matter.
 - 3. Mulch blanket: Knitted construction of biodegradable yarn with uniform openings, Gulf States Paper Corporation, Tuscaloosa, AL 35401 or equal.
 - a. 150-foot lengths or greater.
 - b. U-shaped staples: As standard with mulch-blanket manufacturer.
- I. Mulch Binders: Non-asphaltic only.
 - 1. Synthetic binder for use with the following:
 - a. Wood-cellulose fiber: Terra Tack 1 by Grass Growers, Plainfield, NJ 07061; Soil-Gard by Alco Chemical Company, Philadelphia, PA 1913, or equal.
 - b. Straw: Terra Tack 1 by Grass Growers, Plainfield, NJ 07061 or equal.
 - 2. Biodegradable netting for use with straw: Conwed Erosion Control Netting by Conwed

Corporation, St. Paul, MN 55101 or equal.

J. Herbicides:

1. Broadleaf weed control: Trimec by P.B.I. Gordon Corporation, Kansas City, KS 66118 or equal.
2. Pre-emergent crabgrass control: Balan by Elanco Products Company, Division of Eli Lilly Corporation, Indianapolis, IN 46206 or equal.
3. Post-emergent crabgrass control: A.M.A., D.S.M.A., M.A.M.A. or Calcium Methyl Arsenate by W.A. Cleary Company, Somerset, NJ 08873 or equal.
4. Perennial bunch-grass control: Round-up by Monsanto Agricultural Products Company, Wilmington, DE 19810 or equal.

K. Stakes (for pegging sod): Wood or other biodegradable stakes suitable for the purpose, measuring 1/2-inch by one-inch by 12 inches.

L. Water: Potable.

2.02 SEED MIXTURES:

- A. Grass Seed: Tables 02920-2 and 02920-3.
- B. Crownvetch Seed: Table 02920-4.
- C. Lespedeza Seed: Table 02920-5.
- D. Hydroseeding Crownvetch and Lespedeza Seed: Tables 02920-6 and 02920-7.

2.03 EQUIPMENT:

- A. Dry-Type Seeder: Brillion seeder, drill seeder or other approved mechanical seeder.
- B. Spraying Equipment for Hydroseeding: Use water tank equipped with liquid-level gauge calibrated in increments not larger than 50 gallons over entire range of tank capacity with gauge visible to nozzle operator. Use tank equipped with agitation system capable of maintaining solids in complete suspension until used.

PART 3 - EXECUTION

3.01 PLACING TOPSOIL:

- A. After completion of construction work in the area, prepare surface of subsoil. Finish to lines shown and parallel to proposed finished grade, as approved. Remove rocks and other foreign materials 1-1/2 inches or greater in any dimension. Immediately prior to covering with topsoil, loosen prepared subsoil surface to a minimum depth of four inches. Leave no depressions.
- B. Place and spread topsoil over areas to be seeded and sodded except areas to receive crownvetch or lespedeza (unless Contract Drawings require 2:1 or greater slopes to be sodded or seeded), to depth which will produce four-inch depth after natural settlement and will conform to finish lines, grades and elevations.
- C. When placing topsoil on slopes, work topsoil into subsoil to minimum depth of four inches to

eliminate slip-plane between the two materials. Leave topsoil at surface to ensure germination of seed.

- D. After spreading topsoil, rake up and remove large stiff clods, hard lumps, large rocks, roots, stumps, litter and other foreign matter.
- E. Maintain specified depth of topsoil from time placed until specified seed or sod is established.
- F. If soil or weather conditions are unsuitable, cease topsoil operations. Resume topsoil operations when proper conditions prevail.

3.02 SEEDING GRASS:

- A. Dry Seeding: After placing topsoil, proceed as follows:
 - 1. Seed bed preparation:
 - a. pH adjustment: Adjust topsoil pH to raise it by applying limestone or approved acidifying agent or elemental sulfur to lower the topsoil pH at per-acre rate recommended by approved soil test report so as to obtain a 6.5 pH. Apply separately prior to fertilizing and seeding operations. Work into the top three inches of soil.
 - b. Fertilizing: After acidity adjustment and within 24 hours before seeding, apply fertilizer at per-acre rate recommended by approved soil test report. Use machine spreader and lightly drag or rake fertilizer into top 1/4 inch of soil.
 - 2. Seeding: Clean seeders as approved prior to applying seed. Apply seed mixture directly after fertilizing.
 - a. Sow specified grass seed mixture from March 1 to April 30 and from August 15 to October 15. Extend or reduce specified periods as approved and as required by weather and soil conditions.
 - b. Sow at minimum rate as specified in Table 02920-3.
 - c. Work seed in to depth of 1/4-inch maximum.
 - d. Finish as follows:
 - 1) Lawn areas with slopes up to 3:1: Raked surface.
 - 2) Roadside areas with slopes up to 3:1: Scarified surface.
 - 3) Slopes over 3:1: Leave surface in irregular condition with ridges running parallel to contour of slope to prevent erosion.
 - 3. Rolling: Directly after seeding, roll lawn areas with slopes up to 3:1 using approved lawn roller, weighing 40 to 60 pounds per foot of width, unless intervening precipitation would cause such rolling to be detrimental.
- B. Hydroseeding: After placing topsoil, proceed as follows:
 - 1. Seed bed preparation:
 - a. Clean hydroseeders as approved prior to coming on site.
 - b. pH adjustment: Adjust soil pH by either applying limestone or approved acidifying agent or elemental sulfur at per-acre rate recommended by approved soil test report so as to obtain a 6.5 pH. Apply separately prior to fertilizing and seeding operations.
 - 1) Use only pulverized limestone to raise soil pH.
 - 2) Apply not more than 300 pounds of limestone for each 100 gallons of water.
 - 3) After applied limestone mixture has dried, work into the top three inches of soil.
 - c. Apply elemental sulfur as recommended, and incorporate into top three

- inches of soil.
 - d. After pH adjustment, again grade and dress seed beds for lawn areas to raked surface.
 - 2. Fertilizing and seeding: After seed bed preparation, apply fertilizer-seed mixture.
 - a. Apply fertilizer at per-acre rate recommended by approved soil test report.
 - b. Apply seed at same rates and times specified for dry seeding. Mix seed and fertilizer together in proportions to meet required application rates.
 - c. If mulching with wood-cellulose fiber on areas with slopes up to 3:1, add mulch to seed and fertilizer mixture.
 - 3. Application method:
 - a. Apply mixtures by means of high-pressure spray directed upward into air so that mixtures fall to ground in uniform spray. Do not direct nozzle of hand-held hose toward ground in manner that would produce erosion or runoff.
 - b. Make uniform applications at required rate, with two passes at 90 degrees to each other, to ensure uniformity and prevent misses.
 - c. Agitate mixtures constantly from time mixed until application to seed bed.
 - d. Use mixtures within eight hours after mixing.

3.03 SEEDING CROWN VETCH:

- A. Seed Bed Preparation: After construction work in the area has been completed, proceed as follows:
 - 1. Grading: Rough grade to remove large stones and roots. Remove or break up clods greater than one-foot diameter. Chisel surface to depth of four to six inches. When preparing slopes, chisel parallel to contour of slope.
 - 2. pH adjustment: Adjust soil pH by applying limestone or approved acidifying agent or elemental sulfur at per-acre rate in Table 02920-6, except as recommended by approved soil test report so as to obtain a 6.5 pH. Apply separately prior to fertilizing and seeding operations.
 - a. Apply 2/3 of limestone when seed bed is prepared. Work this into the top six inches of soil.
 - b. Apply remaining 1/3 of limestone with seed mixture.
 - 3. Fertilizing: After acidity adjustment, apply fertilizer at per-acre rate in Table 02920-6, except as recommended by approved soil test report.
 - 4. Hydraulic overseeding: For overseeding existing vegetation, cut existing vegetation to height of three inches and remove resultant refuse prior to overseeding.
- B. Seed Preparation:
 - 1. Inoculate crownvetch seed on day it is used.
 - 2. Reinoculate seeds not sown within 24 hours following inoculation.
- C. Hydroseeding: Clean hydroseeders as approved prior to coming on site.
 - 1. From March 1 to October 15, sow specified crownvetch seed mixture (Table 02920-4) at a rate of 100 pounds per acre.
 - 2. From June 1 to August 15 sow specified crownvetch seed mixture (Table 02920-4) at a rate of 100 pounds per acre, except add an additional three-percent by weight of Loehmans Weeping Lovegrass.
 - 3. Extend or reduce specified periods as approved and as required by weather and soil conditions.
 - 4. Bare areas: Perform application-sequence Stages I and II, specified below.
 - 5. Existing vegetation areas (hydraulic overseeding): Perform only application-sequence Stage I, specified below. Obtain the Engineer's on-site approval on whether to use

- nozzle or hose for hydraulic overseeding.
6. Application method:
 - a. Apply mixtures by means of high-pressure spray directed upward into air so that mixtures fall to ground in uniform spray. Do not direct nozzle of hand-held hose toward ground in manner that would produce erosion or runoff.
 - b. Make uniform applications at required rate, with two passes at 90 degrees to each other, to ensure uniformity and prevent misses.
 - c. Agitate mixtures constantly from time mixed until application to seed bed. Use mixtures within eight hours after mixing.
 - d. Use inoculated crownvetch in slurry with fertilizers within one hour after mixing. Use fresh crownvetch seed and reinoculate seed whenever this requirement cannot be met.
 7. Application sequence:
 - a. Stage I, Table 02920-5: Load materials into water-filled tanks in proportion to tank size; agitate until smooth slurry is formed. Spray on seed bed at rates specified. Follow within two hours with Stage II.
 - b. Stage II, Table 02920-6: Mulch area within two hours after completing Stage I. Use straw mulch for slopes up to 2:1. Use mulch blanket for slopes greater than 2:1. Do not use wood-cellulose fiber.

3.04 SEEDING LESPEDEZA:

- A. Seed Bed Preparation: After construction work in the area has been completed, proceed as follows:
 1. Grading: Rough grade to remove large stones and roots. Remove or break up clods greater than one-foot diameter. Chisel surface to depth of four to six inches. When preparing slopes, chisel parallel to contour of slope.
 2. pH adjustment: Adjust soil pH by applying limestone or approved acidifying agent, or elemental sulfur at per-acre rate in Table 02920-6, except as recommended by approved soil test report so as to obtain a 6.5 pH. Apply separately prior to fertilizing and seeding operations.
 - a. Apply 2/3 of limestone when seed bed is prepared. Work this into the top six inches of soil.
 - b. Apply remaining 1/3 of limestone with seed mixture.
 3. Fertilizing: After acidity adjustment, apply fertilizer at per-acre rate in Table 02920-6, except as recommended by approved soil test report.
 4. Hydraulic overseeding: For overseeding existing vegetation, cut existing vegetation to height of three inches and remove resultant refuse prior to overseeding.
- B. Seed Preparation:
 1. Have lespedeza seed hulled, scarified and inoculated for spring sowing.
 2. Inoculate lespedeza seed on day it is used.
 3. Reinoculate seeds not sown within 24 hours following inoculation.
- C. Hydroseeding: Clean hydroseeders as approved prior to coming on site.
 1. Sow specified lespedeza seed (Table 02920-5) from March 1 to April 30 and August 15 to October 31 at the rate of 90 pounds per acre.
 2. Extend or reduce specified period as approved and as required by weather and soil conditions.
 3. Bare areas: Perform application-sequence Stages I and II, specified below.
 4. Existing vegetation areas (hydraulic overseeding): Perform only application-sequence Stage I, specified below. Obtain the Engineer's on-site approval on whether to use

- nozzle or hose for hydraulic overseeding.
5. Application method:
 - a. Apply mixtures by means of high-pressure spray directed upward into air so that mixtures fall to ground in uniform spray. Do not direct nozzle of hand-held hose toward ground in manner that would produce erosion or runoff.
 - b. Make uniform applications at required rate, with two passes at 90 degrees to each other, to ensure uniformity and prevent misses.
 - c. Agitate mixtures constantly from time mixed until application to seed bed. Use mixtures within eight hours after mixing.
 - d. Use inoculated lespedeza in slurry with fertilizers within one hour after mixing. Use fresh crownvetch seed and reinoculate seed whenever this requirement cannot be met.
 6. Application sequence:
 - a. Stage I, Table 02920-5: Load materials into water-filled tanks in proportion to tank size; agitate until smooth slurry is formed. Spray on seed bed at rates specified. Follow within two hours with Stage II.
 - b. Stage II, Table 02920-6: Mulch area within two hours after completing Stage I. Use straw mulch for slopes up to 2:1. Use mulch blanket for slopes greater than 2:1. Do not use wood-cellulose fiber.

3.05 MULCHING:

- A. General:
 1. Mulch according to the following slope limitations, except as limited for crownvetch and lespedeza.
 2. Mulch within two hours after seeding as follows:
 3. Immediately replace displaced mulching.
- B. Slopes up to 3:1:
 1. Wood-cellulose fiber:
 - a. Apply at a net dry weight 1,500 pounds per acre.
 - b. Apply hydraulically with seed and fertilizer at rate of 50 pounds per 100 gallons of water.
 2. Straw:
 - a. Methods of application:
 - 1) Hand spreading: 4,000 pounds per acre (100 pounds per 1,000 square feet). Cover areas uniformly to depth of not less than two inches of loose material.
 - 2) Blowing: Use of cutters is permitted in blowing equipment if at least 95-percent of mulch is six inches or more in length. For cut mulches applied by blowing method, achieve uniform distribution and loose in-place depth of not less than two inches.
 - 3) Mulch-binder application:
 - a) Synthetic binder: Apply according to manufacturer's instructions.
 - b) Biodegradable netting: Apply according to manufacturer's instructions.
- C. Slopes 2:1 to 3:1: Straw as specified above.
- D. Slopes over 2:1: Mulch blanket, applied and stapled according to manufacturer's instructions.

3.06 SODDING:

- A. Sod Bed Preparation: After placing topsoil, proceed as follows:
1. pH adjustment: Adjust soil pH by applying limestone or approved acidifying agent, or elemental sulfur at per-acre rate recommended by approved soil test report so as to obtain a 6.5 pH. Mix into soil to a depth of four inches minimum.
 2. Fertilizing: After pH adjustment, apply fertilizer at per-acre rate recommended by approved soil test report. Mix into soil to a depth of four inches minimum.
 3. Compact topsoil with lawn roller or tractor roller to three inches of final compacted thickness as approved.
- B. Laying Sod:
1. Lay sod between September 15 and June 1, grown from seed varieties identical to grass seed mixture in Table 02920-3, or sod which is Blue-Tag certified.
 2. Extend or reduce specified period as approved and as required by weather and soil conditions.
 3. When soil surface is hot or dry, wet soil to a depth of two inches, six to eight hours before sodding. Do not accept or lay dried sod.
 4. Place sod by hand with butted joints and no overlapping. When Beck Roll of sod is used, lay also in accordance with the supplier's instructions.
 5. Lay first row of sod in straight line. Place subsequent rows parallel to and tightly against each other. Stagger perpendicular joints to promote more uniform growth and strength. Do not stretch sod. On slopes, lay sod parallel to contour of slope.
 6. Peg sod placed on slopes 2:1 or greater. Peg each strip or section of sod with at least two stakes not more than two feet apart. Drive stakes flush with top of sod so that roots are in contact with topsoil.
 7. Water sod immediately to prevent excessive drying during progress of work. Sod which dries out will be rejected.
 8. Roll entire area as sodding is completed in each section so that sod is without surface irregularities, such as depressions and high spots.
 9. Irrigate immediately after rolling, enough to wet underside of sod and one inch of soil immediately below.

3.07 MAINTENANCE AND REPLACEMENT:

- A. Maintenance: Maintain seeding, sodding and incidental work during seeding and sodding and thereafter for a period of 120 days for work performed in the spring and for 90 days of subsequent growing weather for work performed in the fall. Perform the following and other operations of care appropriate for promotion of healthy growth, so that work is in an approved condition throughout maintenance period; uniform in color, quality and coverage; and free of weeds, insects, diseases, surface damage and other imperfections:
1. Watering:
 - a. First week: Perform watering daily to keep soil and sod pads continuously moist, maintaining moist topsoil to a depth of at least four inches. Water prior to heat of the day as necessary to prevent wilting or as approved.
 - b. Subsequent weeks: Water seeded and sodded areas to maintain moisture in upper four inches of soil for promotion of deep root growth.
 2. Mowing: Mow only when seed or sod has firmly rooted, is securely in place and has grown to height of six inches. Mow to height of three inches at first cutting. Thereafter, do not remove more than 1/3 of grass leaf at any cutting. Maintain Kentucky Bluegrass between height of two and 2-1/2 inches and tall fescue at height of three inches, unless otherwise directed.

3. Edging: Edge walks during alternate mowings.
 4. Rolling: Roll to maintain uniform surface.
 5. Applying herbicides: Apply in spray form. Do not apply when temperature exceeds 80F or during periods of drought. Have workers wear personal protective equipment appropriate for the submitted MSDS.
 6. Clean-up: Remove rubbish and debris caused by this work. Keep site clean during maintenance period.
- B. Replacing Seeding and Sodding: During maintenance period and until Final Acceptance, replace seeded and sodded areas that are dead, unhealthy, unsightly or badly impaired. Replace as soon as possible during the specified planting seasons. Make such replacements in the same manner as required for original seeding and sodding.

3.08 SUBSTANTIAL COMPLETION INSPECTION (SCI):

- A. Substantial Completion Inspection will be held by the Engineer after completion of seeding and sodding to verify that the work was performed as defined in the Contract Documents.
- B. The Contractor will not be held responsible or liable for damage by animals, by malicious or careless human agencies over which the Contractor has no control, by fire or storm, or by vehicular accidents by others that occur after the Substantial Completion Inspection.

3.09 FINAL ACCEPTANCE:

- A. Request inspection for final acceptance at least 10 days before end of maintenance period.
- B. Replace rejected seeded and sodded areas as specified so that repair or replacement plantings are rooted and established prior to final acceptance.
- C. Final acceptance of crownvetch or lespedeza areas requires a minimum of nine vigorous, healthy seedlings evenly distributed per each square yard after 12 weeks of growing weather following germination.

THIS SPACE INTENTIONAL LEFT BLANK

TABLE 02920-1: MATERIALS SUBMITTAL CHART This chart indicates minimum length of time required for the approval process before intended use and by which submittals must be made, as well as the minimum quantity for each sample. Useable samples will be returned.			
ITEM	TIME	QUANTITY	COMMENT
SEED	40 days	10 pounds or 5 kilograms	If seed is purchased as a mixture.
		5 pounds or 3 kilograms	Per component prior to blending if Contractor blends mixture.
INOCULANT	7 days	1 packet	Keep temperature of inoculant below 70F (21C).
SOD	7 days	--	Notification of source.
FERTILIZER	14 days	50 pounds (25 kilograms)	Provide sample of each type of fertilizer used. Unopened container.
LIMESTONE	14 days	50 pounds (25 kilograms)	As specified. Unopened container.
MULCH	7 days	10 pounds (5 kilograms)	Wood-cellulose fiber mulch.
		1 unbroken bale	Straw mulch.
		1 square yard (1 square meter)	Mulch blanket including staples.
MULCH BINDER	14 days	1 quart (1 liter)	Synthetic binder.
		1 square yard (1 square meter)	Biodegradable netting including staples.
TOPSOIL	28 days	25 pounds (15 kilograms)	--
HERBICIDE	7 days	1 quart (1 liter)	Unopened container. Include MSDS
OTHER MATERIAL	7 days	As directed and as approved	--

TABLE 02920-2. GRASS SEED FOR SEED MIXTURES			
SPECIES	MINIMUM GUARANTEED PURITY	MAXIMUM WEED SEED AND OTHER CROP	MINIMUM GUARANTEED GERMINATION
Certified Turf-Type Tall Fescue Festuca elatior arundinacea (Cultivars from current Agronomy Mimeo #77)	98 percent	0.2 percent	85 percent
Certified Kentucky Bluegrass Poa pratensis	95 percent	0.2 percent	85 percent

SECTION 02930

LANDSCAPING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing and maintaining landscape plantings, edge plantings and related accessories. It also specifies existing tree pruning and removal requirements.
- B. Related Work Specified Elsewhere:
- | | |
|---------------|------------------------------------------------|
| Section 02320 | Grading, excavating and backfilling |
| Section 02920 | Topsoil, seeding and sodding |
| Section 02205 | Removal and restoration of existing facilities |
- C. Definitions:
1. Landscape Plantings (Outside Reforestation areas and in Median strips): Designed planting of trees and shrubs within lawn or established areas, as shown. Landscape plantings are indicated on the Drawings with a square symbol as shown on the key in the Drawings.
 2. Edge Plantings: Planting of trees and shrubs along edge of reforestation areas, as shown. Edge plantings are indicated on the Drawings with a triangular symbol as shown on the key in the Drawings.
 3. Reforestation: Planting of trees and shrubs within designated reforestation areas. These reforestation areas are outside the limits of existing woodlands and wetlands and of landscape and mow areas, as shown. Reforestation planting areas are indicated on the Drawings with small circles as shown on the key in the Drawings.
 4. Plants or Plant Material: Vegetation, including trees, shrubs, ground cover, vines, and seasonal flowers.
 5. Size: The factor controlled by dimensions representing caliper, height or spread. For standard quality a dimension is given for caliper, height or spread, whichever is a typical characteristic of the plant. For specimen quality, all dimensions may be specified.
 6. Condition: The factor controlled by vitality and ability to survive and thrive and be comparable with normal plants of the same species and variety in the vicinity, at the same season of the year, free from physical damage or adverse condition that would prevent thriving, whether dormant or growing.
 7. Foliage line: Maximum dimension measured from ground to lowest part of body of plant.
 8. Quality: Structure and form as evidenced by density and number of canes and branches, compactness, symmetry and general development, without consideration of size or condition.
 - a. Standard: The least acceptable quality, good average uniform growth, absence of irregularities, typical characteristics of the species and variety, nursery-grown, well-formed, and uniformly branched, sound, healthy, vigorous and free of disease and insects, and having healthy, well-developed root systems, and having the minimum number of canes specified or conforming to minimum quality index. Plant materials below specified standard will be considered unacceptable culls and are not acceptable.

- b. Specimen: An exceptionally heavy, symmetrical, tightly knit plant, trained or favored in its development and appearance so as to be An unquestionably and outstandingly superior in form, of the designated species or cultivar number of branches, compactness and symmetry.
- 9. Spread: Single dimension that represents the minimum acceptable width. Where range is shown between two spread dimensions, the lesser is the minimum acceptable.
- 10. Root Protection Zone (Area): The root protection area is an area equal to a radius of 1.5 feet for each inch of diameter at breast height (dbh) (i.e.; a 10-inch dbh tree will require protection 15 feet from the main trunk in every direction.
- 11. Diameter at Breast Height (DBH): The DBH is the trunk diameter measured at a point 4.5 feet (Maryland State Standard) above the average ground level. If the trunk divides into several smaller trunks at a point lower than 4.5 feet (Maryland State Standard) from the ground, the tree size is the diameter measured at the highest point on the single trunk.
 - a. If a tree falls between sizes as listed in the bid schedule, the tree is placed in the next larger size. For example, a 17-1/2 inch diameter tree is placed in the 18-inch to 23-inch size.
- 12. Tracing: Careful cutting of bark along the line of sap flow to encourage wound closure and to smoothly outline the wound area.
- 13. Girdling Roots: Surface roots whose circular growth around the base of a tree trunk or around other roots applies pressure to the bark thereby restricting the sap flow.
- 14. Stumps: Stumps include the base of the trunk and visible surface roots attached to the trunk no more than three feet high, measured from the average ground level. Stump size is the diameter of the cut wood surface as measured across the narrowest portion.
- 15. B&B: Balled and burlapped.
- 16. NIC: Not in Contract.
- 17. Other Terms: The following in accordance with ANSI Z60.1:
 - a. Height.
 - b. Cane.
 - c. Caliper: Determine caliper measurement by taking the average of two trunk caliper measurements at right angles six inches above the root crown.
 - d. Height of branching.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications: Keep always available at the work site a copy of each of the cited references.
 - 1. Codes and regulations of jurisdictional authorities, including but not limited to NPS, MNCPPC and MDNR.
 - a. Wherever specific reference is made to NPS, MNCPPC and MDNR, it applies to work performed on or affecting the property governed by these agencies.
 - 2. ANSI: Z60.1 (American Standard for Nursery Stock), Z133.1 (Safety Requirements for Pruning, Trimming, Repairing, Maintaining and Removing Trees and Cutting Brush).
 - 3. Bailey's Standard Cyclopedia of Horticulture.
 - 4. American Joint Committee on Horticultural Nomenclature (AJCHN): Standardized Plant Names.
 - 5. Hortus III.
 - 6. USDA-SCS.
 - 7. FS: O-F-241.
 - 8. ASTM: A36, A48, A53, A153, A307, A501, C51, D448, D2729, F593.

- B. Source Quality Control:
1. Verification of availability: Before bidding, verify sources of supply of the plants on the plant schedule, including requirements for size, species, variety and quality shown and specified.
 2. Furnish plant materials certified by state or federal Department of Agriculture to be free from disease or infestation.
 3. Obtain plants climatized to the Project area. Acclimate plants for a minimum of 3 months. Supply plants only from nurseries within U.S.D.A. Plant Hardiness Zone 6 or 7, and not more than 500 miles from the Project site.
 4. Pre-select and tag at the nursery the large plants of quality and number indicated, prior to inspection by the Engineer.
 5. Inspection of plant material:
 - a. Inspection: Have plant material inspected and trees seal-tagged by the Engineer at the nurseries prior to digging. Have representative samples of shrubs and miscellaneous plants sealed.
 - 1) To be approved, remaining plants are to be equal to sealed samples. Obtain approval of plants after delivery and before planting.
 - 2) Inspection and approval of plants at the nursery or at delivery is for quality, size and variety only and will not abolish or abrogate the right of rejection for failure to meet other requirements discovered during the progress of the work.
 - b. Travel expenses: In the bid price, include related Authority-incurred expenses for the Engineer's travel. Allow sufficient time for travel advance to be processed, minimum 2-weeks.
 - 1) Appropriate expenses include the costs associated with meals, lodging and transportation; i.e., airfare, auto rental, parking, tolls, and privately owned vehicles at the rate per mile currently in effect under Federal Travel Regulations. Daily lodging and meal expenses may not exceed the per diem limits allowed under the provisions of the Federal Travel Regulations in effect at the time the expenses are incurred. Air travel is limited to regularly scheduled airline flights, coach class, whenever possible
 - 2) In these costs allow for maximum 8-hour work days, including suitable inspection time and round-trip travel time.
 - 3) No costs are borne by the Contractor for Authority-furnished labor.
 - c. The NPS and MNCPPC, as applicable to the planting location, have the right to inspect, select and tag plants before delivery to the job site. If this inspection is made, it will be at the nursery at no additional cost to the Contractor.
 6. Inspection of topsoil.
 - a. Make arrangements with the Engineer for inspection at the source. Furnish travel expenses as specified for Inspection of Plant Material.
 - b. Obtain representative topsoil samples for submittal as specified in Section 02920.
 - c. Contractor is liable and responsible for any deleterious soil material brought on site, and subsequent pollution abatement clean-up.
- C. Personnel Qualifications:
1. Superintendent: Use a Landscaping Superintendent with previous knowledge and verifiable experience in supervising landscaping work and grounds maintenance of similar size and scope. Have the Superintendent present whenever work is being

performed and have the Superintendent responsible for controlling the quality of work and inspecting completed work to ensure that Contract requirements are met. The Superintendent is the primary contact person with the Engineer regarding landscaping work.

2. **Arborist:** Perform tree pruning and removal work under the direction and general supervision of an Arborist certified by the International Society of Arboriculture, PO Box 908, Urbana, IL 61801, telephone 217/328-2032; or by a Maryland-licensed Tree Expert; who has verifiable experience and technical competence in tree physiology, identification, diagnosis of disorders, and current tree care and safety practices in accordance with accepted industry standards. The Arborist is responsible for controlling the quality of pruning and removal work and for inspecting such completed work.
3. **Tree Crew Supervisor:** Have tree pruning and removal work performed under the full-time supervision of an experienced Tree Crew Supervisor to accompany each tree crew while work is being performed. Ensure that the Tree Crew Supervisor has verifiable work experience as a full time direct supervisor of shade tree pruning and climbing work crews.
4. **Workers:** Have the work performed only by experienced workers, who through related training and verifiable previous on-the-job experience, are familiar with the technical aspects of landscape planting, grounds maintenance, with the hazards of tree pruning and removal work, and with equipment used for each of these operations as applicable. Have each worker abide by the code of ethics or professional conduct established by the Landscape Contractors Association MD-DC-VA, the National Arborist Association and the International Society of Arboriculture.

- D. **Pre-Planting Conference:** Hold a pre-planting conference prior to planting landscaped areas.
1. Set a time, date, and location agreeable to the Engineer and personnel of the Contractor, and jurisdictional agency, including but not limited to, NPS and MNCPPC, who are responsible for the contractual obligations of these parties. Participation of these parties at this conference is mandatory prior to beginning planting.
 2. Have discussion topics include, but not limited to, confirmation of exact plant substitutions previously accepted by the Engineer.
 3. Make notations on plans to document direction received from the jurisdictional agency, including but not limited to, NPS and MNCPPC, and send record copies to attendees.
 4. After conference, notify the Engineer 48 hours prior to beginning landscape planting work. Notify MDNR through the Engineer.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
1. **Location list:** Within 10 calendar days after receipt of NTP, submit a complete list of locations of plant material subject to inspection. Should plant material be exhausted from these sources, the Contractor is responsible to locate elsewhere, at no additional cost to the Authority.
 2. **Request for Substitutions:** Submit requests for plant material substitutions, if necessary, within 10 days of NTP.
 - a. If a substitute is to be used on and jurisdictional agency, including but not limited to, NPS property, it requires approval by the Engineer and the NPS, or applicable agency.

- b. The Engineer will approve substitutions only after thorough evaluation has been made concerning the need for such a change based upon the unavailability of plant material specified. If size changes are made, the Engineer will require equal total caliper inches for trees as bid, or if limited by space, extra numbers of plants equitable to unit cost bid price; at no additional cost to the Authority.
 - 3. Work routes and details: Submit plans of entire project site clearly marked to show proposed work routes of crews and equipment, turning radii, and locations of temporary protective markers, barriers and storage areas, coordinated with details of methods to distribute concentrated loads so as not to compact soil unacceptably (above 75% maximum density). Do not route through zones designated for planting.
- B. Samples: Samples of each required type of material specified in Table 02930-1. Samples failing to meet specified requirements are unacceptable. Resubmit new samples of satisfactory material until approved.
- C. Certifications:
 - 1. Complete, certified reports attesting that proposed materials comply with specified requirements. Furnish certificates of inspection of plant materials by state or federal agency prior to delivery.
 - a. Topsoil: As specified in Section 02920.
 - b. Antidesiccant: Submit certificate from the antidesiccant manufacturer as evidence that the antidesiccant material can be safely used on both deciduous and evergreen plants. Mandatory use, if any plants installed outside the specified planting period.
 - 2. Copies of each license and certificate necessary for complying with Federal, State, and municipal laws, codes, and regulations prior to delivery.
- D. Documentation:
 - 1. Personnel qualifications: A list of the qualifications and experience of the workers, and qualifications and experience of the Landscaping Superintendent, Arborist and Tree Crew Supervisor, as attested by knowledge and experience in supervising contracts of similar size and scope in the past.
 - 2. Soil Density Tests: Submit soil proctor tests made by a qualified independent soil-testing agency, acceptable to the Engineer, stating soil density. Perform tests where directed by the Engineer. Compaction by rolling or operating heavy equipment is not permitted within planting locations. Maximum density of subgrade in planting locations is 75 percent. Disc or rototill bottom of plant beds to remove hard pan that may exist and remove rocks and debris off site, at no extra cost to the Authority.
 - a. Before beginning work: Furnish one pre-construction soil proctor test to 24-inch depth for each 100 square feet of approved work routes and storage areas.
 - b. After completing work: Furnish one post-construction soil proctor test to 24-inch depth for each 100 square feet of approved work routes and storage areas.
 - c. Perform additional soil proctor tests if correcting soil density is required.
 - 3. Topsoil pH Tests: Submit soil pH tests made by a qualified independent soil-testing agency, acceptable to the Engineer, stating soil pH. Report suitability of pH for growth of target crop in each area. State recommended quantities of soil amendments to be added to produce a satisfactory Ph.
 - a. Furnish one test for each 500 square feet of each planting area, and not less than one test for each area.

- b. After adjusting pH, furnish one test for each 300 square feet of each pH-adjusted areas, and not less than one test for each area.
- c. Confirming orders: Within 10 calendar days after receipt of NTP, submit confirming orders from the nursery for plant material.
- 4. Packing slips: Certified plant materials packing slips with each delivery.
- 5. Reports: Furnish copies of the following reports to the Engineer either on a daily or weekly basis as requested.
 - a. Daily Work Log: Maintain a daily work log recording the quantities of trees and shrubs installed, and their locations.
 - b. Maintenance Reports:
 - 1) Prepare monthly reports describing the work of the previous month and work scheduled for the following month.
 - 2) At the end of maintenance period, submit maintenance schedules and instructions for future maintenance.
- 6. Equipment list: A list of the equipment anticipated for use, including the make and model, year manufactured, tag number if applicable, and date of last inspection. If requested by the Engineer, submit a list of the equipment to be used for each delivery order. Have the listed equipment on the job site when necessary during the execution of the delivery order.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

A. Delivery:

- 1. Notify the Engineer at least 48 hours before each delivery. Describe in writing the method of shipment and include an itemized list of quantity and sizes. Do not deliver plants until the areas for planting are prepared as required, and approved by the Engineer.
- 2. With each delivery, include certified packing slip for the shipment listing types and sizes of plants, types of materials, and quantities of each shipped. Inspect received materials against packing slip promptly upon arrival at the job site.
- 3. Deliver materials and products to the job site in their original unopened containers or wrappings, clearly labeled with the manufacturer's name and address, material components, trademark, chemical analysis, species, age and source. Materials and supplies are subject to inspection and sampling for testing.
- 4. Allow no agronomic materials or supplies on site other than those for the project.
- 5. Protect plants from weather and adequately pack them to provide protection against climate and breakage during transit. When shipment is made by open vehicle, tie and cover plant materials to prevent wind-shipping and dehydration. When shipment is made by closed vehicle, carefully pack and adequately ventilate plants to prevent condensation on or overheating of plants during transit.
- 6. Spray evergreen and deciduous plants in leaf with an anti-transpirant in accordance with manufacturer's instruction to protect from drying.
- 7. Protect roots of bare-root plants with approved nursery packing. Keep damp during delivery and storage. If planting is delayed, heel-in plants in topsoil or wet straw and keep moist.
- 8. Do not expose fertilizer to weather until used. Completely protect fertilizer before use and do not store in direct contact with the ground.

- ##### B. Plant Identification Labels:
- Mark plants with identification before delivery to the site. Make labels durable and legible stating the correct botanical name and size/caliper in weather-resistant ink or embossed letters. Securely attach labels to each plant in a manner

that will not restrict growth. Maintain labels until they are removed by the Contractor at final acceptance or when directed otherwise by the Engineer.

- C. Move plants marked B&B on plant list with root systems as intact solid units and with root balls of earth firmly wrapped.
- D. Exercise care during every handling operation so as to prevent damage to bark, branches, roots and stem, and to preclude cracked root balls. Use platforms under balls whenever hoisting plants. Do not use plants with cracked, broken or loosely wrapped root balls. Handle plants only by root balls. Plants handled by tops will be rejected. Protect plant roots, root balls and tops from sun or drying winds until planted.
- E. Do not stack root balls. This will mean that for a 40-foot flat bed trailer, the number of 1.75-inch to 2-inch B&B plants may not exceed 130.
- F. Do not handle soil in a frozen or muddy condition.

1.05 JOB CONDITIONS:

- A. Conduct planting operations only under favorable seasonal conditions throughout the period of the Contract as determined by the Engineer. Install no plants during adverse weather or during periods when soil conditions are unfavorable as determined by the Engineer. Do not plant when ground is frozen.
- B. Daily Work Log: Coordinate daily work log with work performed, recording numbers of plants planted and their locations.
 - 1. To indicate progress, attach color-coded survey tape in the planting areas, with a different color tape per month and marked with the date of installation in weather-resistant ink, keyed to the Plant Schedule shown.
 - 2. Securely attach tape to each plant in a manner that will not restrict growth. Maintain tape on plants until removal is directed by the Engineer.
- C. Protection: During progress of operations, protect walls, walks, curbs, benches, lawn areas, plant material, and other site improvements by adequate means acceptable to the Engineer.
 - 1. Existing Vegetation: Preserve and protect existing vegetation such as trees, shrubs, and grass on or adjacent to the site which do not reasonably interfere with the construction. Box and protect trees and shrubs that may be subject to construction activities within the root protection area with chain link or wood fencing as directed by the Engineer.
 - 2. Weight Restrictions: Do not overload entrance paving, sidewalks and curbs. These areas are limited to a maximum load of 1,250 pounds per square foot.
 - 3. Existing Utilities and Structures: The existence and location of underground utilities on the plans are not guaranteed. Investigate and verify locations in the field before starting work. The Contractor will be held responsible for damages to, and for maintenance and protection of existing utilities and structures.
 - a. Obtain copies of available as-built utility drawings from the Engineer for reference.
 - b. Contact the local utility companies concerned to inform them of excavation plans.
 - c. To locate utilities in the field, contact Miss Utility at 800/257-7777, 48 hours in advance of work.

- d. Perform excavation in vicinity of existing structures and utilities with great care.
 - 4. Pollution: Take necessary and adequate measures to prevent soil erosion, air pollution and water pollution by the materials and equipment used during construction.
 - 5. Repairs: If damage by the Contractor should occur, it is the Contractor's responsibility to repair or replace per the Engineer's direction, as acceptable to concerned parties, and at no additional cost to the Authority. Perform work so that damaged areas make smooth, satisfactory, and imperceptible transitions to existing adjacent work. Use materials and methods conforming to current standards for the area damaged, matching adjacent materials in appearance, and meeting approval of jurisdictional authorities and the Engineer.
 - a. Replace damaged existing turf areas with approved sod per Section 02920.
- D. Root Protection Zone (Area): Do not permit heavy equipment or vehicles or the stockpiling of materials in the root protection area without advance permission of the Engineer. Where such activity is allowed within the root protection area, provide an ample mitigation plan to prevent the possibility of damage to the tree trunk and roots, or to increase soil compaction.
 - 1. If the Engineer approves construction activities within the root protection area, protect tree trunks and shrubs with chain link fence or wooden fencing as directed, cover the entire root protection area with landscape fabric and weed barrier as approved, and mulch with four inches of mulch prior to construction. Placing metal plates, tree pruning, fertilization, aeration and irrigation may also be required as directed by the Engineer.
 - 2. If damage by the Contractor should occur, it is the Contractor's responsibility to repair or replace per the Engineer's direction, as acceptable to the applicable regional jurisdictions, including, but not limited to NPS, MNCPPC, and at no additional cost to the Authority.
 - 3. For pruning or removal of existing trees, obtain approval by the NPS or the MNCPPC, as applicable, through the Engineer. Tree pruning and removal, except as shown, is NIC. and at no additional cost to the Authority.
- E. If, at any time, the Engineer determines that work is unsatisfactory or being conducted in an unsafe manner, immediately cease such work activities upon notification.

1.06 SCHEDULING AND COORDINATION:

- A. General:
 - 1. Perform planting operations according to Contractor's detailed and updated plan of the work as approved by the Engineer.
 - 2. Schedule and arrange work so as not to interfere with normal activities of the applicable regional jurisdictions including, but not limited to NPS and MNCPPC land and adjacent properties. Advance notice will be given to the Contractor if a conflict is expected. Remove plant debris, personnel and equipment that could interfere with an activity or event prior to the activity.
- B. Planting Seasons: The times of year in which planting is permitted is limited by the planting seasons for plant types as stipulated by the appropriate regional jurisdictional agency. Authority planting seasons are as follows. These time periods also include the time required, after initial planting, for staking, pruning and mulching operations.
 - 1. Evergreen material:
 - a. Fall planting: September 15 through November 30.
 - b. Spring planting: March 1 through May 15.

2. Deciduous material:
 - a. Planting period: October 15 through April 30.
 - b. White and Willow Oaks, Ironwood, dogwoods and other species as specifically directed, may be planted in spring only: March 1 through April 30.
3. Subject to the Engineer's approval, extend or reduce planting season as required by weather and soil conditions. Preparations for planting may begin earlier than the specified seasons if weather permits and if the staking of plant locations has been approved.

1.07 WARRANTY:

- A. Six months in addition to the requirements of the General Provisions for a total of 18 months, commencing the day the landscaping is accepted.
- B. Contractor has the responsibility for plant material locations that may be considered by the Contractor to be affected by adverse conditions, such as undesirable soil pH, water table factors, or poor drainage. Contractor also has responsibility during and following adverse weather conditions such as periods of excessive precipitation, extreme temperatures, wind and drought.
- C. As specified in Part 3, Concurrent Maintenance and Warranty Period, seasonally replace dead plants and plants that have died back beyond normal pruning lines as determined by the Engineer and at no additional cost to the Authority.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Plants and Plant Materials:
 1. Provide plants meeting the requirements of the plant schedule as shown, identified by botanical and common names and in accordance with applicable standards of quality, size, condition and type listed.
 2. Supply only plants free from disease, well-branched, in full foliage when in leaf and with healthy normal root systems. Have plants freshly dug, nursery-grown, and meeting the other specified requirements. Cold storage plants are unacceptable.
 3. Plants in marked cans, pots, or other containers on the plant schedule are to have been grown in the containers for a minimum of three months and a maximum of two years. Ensure that plant roots filling the containers show no evidence of being or having been root-bound.
 4. B&B plants: Use B&B plants that meet the Recommended Baling and Burlapping Specifications of ANSI Z60.1. Specifically: freshly dug by hand or with a mechanical tree digger in good condition, free of hydraulic leaks, with blades aligned and free of damage; roots wrapped firmly with untreated burlap, and bound carefully with untreated sisal or jute twine, cord or ungalvanized wire mesh; in a manner so as not to damage the bark, break branches, or destroy the natural shape.
 5. Root ball: Dig trees so that the root crown is at the top of the root ball. Make diameter and depth of root balls sufficient to encompass fibrous and feeding root systems.
 6. Provide genus, species and cultivar names which agree with the nomenclature of the most current edition of Hortus III by L.H. Bailey, Hortorium, Cornell University.

B. Topsoil:

1. Weathered surface soils or natural friable loam obtained from approved sources, free of subsoil, hard fragments and stones larger than one-half inch across greatest dimension, objectionable salts, noxious weeds and plants, debris and other materials inferior to surface soils or that would be toxic or harmful to growth; containing not less than 1.5-percent organic matter as determined by the Walkley-Black Method; capable of sustaining normal, healthy growth and development of seed and sod scheduled and specified.
2. Grading analysis:
 - a. All material must pass through a two-inch screen. Remove all material larger than two inches from the site.

SIEVE	MINIMUM PERCENT PASSING
2 inches	100
1/2 inch	90
1/4 inch	80
No. 10	70

3. Test and analysis of proposed topsoil material: Performed by local state agricultural experiment station or agricultural laboratory recommended by U.S. Department of Agriculture and meeting the following requirements:
 - a. Soil pH range: Between pH 5.0 and pH 7.6 inclusive.
 - b. Soil salinity by electrical-conductivity measurement: 500-ppm soluble salt maximum.
 - c. Soil fertility: Rated high in natural nutrients in pounds-per-acre based on the standard soil test in laboratory.
 - d. Soil texture: Classification consisting of 5 to 25-percent clay, 20 to 60-percent sand, and 15 to 45-percent silt as determined by hydrometer or pipette method. Sand, silt and clay as defined by USDA-SCS.

C. Fertilizer:

1. Commercial fertilizer: FS O-F-241, Type I, of grade noted, Level B, composite and bearing manufacturer's guaranteed statement of analysis. Unless otherwise shown or specified, use 10-10-10, slow-release, meeting the following minimum requirements:
 - a. Nitrogen content: Ten percent; slow-release, 50-percent organic.
 - b. Available phosphoric acid: Ten percent.
 - c. Potash content: Ten percent.
2. Soluble fertilizer: Standard commercial grade, 15-30-15 or higher analysis, Rapid-Gro or equal.
3. Packet tree and shrub fertilizer, minimum two-year time release: Root-Contact Packet, Sando Products, Inc., Prairie du Chien, Wisconsin 53821; Eeesy Grow, Specialty Fertilizer, Inc., Suffern, New York, 10901; 21 Gram, Planting Tablets, 200-10-5 Agriform International Chemicals, Inc.; or equal.

- D. Stable manure: Well-rotted cow manure. Free from fresh manure, sawdust, wood chips, tanbark, long straw, stones, chemicals used to hasten decomposition artificially, or other substances injurious to plants.

- E. Perlite: Granules, sterile, uniform gradation, insoluble, high water-holding capacity; as available from Pennsylvania Perlite Corporation, Lehigh Valley, Pennsylvania 18001 or equal.
- F. Mulch:
 - 1. Mulch blanket: Knitted construction of bio-degradable yarn with uniform openings, Hold-Gro as manufactured by Gulf States Paper Corporation, Tuscaloosa, Alabama 35401 or equal.
 - a. 150-foot lengths or greater.
 - b. U-shaped staples: As supplied by mulch-blanket manufacturer.
 - 2. Shredded hardwood or shredded pine bark: Sound, nondecomposed bark free from sticks, stones, clay and other foreign and toxic substances, with 50 percent over the minimum size indicated.
 - a. Regular size: 1/2-inch to two inches.
 - b. Extra-Coarse size: One inch to three inches.
 - c. Sources: Cove Dehydrated Products, Martinsburg, Pennsylvania 16662; Weyerhaeuser Garden Bark, Weyerhaeuser Company, Silva Products Department, Takoma, Washington 98401; or equal.
- G. Crushed Stone: ASTM D448, Size 57.
- H. Pea Gravel: Smooth, rounded pieces of gravel, clean and free from objectional materials, such as soft particles, coal and lignite particles, or friable particles, graded from 1/4 to 3/8 inch in size.
- I. Sand: Sharp, common, coarse, wet sand as approved, for use under plants.
- J. Peat Moss: Type 1 sphagnum peat moss (at least 75-percent), finely divided, with a pH of 3.1 to 5.0, moistened prior to and at time of use.
- K. Perforated Plastic Pipe: ASTM D2729.
- L. Landscape Fabric and Weed Barrier: Porous geotextile fabric for water and nutrient exchange; tear-resistant, minimum four ounces per square yard; Typar Landscape Fabric, DeWitt Earthmat, Pro 5, or equal.
- M. Limestone: Agricultural or dolomitic, ASTM C51, capable of neutralizing soil acidity and containing not less than 85 percent of total carbonates. Containers or sacks labeled to show chemical and mechanical analysis.
- N. Plant Hormone: Vitamin powder; Transplantone, American Chemical Paint Co., Ambler, Pennsylvania 19002; Super Thrive, Vitamins Institute, 5409 Satsuma Avenue, North Hollywood, California 91601; or equal.
- O. Antidesiccant for Retarding Excessive Loss of Plant Moisture and Inhibiting Wilt: Sprayable, water-insoluble vinyl-vinylidene complex which will produce a moisture-retarding barrier not removable by rain or snow. Capable of forming a film at temperature commonly encountered out-of-doors during planting season and with the moisture-vapor transmission rate of the resultant film not more than 10 grams per 24 hours at 70-percent humidity; Wilt-Pruf, as manufactured by Wilt-Pruf Nursery Specialty Products, Inc., Greenwich, Connecticut 06830; Vapor Gard as manufactured by Miller Chemical Company, Hanover, Pennsylvania 17331; or equal.

- P. Tree Stakes and Guys:
1. Stakes: Sound No. 2 Douglas fir or rough sawn straight-grain oak of uniform size.
 - a. Type 1: Two-inch square or 2-1/2 inches in diameter, eight feet long, with six-inch point at one end. Paint with two heavy brush coats of dark walnut oil stain before installation. After installation, cut off stakes square to a level two inches above the wires.
 - b. Type 2: Two-inch square by 30 inches long and notched to bold wires.
 2. Metal stakes: Steel angle, zinc-coated, ASTM A153, 1/4-inch thickness, 1-3/4 inches by 1-3/4 inches by 30 inches long.
 3. Pipe: ASTM A53, hot-dip galvanized, 1-1/4 inch OD eight feet long.
 4. Wood flags: 1/2 inch by two inches by ten inches, painted white.
 5. Turnbuckles: Galvanized, ASTM A153, three-inch minimum adjustment and 5/16-inch minimum diameter threaded opening fitted with screw eyes.
 6. Wires: Zinc-coated steel, No. 12 wire.
 7. Wire guards: Sound, two-ply, 5/8-inch inside diameter, round hose of fabric and rubber, black or green color.
 8. Ring bolts: 1/4-inch by three-inch tie-wire anchor HILTI HKT 14, HILTI Fastening Systems, Langley Park, Maryland 20783; or equal.
- Q. Wrapping Material:
1. Tree wrap: Two thicknesses of crinkled paper cemented together with bitumen, waterproof, four inches wide; as manufactured by Bemis Bag Company, Chase Bag Company, Sisalkraft or equal. Use as directed by Engineer or required by jurisdiction, always applicable for plants subject to sun scald.
 2. Twine: Lightly tarred medium or coarse sisal yarn.
- R. Watering Pipe: As shown.
- S. Marker Stakes: Sound No. 2 Douglas fir, or equivalent grades of rough sawn straight-grain oak, rough sawn cypress, hard pine, cedar, or locust; straight, of uniform size, 3/4-inch x 2-inch x 18 inches, pointed at one end.
- T. Tree Grates, Tree Grate Frames and Tree Guards:
1. Round tree grates: As shown, or with five-foot diameter, radial pattern, and expandable, as approved.
 2. Square tree grates: As shown.
 3. Guards: As shown.
 4. Cast iron: ASTM A48.
 5. Steel angles, plates and collars: ASTM A36.
 6. Steel tubing: ASTM A501.
 7. Bolts and washers: ASTM A307, zinc-coated.
 8. Screws: Stainless steel, ASTM F593, Alloy S30400.
 9. Tubing and collars: Shop-painted in accordance with Section 05500; finished as shown.
 10. Steel bars: ASTM A36.
- U. Hedge Guards: PVC-coated chain link fencing and accessories as specified in Section 02820, and as shown; consisting posts, fabric, tension wire and ties.
- V. Water: Potable.
- W. Composted screened leaf mold:

1. Processed leaves aerobically composted, free from litter such as glass, paper, plastic and other foreign substances, as approved.
2. Source: Leaf-Gro as available from Maryland Environmental Services, 2020 Industrial Drive, Annapolis, Maryland 21401 (301) 261-8596, or equal. Do not use composted sewage sludge.

2.02 PLANTING MIXTURES:

- A. Planting Mixture A:
 1. Use: For backfilling plant pits of deciduous and evergreen trees, shrubs, excluding azaleas:
 2. Mixture: Four parts topsoil and one part leaf mold or decomposed cow manure plus five pounds of 10-10-10 fertilizer per cubic yard, mixed on site to an approved consistency.
- B. Planting Mixture B:
 1. For backfilling plant pits of deciduous and evergreen groundcover and vines and all azaleas:
 2. Mixture: Four parts topsoil, one part leaf mold and one part perlite plus five pounds of 10-10-10 slow-release fertilizer per cubic yard, all mixed on site to an approved consistency.

2.03 EQUIPMENT:

- A. Use only equipment that meets federal OSHA, state and local safety requirements and that is properly licensed. This includes but is not limited to equipment such as bucket trucks, aerial lifts, chipper trucks, wood trucks and stump grinders, which may be needed to correctly perform landscaping, maintenance, and tree pruning and removal in accordance with the requirements.
- B. Have the name or logo of the Contractor or subcontractor clearly displayed on trucks used on the job.
- C. Use equipment of sizes that clear access routes, protective markers and barriers by 2 feet or more on each side.
- D. Do not use material storage devices or equipment that could increase compaction of existing, undisturbed soils.

PART 3 - EXECUTION

3.01 PREPARATION FOR PLANTING:

- A. See Article above on Scheduling and Coordination.
- B. Pre-Planting Conference: See Article above, under Quality Assurance.
- C. Locate and mark location of each underground utility.
- D. Mark outlines on the ground for locations of individual trenches and planting beds as approved. Have the Engineer approve marked locations before excavating.
 1. Drive marker stakes with at least eight inches projecting above surrounding ground cover.
 2. Paint top four inches of each stake according to the following color schedule and mark stakes with plant common name and sizes for each location:
 - a. Evergreens: Blue.

- b. Deciduous trees: Red.
 - c. Flowering trees: Yellow.
- E. Do not permit personnel, vehicles, or equipment not directly associated with the work into the planting areas.
 - F. Inspect Plants: Do not plant if plants appear damaged, unhealthy, insect infested, or if the root ball is cracked or broken either before or during planting operation.

3.05 PRESERVATION OF EXISTING PLANTS:

- A. Preserve and protect existing plants in accordance with the existing Plant Schedule as shown and with the requirements of Section 02205.

3.02 EXCAVATION FOR PLANTING:

- A. Exercise care during entire time of excavation and planting work so as to prevent contact with, disturbance of or unearthing of utilities and devices. Hand excavate wherever necessary to ensure this level of care.
- B. Exercise care in excavating tree pits at locations with existing drainage systems so as to prevent contact with, disturbance of or unearthing of drainage systems. Hand excavate wherever necessary to ensure this level of care. Place landscape fabric as shown. Staple per manufacturer's directions.
- C. Plant Locations: Locate plants as shown on the Contract Drawings, from dimensions shown, and as approved by the Engineer after locations are marked per the Preparation for Planting requirements specified above.
- D. Excavate pits, trenches, and beds with vertical sides and flat bottoms, to dimensions shown.
- E. Excavate pits to a minimum depth of 24 inches, measured from finished grades, or as shown.
- F. Make pits for bare-root plants to diameters at least 12 inches larger than the maximum spread of the roots and to minimum depth of at least 12 inches below the roots of the plant as placed.
- G. Make pits for balled or potted plants, with ball or container less than 12 inches in diameter, to diameters at least 16 inches larger and depth to size of ball or container. Alleviate hardpan compaction by rototilling or discing sub-soil beneath plant.
- H. Make pits for balled or potted plants, with ball or container 12 inches or greater in diameter, to diameters at least 24 inches larger and minimum depth to size of ball or container.
- I. Install trench drain for trees on slopes greater than 3:1 in locations as shown. Excavate four to six inches wide. Start bottom of trench at elevation of bottom of plant ball and extend away on low side of plant location until daylighted. Fill bottom twelve inches of trench with pea gravel. Backfill to surface with excavated material from trench. Blend surplus over area next to trench. Cover surface with material to match the surrounding area.
- J. Make beds for ground cover plants to the length and width shown with minimum depth of six inches. Install landscape fabric beneath mulch layer, stapling per manufacturer's directions.

- K. Backfill plant pits that are abandoned due to unsuitable conditions with same excavated material, grade and seed.
- L. Before the close of each working day, barricade open pits. When pits are excavated more than fourteen days in advance of planting, backfill the excavations with the planting mixture specified.
- M. Remove and dispose of rocks, debris and excess excavated material off site. Set aside excavated soil needed for backfill mix and to form saucers.

3.03 PLANTING:

- A. Set plants plumb and straight with allowance for settlement. Set watering pipe as shown.
- B. Place balled plants so that the top of the root ball bears the same relation to finish grade as it bore to previous finish grade in nursery, or 1/8 higher than depth of root ball= approximately two inches higher. Place fertilizer packets or tablets in accordance with manufacturer's recommendations alongside the base of root ball. Backfill with specified planting mixture in 12-inch layers and tamp each layer to fill voids until planting mixture is at grade. Cut and remove burlap and lacing six inches away from trunk, or as approved. Leave remainder of burlap and lacing intact. Soak plant with water containing plant hormone.
- C. Open and remove containers from potted plants. If the growing medium is comprised of 75 percent or more of peat, perlite, sand or like material other than soil, pull visible roots away from container medium leaving the roots partially exposed. Place plants in plant pit or trench and carefully place backfill planting mixture among exposed roots. Continue backfilling and tamping in six-inch layers until finish grade is reached. Soak with water containing plant hormone.
- D. Remove and store existing tree grates and replace when planting is complete.
- E. Placement of bare-root plants: Place in pit or trench, cut off broken or frayed roots, spread root system, backfill with planting mixture in six-inch layers, settle to finish grade with water containing plant hormone.
- F. Create saucer around isolated plants with soil to retain water unless otherwise shown. Bring beds to smooth, even surfaces which will conform to established grade after full settlement has occurred. Plant shrubs as a bed, using weed barrier fabric beneath mulch when shrubs are spaced less than six foot on center (6' O.C.), unless otherwise detailed.
- G. Place specified planting mixture in groundcover bed at six-inch depth or as otherwise shown in contract drawing detail, place landscape weed barrier and then top with a layer of mulch to depth of three inches after compaction.
- H. Remove groundcover plants from pots with root system intact and set in mulched planting beds, cut through weed barrier, in the spacing and arrangement shown. Work soil firmly around each plant and restore the mulching material. Settle to finish grade with water containing plant hormone. On slopes greater than 2:1, after preparing planting beds and mulching, but prior to planting, apply mulch blanket as directed and staple according to manufacturer's instructions.
- I. When pits are dug in wet areas or where subsoil will not permit drainage as shown, set plant higher than normal using extra depth of crushed or crushed stone or sand, up to 12 inches

total depth, to keep ball from settling. Set top of plant root ball up to six inches higher than grade, as directed. Blend the immediate area outside the saucer with suitable soil to meet existing grade.

- J. Topsoil or approved fine, dry subsoil excavated or augered from plant pits may be used to form saucers. If plant pits are augered, break down side of the hole to permit root penetration.
- K. Create soil berm around downhill portion of planting pits on slopes.
- L. Cultivating: Cultivate trenches and shrub beds to the line shown. Cultivate area around isolated plants at least six inches beyond diameter of pit.
- M. Mulching: After planting and cultivating are completed, spread a layer of mulch on finished grade around plants to a depth of three inches after compaction. Lay landscape fabric beneath shrubbery beds, groundcover areas, and in tree pits, stapling as necessary per manufacturer's directions. Spread mulch around isolated plants over an area at least six inches greater than diameter of the pit and extend mulch over berm saucers as shown. Completely cover trenches and shrubbery beds with mulch. In planters and beds, spread a layer of mulch to depth of three inches after compaction.
- N. Pruning: Prune plant material after installation as approved to thin branches and foliage and yet retain species shape and trim hedges as shown. Do not cut leaders.
 - 1. Remove limbs, branches, canes and runners which require trimming with a clean cut flush with trunk or adjacent stem.
 - 2. When pruning lateral branches, cut at the same angle as that at which the buds are growing from the branches. Cut at a distance of 1/8-inch to 1/4-inch beyond the buds to avoid injuring them.
 - 3. Sterilize cutting tools with alcohol before proceeding to next plant after pruning out infected twigs and branches.
- O. Planting in Planters: Install crushed stone, landscape fabric and weed barrier, planting mixture and mulch as shown. Mound planting mix as shown for positive drainage. Do not work soil when frozen.
- P. Flower Beds: Plant flowers as shown, at planting seasons recommended by regional jurisdictions and/or growers.
- Q. Wrapping: Check with Engineer for necessity. For plants prone to sun scald use immediately after planting, spirally wrap trunk and main branches of trees with an overlay of two inches starting at the bottom. Tie wrap securely in place with twine.
- R. Guying: Within three days after planting, guy each tree four-inch caliper or larger as shown. Protect trees at points of contact by use of wire guards. After installation, cut stakes square to a level two inches above the wires.
- S. Staking: Support trees smaller than four-inch caliper within three days after planting by staking at perimeter line of ball as specified and to sufficient depth to hold tree rigid. Drive stakes vertically to achieve uniform height of five feet-six inches above finish grade or as directed. Do not twist or pull. Wire tree with wire guards interlocked to each stake at four inches above finish grade, or as directed.
 - 1. Planting areas: Three stakes, 120-degrees apart.
 - 2. Trees with grates: Four stakes, 90-degrees apart.

- T. Installation of Hedge Guard: Space hedge guard posts at a maximum of eight feet on centers. On curves with radii less than 100 feet, space hedge guard posts at a maximum of four feet on centers. Drive posts plumb to a height of three feet-six inches; protect end of pipe. Install one-cubic foot of concrete around base of end post in each run to serve as pull anchor. Secure fabric to posts with ties spaced 12 inches on centers. Install tension wire two inches below top of fabric. Install permanent caps on posts.
- U. Removal of Seals and Tags: As approved.

3.04 EXISTING TREE PRUNING AND REMOVAL:

- A. Safety:
 - 1. Conduct operations in accordance with national and local fire and safety codes, laws, rules, regulations and ANSI Z133.1 Safety Requirements for Pruning, Trimming, Repairing, Maintaining and Removing Trees and Cutting Brush.
 - 2. Have employees wear reflective, bright orange vests while conducting operations in or adjacent to roadways.
 - 3. Do not permit any one except the operator within six feet of a power saw.
 - 4. Block off the work area to pedestrians, other workers and vehicles.
 - 5. Look for, note and report to the Engineer in writing the presence of the slightest structural weakness, disease conditions, decayed trunk or branches, split crotches or branches, or other hazardous condition that has potential for damage to property or personal injury.
- B. Tree Pruning:
 - 1. Prune and thin trees when in foliage according to the Pruning Standards for Shade Trees (revised 1988) by the National Arborist Association. The classes of pruning are as follows:
 - a. Class I Fine Pruning: Fine pruning consists of removing dead, dying, diseased, interfering, objectionable, obstructing and weak branches, as well as selective thinning to lessen wind resistance. Removal of such branches includes those on the main trunks as well as those within the leaf area. An occasional branch as described above up to ½-inch in diameter may remain within the main leaf area where it is not practical to remove.
 - b. Class II Medium Pruning: Medium pruning consists of removing dead, dying, diseased, interfering, objectionable and weak branches on the main trunk as well as those within the leaf area. An occasional branch up to one inch in diameter may remain within the main leaf area where it is not practical to remove.
 - c. Class III Coarse Pruning: Coarse pruning consists of removing dead, diseased, or obviously weak branches, two inches in diameter or greater.
 - d. Class IV Cutting Back or Drop Crotch Pruning: Cutting back or drop crotch pruning consists of reducing tops, sides, underbranches or individual limbs.
 - 1) Undertake this practice only in cases of utility line interference, or where certain portions of the roots or root systems have been severely damaged, or when there is unusual and rapid tree growth, where it is necessary to reduce the top, sides or underbranches, or for specific topiary training or dwarfing.
 - 2) When cutting back, do not reduce more than 1/3 of the total area as a single operation. When cutting back trees, only drop crotch as

- much as necessary. Make every effort to cut back to a lateral, one-third of the diameter of the cut being made.
- 3) In reducing overall size, give attention to the symmetrical appearance. Keep top higher and sides reduced in order to maintain a tree-like form.
 - 4) Contact the Engineer prior to pruning a tree specified as Class I or Class II pruning if said pruning will reduce the surface area of the tree by more than 25 percent. Report tree structural problems.
2. Cut back dead, diseased and dying wood into healthy wood.
 3. On trees known to be diseased, disinfect tools after use on each tree with methyl alcohol at 70 percent (denatured wood alcohol diluted appropriately with water) or Chlorox bleach solution.
 4. Remove weak crotches, defined as split or rotted wood between two trunks of limbs that may break and fall during high wind.
 5. Where branches cross and rub together or are forming a V-crotch, remove one branch without ruining the appearance of the tree.
 6. Selectively prune trees which are developing more than one dominant leader in order to promote a single dominant leader by sub-dominating the other competitive branches. Make selection of the dominant leader with consideration of the tree's natural form, health, and structure.
 7. Inspect old injuries. Where appropriate, trace those not closing properly and where callus growth is not already completely established.
 8. Remove girdling roots.
 9. Trimming for clearance:
 - a. Trim trees to provide three feet of clearance from adjacent buildings and structures.
 - b. For street trees and trees over walks, trails, and picnic areas over six inches diameter at breast height (dbh), remove lateral limbs and water sprouts from the main trunk of the tree to a height of 12 feet above the ground. For trees over 10 inches dbh, remove lateral limbs and water sprouts from the main trunk of the tree to a height of fourteen feet above the ground.
 - c. Prune trees in the vicinity of electrical or phone lines so as to provide six to eight feet of clearance between lines and the nearest limb.
 10. Remove branches with a slanting cut starting just above a vigorous bud or shoot and running back across the limb at a 45 degree angle. Make cuts sufficiently close to the trunk or parent limb, without cutting into the branch collar or leaving a protruding stub, so that closure can readily start under normal conditions. Make clean cuts.
 11. Precut branches that are too heavy to handle to prevent splitting or peeling the bark. Where damage to other trees, foliage or property is possible, lower branches safely to the ground by ropes or equipment. Under no circumstances drop branches or main trunks freely onto a road, shoulder or paved surface.
 12. Trim salvageable branches by removing smaller branches flush with the surface of the main branch.
 13. Do not remove entire or large portions of healthy, sound limbs in order to facilitate the removal of dead or dying terminals.
 14. Complete required pruning and removals at the site of each tree, including removal of logs and debris, before initiating work on the next tree.
 15. Do not use chain saws or circular power blades to remove branches less than two inches in diameter.
 16. Do not use wounding paint,
 17. Do not use climbing hooks while pruning.

- C. Tree and Stump Removal:
1. Take every reasonable precaution, including but not limited to topping, sectioning and lifting of trees, diagnosing soundness of existing wood, and planning escape routes for workers to prevent damage to other vegetation, property, utility lines and persons and to prevent gouging and erosion of soils as a result of removal operations.
 2. Fell trees only when there is an adequate felling area at least equal in radius to the height of the tree. Top and remove in sections trees that cannot be felled due to proximity of buildings, conductors, adjacent trees, or lack of an adequate felling area.
 3. Properly rope, guy, or anchor trees to be felled that may cause damage to property or existing vegetation.
 4. Climbing hooks may be worn for tree removal work.
 5. Remove stumps to a depth of 12 inches below grade. Backfill and level the stump hole with clean wood-waste material.
 6. Completely remove each tree, including removal of logs and debris, before initiating work on the next tree.
- D. Debris removal:
1. Cut branches over six inches into 18 to 24 inch lengths.
 2. Chip material less than six inches in diameter.
 3. Collect, deliver, and unload wood and chips to a location specified by the Engineer. If approved, chips may be blown into adjacent natural areas.
 4. Remove wood, debris and chips on a daily basis. Sale of wood is not permitted on the project site.

3.05 INTERIM MAINTENANCE (UNTIL SCI):

- A. While planting is in progress, perform interim maintenance and management practices on work completed. During the post-planting period and until the SCI, properly care for plants furnished; performing watering, cultivating, and other maintenance tasks necessary to keep the plants in a live, healthy condition.
- B. Maintain plants and work incidental thereto by performing the following and other operations of care to promote root growth and plant health so that plants are in an approved condition throughout the interim maintenance period. Perform work in a manner which maintains the original intent of the reforestation and landscape design. Submit maintenance reports and schedules as specified.
1. Watering and draining: Water plants as required twice each month, or more frequently if weather conditions require such, as directed.
 2. Weeding: Weed by hand the mulched area around each plant and within bedded areas, at least twice each month during the growing season. Remove weeds from the site immediately. As directed, approved chemical weed killers may be used with precautions to prevent undesired damage resulting from such use. Submit Herbicide spill plan and daily use log, when required by jurisdictional agency.
 3. Pruning: Prune plants to ensure a desired growth habit and to remove dead wood, as directed and approved.
 4. Mulching: Mulch to maintain the depth as indicated or as directed.
 5. Securing stakes: Replace or adjust as necessary to maintain stability.

- C. Periodically inspect plants during the interim maintenance period and notify the Engineer in writing of suspected problems. The Contractor is responsible for insect and disease control on Authority property. Take necessary measures to ensure effectiveness of the treatment and plant survival. Insect and disease control are the responsibility of the NPS and MNCPPC ,unless brought in by Contractor's plant source.

3.06 SOIL DENSITY ADJUSTMENT:

- A. After completion of work and before Substantial Completion Inspection (SCI), have the soil-proctor testing along work routes and storage areas performed as required above under Submittals, Documentation.
- B. Adjust unacceptably compacted soil to a maximum of 75 percent maximum dry density in accordance with the Engineer's directions and at no additional cost to the Authority. In root protection zone, use of decompaction machinery is unacceptable.

3.07 SUBSTANTIAL COMPLETION INSPECTION (SCI):

- A. A Substantial Completion Inspection will be held by the Engineer after completion of planting to verify that the work was performed as defined in the Contract Documents.
- B. Do not remove tags, labels, etc. after SCI. These are needed during Concurrent Maintenance and Warranty period. Remove such identifications only at final acceptance.
- C. SCI commences the Concurrent Maintenance and Warranty Period of the Contract for items accepted as of this inspection.

3.08 CONCURRENT MAINTENANCE AND WARRANTY PERIOD:

- A. See warranty requirements in General Provisions, General Requirements, and specified in Part 1 of this section.
- B. After the Engineer has accepted the completed work in accordance with SCI, perform post-planting maintenance and plant management concurrent with the warranty period. During this period, properly care for plants; performing the following and other beneficial operations of care for promotion of root growth and plant life so that each plant is in an approved condition at the Substantial Completion Inspection and throughout the maintenance period:
 - 1. Watering and draining: Water plants as required twice each month. Every two weeks during the growing season, examine or sound the watering pipe at each plant to determine if too much water is collecting in the plant pit. Remove surplus water by pump or syphon without staining the pavement. Bi-weekly check relative moisture content of soil for typical tree and typical area of shrub or hedge planting; weekly during the months of July and August. Use Peerless Moisture Indicator, Tree-Type; or equal; following manufacturer's recommendations. Provide sufficient water to maintain relative moisture content of 25 to 30 percent. Provide water, fittings, hose, and water tanks as required to perform watering operation.
 - 2. Weeding: As necessary, perform seasonal weeding in the mulched area around each plant and in bedded areas, at least twice each month. Pull roots by hand or use approved chemical weed killers. Submit Herbicide spill plan and daily use log, when required by jurisdictional agency. Correct any damage resulting from such use and no not spray when winds are over. Remove weeds from the site.

3. Controlling insects and diseases: Treat plants year-round with an approved chemical spray or systemic chemical as necessary to prevent insects, disease and fungus. Take necessary measures to ensure effectiveness of the treatment and plant survival. Submit Pesticide spill plan and daily use log, when required by jurisdictional agency. Protect vehicles and construction in the vicinity from damage or staining.
 4. Pruning: Prune plants during each growing season to develop a desired growth habit and to remove dead wood.
 5. Fertilizing: Fertilize trees, shrubs, hedge plants and groundcover once between May 15 and July 1 with 15-30-15 soluble fertilizer, or equal, at the manufacturer's recommended rate.
 6. Edging: At least twice during the growing season, edge around the mulched area of each plant.
 7. Mulching: Mulch to maintain the depth as shown.
 8. Wrapping: Rewrap to maintain protection and a neat appearance. Remove wrapping at end of first winter period after planting as approved. Repair damaged areas previously covered by wrapping.
 9. Securing guys and stakes: Replace or adjust to maintain stabilization. Before end of maintenance period, remove stakes and guys above grade.
- C. Removing and Replacing Plants: After early Spring and early Fall seasonal inspections and written notification by the Engineer of the plant material to be removed and replaced, proceed as follows:
1. Remove or cut off at ground line said plant materials that are dead or in an unhealthy, unsightly or badly impaired condition, within three weeks after notification.
 2. Replace the plant materials during the next specified planting season with healthy plants of the same kinds and sizes as originally specified. Make such replacements in the same manner as specified for the original planting. Notify the Engineer prior to performing the work.
 3. Attach color-coded tag indicating replacement, and mark with the date of replacement in weather-resistant ink, keyed to the Plant Schedule shown. Securely attach tag to each plant in a manner that will not restrict growth. Maintain tag on plants until removal is directed by the Engineer.
 4. Failure to notify Contractor of plant material to be removed or replaced does not relieve the Contractor from warranty obligations.
- D. The Contractor will not be held responsible or liable for damage by animals, by malicious or careless human agencies over which the Contractor has no control, by fire or storm, or by vehicular accidents by others that occur after the Substantial Completion Inspection.
- E. Clean-Up: Leave paved surfaces broom clean and stain free. Remove rubbish and debris caused by this work. Keep site clean during maintenance period.

3.09 FINAL ACCEPTANCE:

- A. Prior to final acceptance, perform final cleanup, including removal of stakes above grade, guys, signs and other items as directed by the Engineer, and for remulching plants and beds to a loose measurement as specified. Place no mulch against a trunk or stem.
- B. Cut off watering pipe projecting above the mulch level.
- C. Replace rejected plants as specified.

- D. Submit maintenance reports and schedules as specified.
- E. Request inspection for final acceptance at least 10 days before the end of the Concurrent Maintenance and Warranty Period.

PART 4 - MEASUREMENT AND PAYMENT

4.01 BASIS:

- A. Compensation for work specified in this section will be made in the following manner for work done satisfactorily based upon the lump sum price for the work of this section:
 1. Installation: 70-percent of lump sum price, pro-rated monthly during planting operations.
 2. Concurrent Maintenance and Warranty: 20-percent of lump sum price, pro-rated monthly or quarterly after planting operations.
 3. Final Acceptance: 10-percent of lump sum price, for satisfying Contract requirements pertaining to Final Acceptance.

TABLE 02930-1. MATERIALS SUBMITTAL CHART This chart indicates the minimum length of time required for the approval process before intended use and by which submittals must be made, as well as the minimum quantity for each sample. Useable samples will be returned.			
ITEM	TIME	QUANTITY	COMMENT
Fertilizer	14 days	50 pounds (25 kilograms)	Sample of each type to be used in unopened container.
Mulch	7 days	10 pounds (5 kilograms)	--
Crushed Stone	7 days	10 pounds (5 kilograms)	--
Sand	7 days	10 pounds (5 kilograms)	--
Plastic Pipe	7 days	3 feet (1 meter)	--
Mulch Blanket	7 days	1 square yard (1 square meter)	Include staples.

ITEM	TIME	QUANTITY	COMMENT
Pea Gravel	7 days	10 pounds (5 kilograms)	--
Plant Hormone	14 days	10 pounds (5 kilograms)	--
Antidessicant	7 days	1 pint (0.5 liter)	--
Tree Stakes and Guys	14 days	1 each	Sample of complete guying system to be used.
Wrapping Material	14 days	1 foot (30 centimeters)	Sample of complete wrapping system to be used.
Landscape Fabric and Weed Barrier	7 days	1 square yard (1 square meter)	--
Marker Stakes	7 days	1 each	--
Tree Grates and Guards	14 days	1 each	Sample of complete system to be used.
Perlite	14 days	10 pounds (5 kilograms)	--
Peat Moss	14 days	10 pounds (5 kilograms)	--

ITEM	TIME	QUANTITY	COMMENT
Limestone	14 days	50 pounds (25 kilograms)	Sample in unopened container.
Hedge Guard	14 days	6 feet (2 meters)	Sample of complete system to be used.
Topsoil	28 days	25 pounds (15 kilograms)	--
Screened Leaf Mold	14 days	50 pounds (25 kilograms)	Sample in unopened container
Herbicide	14 days		Supply MSDS and use directions
Other Material	--	--	As directed.

END OF SECTION

SECTION 02935

SALT DOME

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. The work, shall consist of furnishing all labor, materials, related equipment, tools and supervision necessary for the complete construction of the panelized Salt Dome at Shady Grove Yard only, at the approved location, as herein specified and detailed on the approved manufacturer's drawings.
- B. Related work specified elsewhere:
 - Section 02320 Grading excavation and backfilling
 - Section 02725 Base for pavements
 - Section 02740 Bituminous pavement
 - Section 02920 Seeding
 - Section 03100 Concrete form work
 - Section 03200 Concrete reinforcement

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications.
 - 1. Codes and regulations of the jurisdictional authorities.
 - 2. ACI
 - 3. ASTM: A307, C150-74, D-226-68.
 - 4. American Softwood Lumber: PS-1-83, PS-20-74.
 - 5. BOCA.
- B. Testing Laboratory:
 - 1. In accordance with Section 03300.
- C. Design Criteria:
 - 1. Size:
 - a. Capacity: 535 tons of de-icing salt based on the weight of 80 lbs. per cubic foot or 2160 tbs. per cubic yard. Storage of piled salt shall not exceed an angle or repose of 33 degrees.
 - b. Diameter: As shown on the approved drawings.
 - c. Retaining wall height: 4 feet.
 - d. Entrance opening:
 - 1) Minimum width: 15'-0"
 - 2) Minimum height: 16'-0"
 - 2. Snow load: 40 psf. Add coefficients to allow for slope of roof.
 - 3. Wind load: 90 mph. Add coefficients to allow for slope of roof.
 - 4. Roof slope: As shown as shown on the approved drawings.
 - 5. Layout:
 - a. Dome shaped, self-supporting with no internal supports inside to hamper loading and unloading of de-icing material.
 - b. One (1) doorway opening
 - c. One (1) fan dormer.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Samples:
 - 1. Submit proposed materials not less than ten days prior to date of expected first shipment.
- B. Manufacturer's Drawings:
- C. Shop Drawings:
 - 1. Include complete catalog information and shop drawings for material and equipment.
- D. Certification.

1.04 QUALIFICATIONS:

- A. Submit three (3) locations of identical work experience during the past two years. List contact person, firm, address and telephone number for each site.

1.05 WARRANTY:

- A. General: One (1) year
- B. Roof: Five (5) years.
- C. All warranties shall include material and labor.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. Wooden Structure:
 - 1. As manufactured by Dome Corporation of North America, Saginaw, Michigan, or approved equal.
 - 2. Framing and sheathing:
 - a. Plywood: 5 ply, 5 layer, douglas fir plywood, exterior grade structural #1, CCX, conforming with PS-1-83.
 - b. Lumber: The outside framing members of the panel shall be SPF species or better, grade #2 or better, kiln dried to a maximum moisture content of 19%. The internal studs shall be southern pine species or better, #2 or better, and be kiln dried to a maximum moisture content of 22%. Conform to American Softwood Lumber Standard PS-20-74.
 - c. Glue: Liquid Resorcinol-Phenolic Formaldehyde Resin, mixed and applied as per manufacturer's instructions, to attach plywood sheathing to framing.
 - 3. Hardware:
 - a. The hardware used to assemble the stress skin panels on site shall be 5/8" dia. hot dip galvanized bolts with 2-3/4" square washers, also hot dip galvanized.
 - b. 3 1/4" galvanized spiral nails to assemble framing.
 - c. 2" spiral nails or 1 3/4" galvanized staples to attach plywood sheathing to framing.
 - 4. Roofing:
 - a. Shingles:
 - 1) Standard, self-sealing, asphalt roofing shingles with either fiberglass or organic mat carrying a minimum manufacturer's warranty of 25 years.
 - 2) Color:
 - b. Roofing Underlayment: Non-perforated, 15 lb. per 100 sq. ft. asphalt saturated felt, 36 or 32 inches in width conforming to ASTM D-226-68 for all

areas with a slope of less than twelve (12) degrees. Not required on steeper portions of the roof.

- c. Ventilation Louver: Gravity shutter, corrosion resistant with a HERESITE VR-500 epoxy coating or an approved equal.

- B. Portland Cement Concrete:
 - 1. Section 3300, Class 4000, air-entrained, except as noted below.
 - 2. Reinforcing Steel: Deformed steel reinforcing bars conforming to ASTM A615, Grade 60, clean and free from loose rust, scale, or coatings that will reduce bond.
 - 3. Anchor Bolts: Unfinished grade ASTM A307 with yield strength $F_y = 36$ ksi. The anchor bolts shall be hot dip galvanized.
 - 4. Metal Accessories: Provide all spacers, chairs, ties and other devices necessary for the proper spacing, supporting and fastening of the reinforcing steel in place.
 - 5. Protective coating: Mixture of 50% mineral spirits and 50% linseed oil.

- C. Foundation Pad: In accordance with Sections 02725 and 02740.

PART 3 - EXECUTION:

3.01 FOUNDATION PAD:

- A. Grade site in accordance with Section 02320.

- B. Construct foundation pad in accordance with Sections 02725 and 02740. The finished pad for dome floor & wall should be completely level at the elevation shown $\pm 1"$.

3.02 STRUCTURE:

- A. Form retaining walls in accordance with Section 03100.

- B. Erect Building structure per manufacturer's recommendations.
 - 1. Assemble framing using 3 1/4" galvanized spiral nails, all joints shall be tight and present a smooth surface for gluing.
 - 2. Attach plywood sheathing to framing using glue and 2" spiral nails or 1 3/4" galvanized staples. Bevel plywood to suit the framework and eliminate sharp edges which may puncture roofing.
 - 3. Roofing:
 - a. Surface to be covered with asphalt shingling shall be smooth and free from defects, dry and clean from dirt, rubbish and other foreign materials before the roofing is started. All projecting nails shall be set flush to the roofing sheathing.
 - b. The roofing shall be installed in accordance with the manufacturer's instructions in the conventional manner after the complete building has been erected. At no time should roofing felt or shingles be stored or applied on the building until all internal bracing has been installed.
 - c. Flashings shall be installed where shown and shall be of .025 mill finish aluminum, non corrosive metal or non-metallic material.
 - d. The roofing felt shall be applied in such a manner that each panel joint is over-lapped to prevent leakage and installed with large head galvanized roofing nails. roofing felt is not required on areas that are steeper than 12 degrees.
 - e. The roofing shingles shall be applied with large head galvanized roofing nails, the number and location of the nails per the manufacturer's recommendations.
 - f. Roof vents and other openings in the roof shall be installed to prevent leakage.
 - 4. Install fan dormer.

- C. Three days after removing forms, apply two coats of protective coating to all exposed interior surfaces. Saturate surface of concrete.
- D. Paint all exposed steel at the structure entrance in accordance with Section 09920.

END OF SECTION

SECTION 03100

CONCRETE FORMWORK

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies formwork for concrete structures and other facilities.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Concrete reinforcement: Section 03200.
- B. Cast-in-place structural concrete: Section 03300.
- C. Structural precast concrete: Section 03400.
- D. Prestressed concrete: Section 03415.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ACI: 347, Publication # 4
 - 3. Western Woods Producers Association : Western Lumber Grading Rules.
 - 4. CE: CRD-C 572.
 - 5. AASHTO: M153.
 - 6. ASTM: D1056, D1149, D1692.
 - 7. APA: HDO Plywood Exterior Grade.
 - 8. U.S. Product Standard : PS 1
- B. Responsibilities:
 - 1. Design and construction of formwork is the responsibility of the Contractor, subject to review by the Engineer.
- C. Design Criteria:
 - 1. Design formwork for vertical loads and lateral pressures in accordance with ACI 347.
 - 2. Design formwork system which is adequately braced and has adequate strength and stability to ensure finished concrete within the specified tolerances.
 - 3. When necessary to maintain the specified tolerances, design camber into the formwork to compensate for anticipated deflection and creep due to the weight and pressure of the fresh concrete, prestressing forces and construction loads.

1.04 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Working Drawings:
 - a. Include details of form types, methods of form construction and erection, design computations and location of form joints and form ties, location and dimensions of blockouts and openings in structure, and embeds.
 - 2. Samples:
 - a. Each type of waterstop proposed for use, each one foot long: Two.

- b. Each type of premolded expansion-joint filler proposed for use, each six inches by 12 inches: Two.
 - c. Proposed dovetail anchor slot, each twelve inches long: Two.
 - d. Snap-off form ties: Two.
3. Certification:
- a. Manufacturer's certificates.
 - b. Certified test reports of specified concrete tests.
4. Documentation:
- a. Calculations: Early form removal calculations as specified certified by a professional engineer registered in the area where the work is to be performed. Submit in advance for obtaining approval prior to form removal.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. General:

- 1. Wood forms:
 - a. All framing lumber stress-graded.
 - b. Lumber in direct contact with concrete, dressed on at least the contact side, with dressed or tongue-and-groove edges; other lumber may be dressed or rough.
 - c. Where vertical board finish is shown or specified, use the following:
 - 1) Form board: Tongue-and-groove, Number 1 Common or better, Ponderosa or White pine, in accordance with the Western Lumber Grading Rules book published by WWPA (not the Southern Pine Inspection Bureau grading rules), one-inch nominal thickness, four-inch nominal width, groove S2S milled or beveled one side only and center matched with 45-degree beveled edges to produce sharp V-shaped 3/8-inch wide in concrete. Four-inch tongue-and-groove boards to be toenailed at edge or face-nailed to backer board.
 - 2) Smooth concrete: Tongue-and-groove, square cut unturned edges, Number 1 Common or better, Ponderosa or White pine, in accordance with the Western Lumber Grading Rules book published by WWPA (not the Southern Pine Inspection Bureau grading rules), one-inch nominal thickness, four inches nominal width, S2S and center-matched.
- 2. Plywood forms:
 - a. APA grade-marked:
 - 1) B-B Plyform Exterior grade Group I or II for unexposed finished concrete.
 - b. APA High-Density Overlay (HDO) plywood;
 - 1) B or better face veneer Exterior grade Group I for exposed to public view finished concrete..
 - c. USPS : PS 1
- 3. Tubular fiber forms:
 - a. Spirally constructed of laminated plies of fiber.
 - b. Wall thickness as recommended by the manufacturer to meet load requirements of various uses and sizes.
 - c. Outside surface wax-coated for moisture resistance.

- d. Inside surface of column forms coated with bond-breaker compound and fabricated so that finish concrete surfaces are smooth and free of spiral and seam marking.
- 4. Fibrous-glass reinforced plastic forms:
 - a. One-piece dome system forms, fabricated of plastic reinforced with fibrous glass.
 - b. Molded under heat and pressure using matched metal dies.
 - c. Special sizes and cross sections with thickness, reinforcement and surface finish as necessary to form concrete surfaces that are smooth and free of irregularities.
- 5. Steel forms:
 - a. One-piece dome system forms.
 - b. Special sizes and cross sections as shown, with metal gauges, reinforcement, stiffeners and surface finish as necessary to form concrete surfaces that are smooth and free of irregularities and concrete stain.
- 6. Hardboard:
 - a. For concrete not exposed to public view: tempered, smooth-one-side (S1S) panels not less than 3/16-inch thick, in accordance with AHA IS 1.
- 7. Form ties:
 - a. Factory-fabricated, snap-off metal type, of adequate design to minimize form deflection and preclude concrete spalling upon removal.
 - b. Fabricated so that set-back in concrete is such that portion of tie remaining after snap-off and removal of exterior portions is at least 1-1/2 inches below concrete surface.
- 8. Form release agent: Chemically reactive liquid product that will not bond with, stain, or impair concrete surfaces. Follow form panel manufacturers approved product and recommendations for application. Agents containing castor oil are prohibited
- 9. Preformed expansion joint filler: AASHTO M153.
 - a. Type I: Sponge rubber.
 - b. Type II: Cork. Type III: Self-expanding cork.
- 10. Waterstops: PVC, CE CRD-C 572.
- 11. Dovetail-anchor slots: 22-gauge electrogalvanized steel, with removable felt filler.
- 12. Chamfer strips: Except where other sizes are shown, 3/4-inch by 3/4-inch triangular fillets milled from clear, straight-grain pine, surfaced-each-side, or extruded-vinyl tape.
- 13. Miscellaneous preformed strips for reveals, rustications and similar joints: Fabricated of wood, metal, plastic or other approved material formed to cross sections shown.
- 14. Hydraulic-cylinder well casing: Assembly of pipe, coupling and bottom end cap, of thermosetting-polymer vinylester resin reinforced with fibrous glass, with integral waterstop and anchor flange at invert slab as shown and concrete contact area surfaced with alkaline-resistant barrier, with the following additional requirements:
 - a. Properties.
 - 1) Minimum density at 73F: 0.060 pound per cubic inch.
 - 2) Minimum tensile strength at 73F: 12,000 psi.
 - 3) Minimum compressive strength: 18,000 psi.
 - 4) Minimum flexural strength: 20,000 psi.
 - 5) Minimum flexural modulus of elasticity at 73F: 1,500,000 psi.
 - 6) Maximum fire-spread rate: 25.
 - 7) Maximum heat-distortion temperature at 264 psi: 215F.
 - 8) Maximum water absorption in 24 hours at 73F: 0.02 percent.
 - b. Wall thickness: As shown but not less than 3/8 inch.
 - c. Inside diameter: 20 inches.

- d. Pipe furnished with fewest number of joints, watertight, developing full strength of section, made true and straight, with not more than ½-inch deviation from vertical for entire length of pipe.
- 15. Conduit: Schedule 40, black steel pipe, butt-welded as specified in Section 15205.
- 16. Premolded Elastic Filler for elevator hoistways:
 - a. Closed-cell neoprene:
 - 1) ASTM D1056, Grade SCE-45.
 - 2) Water absorption: No increase in weight in excess of two percent when tested in accordance with ASTM D1056 and completely immersed in water for 70 hours at room temperature.
 - 3) Flame resistance: Self-extinguishing when tested in accordance with ASTM D1692.
 - 4) Resistance to ozone cracking: No cracking when tested in accordance with ASTM D1149, after exposure to 100-pphm ozone in air for 100 hours at 100F with specimens under 20-percent strain.
- 17. Bonding adhesive: As recommended by manufacturer of premolded elastic filler.

PART 3 - EXECUTION

3.01 CONSTRUCTION AND WORKMANSHIP:

- A. Concrete finishes and usage locations of various types of forms and form lining: As shown or specified.
- B. Unless otherwise shown for concrete surfaces exposed to public view, use HDO Plywood in largest practicable continuous panels to produce plane, smooth surface free from grain imprint, patchmarks, and discoloration.
- C. Construct adequately braced formwork so that resulting concrete surfaces conform to specified tolerances.
- D. Brace forms, falsework and centering adequately to retain forms in position as shown on approved working drawings.
- E. Provide mortar-tight forms of wood, plywood, fibrous-glass-reinforced plastic, steel or other approved materials which conform to shapes, lines and dimensions shown and produce smooth surface without fins and projections.
- F. Where shown or directed because of lagging or form irregularity, and where concrete surfaces will not be exposed to public view, line inner form surfaces with hardboard as follows:
 - 1. Use widest available width of hardboard.
 - 2. Line areas less than four feet wide with single-width piece of hardboard.
 - 3. Offset lining joints from those in backing.
 - 4. Fasten securely to backing with galvanized or aluminum nails driven flush.
- G. Forms shall be clean of any rust, molds, concrete scale..etc.

3.02 FIELD QUALITY CONTROL:

- A. Allowable Tolerances:
 - 1. Construct elements to meet allowable tolerances of dimensions, elevations and positions shown and specified in Section 03300.

2. Prior to installation, test hydraulic cylinder well casing assembly hydrostatically at 60 psi pressure for two hours in the presence of the Engineer.

3.03 COATING FORMS:

- A. Lightly coat form panels with chemically reactive release agent prior to initial concrete placement and before each subsequent placement.
- B. Do not allow excess coating material to stand in puddles in forms nor to come into contact with concrete against which fresh concrete is to be placed.
- C. Coat with release agent bolts and rods that are to be completely removed or to be free to move

3.04 EMBEDDED ITEMS:

- A. Ensure that items to be embedded in concrete are free from oil and foreign matter that would weaken bond of concrete to such items.
- B. Install in formwork inserts, anchors, sleeves and other items specified elsewhere. Close ends of conduits, piping and sleeves embedded in concrete with caps or plugs.
- C. Install continuous dovetail-anchor slots where shown.
- D. Complete tests on piping and other items before starting concrete placement.
- E. Before depositing concrete, check location and support of piping, electrical conduits and other items which are to be wholly or partially embedded.

3.05 OPENINGS AND RECESSES IN CONCRETE:

- A. Provide openings and recesses; place sleeves furnished by other trades.

3.06 JOINTS:

- A. Unless otherwise directed, make contraction, expansion and construction joints only where shown. Where concrete will be exposed to public view, use largest practicable size sheets to minimize joints.
- B. Form keyways as shown.
- C. Continue reinforcing steel and wire fabric across joints unless they are shown as being free to move.
- D. Make maximum distance between transverse contraction joints 50 feet or as shown, as measured along centerline of track on tangent alignment.
- E. Install premolded joint filler at locations shown. Extend filler from bottom of concrete up flush to finish concrete surface or hold down below finish surface as shown.
- F. Make splices in premolded filler in manner to preclude penetration of concrete between joint faces.

- G. Where premolded joint filler is held below finish concrete face, install in the form a water-soaked wood strip of dimensions shown, to form, after removal, proper size slot to receive sealant compound specified in Section 07900.

3.07 WATERSTOPS:

- A. Install waterstops in construction joints below grade and where shown. Use six-inch minimum width, except use nine-inch minimum width in tunnel structures, or as shown.
- B. Support and protect that portion of waterstop which extends beyond bulkhead, during placing of concrete and subsequent removal of forms.
- C. Position waterstops so as to clear reinforcement. Ensure that the waterstop does not get misaligned or misplaced during concreting.
- D. Make field splices by heat-sealing square cut ends of waterstop using hot metal plate or thermostatically controlled electric-heating iron designed for such purpose. Join ends when material becomes molten, maintaining continuity of ribs and bulbs; allow to cool before stressing.
- E. Make field splices to develop watertightness equal to that of unspliced material and tensile strength of not less than 50 percent of unspliced material. Have 90-degree splices and as many other splices as possible made in the factory.

3.08 REMOVAL OF FORMS, FALSEWORK AND CENTERING:

- A. Maintain forms, falsework and centering in place until the concrete has attained minimum percentage of specified design strength in accordance with Schedule 1:

THIS SPACE INTENTIONALLY LEFT BLANK

Structural Member	Minimum Percentage of Specified Design Strength	
	Schedule 1	Schedule 2
Footings; inverts; sides of beams; slabs and girders; slabs and beams on grade	25	20
Free-standing walls, columns and piers	40	30
Stairways	80	60
Soffits, beams, slabs and girders; clear span between supports,		
under 20 feet	80	60
over 20 feet	90	70
Cantilevers	90	70

- B. Early removal of forms, falsework and centering will not be allowed for concrete strength values below Schedule 2, but will be allowed for concrete strength values between Schedule 1 and Schedule 2 only after:
1. The Engineer has approved calculations showing anticipated concrete strengths at time of proposed early removal based on:
 - a. Ratio of dead load over live load.
 - b. Span, height and shape.
 - c. Ratio of rise over span.
 - d. Reshoring.
 - e. Loads, resultant stresses and deformations to which concrete and reinforcing steel will be subjected at time of removal, subsequent to removal and until concrete has attained design strength.
 - f. Prevailing site conditions.
 2. Concrete strength attained prior to form removal has been determined by analysis of quality-assurance data in accordance with Section 03300.
- C. Do not remove wood board forms within 48 hours of pouring concrete.
- D. Do not alter loading conditions on concrete subsequent to removal of forms if it results in exceeding permissible stresses and deformations at attained concrete strengths.
- E. The Engineer may permit early removal of concrete support without submittal of calculations prior to attainment of specified design strength if he considers such submittals to be unnecessary.

3.09 INSTALLATION OF HYDRAULIC-CYLINDER WELL CASINGS:

- A. Cement bottom end cap to casing pipe with solvent cement prior to installation. Solvent cement, procedures, environmental requirements and instructions for proper cementing as recommended by pipe manufacturer.
- B. Accurately position, plumb and set as shown. Separate casing, including anchor flange, two inches minimum from reinforcing steel and other metallic material.
- C. Except as otherwise specified, perform excavation and backfill as specified in Section 02320. Do not jack or drive casing. Backfill excess excavation around exterior of casing with sand.
- D. Recheck casing for orientation and secure immediately prior to pouring of concrete slabs in which it is to be set.
- E. Deviation of alignment of centerline of casing not more than 1/2 inch from true vertical, end-to-end.

END OF SECTION

SECTION 03200

CONCRETE REINFORCEMENT

PART 1 - GENERAL

1.01 SUMMARY:

- A. This section specifies reinforcement for concrete structures and other facilities.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Concrete formwork: Section 03100.
- B. Cast-in-place structural concrete: Section 03300.
- C. Structural precast concrete: Section 03400.
- D. Prestressed concrete: Section 03415.
- E. Asphalt or bitumen fill in concrete notches at copper bonding: Section 07125.
- F. Additional copper bonding work adjacent to traction power substations: Section 16060.

1.03 DEFINITIONS:

- A. Cover: Thickness of concrete between outside surface of reinforcement and outside face of concrete

1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ACI: SP-66, 318.
 - 3. CRSI: Manual of Standard Practice; Placing Reinforcing Bars.
 - 4. AASHTO: Standard Specifications for Highway Bridges.
 - 5. ASTM: A82, A185, A615, A775, A706.
- B. Allowable Tolerances:
 - 1. Cut and bend reinforcing steel to conform to dimensions shown within the following tolerances:
 - a. Sheared length: Plus-or-minus one inch.
 - b. Depth of truss bars: Plus zero or minus 1/2 inch.
 - c. Stirrups, ties and spirals: Plus-or-minus 1/2 inch.
 - d. All other bends: Plus-or-minus one inch.

1.05 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Shop Drawings:
 - a. Detail reinforcing in accordance with ACI SP-66.
 - b. Bar lists showing the individual weight of each bar, total weight of each bar size and total weight of bars on list. Base calculated weights on theoretical unit weights shown in ASTM A615, Table 1.
 - c. Details showing bonding of reinforcement for stray current and cathodic protection.

2. Certification:
 - a. Manufacturer's certificates.
 - b. Mill tests on each heat showing chemical and physical analyses performed in accordance with ASTM A615, as modified by ACI 318.
 - c. Record of mill tests traceable to individual reinforcement bars supplied to the project.

1.06 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Ship reinforcing steel in bundles limited to one size and length.
- B. Tag each bundle at mill with waterproof tag showing name of mill, heat number, grade and size of bars and identifying number.
- C. Protect reinforcing steel and wire fabric from damage; foreign matter such as dirt, oil and grease; and rust-causing conditions.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Reinforcing Steel Bars:
 1. ASTM A615, Grade 60, modified in accordance with ACI 318.
 2. ASTM A706, for all welding reinforcing bars, except for electrical bonding.
 3. Epoxy Coating: ASTM A775, as shown.
- B. Spiral Reinforcement: ASTM A82 or ASTM A615, Grade 60.
- C. Welded Steel-Wire Fabric: ASTM A185.
- D. Metal Accessories: As recommended by CRSI Manual of Standard Practice. Where concrete surfaces will be exposed to public view in finish structure, use supports with plastic-protected legs or stainless steel legs.

PART 3 - EXECUTION

3.01 CUTTING AND BENDING:

- A. Perform cutting and bending in the shop. Bend steel cold. Do not bend or straighten bars so as to damage material.
- B. Do not bend bars in the field except to correct minor errors and damage occurring during shipping and handling.

3.02 BAR SUPPORTS AND SPACERS:

- A. Support bars by means of bolsters or chairs with no less than minimum required by ACI SP-66.
- B. Reinforcing steel in bottom of slabs resting on earth may be supported by concrete brick or mortar blocks.
- C. In walls, columns, piers and abutments hold reinforcing steel in position by means of mortar blocks, bar supports or spacers wired to reinforcing steel.

- D. Do not use stones, clay bricks, wood blocks or pieces of broken concrete to support reinforcing steel.
- E. Do not place bars or fabricated mats on layers of fresh concrete as work progresses.

3.03 PLACING AND FASTENING:

- A. Arrange and place reinforcing steel as shown.
- B. Secure reinforcement positively against displacement during placing of concrete.
- C. Wire or clip bars together as recommended in CRSI Placing Reinforcing Bars.
- D. Maintain reinforcing steel accurately in locations shown in tops of inverts to permit arrangements of anchor bolts for rail-tie plates.
- E. Before placement, ensure that reinforcement is free from dirt, mill scale, rust scale, oil, grease and other foreign matter.

3.04 SPLICING:

- A. Furnish reinforcing bars in full lengths as shown on the Contract Drawings and approved shop drawings.
- B. Do not splice bars unless approved in writing.
- C. Make splices when authorized, in accordance with ACI 318, except make all butt splices by welding with a capacity of not less than 125 percent of minimum yield strength of bar. Mechanical connections for tensile splice shall be by Cadweld only. However, mechanical connection for precast prestressed structures and parking garages, when the splice is located inside the precast member, may be made by NMB Splices instead of the Cadweld, with prior approval of the Authority.

3.05 ELECTRICAL BONDING:

- A. Weld steel straps to transverse end reinforcing bars and longitudinal reinforcing bars adjacent to joints between pour sections at locations shown.
- B. No electrical bonding is required for epoxy coated rebars.
- C. Thermit weld or Cadweld stranded, bare-copper conductors to adjacent steel strips at specified end locations. Likewise, weld copper conductors to lapped, welded-wire fabric at joints in slabs at locations shown.
- D. Additional copper bonding work adjacent to traction power substations: Section 16060.
- E. Asphalt or bitumen fill in concrete notches at copper bonding: Section 07125.

3.06 STUDS:

- A. Install welded studs in track invert slabs on top of transverse bars 10 feet on center and on first transverse bar at each end of units. Expose tops of studs and set flush with top surface of slab.

3.07 INSPECTION:

- A. Placement of concrete prior to approval of reinforcement and electrical bonding work is prohibited.

3.08 CONCRETE PROTECTION FOR REINFORCEMENT (COVER):

- A. Underground Box Section Structures:
 - 1. Invert slab:
 - a. Top steel: Two inches.
 - b. Bottom steel: Three inches.
 - 2. Roof slab:
 - a. Top steel: Two inches.
 - b. Bottom steel: 1-1/2 inches.
 - 3. Exterior walls:
 - a. Outer-face steel: Three inches.
 - b. Inner-face steel: 1-1/2 inches.
 - 4. Center walls: 1-1/2 inches.
 - 5. Beams, girders and columns: 1-1/2 inches.
 - 6. Intermediate floors, platform slabs and stairs: 3/4 inches.
- B. Retaining Walls:
 - 1. Footing:
 - a. Top steel: Two inches.
 - b. Bottom steel: Three inches.
 - 2. Wall:
 - a. Outer-face steel: Three inches.
 - b. Inner-face steel: Two inches.
- C. Other Underground Structures:
 - 1. Outer-face steel: Three inches.
 - 2. Inner-face steel: Two inches.
 - 3. Drainage slot: Two inches.
 - 4. Safety walk: 1-1/2 inches.
 - 5. Beams, girders and columns: 1-1/2 inches.
 - 6. Intermediate floors, platform and slabs and stairs: 3/4 inch.
- D. Above-Ground Structures:
 - 1. Prestressed concrete bearing highway or transit loads: In accordance with AASHTO Standard Specifications for Highway Bridges.
 - 2. Ancillary structures including precast prestressed structures: : ACI 318.

3.09 EPOXY COATING:

- A. Preparation of surface: Perform the following in order given:
 - 1. Clean surface contaminated with oil and grease using naphtha or xylol.
 - 2. Remove weld slag, rust and mill scale from surfaces by wire brushing.
 - 3. Coat surfaces immediately with methyl-methacrylate primer.
 - 4. Apply coating only to surfaces which are dry and free of contaminants.

END OF SECTION

SECTION 03300

CAST-IN-PLACE STRUCTURAL CONCRETE

PART 1 - GENERAL

1.01 SUMMARY:

- A. This section specifies providing portland-cement cast-in-place concrete.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Concrete pavement: Section 02750.
- B. Curbs, gutters and walks: Section 02772.
- C. Chemical grout: Section 2415.
- D. Concrete formwork: Section 03100.
- E. Concrete reinforcement: Section 03200.
- F. Structural precast concrete: Section 03400.
- G. Prestressed concrete: Section 03415.
- H. Asphalt or bitumen fill: Section 07125.
- I. Copper bonding work: Section 16060.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ACI: 201.2R, 211.1, 304, 309, 318, 318.1.
 - 3. AASHTO: M182, T26.
 - 4. NBS: Handbook 44.
 - 5. USBR: Concrete Manual.
 - 6. FS: A-A-341A, HH-I-521, K-P-146.
 - 7. ASTM: A43, A47, A48, C31, C33, C39, C40, C42, C87, C88, C94, C131, C150, C171, C172, C260, C295, C309, C311, C330, C494, C535, C586, C595, C618, C665, C685, C881, C989, C1107, C1260, D98, E328.
 - 8. CPMB (Concrete Plant Manufacturer's Bureau): Concrete Plant Standards.
- B. Testing Laboratory:
 - 1. Furnish the services of an independent testing laboratory. Employment of an independent laboratory does not relieve the Contractor of the obligation to perform the work in accordance with requirements of the Specifications and Drawings. Submit certified results of the tests performed.
 - 2. Furnish proof that the laboratory satisfies the requirements of the American Council of Independent Laboratories' Recommended Requirements for Independent Laboratory Qualification. Laboratory need not be a member of the American Council of Independent Laboratories.
 - 3. Certify that testing equipment has been calibrated by an accredited calibration agency at not more than 12-month intervals using devices of accuracy traceable to the National Institute of Standards and Technology (NIST) or accepted values of material physical constants

C. Properties of Concrete:

1. General:

- a. Design mixes to produce concrete of proper workability, durability, strength, maximum density, minimum shrinkage and permeability.
- b. Design mixes to have minimum water content per cubic yard of concrete, cement content corresponding to appropriate water-cement ratio, largest permissible maximum size specified of coarse aggregate available and optimum percentage of fine aggregate.
- c. Use maximum size of coarse aggregate in accordance with ACI 211.1.
- d. Use same brand from same source throughout the work.
- e. Use aggregates from same source throughout the work.
- f. Use ground-iron blast-furnace slag and fly ash from the same sources respectively throughout the work.

2. Durability:

- a. Maximum water cementitious materials ratio as per ACI 318, Chapter 4 and ACI 201.2R.
- b. Use a suitable combination of approved air-entraining admixture and water reducer to reduce water content and permeability of the concrete, provided such admixtures do not adversely affect other specified properties of concrete.

3. Workability:

- a. Use approved chemical admixtures as needed for workability so that concrete can be placed, consolidated, and finished without segregation or excessive bleeding.

4. Strength:

- a. Design mix for each class and type of concrete of each specified strength based on overdesign factor in accordance with ASTM C94. Unless otherwise shown, working-stress method applies to structures.
- b. Design each class of concrete in accordance with the following:
 - 1) Not more than the following percentages of strength tests to have values less than specified strength:
 - 2) Working-stress method: 20 percent.
 - 3) Ultimate-strength method: 10 percent.
 - 4) Prestressed structures: 10 percent.
 - 5) Average of the following numbers of consecutive strength tests to be equal to or greater than specified strength:
 - (a) Working-stress method: Six.
 - (b) Ultimate-strength method: Three.
 - (c) Prestressed structures: Three.
- c. When number of tests totals six or less, average to be in accordance with Note 21 of ASTM C94.

5. Appearance:

- a. Cured concrete exposed to public view shall be uniform in color, texture and finish with no discernible form or patch marks, grain imprint, joint irregularities or discoloration. Use only manufacturer approved chemically reactive release agents on HDO plywood forms.
- b. Final selection and approval for color shall be made by the Engineer.

D. Method of Proportioning:

1. Proportion mixes as described in ACI 211.1.

2. Approximate mixing-water and air-content requirements for mixes of different slumps and nominal maximum sizes of aggregates as specified in ACI 211.1, Table 5.3.3.
3. Do not vary proportions of ingredients of approved mixes without written approval.

E. Ready-Mixed Concrete: ASTM C94.

1.04 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Product Data: Manufacturer's literature completely describing each material, standard, test data, installation instructions and special instructions or safety precautions applicable to the materials.
- B. Samples:
 1. Concrete surface sealer: Two, each one pint.
 - a. Membrane-forming curing compound: Two of each type, each one pint.
 2. Sandblast finish:
 - a. Number 6 sandblast finish as specified, each 12 inches square by two inches: Two.
 - b. Seal 1/2 of face of each sample with concrete surface sealer.
 - c. If samples are not approved or if concrete mix is changed, submit additional samples until approved.
 - d. When samples have been approved, submit details of procedures followed to produce approved surface finish including, but not limited to, the following:
 - 1) Size and type of nozzle.
 - 2) Air pressure.
 - 3) Distance of nozzle from surface blasted.
 - 4) Duration of blast.
 3. Concrete panels of each type of concrete used in the work: Two each, 18 inches square by two inches thick.
- C. Certification:
 1. Ingredients:
 - a. Submit with mix design, laboratory test reports and mill or manufacturer's certificates verifying that ingredients conform to specified requirements. Use ingredients in design mix which are representative samples of materials to be used in the work.
 - 1) Submit test results whenever the aggregates, cement or other additives to be used in the concrete come from a different lot, source, other area of the quarry, different quarry or from other than the representative stockpile or batch from which the original material was tested and approved.
 - b. In case the source, brand or characteristic properties of ingredients need to be varied during the term of the Contract, submit revised laboratory-mix report in accordance with procedures specified for original mix design.
 2. Batch tickets:

- a. Before unloading at the site, submit certification or delivery ticket from concrete supplier with each batch delivered to the site bearing the following information:
 - 1) Name of supplier.
 - 2) Name of batching plant and location.
 - 3) Serial number of ticket.
 - 4) Date.
 - 5) Truck number.
 - 6) Specific job designation: Contract number and location.
 - 7) Volume of concrete in cubic yards.
 - 8) Class and type of concrete.
 - 9) Time loaded.
 - 10) Type and brand of cement.
 - 11) Weight of cement and fly ash or ground-iron blast-furnace slag.
 - 12) Maximum size of aggregates.
 - 13) Weights of coarse and fine aggregates.
 - 14) Maximum amount of water to be added and amount of water added at the site.
 - 15) Kind and amount of admixtures.
- D. Documentation:
- 1. Proposed methods for controlling concrete temperature and plans for placing concrete taking into account sun, heat, wind, ambient air temperature or other limitations of facilities that will prevent proper finishing or curing.
 - 2. Quality control plan for floor treatment. Submit as specified prior to installation.
 - 3. Quality control reports. Submit as specified after installation.
 - 4. Design mixes:
 - a. Prior to placing concrete, submit design mixes for each class and type of concrete, certifying that proposed concrete ingredients and proportions will result in concrete mix meeting specified requirements.
 - b. Include for each class and type of concrete as many mix designs as there are combinations of different ingredients or types of ingredients anticipated to cover requirements of the work.
 - c. Establish mix designs through an approved design laboratory.
 - d. Design concrete mix for protection against alkali-aggregate reactivity.
 - e. The Contractor may present for approval a concrete mix previously approved for Authority work provided such mix is made with proposed ingredients that meet requirements and provided that concrete has complied with compressive-strength requirements based on control record of at least 30 consecutive-strength tests recently obtained.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Aggregates :
 - 1. Transport and stock pile aggregate separately according to sources and gradations. Handle so as to prevent segregation, loss of fines and contamination by earth or other foreign materials.
 - 2. If aggregates show segregation or if different grades become mixed, rescreen before placing in proportioning bins.
 - 3. Do not combine aggregate from different sources or of different gradations except to obtain different gradations.

4. Do not transfer aggregates directly from trucks, railroads cars or barges to proportioning bins when moisture content is such that it will affect accurate proportioning of concrete mixture. In such cases, stockpile aggregate until excess moisture drains off.
- B. Packaged Cement:
1. Deliver to project site in original sealed packages labeled with weight, name of manufacturer, brand and type.
 2. Store packages in watertight building.
 3. Do not use cement which has been reclaimed by cleaning bags.
 4. Do not use cement which has been exposed to moisture or contaminated.
 5. Deliver packages conforming to weight specified.
 6. Packaged cement will be subject to testing.
- C. Bulk Cement:
1. Store bulk cement separately from other cement and protect to prevent exposure to moisture and contamination.
 2. In ready-mix plant, provide facilities to maintain separation of cement meeting specified requirements from other cement.
 3. Provide in cement manufacturer's plant, facilities for sampling cement at weighing hopper or in feed line immediately before entering hopper.
- D. Ready-Mixed Concrete: ASTM C94.
- E. Blast-Furnace Slag or Fly Ash for use with Portland Cement:
1. Transport in covered carriers.
 2. Store in watertight bins or silos to provide protection from dampness and contamination. When compartmented bins are used, conduct periodic, but not less than weekly checks between adjacent bins to avoid contamination of either of the stored materials.
- F. Concrete Additives, Sealers and Corrosion Inhibitor . As required by the manufacturer.

1.05 WARRANTY

- A. Penetrating Concrete Sealer: Provide a minimum effective service life warranty of 10 years for the penetrating concrete sealer.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Cementitious Materials:
1. Portland Cement: ASTM C150, Types I and II. Use Type II only for underground structures.
 - a. Alkali content not to exceed 0.6 percent.
 2. Blended Hydraulic Cement: ASTM C595 Type IS and IP.
- B. Ground-Iron Blast Furnace Slag: ASTM C989, Grade 100 or 120.
- C. Fly Ash: ASTM C311 and ASTM C618, Class F:

1. Loss on ignition not to exceed 4 percent.
2. Maximum available alkalis (for combination of cement and fly ash) not to exceed 0.6 percent based on proportions to be used and alkalinity measurements for cement and fly ash individually or in combination.
 - a. Fly ash used to be qualified for each source.
3. Uniform color when used in concrete exposed to public view.

D. Aggregates:

1. Aggregates for normal concrete and shotcrete: ASTM C33 with the following additional requirements:
 - a. Coarse aggregate: Gravel, crushed gravel or crushed stone.
 - 1) Deleterious substances:
 - a) Maximum allowable amounts:

<u>Substance</u>	<u>Maximum Allowable Percentage by Weight</u>
(1) Soft particles:	5.0
(2) Coal and lignite particles:	0.5
(3) Friable particles:	0.25
(4) Material passing Size 200 sieve:	1.0
(5) Thin or elongated pieces:	15.0
(6) Other local deleterious substances:	1.0
 - b) Soft particles: Higher percentage may be approved where concrete is not subject to abrasion, provided concrete strength is achieved without the use of excess cement.
 - c) Crushed aggregates: If material finer than Number 200 sieve consists of dust of fracture essentially free from clay or shale, percentage may be increased to 1.5.
 - d) Thin or elongated pieces: Length of pieces to be greater than five times the smallest dimensions of a circumscribing rectangular prism.
 - 2) Percentage of wear: 45 maximum when tested in accordance with ASTM C131 and ASTM C535.
 - 3) Weighted percentage of loss: 15-percent maximum by weight when subjected to five cycles of magnesium sulphate soundness test in accordance with ASTM C88.
 - 4) Gradation: In accordance with ASTM C33, Table 2, and represented by a smooth gradation curve within required limits.
 - b. Fine aggregate:
 - 1) Washed natural sand or washed stone sand. Stone sand may be subject to special gradation requirements as directed.
 - 2) Gradation in accordance with ASTM C33.
 - a) Minimum percentages of material passing Size 50 and Size 100 sieves may be reduced to five and zero, respectively, if aggregate is to be used in concrete with

three percent minimum air entrainment, or in concrete containing more than 517 pounds of cement per cubic yard.

3) Weighted percentage of loss not more than 12 percent by weight when subjected to five cycles of magnesium sulphate soundness test in accordance with ASTM C88.

4) Deleterious Substances:

<u>Substance</u>	<u>Maximum Allowable Percentage by Weight</u>
a) Friable particles:	1.0
b) Coal and lignite:	0.5
c) Material passing the Size 200 sieve:	5.0
d) Other deleterious substances, such as shale, alkali, mica, coated grains, soft and flaky particles:	2.0

5) Free from injurious amounts of inorganic impurities as determined by ASTM C40. Should materials fail to pass test for organic impurities in sand for concrete, retest in accordance with ASTM C87. If fine aggregate shows by colorimetric test a darker color than that of sample originally approved for the work, stop using such aggregate until approved tests have been made to determine whether change in color is indicative of injurious amount of deleterious substances.

c. Evaluate for potential alkali aggregate reactivity:

1) Perform a petrographic examination in accordance with ASTM C295. The petrographic analysis will identify the constituents of the fine and coarse aggregate and will also identify aggregate found to be potentially alkali-carbonate reactive. Fine and coarse aggregate containing more than the following quantities of constituents is unacceptable:

- a) Optically strained, microfractured or microcrystalline quartz exceeding five percent (a common constituent or granite and granite gneiss).
- b) Chert, Metaquartzite, Chalcedony or combination thereof exceeding three percent. However, fine aggregate may contain up to eight percent provided that mortar bar test results are acceptable.
- c) Tridymite or cristobalite exceeding one percent.
- d) Opal exceeding five percent.
- e) Natural volcanic glass in volcanic rocks exceeding three percent.

2) Test aggregate for alkali-silica reactivity in accordance with ASTM C1260. Aggregate sources that exhibit a C1260 mean mortar bar expansion at 16 days greater than 0.08 percent are unacceptable.

3) Aggregate identified by the petrographic analysis to be potentially alkali-carbonate reactive is to be further evaluated in accordance

with ASTM C586. Expansion of test specimen cylinders not to exceed 0.10 percent after 28 day immersion in NaOH solution.

- d. Aggregate which fails the evaluation criteria for potential alkali aggregate reactivity may be reclassified as acceptable if prior field performance demonstrates that the aggregate is nonreactive. Include service records (material records, batch quantities, exposure conditions, and petrographic evaluation) demonstrating the aggregate to be nonreactive in the mix design submittal.
2. Aggregates for Lightweight Structural Concrete: ASTM C330, with the following additional requirements:
 - a. Coarse aggregate:
 - 1) Composition: Expanded shale, clay or slate, predominantly lightweight, cellular and granular.
 - 2) Percentage loss: 10-percent maximum by weight when subjected to five cycles of the magnesium sulphate soundness test in accordance with ASTM C88.
 - 3) Gradation: In accordance with ASTM C330, Table 1.
 - 4) Unit weight: In accordance with ASTM C330, Table 2.
 - b. Fine aggregate:
 - 1) Composition: Particles of expanded shale, clay, slate or ASTM C33 natural sand as necessary to obtain specified compressive strength and comply with specified air-dry unit weight for lightweight structural concrete.
 - 2) Gradation: In accordance with ASTM C330, Table 1.
 - 3) Unit weight: In accordance with ASTM C330, Table 2.
 - 4) Percentage loss: 10 percent maximum by weight when subjected to five cycles of magnesium sulfate soundness test in accordance with ASTM C88.
- E. Water:
1. Natural potable water with no pronounced taste or odor.
 2. Containing no impurities, suspended particles, algae or dissolved natural salts in quantities that will cause:
 - a. Corrosion of reinforcing steel.
 - b. Volume change that will increase shrinkage cracking.
 - c. Efflorescence.
 - d. Excessive air entraining.
 3. pH: Not less than five.
 4. When tested in accordance with AASHTO T26, standard mortar-briquette tests to show no indication of unsoundness, no change in setting time in excess of plus-or-minus 30 minutes and no reduction in strength in excess of 10 percent.
- F. Ready-Mixed Concrete: ASTM C94, Option C.
- G. Admixtures:
1. In accordance with the following:
 - a. Air-entraining admixtures: ASTM C260.
 - b. Chemical admixtures: ASTM C494.
 2. Approved brands: Chlorides may be present in admixtures provided total chloride in mixing water of proposed concrete mixture, including chloride ions contributed by admixture or admixtures, aggregate and mixing water is not in excess of 150 ppm.

3. Meeting requirements of reference standards or documented to have five-year minimum history of demonstrably satisfactory performance for similar structures under equivalent conditions.

H. Aluminum Powder: FS A-A-341A, free of oil, grease, soluble alkalis and organic materials, gradation as approved.

I. Ferrous Aggregate:

1. Cast-iron particles, ASTM A43, ASTM A47, or ASTM A48, free of oil, grease, soluble alkalis and organic materials.
2. Aggregate graded as follows:

<u>Sieve Designation</u> <u>US Standard Square Mesh</u>	<u>Percentage by Weight</u> <u>Passing Individual Sieves</u>
3/8 inch	—
Size 4	100
Size 8	90 - 100
Size 16	75 - 90
Size 30	45 - 60
Size 50	15 - 25
Size 100	10 - 20

3. If recommended by manufacturer and approved, in lieu of the above gradation use lower percentage of aggregate passing Size 100 sieve.

J. Abrasive Aggregate: 60 to 75 percent silicon-carbide abrasive, bonded by vitreous ceramic material, black, graded from 12 to 30.

K. Floor Treatment:

1. Sealer: Zinc or magnesium fluosilicate and wetting agent formulated and mixed with water in concentration recommended by manufacturer.
2. Floor hardener system:
 - a. Floor hardener:
 - 1) Free from non-ferrous metallic particles, filler material, silica sand, natural aggregates, rust and materials which disguise rust.
 - 2) Ready-to-use formulation proportioned, mixed and packaged at factory ready for application.
 - 3) Ingredients proportioned to maintain two parts well-graded iron aggregate to one part consisting of cement, plasticizing agents and other ingredients designed to absorb moisture from floor slab.
 - 4) Color: Per sample, or as selected by the Engineer.
 - 5) Masterplate 200, Master Builders, or equal.
 - b. Floor curing compound:
 - 1) Clear modified-acrylic resin.
 - 2) Moisture retention: In accordance with ASTM C309 when applied at a rate of 400 square feet per gallon.
 - 3) Masterkure, Master Builders, or equal.

L. Penetrating Concrete Sealer:

1. Penetrating silane sealer, which is readily absorbed into concrete substrate and which reacts chemically to provide a hydrophobic barrier that will not wear off when

exposed to sunlight or wheel traffic; which allows concrete to breathe, allowing the escape of water vapor but preventing the absorption of surface water; colorless; not altering the surface texture of the concrete substrate. See Warranty requirements.

2. Provide one of the following:
 - a. Chem-Trete BSM 40, Hüls America, Inc. (1-800-828-0919).
 - b. Penetrating 40, Sonneborn Division Chemrex (1-800-CHEMREX).
 - c. Master Seal SL40, Master Builders Technologies.

M. Curing Materials:

1. Plastic sheeting: Polyethylene, ASTM C171.
 - a. Curing sheet: Type 1.1.1 and 1.1.2.
 - b. Vapor barrier: Clear 10-mils thickness.
2. Burlap sheet: AASHTO M182, Class 3 or 4.
3. Tarpaulin: FS K-P-146.
4. Blanket insulation: FS HH-I-521.
5. Membrane-forming curing compound: ASTM C309, Type 1-D, 100 resin with fugitive dye, and Type 2.

N. Epoxy Mortar:

1. Epoxy: ASTM C881, Type III-C, grey.
2. Sand: Clean, dry, well-graded particles, passing Size 16 sieve, with the following additional requirements:

<u>Individual Sieve Size</u>	<u>Percent by Weight Retained on Sieve</u>
30	26 to 36
50	18 to 28
100	11 to 21
Pan	25 to 35 (range shown is applicable when 60 to 100 percent of pan is retained on Size 200 sieve)

O. Chemical Grout: Section 02415.

P. Paver Tile Setting Bed:

1. Concrete: 4,000 psi.
2. Reinforcement: 4 x 4 - W4.0 x W4.0, Section 03200, furnish in sheets, not rolls

Q. Elastomeric Concrete:

1. Elastomeric Concrete to consist of an aggregate and binder mixture proportioned by the manufacturer.
2. Manufacturer qualifications: Manufacturer to have the following minimum qualifications:
 - a. Ten years experience in the manufacturing of elastomeric concrete materials.
 - b. Qualified personnel, factory trained and certified in the proper installation procedures, are to be available during construction.
3. Manufacturers: The naming of certain manufacturers is intended to establish a standard of quality. Elastomeric Concrete from the following manufacturers is acceptable:

- a. Delcrete Elastomeric Concrete by the DS Brown Company, PO Box 158, North Baltimore, OH 45872, telephone (419)257-3561.
- b. Wabocrete by Watson Bowman Acme Corporation, 95 Pineview Drive, Amherst, NY 14228, telephone (716)691-7566.
- 4. Equal Products: Other manufacturers or material suppliers who wish to propose their product as equal to this specification submit product information and a working sample along with independent physical test property verification, and product literature for review and approval.
- R. Waterstop: Section 03100.
- S. Chairs for Reinforcement: Plastic or stainless steel.
- T. Corrosion-inhibitor in concrete. The corrosion-inhibitor shall be calcium nitrite-based admixture DCI or approved equal. Use four (4) gallons per cubic yard of the corrosion inhibitor when the water-cement ratio is 0.40 or less and use three and a half gallons (3-1/2) per cubic yard when water-cement ratio is 0.38 or less. For precast prestressed parking structures/garages use the corrosion-inhibitor in cast-in-place concrete overlay topping over the double tees and the inverted tee beams on top level and for cast-in-place concrete in wash strips and wash areas on all levels.

2.02 SAMPLING:

- A. Sample concrete ingredients prior to use and have them tested by an approved laboratory in accordance with methods specified. Subsequently test materials as often as necessary to verify that materials conform to specified requirements and that quality of product is maintained.
- B. Make arrangements for the Engineer to witness sampling and testing. Submit record of test results.
- C. Ready-Mixed Concrete: ASTM C94.

2.03 GROUT MIXES:

- A. Portland-cement grout:
 - 1. Prepare grout composed of portland cement, sand and water.
 - 2. Use portland-cement grout under bearing plates, in recesses, holes and surfaces under structural members and at other locations shown.
 - 3. Do not use staining ingredients in grout exposed to view.
 - 4. Formulation: Two parts sand and one-part cement measured by volume.
 - 5. Mix grout with sufficient water to permit placing and packing, approximately 45 minutes prior to use.
- B. Nonshrink grout: ASTM C1107.
- C. Shrinkage-compensating grout:
 - 1. Use shrinkage-compensating grout for setting structural members, anchor bolts, embedded items or items of equipment and machinery on hardened concrete.

2. Prepare nonstaining shrinkage-compensating grout with portland cement, sand and aluminum powder and use in accordance with manufacturer's recommendations.
 3. Prepare shrinkage-compensating grout for use up to two inches thick as follows, measured by volume:
 - a. One-part portland cement, Type I or II.
 - b. One-part fine natural-sand aggregate, graded as specified.
 - c. One-part ferrous aggregate, graded as specified, combined with Type-A chemical admixture, oxidation agent and water in sufficient amount to permit placing and packing.
- D. Premixed shrinkage-compensating grout:
1. In lieu of specified shrinkage-compensating grout, use premixed ready-to-use formulation when approved. Approval will be based on manufacturer's certification that:
 - a. Material will perform as specified.
 - b. Composition and proportioning of grout materials is essentially as specified for shrinkage-compensating.
 - c. Formulation has been used successfully in like applications for at least five years.
 2. Proportion ingredients in accordance with the manufacturer's recommendations.
- E. Mixing water:
1. Proportion mixing water in accordance with grout manufacturer's recommendation or to produce flowable mixture without segregation or bleeding.
- F. Curing:
1. After grout has attained initial set, keep damp for 24 hours minimum.

PART 3 - EXECUTION

3.01 FIELD QUALITY CONTROL:

- A. Classes of Concrete:
1. Classes of concrete are designated by numerals corresponding to their specified 28-day compressive strength in pounds per square inch as determined by ASTM C94.
 2. Concrete classes used in this project are specified. Unless otherwise indicated, use Class 4000.
 3. Each class of concrete may comprise one or more mixes determined by maximum size of aggregate, cement factor and types of admixtures used.
 - a. Portland cement may be used alone or mixed with either ground-iron blast-furnace slag or fly ash. Do not use fly ash in architectural concrete exposed to public view.
 - b. Maximum allowable ground-iron blast-furnace slag: 50 percent of the total weight of the portland cement and ground-iron blast-furnace slag mixture.
 - c. Maximum allowable fly ash: 20-percent of the total weight of the portland cement and fly-ash mixture.
 4. Concrete with fly ash or ground-iron blast-furnace slag may be used at locations shown on the drawings.

- B. Types of Concrete:
1. Types of concrete are designated as Concrete Other than Lightweight and Lightweight Structural Concrete.

- C. Minimum Cement Factor:
1. Observe minimum cement factor for various classes of concrete other than lightweight, as follows:

Class of Concrete	Minimum Cement Factor Bags Per Cubic Yard Of Concrete
5,000	6.5
3,500 - 4,000	6.0
2,500 - 3,000	5.0

* one bag of cement = 94lbs. of cement

2. If a mix of portland cement and ground-iron blast-furnace slag or portland cement and fly ash is used, the mix is the basis of determining the bags per cubic yard of concrete.

D. Air Entrainment:

1. Determine air content of concrete in accordance with ASTM C94.

E. Testing of Concrete:

1. General:
 - a. Furnish molds and cast concrete specimens for testing. In addition, furnish necessary testing equipment and tools to perform sampling, slump tests and yield tests. Furnish boxes for shipping samples.
2. Perform strength tests by making not less than one set of standard cylindrical test specimens for each 100 cubic yards of concrete or any portion thereof for each structure.
 - a. For each work shift, when concrete is delivered, make at least one set of specimens. A set of test specimens consists of at least three standard cylinders from a batch.
 - b. Perform slump tests, unit weight and air content tests with no less frequency than that of strength-specimen sets.
3. Concrete strengths:
 - a. Determine strengths from standard test specimens according to ASTM C31 and ASTM C172 and cured and tested in accordance with ASTM C39 by the testing laboratory. Core drilling and testing in accordance with ASTM C42. Consider the effects of corrosion-inhibiting admixture and other admixtures on the strength of the concrete, in the concrete mix design. The corrosion-inhibiting admixture and other admixtures must be present in the concrete used for the test of the proposed mix strength.
 - b. Compute and evaluate in accordance with ASTM C94.

F. Variability of Constituents in Concrete:

1. Take representative samples of concrete mortar.
2. Maximum allowable unit-weight variation of air-free mortar taken from consecutive batches as discharged from mixer:

- a. Average of two mortar weights: 0.8-percent maximum.
- b. Average of six mortar weights: 0.5-percent maximum.
- 3. Maximum allowable weight variation of coarse aggregate per cubic foot of concrete taken from consecutive batches as discharged from mixer.
 - a. Average of two weights: Five-percent maximum.

G. Batching Plant:

- 1. Arrangement:
 - a. Provide separate bins or compartments for each size or classification of aggregate and for bulk portland cement, ground-iron blast-furnace slag or fly ash.
- 2. Compartments:
 - a. Provide compartments of ample size, so constructed that materials will be kept separated under working conditions. Equip batching plant so that flow of each material into its batcher is stopped automatically when designated weight has been reached.
 - b. Weigh aggregates in separate weight batches with individual scales or cumulatively in one batcher on one scale. Weigh bulk cement on separate scale in separate weight batcher. Weigh ground-iron blast-furnace slag or fly ash on the same scale in the same weight batcher containing the bulk cement. Weigh and record bulk cement first; then add to the bulk cement, weigh and record the ground-iron blast-furnace slag or fly ash. Weigh and record the cumulative bulk cement and ground-iron blast-furnace slag or the bulk cement and fly ash.
 - c. Water amount may be measured by weight or volume. If measured by weight, do not weigh cumulatively with other ingredients.
 - d. Interlock batching controls so that charging mechanism cannot be opened until scales have returned to zero. Satisfy these requirements by semi-automatic batching system as defined in the Concrete Plant Standards of the CPMB, with specified interlocking, or by automatic-batching system as defined in the Concrete Plant Standard.
 - e. Arrange plant so as to continuously facilitate inspection of operations. Provide facilities for obtaining representative samples of aggregate from each bin or compartment for test purposes.
 - f. Deliver materials from batching equipment within limits specified in ASTM C94.
 - g. Subject to approval, accomplish batching in accordance with ASTM C685, in lieu of weight batching, provided batching plant complies with requirements of CPMB Concrete Plant Standards.
- 3. Water batcher and admixture dispensers:
 - a. Provide equipment for batching water and air-entraining or other admixtures at batching plant except in cases where mixing is to be performed at jobsite in paving mixers or in truck mixers.
 - b. Provide water-measuring device capable of measuring mixing water within specified requirements for each batch. Provide mechanism for delivering water to mixers so that leakage does not occur when valves are closed.
 - c. Interlock filling and discharge valves for water batcher so that discharge valve cannot be opened before filling valve is fully closed.
 - d. Introduce admixtures in solution form.
 - e. Provide measuring devices for admixtures capable of ready adjustment to permit varying quantity of admixture to be batched. Interlock dispenser for

- admixtures with batching and discharging operations so that batching and discharging of mixture will be automatic.
- f. If noninterlocked dispensers are permitted, check calibration of dispensers at directed intervals. Record results of such calibration for inspection by the Engineer.
4. Moisture control:
 - a. Provide plant capable of ready adjustment to compensate for varying moisture contents of aggregate and to change weights of materials being batched. Provide approved electric moisture meter for measurement of moisture in fine aggregate. Calibrate as often as directed.
 - b. Moisture content of fine aggregate not to exceed eight percent. Arrange sensing element so that measurement is made near batcher.
 5. Scales:
 - a. Provide accurate measurement facilities for and control of each of the materials entering each batch of concrete. Provide accurate weighing equipment in accordance with NBS Handbook 44.
 - b. Include in each weighing unit a visual springless dial to indicate scale load at each stage of weighing operation or include beam scale with beam balance indicator to show scale in balance at zero load and at each beam setting, indicator to have undertravel and overtravel equal to at least five percent of capacity of beam.
 - c. Provide standard test weights and other auxiliary equipment necessary to verify operating performance of each scale or other measuring device.
 - d. Make periodic tests in the presence of the Engineer at directed intervals. Upon completion of each check test and before further use of indicating, recording and control devices, make adjustments, repairs or replacements as necessary to ensure satisfactory performance.
 6. Recorders:
 - a. Provide accurate recorder for producing digital printout of scale readings corresponding to each concrete ingredient of each concrete batch, including zero initial readings; indicate presence of each individual admixture by corresponding code in lieu of weight or volume record.
 - b. Record water in gallons where batched by volume. In addition, on each printout show date and time of batching, identification number identical to that of concrete delivery ticket and codes for mix design and for project section.
 - c. Prepare printout in duplicate and submit one copy with its corresponding concrete ticket at the time and site of concrete placement.
 - d. House each recorder in locked cabinet.
 - e. Place recorders in position convenient for observation by plant operator and the Engineer.
 7. Protection:
 - a. Protect weighing, indicating and control equipment against exposure to dust and weather; isolate against vibration or movement caused by other operating equipment.
 8. Dry batching:
 - a. When bulk cement and aggregates are hauled from central batching plant to mixers, place cement, ground-iron blast-furnace slag or fly ash for each batch in an individual compartment which, during transit, will prevent cement from intermingling with aggregates and will prevent loss of cement.
 - b. Provide bins of batch trucks with suitable covers to protect materials.

- c. Provide batch compartments of sufficient capacity to prevent loss in transit and to prevent spilling and intermingling of batches as compartments are being emptied.
- H. Allowable Concrete Finish Tolerances:
- 1. Finish concrete elements to dimensions, elevations and positions shown within the tolerances specified for each:
 - a. Formed surfaces such as walls, roof soffits, columns, beams and girders: Plus-or-minus 1/4 inch.
 - b. Arches: Plus-or-minus 1/2 inch.
 - c. Bearing-assembly locations of aerial structure piers and abutments: Plus-or-minus 1/16 inch.
 - d. Traction-power substations, tie-breaker stations and ac-switchboard rooms: Plus zero or minus 1/4 inch.
 - e. Safety walks, vertical and horizontal: Plus-or-minus 1/2 inch.
 - f. Station platforms:
 - 1) Vertical: Plus-or-minus 1/4 inch.
 - 2) Horizontal, measured from centerline of track to edge of platform: Plus 1/4 inch or minus zero.
 - g. Invert slabs and floating slabs:
 - 1) Maximum deviation from profile grade: Plus zero or minus 1/2 inch.
 - 2) Maximum deviation from 10-foot steel straightedge: Plus-or-minus 1/8 inch, noncumulative.
 - 3) Verify adequacy of finish for draining by hosing area. Ponding or obstructions to flow toward invert drains constitute defects.
 - h. Invert under floating slabs:
 - 1) Maximum deviation from profile grade: Plus zero, minus 1/2 inch.
 - 2) Maximum deviation from 10-foot steel straightedge: Plus-or-minus 1/8 inch, noncumulative.
- I. Water tightness Criteria:
- 1. Maximum allowable water leakage: No leakage permitted.

3.02 MATERIAL PREPARATION:

- A. Mixing Concrete:
- 1. Operations:
 - a. Provide concrete mixers that discharge concrete of uniform composition and consistency.
 - b. Combine coarse aggregates of different gradation and identical sources, provided corresponding concrete mix has been approved. The use of alternate batches of gravel, crushed gravel or crushed stone of a single size is prohibited.
 - c. Adequacy of mixing will be determined by the Engineer by means of mixer performance tests in accordance with USBR Concrete Manual, Designation 26, Variability of Constituents in Concrete, in the appendix.
 - d. The Engineer may reduce size of batch to be mixed or increase mixing time when charging and mixing operations fail to produce concrete which conforms to specified requirements and which has uniform coloration and consistency.

- e. Add water prior to, during and following mixer-charging operations. Do not overmix or add water to maintain consistency.
 - f. Use of concrete to which water in excess of amount permitted by approved design mix has been added to overcome conditions caused by excessive retention in mixer is prohibited.
2. Central-mixed concrete:
- a. Arrange mixers in centralized mixing plant so that mixing action in mixers can be conveniently observed by the Engineer and plant operator.
 - b. Do not load mixers in excess of rated capacity. Mix concrete ingredients in batch mixer for not less than period of time specified for various mixer capacities after each ingredient except full amount of water is in mixer. Reduce mixing time if thorough mixing as specified can be obtained in less time and if approved.
 - c. Mixing time:

Cubic-Yard Capacity of Mixer	Mixing Time
2 or less	1-1/2 minutes
3	2 minutes
4	2-1/2 minutes
More than 4	To be determined per ASTM C94 tests by the Engineer

- d. Equip each mixer with mechanically operated batch counter and timing and signaling device to indicate completion of mixing period.
3. Truck-mixed concrete: Use equipment and procedures that conform to the requirements of ASTM C94 and ACI 304, Chapter 5, with the following additional requirements:
- a. Introduce materials, including water and mixtures, into the mixing drum only at the central batching plant, or
 - b. Transport aggregates from the central plant to the jobsite in the mixing drum and add measured and recorded cement, admixtures and water into the drum prior to mixing at discharge point.
 - c. When ice is used, add it with the water and counted as part of the water-cement ratio.
 - d. Place concrete within 90 minutes after cement is introduced into the mixing drum.
 - e. Accomplish initial mixing by 70 to 100 revolutions with drum rotating at the manufacturer's recommended speed. 30 revolutions at mixing speed will be required, if the addition of water is permitted. Do not exceed total of 300 mixing and agitating revolutions.
4. Temperature control:

- a. Use preparation methods capable of producing concrete with temperature 85F maximum and 55F minimum at time of placement.
- b. Do not heat concrete ingredients to temperature higher than that necessary to keep temperature of mixed concrete as placed within specified temperatures.
- c. Do not heat water in excess of 140F.

B. Admixtures:

- 1. Introduce admixtures in solution form.
- 2. Air-entraining admixture: Use for concrete exposed to weathering or in contact with rock or moist soil.
- 3. Chemical admixtures:
 - a. Use water-reducing admixtures in concrete areas below grade in contact with rock, earth or fill.
 - b. Employ admixtures without interfering with specified air-content dosage of air-entrained concrete.
 - c. Except as otherwise specified or approved, use of water-reducing, set-retarding or set-accelerating admixtures is prohibited.
 - d. If introduction of certain admixtures to improve concrete strength is approved, do not reduce cement content below minimum amounts specified.

C. Consistency:

- 1. For concrete to be compacted by approved mechanical vibrators, maintain slump range at point of delivery within the following limits:
 - a. Concrete pavement, pavement base, sidewalk and incidental construction: Two to three inches.
 - b. Unreinforced concrete other than pavements: One to three inches.
 - c. Reinforced concrete: Two to four inches.
 - d. Concrete placed by pumping and concrete for filling steel-shell piles: Four to five inches.
 - e. Do not use concrete if slump exceeds maximum by 1/2 inch or more.

D. Lightweight Structural Concrete:

- 1. Prepare lightweight structural concrete with minimum cement content as follows:

Compressive Strength	Cement Content Bags Per Cubic Yard
2,000 psi	4 to 7
3,000 psi	5 to 8
4,000 psi	6 to 9
5,000 psi	7 to 10

- 2. Air-entrainment:
 - a. Use air-entraining admixture in lightweight structural concrete to provide not less than four nor more than six percent of entrained air.
- 3. Dry unit weight:
 - a. Prepare lightweight structural concrete to provide air-dry weight required by design but not less than 90 pounds per cubic foot.

4. Consistency:
 - a. Maintain slump range within two to four inches.

3.03 CONVEYING:

- A. General:
 1. Provide equipment for conveying concrete from mixer with continuous flow of concrete to point of placement without segregation.
 2. Provide arrangement at discharge end of conveyor to prevent segregation.
 3. Design long conveyor runs to discharge concrete into hopper, without segregation, before it is deposited in forms.
 4. Ensure that pumps, pneumatic equipment, pipes, chutes and troughs are cleaned of dirt and concrete before use.
- B. Chutes and Troughs:
 1. Use only ferrous-metal-lined chutes and open troughs. Where steep slopes are unavoidable, equip chutes or troughs with baffles to minimize segregation of aggregates. Keep chutes or open troughs clean of hardened concrete by flushing with water after each use.
 2. Discharge water used for cleaning outside lines of structure. Lay out chutes or open troughs with slope one-foot vertical to two feet horizontal maximum and one-foot vertical to three feet horizontal minimum.
 3. Discharge chutes 20 feet or more in length into hopper before final distribution.
- C. Adjustable Length Pipes (Elephant Trunks):
 1. Use flexible pipes of ferrous metal, rubber or plastic, six inches minimum diameter so as to prevent segregation of concrete.
 2. Position chutes or flexible pipes so that concrete is delivered in continuous flow to points not more than five feet horizontally and five feet vertically from final location. In vicinity of expansion and contraction joints, reduce horizontal distance to three feet maximum.
 3. Clean flexible pipes and elephant trunks after each use.
- D. Buggies:
 1. Construct runways for buggies so they will not come into contact with or be supported by reinforcing steel of structure.
- E. Pumping and Pneumatic Conveying Equipment:
 1. Use pumping and pneumatic conveying equipment, designed to handle without segregation types, classes and volumes of concrete to be conveyed.
 2. Operate pump or pneumatic equipment so that continuous stream of concrete without air pockets is produced. Position discharge end of line as near final position of concrete as possible but in no case more than five feet away.
 3. At conclusion of placement, clean equipment. Discharge debris and flushing water outside of forms.

3.04 PLACEMENT:

- A. General:
 1. Prior to placing concrete, remove debris and extraneous material from interior of forms.

2. Place first lift of concrete on wet surface. Consolidate by dragging vibrator along edges of joints. Make sure there is no free or standing water over the surface.
3. Place concrete continuously and as rapidly as possible after mixing. Do not use vibrators for shifting mass of fresh concrete.
4. Place concrete in layers of such thickness that no concrete will be deposited on concrete which has hardened sufficiently to cause formation of seams or planes of weakness. Cover each layer of concrete with fresh concrete within 45 minutes.
5. Do not place concrete which has attained initial set or concrete which has contained mix water for more than 90 minutes.
6. Remove temporary spreaders in forms when concrete has reached elevation which makes them unnecessary.
7. Place column concrete using adjustable-length flexible pipes or elephant trunks to avoid dropping concrete over five feet. In monolithic placements, do not deposit concrete in supported elements such as beams, girders and slabs until concrete previously deposited in columns or walls has completed its settlement shrinkage, but not to the point at which concrete in supporting members will not permit vibrator to sink into its mass of its own weight.
8. Placing will not be permitted when sun, heat, wind or limitations of facilities will prevent finishing and curing.
9. Concrete temperature at time of placement:
 - a. 55F, minimum.
 - b. 85F, maximum.
10. Unless approved, do not continue concreting when descending ambient air temperature falls lower than 40F.
11. Prior to placing fresh concrete against rock or previously placed concrete, take necessary steps, such as flushing with water, to ensure removal of foreign matter which would adversely affect bond.
12. Maintain wire fabric and other reinforcing in proper position on chairs during concrete placement.

B. Underwater Concrete Placement:

1. Place concrete carefully and continuously in compact mass by means of tremie or underwater bottom-dump bucket; do not disturb after depositing. Maintain still water at point of deposit. Use tight forms. In placing concrete, produce approximately horizontal surfaces.
2. Do not perform pumping within area until concrete has set at least 48 hours.
3. Tremie:
 - a. Provide tremie consisting of watertight tube, 10-inch minimum diameter, with hopper at top. Equip tube with device to close discharge end and prevent water from entering tube while charging tube with concrete.
 - b. Support tremie so as to permit free movement of discharge end over entire top surface of work and to permit rapid lowering when necessary to retard or stop flow of concrete.
 - c. Close discharge end at start of work to prevent water entering tube and maintain entirely sealed, except when concrete is being placed. Keep tremie tube full of concrete.
 - d. Maintain continuous flow until work is complete and resulting concrete seal is monolithic and homogenous. Control tremies so that concrete will be effectively compacted into horizontal layers not more than 12 inches thick.
 - e. Space tremies so as to avoid segregation.

- C. Consolidation:
1. Consolidate concrete thoroughly as it is placed in order to secure a dense mass. Work concrete well around reinforcement, embedded items and into the corners of forms. Consolidate concrete in accordance with ACI 309.
 2. Use internal vibrators unless external vibrators are approved.
 3. Use vibrators capable of generating frequencies of not less than 7,000 impulses per minute. Verify that vibrators have power and amplitude factor so as to visibly affect mass of concrete of one-inch slump over radius of at least 18 inches. Prevent formation of laitance and accumulation of excessive water on surface of concrete as it is deposited. Remove excessive water by pumping or other approved means.
 4. When consolidating concrete in haunches, girders, beams or slabs, ensure that vibrator penetrates and revibrates previously placed concrete in top of supporting members.
 5. Do not use vibrators where internal vibration might cause damage to embedded items; in such cases spading is required.

3.05 CURING AND PROTECTING:

- A. General:
1. Protect freshly placed concrete from excessively hot or cold temperatures. Maintain without drying for period of time necessary for hydration of cement and proper hardening of concrete.
 2. Provide sufficient tarpaulins to cover completely or enclose forms and working areas prior to and during placing and finishing operations.
 3. Cure newly placed concrete continuously for seven days at ambient temperature in excess of 55F.
 4. Cure concrete in subway structures by normal curing method specified.
 5. During curing period keep steel and wood forms wet. If forms are removed during curing, use one of the following methods of curing immediately and continue for remainder of the curing period.
- B. Normal Curing and Protection:
1. Use one of the following methods for flat surfaces, weather permitting:
 - a. Use ponding on horizontal surfaces providing surface is continuously submerged for required curing period.
 - b. Apply continuous sprinkling with nozzle or nozzles which, during first 24 hours, atomize flow of water providing a mist and not a spray. Do not apply moisture under pressure directly upon concrete; avoid flowing or washing on surfaces while susceptible to erosion.
 - c. Cover entire surface of concrete with double thickness burlap sheet, laid directly on concrete and kept continuously wet. Maintain in good condition.
 - d. Sprinkle concrete surface as specified for at least 18 hours and immediately cover with waterproof curing sheet, free from holes or tears. Hold in position so that entire surface of concrete is fully and continuously covered.
 - e. Do not damage burlap, waterproof sheet or concrete surfaces.
- C. Membrane-Forming Curing Compound:

1. Use curing compound when approved for circumstances where application of moisture is impracticable and where such compounds will not jeopardize appearance of concrete. Except as otherwise specified, use Type-1 compound, uniformly applied over surface at thickness recommended by manufacturer. Thoroughly mix compound and apply within one hour after mixing.
 2. Where surfaces are subject to sunlight, apply Type-2 compound. Except for surfaces exposed to public view and architectural finished concrete.
 3. Do not apply wax-resin curing compounds to surfaces requiring bond for additional concrete or where bonded surface coating such as paint, tile, dampproofing, waterproofing or roofing is to be applied.
 - a. Do not apply curing compound to floors to be chemically sealed.
 4. Warm or stir curing compound if necessary for satisfactory application in accordance with manufacturer's recommendations. If film of compound is damaged before expiration of curing period, repair immediately with additional compound.
 5. Inside surfaces of tunnels, cut-and-cover boxes and other surfaces specifically approved may be cured with Type-1 membrane curing compound.
 6. Finish surfaces prior to application of curing compound. Do not use curing compound on construction joints.
 7. Apply curing compound in two coats. Apply first coat immediately after stripping of forms and acceptance of concrete finish.
 8. If surface is dry, thoroughly wet concrete with water and apply curing compound just as surface film of water disappears. Apply second coat after first coat has set.
 9. Protect coating against damage for at least 10 days after application. If damage occurs, apply additional coating.
 10. If use of curing compound results in streaked or blotchy appearance, cease operations and use other method of curing until cause of defective appearance is corrected.
- D. Floor Treatment:
1. In accordance with recommendations of manufacturer of floor hardener, apply floor curing compound and curing sheet to surfaces to receive floor hardener.
 2. Where such surfaces are subject to sunlight, protect them by tenting white opaque, polyethylene waterproof sheet.
- E. Protection of Rod Reinforcement:
1. After forms are removed, coat rod reinforcement and dowels extending beyond concrete surfaces with application of neat cement paste.
 2. Remove hardened cement paste and resultant debris immediately prior to extension of reinforcement or installation of formwork.

3.06 COLD WEATHER CONCRETING:

- A. Do not place concrete when ambient temperature is less than 55 ° F and falling. Do not place concrete unless the form temperature at the time of placement is at least 40 ° F.
- B. When ambient temperature is 40 ° F and falling, carry out one of the following procedures to protect placed concrete:

1. Heating:
 - a. Enclose forms or structures and heat to maintain concrete and air within enclosure at not less than 55 ° F for seven days after placement.
 - b. Maintain relative humidity at not less than 40 percent during curing period when heat is applied to enclosures. Arrange stoves, salamanders or heaters so as to provide uniform distribution of heat. Vent combustion gases to outside air. Do not let hot air blow across concrete surfaces.
 - c. After seven-day curing period, reduce temperature within enclosure gradually at maximum rate of 20 ° F per day until outside temperature has been reached.
 - d. Provide continuous and adequate fire protection and watchmen when heating units are in operation.
 2. Form insulation:
 - a. Insulate forms with blanket insulation of approved type and thickness to maintain concrete at 55 ° F minimum for seven days.
 - b. Protect top of placed concrete by tarpaulins or other approved waterproof material over insulation.
- C. Do not allow concrete to freeze in a saturated condition prior to achieving a strength of 4000 psi.

3.07 HOT WEATHER CONCRETING:

- A. When temperature in forms is 75F or above, carry out the following procedures to protect placed concrete:
1. Protect concrete from direct sunlight.
 2. Keep forms moist by means of cool-water sprinkling or application of wet burlap or cotton mats.
 3. At 90F or above cool aggregates with water spray hoses.
 4. Cool truck barrels with water spray system.

3.08 JOINTS:

- A. General:
1. Unless otherwise shown make construction joints bonded joints by roughening surface to expose aggregates. Clean and roughen surface by wet sandblasting, by cutting with high-pressure water jet with a minimum pressure of 2,000 psi or by other approved means. Perform cleaning after concrete has hardened to prevent raveling of surface.
 2. Exercise caution in cleaning concrete to prevent damage to waterstops.
 3. Treat overlays on slabs the same as for rock or other bonded joint.
 4. Place construction joints at locations shown, or at locations approved by the Engineer.
- B. Horizontal Construction Joints:
1. Joints within 18 inches of tops of faces are prohibited.
 2. Trowel top surface of concrete adjacent to forms smooth to minimize visible joints on exposed faces. Remove laitance and other objectionable materials from joint surface to expose sound concrete as soon as concrete is firm enough to retain its form.

3. Immediately after placement of concrete, remove accumulations splashed on exposed reinforcement and surfaces of adjacent forms before concrete attains initial set.
- C. Waterstops:
1. Provide waterstops per Section 03100, Article 3.07.
 2. Rework or replace concrete where waterstop has moved unacceptably.
 3. Support water stop in exact position, do not sink water stops in fresh concrete.

3.09 CONCRETE FINISHING:

- A. When forms are removed, do not remedy voids, stone pockets and other defects until the Engineer has inspected them and given directions.
- B. Finish concrete surfaces as shown and as follows:
1. Number-1 Form Finish:
 - a. Immediately following form removal, remove fins and irregular projections from surfaces exposed to view or those that will receive waterproofing.
 - b. Prepare pointing mortar not more than 30 minutes prior to use.
 - c. Cure mortar patches as specified under curing and protection.
 - d. Leave contraction joints and articulated joints in completed work carefully tooled and free of mortar and concrete.
 - e. Leave joint filler exposed for its full length with clean and true edges.
 - f. Apply this finish to structures, unless otherwise shown.
 2. Number-2 Wet-Rubbed Finish:
 - a. Start rubbing of concrete after removal of forms and as soon as its condition will permit. Keep concrete thoroughly saturated with water before starting this work.
 - b. Allow sufficient time to elapse before wetting down to allow pointing mortar to thoroughly set. Rub surfaces with medium-coarse carborundum stone.
 - c. Continue rubbing until form marks, projections and irregularities have been removed, voids are filled and uniform surface is obtained.
 - d. Leave paste produced by rubbing in place. Obtain final finish by rubbing with fine carborundum stone and water after concrete above surface being treated has been cast. Continue rubbing until entire surface is of smooth texture and uniform color. After final rubbing is completed and surface has dried, rub with burlap to remove loose powder and objectionable marks.
 3. Number-3 Broomed Finish:
 - a. Where floors and other areas are shown to have rough finish, strike-off surface with screeds and wood floats at elevation shown.
 - b. Before concrete has achieved initial set, broom transversely to flow of traffic with stiff, medium-bristle broom especially made for intended purpose to develop corrugations not more than 1/8-inch deep.
 4. Number-4 Steel-Troweled Finish:
 - a. Where floors are shown to have a steel-troweled finish, screed concrete to established grades and compact with wood or power-driven disc float.
 - b. After surface has hardened sufficiently, finish with steel trowel to dense hard finish, free of trowel marks.
 - c. Do not use dry cement or mixture of dry cement and sand to absorb water.
 5. Number-5 Wood-Float Finish:

- a. Screed inverts of subway structure, floors not specified or shown to be finished otherwise, areas below floating slabs and areas to receive dampproofing, waterproofing or roofing to a true and uniform surface conforming to shape and elevations shown.
 - b. Follow with wood-float finish to tolerances specified.
 - c. On slabs and floors, where drainage is shown, maintain accurate slopes for drainage.
 - d. Protect floors and slabs until final acceptance.
6. Number-6 Sandblast-Sealer Finish:
- a. Where concrete surfaces are shown to receive sandblast finish and a sealer prepare sample using sandblast finish on file in the Engineer's office as criterion.
 - b. Prepare samples with degree of sandblasting which will produce uniform texture on surface of concrete. Blast to achieve smooth, sanded surface approximately equivalent to 100-120 grit sandpaper finish.
 - c. Sandblasted surfaces will be inspected before sealing and compared with approved samples.
 - d. Apply concrete surface sealer to sandblast finish in accordance with approved procedures.
7. Number-7 Natural-Board Finish:
- a. After stripping forms, cut back form ties as specified. Touch-up holes created by form ties and damaged or defective finish using grout closely matching surrounding concrete. Accomplish grouting and repairs as specified. Knock-off heavy elongated fins, but do not rub down.
8. Number-8 Abrasive-Aggregate Finish:
- a. After screeding and floating as for Number-4 Finish, apply abrasive aggregate at rate of not less than 0.6 pound per square foot.
 - b. Sprinkle evenly in two applications using one half the amount for each application. Apply second half at right angle to first.
 - c. Follow with wood float; lightly tamp or roll surface to embed aggregate flush with concrete surface.
 - d. Lightly steel trowel to smooth, even finish.
 - e. After curing, rub surface using abrasive brick with water to slightly expose abrasive aggregate.

C. Do not sprinkle water or cement on surfaces to be trowel finished.

3.10 FLOOR TREATMENT:

- A. Sealer:
- 1. Water cure floor surfaces to be sealed for 28 days minimum and ensure that they are completely dry before treatment.
 - 2. Complete overhead work before sealer is applied.
 - 3. Apply liquid floor sealer in three separate coats as recommended by the manufacturer using maximum quantity recommended. Allow to dry between applications.
- B. Floor-Hardener System:
- 1. Areas of application: Concrete floor surfaces as shown.
 - 2. Preparation:

- a. Strike concrete to established grade using wooden strike-off bar. Further level and consolidate concrete with wood bull float or wood darby immediately following strike-off. Complete before free moisture rises to surface.
 - b. Begin floating adjacent to columns, forms and walls where concrete is most likely to stiffen first.
3. Application:
- a. Apply at uniform rate of 1.8 to 2.2 pounds of hardener per square foot of floor surface.
 - b. Apply first shake to floated concrete adjacent to forms, columns, and walls where moisture will be lost first. Apply 2/3 of specified total shake immediately following floating of total area as follows:
 - 1) Distribute evenly.
 - 2) Throwing shake is prohibited.
 - 3) Perform hand floating with wood floats. Magnesium floats are prohibited.
 - c. Use finishing machines with float blades as soon as shake has absorbed moisture as evidenced by darkening of surface. Do not allow float blades to dig into surface. Float sufficiently to bring moisture from base slab through shake.
 - d. Immediately after floating first shake, apply remaining 1/3 of total specified shake in the same manner and machine float as specified. Plan operations to avoid necessity of sprinkling water on surface.
 - e. As surface stiffens as evidenced by loss of sheen, finish by hand steel trowel removing marks and pinholes; leave surface in uniform condition with relatively smooth but nonslip surface.
4. Field service:
- a. During installation, provide services of qualified representative of manufacturer to aid in proper use of product. Notify manufacturer three days minimum prior to initial application of product.
5. Quality control:
- a. Prior to installation, submit for approval detailed quality-control plan describing method of application of floor hardener and listing items to be checked to ensure that materials are placed at proper time and in proper manner to achieve optimum durability of finished floor surface. Prior to submittal, have quality-control plan authenticated by qualified representative of material manufacturer indicating manufacturer's approval.
 - b. Submit quality-control reports authenticated by manufacturer's representative verifying that installation has been made in accordance with approved quality-control plan.

3.11 DEFECTIVE CONCRETE:

- A. Concrete will be considered defective unless it is structurally sound, watertight, properly finished and within specified tolerances.
- B. Concrete in place that is deemed structurally defective will be checked by the Engineer by drilled core specimens. If testing of core specimens shows that strength is less than 85 percent of specified strength, costs incurred in taking and testing of core specimens will be borne by the Contractor.

- C. Replace, strengthen or correct defective concrete as directed.

3.12 PROTECTION FROM AND REMOVAL OF STAINS:

- A. Protect concrete structure from rust staining by structural-steel members or from other substances during the work.
- B. If staining should occur, remove stains and restore concrete to its original color.

3.13 DAMAGED WORK:

- A. Before final acceptance of the work, neatly repair damaged surfaces, corners of concrete and concrete finish.
- B. Where surface repairs are permitted, finish damaged areas to smooth, dense watertight condition.
- C. Replace concrete that is not satisfactorily repaired.

3.14 CORRECTIVE WORK:

- A. Submit corrective action patching procedure.
- B. If correction of defects is approved, remove defective concrete; key area to be repaired, soak surface with water and patch with approved materials. Patch architectural concrete so as to match existing. Use bonding agents applied to the substrate or mixed with patching material only as approved by the Engineer.
- C. Clean surface cavities produced by form ties, other holes, honeycomb spots, broken corners or edges and other defects. Saturate with water and point with mortar paste consisting of cement and fine aggregate mixed in proportions to give same appearance as original concrete.
- D. Prepare pointing mortar not more than 30 minutes prior to use. Cure mortar patches properly. Carefully tool contraction and articulated joints in completed work and keep them free of concrete. Where necessary, leave joint filler exposed for its full length with clean and true edges.
- E. Tolerance deviations and other surface defects may also be corrected, if approved, by grinding high areas and swales. Leaks in station electrical rooms, TPSS and TBS shall be epoxy injected.
- F. Where necessary or when directed, repair leakage in excess of specified maximum allowable, by means of contact grouting, chemical grouting or other approved means.
- G. Where corrective work is unsatisfactory, completely remove such work and replace with new work complying with specified requirements.

3.15 EPOXY MORTAR REPAIRS:

- A. Surface Preparation:
1. Remove defective concrete with chipping hammers or other approved equipment. To prevent removing extra material and causing cracks, saw-cut concrete area to be removed into maximum six-inch square checkerboard pattern 4-1/2 inches deep.
 2. Prepare exposed concrete surface by sandblasting clean and allowing to dry thoroughly. Surface drying may be accomplished by air jet. Ensure that compressed air used in cleaning and drying is free from oil or other contaminating materials.
 3. Maintain concrete surface in sufficient depth at temperature of 65F minimum during first four hours after placement of epoxy bond coat. Preheating may be done with radiant heaters or other approved means. Do not preheat concrete in excess of 200F with final surface temperature below 105F at time of placing epoxy materials.
- B. Application of Epoxy Bonding Agents:
1. Prepare epoxy bonding agent in accordance with manufacturer's recommendations.
 2. Apply epoxy bonding agent to prepared dry concrete surface at coverage of 80 square feet per gallon maximum or as recommended by manufacturer
 3. Epoxy bonding agent may be applied by any convenient and safe method which will yield effective coverage, such as squeegees, brushes or rollers.
 4. During application of epoxy bonding agent, ensure that material is confined to area being bonded; avoid contamination of adjacent surfaces. Extend epoxy bond coat slightly beyond edges of repair area.
- C. Application of Epoxy Mortar:
1. Mix epoxy components in accordance with manufacturer's recommendations.
 2. Proportion: 5-1/2 parts sand by weight to one-part epoxy.
 3. Mix components with slow-speed mechanical device.
 4. Prepare mortar in small batches so that each batch can be completely mixed and placed within approximately 30 minutes.
 5. Do not add thinners or dilutants to mortar mixture.
 6. Immediately after application of epoxy bonding agent, place, tamp, flatten and smooth epoxy mortar.
 7. Work mortar to grade.
 8. Steel-trowel finish. Trowels may be heated to facilitate finishing.
- D. Curing:
1. Cure epoxy mortar repairs immediately after completion at 60F minimum until mortar is hard.
 2. Initiate post-curing of four hours minimum at surface temperature of 90F minimum, 110F maximum.
 3. Heat may be applied by using portable propane heaters, infrared heaters or other approved sources positioned to attain necessary surface temperature.
 4. Do not subject epoxy-bonded epoxy mortar to moisture until after specified post-curing has been completed.

3.16 CONCRETE OVERLAYS AND TILE SETTING BEDS:

- A. General:
1. Water blast (3,000 - 5,000 psi) or sand blast the substrate.
 2. Keep slabs continuously wet for 24 hours prior to concrete placement. Substrate to be air blown just prior to concrete placement.
 3. Place concrete in two pours of equal thickness. Place welded-wire-fabric reinforcement on first pour and then place second pour.
 4. Use a vibratory screed on overlays.
 5. Float slab and apply light broom finish. Cure slabs with water.
 6. Remove laitance by methods in number one above if the overlay requires a bonding surface for tile or other treatments.
 7. Continuously moist cure of overlay (setting bed) for seven (7) days.

END OF SECTION

A. General:

1. Water blast (3,000 - 5,000 psi) or sand blast the substrate.
2. Keep slabs continuously wet for 24 hours prior to concrete placement. Substrate to be air blown just prior to concrete placement.
3. Place concrete in two pours of equal thickness. Place welded-wire-fabric reinforcement on first pour and then place second pour.
4. Use a vibratory screed on overlays.
5. Float slab and apply light broom finish. Cure slabs with water.
6. Remove laitance by methods in number one above if the overlay requires a bonding surface for tile or other treatments.
7. Continuously moist cure of overlay (setting bed) for seven (7) days.

SECTION 03400

STRUCTURAL PRECAST CONCRETE

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. Brentwood Yard
- B. Greenbelt Yard
- C. Shady Grove Yard

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Concrete Formwork: Section 03100.
- B. Concrete Reinforcement: Section 03200.
- C. Cast-in-Place Concrete: Section 03300.
- D. Prestressed Concrete: Section 03415.
- E. Flashing and Reglets: Section 07600.
- F. Quality Control: Section 01428.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ACI: 503.
 - 3. ASTM: A666, C143, C50, C881, C1107.
 - 4. PCI: MNL 116, Plant Certification Program.
- B. Manufacturer's Qualifications: Use only a precast concrete manufacturing plant (or site) certified by PCI Plant Certification Program.
 - 1. Certification is required at time of bidding and throughout construction time.
 - 2. Furnish certification in the following product groups and categories: A1, C3, plus additional certification as appropriate to the visibility and use of precast units required.
 - 3. Furnish name, qualifications and evidence of recent experience on work comparable to that specified.
 - 4. Do not commence work until fabricator has been approved.
- C. Installer qualifications: Use only an experienced, PCI qualified installer who has completed precast concrete work similar in material, design and extent to that indicated for this Project and with a record of successful in-service performance.
- D. Test Units:
 - 1. Prior to production runs of precast elements, cast at least two full-size test units as specified. Perform sampling, testing and frequency of testing in accordance with Section 03300, except as otherwise specified.
 - 2. Mold two cylinders for each casting bed each day it is used or for each 100 cubic yards of concrete or fraction thereof for each precast-concrete structure.

- 3. Test for compressive strength on twenty-eighth day.
- 3. Have tests performed by approved independent testing agency.
- 4. The Engineer may test concrete at any time during fabrication operations.
- 5. Color, texture, finish and workmanship subject to approval.
- E. Uniformity of Materials:
 - 1. To minimize irregularities in color and texture, use same cement, aggregate and water in delivered production units as that used in approved samples and test units.
- F. Repair of Defective Concrete: Effect epoxy-mortar repairs in accordance with ACI 503.4- 7, except as otherwise specified.

1.04 SUBMITTALS

Submit the following for approval in accordance with the General Conditions and with the additional requirements as specified for each:

- A. Shop Drawings:
 - 1. Have drawings and calculations certified by a registered professional engineer who is licensed to practice in the jurisdiction where the work is to be performed and is experienced in the work to be performed.
 - 2. Include details of form fabrication, profiles, joints, reinforcing steel, clips, anchors, inserts, reglets, lifting devices, connection to other work and placement and erection sequence.
- B. Samples:
 - 1. Panels representing color, texture and general finish of test units and production panels, each 12 inches square by 1-1/2 inches: Two. Submit prior to fabrication.
 - 2. Gasket and flashing materials proposed for use, each 12 inches long: Two.
- C. Certification:
 - 1. Certificates from concrete supplier as specified in Section 03300.
 - 2. Certification or published listing of manufacturer per Quality Assurance paragraph above.
- D. Documentation:
 - 1. Prior to installation of units, submit schedule indicating sequence of installation, joints, support and bracing system and anchoring system.
 - 2. Design mix. Submit prior to use for test units.
 - 3. Delivery tickets from concrete supplier in lieu of certification as specified in Section 03300.
- E. Quality Control Plan: Provide production quality control in accordance with the requirements of PC MNL 116.
- F. Keep units under cover and protected until installed.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Concrete: Section 03300, Class 5000 unless otherwise shown; slump of 3-1/2 inches

plus-or-minus 1/2 inch as determined by ASTM C143.

1. Color matching sample on file with the Engineer.
- B. Formwork:
1. One of the following in accordance with Section 03100.
 - a. Fibrous-glass-reinforced plastic forms.
 - b. Steel forms.
 - c. Epoxy-coated concrete forms.
 2. Use largest sizes possible to produce units without visible joints.
- C. Reinforcement Section 03200, welded-wire fabric to be galvanized.
- D. Gaskets:
1. ASTM C509, preformed, expanded closed-cell neoprene sponge, acid-resistant, non-staining, inert to temperature changes, sized to provide constant compression in joint and in pieces as long as practicable to minimize field splices.
 2. Gasket cement Type recommended by gasket manufacturer.
- E. Anchors, Dowels and Accessories Cast Into Precast Units: Steel, hot-dip galvanized.
- F. Joint Connections: Stainless steel, ASTM A666.
- G. Penetrating Concrete Sealer. Silane penetrating sealer as specified in Section 03300.
- H. Sandblasting Sand: One-size silica sand equivalent to Ottawa Sand Grade, graded to pass Size 20 sieve and retained on Size 30 sieve.
- I. Non-shrink Grout Premixed, nonmetallic, non-corrosive, non-staining grout containing selected silica sands, portland cement, shrinkage-compensating agents, plasticizing and water-reducing agents, complying with ASTM C1107, with fluid consistency and a 30-minute working time.
- J. Epoxy Adhesive: Non-sagging. Consist of epoxy resin bonding material and a hardener. Epoxy shall conform to ASTM C881.
- K. Corrosion Inhibitor Calcium nitrite-based corrosion inhibitor as specified in Section 03300.

PART 3 - EXECUTION

3.01 FABRICATION OF TEST UNITS:

- A. In order to determine materials, proportions and techniques which will result in required color, texture, finish and strength and which will be used in precast concrete production, cast at least two full-size test units, using forms, concrete mix proportions, admixtures and methods proposed for production work.
- B. Design mix to conform to Section 03300 and submit for approval prior to use in test units.
- C. Cast test units as directed to simulate production run, incorporating reinforcing and embedded items as shown.
- D. Maintain complete records of proportions, mixing, consolidation and curing procedures during casting.

- E. Prepare a set of at least four test cylinders during casting of each test unit for compressive tests as specified in Section 03300.
- F. If approved, precast-concrete elements may be cured by accelerated method such as steam treatment. The Engineer may direct that test cylinders be cured in accordance with curing process selected in order to determine satisfactory period of hardening of concrete in the units.
- G. Sandblasting and Sealing:
 - 1. After curing and when so directed, sandblast test units to determine conditions for achieving required texture of concrete surface. Use specified silica sand.
 - 2. Determine required surface texture by varying blasting pressure, size of nozzle, duration of blasting and distance between nozzle and surface. Maintain complete records of sandblasting.
 - 3. After sandblasting test units, seal surface with application of sealing compound as specified.
 - 4. Prior to application of sealer, thoroughly clean surface by application of water or air. Apply sealer as recommended by manufacturer.
 - 5. Keep complete record of each sealer application.
 - 6. Utilize approved procedures and materials on the basis of test applications specified for sandblasting and sealing of surfaces of precast-concrete work.
- H. After test units are approved, fabricate units using mix, ingredients, sandblasting technique and sealer formulation used to prepare test units.
- I. If strength, color, texture, finish or workmanship of test units is rejected, cast additional units until units meet requirements and approval is obtained.

3.02 FABRICATION OF PRODUCTION UNITS:

- A. Fabricate units in number and sizes shown and specified to match approved test units.
- B. Deliver units to site in compliance with erection schedule.

3.03 DEFECTIVE AND DAMAGED CONCRETE UNITS:

- A. Do not install units with surface imperfections such as air bubbles, joint lines, warpage, stains, uneven matrix plane or uneven exposure of aggregate or units which are warped, cracked, broken, spalled, stained or otherwise defective

3.04 ERECTION

- A. Lift, support and erect precast members so as to prevent damage or over stressing. Handle precast members by means of lifting inserts, loops or other approved means.
- B. After erection remove lifting loops, bend them over or cut them flush with the surface of the concrete. If insert material may cause stains to surfaces exposed to view, inset cut and patch concrete.
- C. Set members in position properly leveled, aligned and braced as shown.
- D. Install members so that their erected position does not differ from position shown on approved shop drawings by more than allowable tolerances.
- E. Bring defects detected after erection to the attention of the Engineer who will conduct inspection. Where in his opinion structural adequacy is impaired, replace member.

END OF SECTION

SECTION 03400

STRUCTURAL PRECAST CONCRETE

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. Brentwood Yard
- B. Greenbelt Yard
- C. Shady Grove Yard

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Concrete Formwork: Section 03100.
- B. Concrete Reinforcement: Section 03200.
- C. Cast-in-Place Concrete: Section 03300.
- D. Prestressed Concrete: Section 03415.
- E. Flashing and Reglets: Section 07600.
- F. Quality Control: Section 01428.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ACI: 503.
 - 3. ASTM: A666, C143, C50, C881, C1107.
 - 4. PCI: MNL 116, Plant Certification Program.
- B. Manufacturer's Qualifications: Use only a precast concrete manufacturing plant (or site) certified by PCI Plant Certification Program.
 - 1. Certification is required at time of bidding and throughout construction time.
 - 2. Furnish certification in the following product groups and categories: AI, C3, plus additional certification as appropriate to the visibility and use of precast units required.
 - 3. Furnish name, qualifications and evidence of recent experience on work comparable to that specified.
 - 4. Do not commence work until fabricator has been approved.
- C. Installer qualifications: Use only an experienced, PCI qualified installer who has completed precast concrete work similar in material, design and extent to that indicated for this Project and with a record of successful in-service performance.
- D. Test Units:
 - 1. Prior to production runs of precast elements, cast at least two full-size test units as specified. Perform sampling, testing and frequency of testing in accordance with Section 03300, except as otherwise specified.
 - 2. Mold two cylinders for each casting bed each day it is used or for each 100 cubic yards of concrete or fraction thereof for each precast-concrete structure. Test for compressive strength on twenty-eighth day.
 - 3. Have tests performed by approved independent testing agency.
 - 4. The Engineer may test concrete at any time during fabrication operations.

5. Color, texture, finish and workmanship subject to approval.
- E. Uniformity of Materials:
 1. To minimize irregularities in color and texture, use same cement, aggregate and water in delivered production units as that used in approved samples and test units.
- F. Repair of Defective Concrete: Effect epoxy-mortar repairs in accordance with ACI 503.4- 7, except as otherwise specified.

1.04 SUBMITTALS

Submit the following for approval in accordance with the General Conditions and with the additional requirements as specified for each:

- A. Shop Drawings:
 1. Have drawings and calculations certified by a registered professional engineer who is licensed to practice in the jurisdiction where the work is to be performed and is experienced in the work to be performed.
 2. Include details of form fabrication, profiles, joints, reinforcing steel, clips, anchors, inserts, reglets, lifting devices, connection to other work and placement and erection sequence.
- B. Samples:
 1. Panels representing color, texture and general finish of test units and production panels, each 12 inches square by 1-1/2 inches: Two. Submit prior to fabrication.
 2. Gasket and flashing materials proposed for use, each 12 inches long: Two.
- C. Certification:
 1. Certificates from concrete supplier as specified in Section 03300.
 2. Certification or published listing of manufacturer per Quality Assurance paragraph above.
- D. Documentation:
 1. Prior to installation of units, submit schedule indicating sequence of installation, joints, support and bracing system and anchoring system.
 2. Design mix. Submit prior to use for test units.
 3. Delivery tickets from concrete supplier in lieu of certification as specified in Section 03300.
- E. Quality Control Plan: Provide production quality control in accordance with the requirements of PC MNL 116.
- F. Keep units under cover and protected until installed.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Concrete: Section 03300, Class 5000 unless otherwise shown; slump of 3-1/2 inches plus-or-minus 1/2 inch as determined by ASTM C143.
 1. Color matching sample on file with the Engineer.
- B. Formwork:

1. One of the following in accordance with Section 03100.
 - a. Fibrous-glass-reinforced plastic forms.
 - b. Steel forms.
 - c. Epoxy-coated concrete forms.
 2. Use largest sizes possible to produce units without visible joints.
- C. Reinforcement Section 03200, welded-wire fabric to be galvanized.
- D. Gaskets:
1. ASTM C509, preformed, expanded closed-cell neoprene sponge, acid-resistant, non-staining, inert to temperature changes, sized to provide constant compression in joint and in pieces as long as practicable to minimize field splices.
 2. Gasket cement Type recommended by gasket manufacturer.
- E. Anchors, Dowels and Accessories Cast Into Precast Units: Steel, hot-dip galvanized.
- F. Joint Connections: Stainless steel, ASTM A666.
- G. Penetrating Concrete Sealer. Silane penetrating sealer as specified in Section 03300.
- H. Sandblasting Sand: One-size silica sand equivalent to Ottawa Sand Grade, graded to pass Size 20 sieve and retained on Size 30 sieve.
- I. Non-shrink Grout Premixed, nonmetallic, non-corrosive, non-staining grout containing selected silica sands, portland cement, shrinkage-compensating agents, plasticizing and water-reducing agents, complying with ASTM C1107, with fluid consistency and a 30-minute working time.
- J. Epoxy Adhesive: Non-sagging. Consist of epoxy resin bonding material and a hardener. Epoxy shall conform to ASTM C881.
- K. Corrosion Inhibitor Calcium nitrite-based corrosion inhibitor as specified in Section 03300.

PART 3 - EXECUTION

3.01 FABRICATION OF TEST UNITS:

- A. In order to determine materials, proportions and techniques which will result in required color, texture, finish and strength and which will be used in precast concrete production, cast at least two full-size test units, using forms, concrete mix proportions, admixtures and methods proposed for production work.
- B. Design mix to conform to Section 03300 and submit for approval prior to use in test units.
- C. Cast test units as directed to simulate production run, incorporating reinforcing and embedded items as shown.
- D. Maintain complete records of proportions, mixing, consolidation and curing procedures during casting.
- E. Prepare a set of at least four test cylinders during casting of each test unit for compressive tests as specified in Section 03300.
- F. If approved, precast-concrete elements may be cured by accelerated method such as steam treatment. The Engineer may direct that test cylinders be cured in accordance with

curing process selected in order to determine satisfactory period of hardening of concrete in the units.

G. Sandblasting and Sealing:

1. After curing and when so directed, sandblast test units to determine conditions for achieving required texture of concrete surface. Use specified silica sand.
2. Determine required surface texture by varying blasting pressure, size of nozzle, duration of blasting and distance between nozzle and surface. Maintain complete records of sandblasting.
3. After sandblasting test units, seal surface with application of sealing compound as specified.
4. Prior to application of sealer, thoroughly clean surface by application of water or air. Apply sealer as recommended by manufacturer.
5. Keep complete record of each sealer application.
6. Utilize approved procedures and materials on the basis of test applications specified for sandblasting and sealing of surfaces of precast-concrete work.

H. After test units are approved, fabricate units using mix, ingredients, sandblasting technique and sealer formulation used to prepare test units.

I. If strength, color, texture, finish or workmanship of test units is rejected, cast additional units until units meet requirements and approval is obtained.

3.02 FABRICATION OF PRODUCTION UNITS:

- A. Fabricate units in number and sizes shown and specified to match approved test units.
- B. Deliver units to site in compliance with erection schedule.

3.03 DEFECTIVE AND DAMAGED CONCRETE UNITS:

- A. Do not install units with surface imperfections such as air bubbles, joint lines, warpage, stains, uneven matrix plane or uneven exposure of aggregate or units which are warped, cracked, broken, spalled, stained or otherwise defective

3.04 ERECTION

- A. Lift, support and erect precast members so as to prevent damage or over stressing. Handle precast members by means of lifting inserts, loops or other approved means.
- B. After erection remove lifting loops, bend them over or cut them flush with the surface of the concrete. If insert material may cause stains to surfaces exposed to view, inset cut and patch concrete.
- C. Set members in position properly leveled, aligned and braced as shown.
- D. Install members so that their erected position does not differ from position shown on approved shop drawings by more than allowable tolerances.
- E. Bring defects detected after erection to the attention of the Engineer who will conduct inspection. Where in his opinion structural adequacy is impaired, replace member.

END OF SECTION

SECTION 03415

PRESTRESSED AND POST-TENSIONED CONCRETE

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. Brentwood Yard: Not applicable
- B. Greenbelt Yard
- C. Shady Grove Yard: Not Applicable..

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Concrete formwork: Section 03100.
- B. Concrete reinforcement: Section 03200.
- C. Cast-in-place structural concrete: Section 03300.
- D. Precast concrete: Section 03400.

1.03 DEFINITIONS:

- 1. Site or job site: Location where members are to be manufactured.

1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. PCI: MNL 116, Plant Certification Program.
 - 3. ASTM: A416, A421, A722, C109, C404, C618.
- B. Fabricator Qualifications: Use only a prestressed concrete manufacturing plant (or site) certified by PCI Plant Certification Program.
 - 1. Certification is required at time of bidding and throughout construction time.
 - 2. Furnish certification in the following product groups and categories: A1, C3 (if straight strand) or C4 (if draped stand), plus additional certification as appropriate to the visibility and use of prestressed units required.
 - 3. Furnish name, qualifications and evidence of recent experience on work comparable to that specified.
 - 4. Do not commence work until fabricator has been approved.
- C. Installer qualifications: Use only an experienced, PCI qualified installer who has completed prestressed concrete work similar in material, design and extent to that indicated for this Project and with a record of successful in-service performance.
- D. Allowable Tolerances:
 - 1. Fabricate prestressed-concrete members in accordance with dimensional tolerances indicated in referenced PCI standard.
- E. Sampling and Testing:
 - 1. Concrete:

- a. Perform sampling, testing and frequency of testing in accordance with Section 03300, except as otherwise specified.
 - b. Mold three sets of at least two cylinders for each casting bed each day it is used or for each 100 cubic yards of concrete or fraction thereof for each prestressed-concrete structure. In any case, have at least six cylinders cast for each group of members cast from each batch.
 - c. Cure cylinders for stress transfer in same environment as members or structures they represent.
 - d. Test one set for compressive strength at stress transfer and one set on twenty-eighth day.
 - e. Have tests performed by approved independent testing agency.
 - f. The Engineer may test concrete at any time during fabrication operations.
 - g. For major members carrying rapid transit loads or underpinning loads or as directed, perform sampling and testing in accordance with ASTM A416 and ASTM A421.
2. Tendons:
- a. Furnish samples for testing from each size and each heat of prestressing bars, from each manufactured reel of prestressing-steel strand, from each coil of prestressing wire and from each lot of anchorage assemblies and bar couplers to be used. With each sample of prestressing-steel wires, bars or strands furnished for testing, submit certificate stating manufacturer's minimum guaranteed ultimate tensile strength of sample furnished. Prior to installation submit certified test results from each manufacturer for each type of low-relaxation steel.
 - b. Furnish testing materials and equipment.
 - c. Assign individual lot number to bars of each size from each mill heat, wire from each coil, and strand from each manufactured reel to be shipped to site and tag so that each lot can be accurately identified at job site. Likewise, identify each lot of anchorage assemblies and bar couplers to be installed.
 - d. Unidentified prestressing steel, anchorage assemblies or bar couplers received at site will be rejected.
 - e. Submit the following samples of materials and tendons, selected by the Engineer from prestressing steel at plant or jobsite:
 - 1) For wire, strand or bars: One sample of each size from each heat or reel.
 - 2) If prestressing tendon is to be prefabricated, one completely fabricated prestressing tendon five feet in length for each size of tendon, including anchorage assemblies. If the prestressing tendon is to be assembled at jobsite, sufficient wire or strand and end fittings to make up one complete prestressing tendon five feet in length for each size of tendon, including anchorage assemblies.
 - 3) If prestressed tendon is a bar, one five-foot length complete with one end anchorage; if couplers are to be used with the bar, two four-foot lengths of bar equipped with one coupler and fabricated to fit coupler.
 - f. For prefabricated tendons, notify the Engineer at least 10 working days prior to commencing installation of end fittings or heading of wires. The Engineer will inspect end-fitting installations and wire headings while such fabrication is in progress at the plant and will arrange for testing of material to be shipped to the site.
 - g. Do not ship prefabricated tendons to the site until they are released by the Engineer. Tag each tendon before shipment as specified.

- h. Material released by the Engineer will be rejected if subsequently damaged or found defective

1.05 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Shop Drawings:
 - a. Have drawings and calculations for prestressed products certified by a registered professional engineer who is licensed to practice in the jurisdiction where the work is to be performed and who is experienced in the work of this section.
 - b. Include the following:
 - 1) Description of equipment to be used and procedure for constructing prestressed-concrete members.
 - 2) Ductwork and method of holding ducts in position, tendon or bar sizes, splicing of bars, unit weights, materials and stress grade, jack clearances and procedures, stressing sequence, initial-tensioning forces, pressure gauge or load cell for determining loads, calculated friction and elastic-shortening losses and tendon or bar elongation, anchorage details and anchorage-slippage losses, bonding and grouting procedures, mild-steel placement, provisions for camber and clearances and concrete dimensions.
 - 3) Details of procedures for yard and site, handling, transporting, storing and erecting. If necessary, furnish design calculations. Show embedded items including, but not limited to, inserts, anchors, couplings, fittings, vent-hole openings and anchorage pockets. Show method of tendon support for post-tensioned systems during tendon-placing operations.
 - 4) Complete details and substantiating calculations of method and materials proposed for use in prestressing operations, including additions or rearrangement of reinforcing steel from that shown. Calculate, detail and show individual tendon layout and anchorage arrangement to satisfy design requirements and to avoid interferences. Coordinate with embedded items. Changes or rearrangement of details shown permitted only with approval. Ensure that spacing of tendon is sufficient for full encasement of each tendon in concrete. Plan sequence of installation to minimize fitting problem of various components embedded in prestressed member. Show camber computations.
 - 5) Stress/strain curve of tendons and bars. Show amount of slip normally expected in seating anchorage devices as opposed to that assumed in design calculations. Show friction-wobble coefficient and friction-curvature coefficient expected from tendons and bars and duct material. Show complete stress diagram for each tendon size or type.
 - 6) Bills of materials, erection diagrams and details of connections to other work.
 - 7) Details and design calculations for size and thickness of anchor plates and corresponding reinforcement necessary for each system

to guarantee safe transfer of forces into end block. Show amount, size and arrangement of such reinforcement to be installed at anchorage zones and along path of tendons to prevent bursting and splitting concrete members when subjected to prestressing forces. Special Anchorage Devices, as defined by the AASHTO Guide Specifications for Design and Construction of Segmental Concrete Bridges, shall be approved based on the results of testing representing actual jobsite conditions.

2. Working Drawings:
 - a. Complete working drawings and necessary calculations for formwork and falsework.
 - b. Include compensation for deflection as necessary to construct structure to lines and grades shown.
 - c. Consider loads, forces and stresses to be imposed during casting and post-tensioning elements of structure.
 3. Samples: As previously specified.
 4. Certification:
 - a. Tendons:
 - 1) Certificates for each five reels or coils or fraction thereof.
 - 2) Submit certificates prior to delivery of tendons to jobsite.
 - 3) Applicable certificates to accompany each shipment of tendons.
 - b. Hydraulic jacks:
 - 1) Certified calibration curves for each hydraulic jack.
 - c. Certified test reports:
 - 1) Concrete tests.
 - 2) Tendons: For each size of strand to be used in the work, submit test certificates showing physical, chemical and stress/strain test properties including modulus of elasticity and stating guaranteed minimum ultimate tensile and yield strength.
 5. Documentation:
 - a. Specified calculations.
 - b. Records of tendon elongation promptly upon completion of post-tensioning of each member.
- B. Quality Control Plan: Provide production quality control in accordance with the requirements of PCI MNL 116.

1.06 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Prestressing Steel:
 1. Protect prestressing steel against physical damage and rust or other results of corrosion at all times from manufacture to grouting or encasing in concrete. Physically damaged prestressing steel will be rejected. Rust or other corrosion will be cause for rejection.
 2. Package prestressing steel in containers or shipping forms for protection against physical damage and corrosion during shipping and storage. Place corrosion inhibitor

- and rust preventive in package or form or use corrosion-inhibiting carrier-type packaging material. If approved, apply corrosion inhibitor directly to steel.
3. Use corrosion inhibitor which has no deleterious effect on steel, concrete or bond strength of steel to concrete.
 4. Replace or restore to original condition damaged packaging or forms.
 5. Clearly mark shipping package or form with statement that package contains high-strength prestressing steel, and caution that care be used in handling. Show type, kind, amount and placement date of corrosion inhibitor used. Include safety recommendations and instructions for use.
 6. When prestressing steel for post-tensioning is installed in members prior to placing and curing concrete, provide protection against rust or other corrosion, until grouted, by means of corrosion inhibitor placed in ducts or applied to steel in duct.
 7. Do not stress tendons until 28 day compressive strength is verified.

B. Members:

1. Handle, store and transport completed members and member components so as to prevent damage.
2. Maintain beams in upright position.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Concrete:

1. Section 03300: Class 5000, unless otherwise specified.

B. Grout:

1. Materials for grout: Section 03300 and ASTM C404. Pozzolans, if used: ASTM C618.

C. Formwork and Accessories: Section 03100.

D. Reinforcing Steel: Section 03200.

E. Tendons, Anchorage, Couplers and Ducts:

1. Pretensioning tendons:
 - a. Steel strand: ASTM A416, Grade 270, regular or low-relaxation.
 - b. Strand similar to specified steel strand but with different number of wires per strand: As approved.
 - c. Steel wire: ASTM A421.
2. Post-tensioning tendons:
 - a. Strand as specified or shown for pre-tensioning either in single-strand units or in multiple-parallel-strand units, with wedge-type anchorages.
 - b. Button heads to be cold-formed symmetrically about axes of wires so that butt develops minimum guaranteed ultimate tensile strength of wire. Use of cold-forming process that causes indentations in wire is prohibited.
 - c. Prestressing bars:
 - 1) Fabricated and processed in accordance with ASTM A722 and as specified.
 - 2) High-tensile-strength hot-rolled alloy steel, individually cold-stretched and thermally stress-relieved to ensure uniform stress/strain

characteristics and to obtain yield strength not less than 85 percent of required minimum guaranteed ultimate tensile strength.

3)

In accordance with the following minimum requirements:

4)

Properties	Regular Grade	Special Grade
a) Ultimate tensile strength	150,000 psi	160,000 psi
b) Modulus of elasticity at 70 percent of manufacturer's minimum guaranteed ultimate strength	29x10 ⁶ psi	30x10 ⁶ psi

5)

High-strength, thermally stress-relieved, large steel cables with socketed ends fitted with anchorage nuts on peripheries of sockets and meeting required breaking strength, yield strength, elongation, composition and other pertinent requirements may be used if approved. Oil-tempered wires are prohibited.

3. Unbonded tendons are prohibited unless approved.

4. Anchorages and couplers:

a. Steel anchorages and couplers as approved if compatible with particular installation. Anchorage devices to hold prestressing steel at load-producing stress of not less than 95 percent of specified minimum ultimate tensile strength of prestressing steel. Anchorages with cut threads or notches are prohibited on prestressing steel. Fabricate stressing anchorages to provide adjustable-seating loss. Ensure that each anchorage is capable of lift-off, de-tensioning and re-tensioning tendon at any time prior to grouting.

5. Ducts:

a. Galvanized ferrous metal.
 b. Strong enough to retain shape and resist damage during construction.
 c. Capable of preventing entrance of cement paste and water from concrete.
 d. Incapable of causing electrolytic action or deterioration in concrete.
 e. When grouting is necessary, ensure that:
 1) Inside diameter of duct is at least 1/4-inch larger than bar or strand tendons or, in the case of parallel-wire cable tendons, that inside area of duct is at least 100-percent larger than area of tendon.
 2) Ducts have grout holes at each end and at high points.
 3) Ducts have drain holes at low points.
 f. Grout and vent-hole connections to duct made with metallic structural fasteners. Connections to be mortar-tight, taped as necessary. Provide grout holes with means to inject grout. Provide positive shutoff valves.

F. Corrosion Inhibitor: Water-soluble oil; VISCONORUST 84-18, Viscosity Oil Company, or equal.

PART 3 - EXECUTION

3.01 CONCRETE:

- A. Mixing and Placing:
 - 1. Mix concrete in accordance with the requirements of Section 03300, with the following additional requirements:
 - a. Do not use admixtures containing chlorides, fluorides or nitrates.
 - b. Use more than one admixture only if compatible with each other. If used, add separately during batching sequence.
 - 2. Placement of concrete: Section 03300.
- B. Sampling and Testing:
 - 1. Perform sampling and testing as specified.
- C. Concrete Protection for Reinforcement: Section 03200
- D. Compaction of Concrete:
 - 1. Compact concrete by means of internal, external or surface vibrators as approved and as follows:
 - a. Use internal vibrators on sections that are sufficiently large to admit them.
 - b. Use external vibrators on smaller sections and sections produced by extrusion or slip-form method.
 - c. Surface or screed vibrators may be used for flat slabs.
 - 2. Use vibrators having operating frequencies of at least 7,000 impulses per minute and higher frequencies if approved. Use vibrators only for compacting, not for moving concrete along forms.
- E. Patching:
 - 1. Thoroughly clean and hammerpack holes left by tie rods, strand hold-down devices or other temporary inserts with stiff dry mortar made with same type of sand and cement used in concrete. In areas of tensile stress, bond hole patches with approved epoxy resin.
 - 2. Members with honeycombs of such depth as to expose tendons will be examined by the Engineer for structural adequacy. Where in the Engineer's opinion impairment of structural adequacy is apparent, member will be rejected.
 - 3. Where honeycombed areas are to be repaired, remove loose material and cut area back until coarse aggregate breaks under chipping; coat area with layer of epoxy bonding agent and patch with grout matching existing concrete color and strength. Obtain approval of proposed method and materials.
- F. Curing: Section 03300.
- G. Finishes:
 - 1. Types of concrete finishing: As shown and specified.

3.02 FORMS:

- A. Ensure that joints are smooth and tight to prevent leakage of mortar. Maintain accurate alignment of forms during casting operations. Check form alignment and grade for each casting.

- B. Make provisions in form-anchorage system for anticipated differential movement of beds and forms during casting and curing operations. In details of forms, ties, inserts, bulkheads and other accessories, detail forms and anchor them so that differential movement cannot occur or loosen them so that movement can occur without damage to member or forms. Ensure that bearing devices supporting prestressed members are free to rotate and that expansion bearings are free to translate during post-tensioning operation.
- C. Clean beds and forms thoroughly before casting. Do not allow coatings used for bond breakers to accumulate in bottoms of forms. For members to be cured by artificial heat, provide for ventilation of void forms.
- D. In areas subject to freezing and thawing, make provisions for draining voids.
- E. Treat surfaces in contact with concrete with effective bond breaker.
- F. Prevent contamination of tendons by bond breaker, mud, grease or other detrimental substances.
- G. Provide bolting fittings and welding plates for embedment in prestressed members to allow later attachment of conduits, pipes, boxes and similar items.

3.03 JACKS:

- A. Equip each jack used to stress tendons with pressure gauge or load cell to determine jacking stress.
- B. If pressure gauge is used, provide accurate, easily readable dial at least six inches in diameter. Calibrate each jack and its gauge as a unit with cylinder extension in approximate position in which it will be at final jacking force. Provide certified calibration chart as specified.
- C. If inconsistencies occur between measured elongation and jack gauge reading, recalibrate gauge. If further discrepancies occur, determine cause and report to the Engineer. Agreement within seven percent will be satisfactory.
- D. If load cell is used, calibrate and provide with indicator by means of which prestressing force in tendon may be determined. Ensure that range of load cell is such that lower 10 percent of manufacturer's-rated capacity will not be used in determining jacking stress.

3.04 TENDONS:

- A. Placement and Tensioning of Tendons for Prestressing:
 1. Prior to stringing tendons, inspect bottom of forms for cleanliness and accuracy of alignment.
 2. String tendons singly or in multiples.
 3. Splicing of wires or strands is prohibited.
 4. Cut length of each tendon between tendon vise and coil or reel.
 5. Do not string tendons incorporating points previously gripped by tendon vises or wedges within lengths to be stressed. Do not use notched, nicked, pitted, rusted or otherwise damaged tendons.
 6. Provide tendon vises or wedges capable of anchoring stressing loads positively with a minimum of differential slippage. Have vises or wedges cleaned, lubricated and inspected between each use.

7. Discard grips which become visibly worn or distorted or which allow excessive slippage. Furnish full set of cleaned and inspected tendon vises or wedges before commencing each stressing operation. Ensure that vises and wedges are free of rust and physical damage.
8. Position tendons to conform to tensioning detail dimensions shown. Prevent sagging and kinking of tendons. Support tendons as necessary to maintain proper position and prevent vertical movement during pouring of concrete. Permissible deviations from profile shown on approved shop drawings as follows:

	Depth of Member	Permissible Deviation
a)	Less than 10 inches	Plus-or-minus 1/8 inch
b)	Ten inches or more	Plus-or-minus 1/4 inch

9. After straight wire tendons have been positioned, apply initial force to each tendon to eliminate slack and to provide uniform initial-stress condition in all tendons prior to final stressing. Initial force may be applied only by pressure jacks equipped with proper gauging system for measuring initial force.
10. Do not weld or make grounds for welding equipment on forms or on steel in member after prestressing steel has been installed.
11. Maintain records of elongation of each tendon and tension applied to each tendon.
12. Use load cells to calibrate load-measuring devices and to check initial force on at least 10 percent of tendons.
13. Regardless of method used, measure initial load within tolerance of plus-or-minus 50 pounds or two percent, whichever is larger.
14. Do not use elongation measurements as measure of initial stress.
15. Perform final stressing as shown on approved shop drawings.
16. If prestressing bars less than 30 feet long are used, measure elongation by means of dial indicators.

B. Tendon Vises for Pretensioning:

1. Use tendon vises for pretensioning capable of anchoring tendon positively without slippage after seating.
2. Have steel cases for tendon vises proof-tested by manufacturer to at least 95 percent of guaranteed minimum tensile stress of prestressing steel.
3. Maintain chucks in serviceable condition. Discard chucks that become visibly worn or show evidence of allowing post-seating slippage of tendon.

C. Post-Tensioning:

1. Perform sequence and staging of post-tensioning in accordance with approved shop drawings. Perform special techniques, such as overjacking with following reduction of load or jacking from both ends of the tendon, in accordance with approved shop drawings.
2. Stress post-tensioned prestressing steel by means of hydraulic jacks equipped with accurately calibrated, easily readable hydraulic pressure gauges or load cells to permit reading stress in prestressing steel throughout stressing operation.

3. Keep records of tension and elongation of each tendon at all stages and submit records as specified. Make readings of elongations to within plus-or-minus 1/32 inch when dial indicators are used, reading accuracy to be accordingly higher.
4. At the time of stressing first member of each type, check stresses in individual tendons and verify calculated frictional losses and seating losses to establish post-tensioning procedure and ensure uniform results.
5. Recheck may be directed if it appears that stress shown is not being obtained.
6. If the measured elongation is within seven percent, and the jacking force as measured by the pressure gauge is within five percent of theoretical, tendons may be cut and sealed for grouting. If an elongation or force is outside of these limits, obtain written approval before cutting and capping post-tensioned anchorage.
7. If friction losses in post-tensioned tendon exceed calculated friction losses shown, relieve tendons of stress, lubricate with water-soluble oil or graphite spray and retension.
8. Anchor prestressing steel at initial stresses (transfer) calculated to result in final force shown. Initial stress not to exceed 70 percent of minimum ultimate tensile strength of prestressing steel at any point of tendon.
9. During jacking of prestressing steel, do not exceed 80 percent of the minimum guaranteed ultimate tensile strength of tendon.
10. Make accurate measurements of anchorage slippage losses at time of anchoring first tendon of each type of member and compare with assumed slippage losses. In case of deviation, de-tension tendon; repeat tensioning in accordance with special approved procedure or by shimming as necessary for particular system.
11. When necessary and approved, make adjustments to post-tensioning procedure to obtain required stresses.
12. Submit for approval proposed remedy for inconsistencies which occur between measured elongation and jack-gauge readings and which cannot be corrected by specified recalibration of gauge nor by lubrication of tendons. Replace tendon, if necessary.
13. Immediately after concreting, check ducts for obstructions by drawing cleaning device through them, by blowing through or by movement of tendon. Immediately prior to installation of tendons in ducts, demonstrate that ducts are free of water, debris and other obstructions.

3.05 GROUTING:

- A. Immediately prior to grouting, clean ducts of foreign materials and remove corrosion inhibitor by thoroughly flushing duct with water and dry by blowing. Unless prestressing steel is adequately protected from corrosion, complete grouting operation within 28 days after concrete is placed around ducts but not later than 10 days after stressing.
- B. Mix grout as recommended by manufacturer, as tested and approved or for 1-1/2 minutes in high-speed mechanical mixer; pass through strainer into pumping equipment which has provision for recirculation. Begin pumping grout as soon as possible after mixing. Pumping may be continued as long as grout retains proper consistency.
- C. Use grout consisting mainly of cement and water unless gross inside area of duct exceeds five times tendon area, in which case fine sand may be added.
- D. When approved, add aluminum powder of proper fineness or other approved material in quantity sufficient to obtain a maximum of 10-percent expansion of grout when measured unconfined.

- E. Base proportions of materials on results of tests made on grout to achieve the following:
 - 1. Water content: Minimum necessary for proper placement.
 - 2. Water-cement ratio: Limited to maximum of 0.45 by weight.
 - 3. Minimum seven-day compressive strength: 2,500 psi for two-inch cubes molded, cured and tested in accordance with ASTM C109.
- F. Do not retemper grout.
- G. Inject grout into ducts and anchorage fittings. Continue flow until grout of consistency equivalent to that injected, flows from vent openings without presence of air in bubbles. Ensure that there is enough grout in supply bin to prevent suction of air.
- H. Close vent openings progressively in direction of flow. After vent openings are closed, raise grouting pressure to 100-psi minimum and plug injection hole. Keep accurate records of progress of grouting operations.
- I. In the event of blockage or interruption of grouting, remove grout from duct by flushing with water. Provide water pump in standby condition.
- J. Prevent water trapped in ungrouted ducts from freezing.
- K. Maintain temperature of concrete around grouted tendons at 45F or higher for at least three days after grouting.

3.06 STRESS TRANSFER:

- A. Perform stress transfer to pretensioned or post-tensioned members only after concrete strength, as demonstrated by test cylinders, is in accordance with the transfer strength specified or shown.
- B. Minimum transfer strengths of concrete:
 - 1. Centrally stressed members: 3,000 psi.
 - 2. Eccentrically stressed members: 3,500 psi.
 - 3. Bridge beams or other members in which camber must be minimized: 4,000 psi.
 - 4. Post-tensioned members: 4,000 psi or as shown.
- C. If precast concrete has been moist-heat cured, perform de-tensioning immediately following curing period while concrete is still warm and moist.
- D. In de-tensioning operations, release tension so as to minimize eccentricity between resultant of prestressing forces and the vertical centroidal axis of member and so as to minimize sudden or shock loading. Limit maximum eccentricity about vertical centroidal axis to one strand.
- E. Prior to detensioning, remove or loosen forms, ties, inserts, holddowns or other devices that would restrict longitudinal movement of members along bed.

THIS PAGE NOT USED

SECTION 03450

PLANT - ARCHITECTURAL PRECAST CONCRETE

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing precast architectural concrete units and thin-brick-faced, precast architectural concrete units.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Concrete Unit Masonry: Section 04220.
- B. Flashing and Sheet Metal: Section 07600.
- C. Seals and Sealants: Section 07900.

1.03 PERFORMANCE REQUIREMENTS:

- A. Structural Performance: Provide precast architectural concrete units and connections capable of withstanding design loads within limits and under conditions indicated.
- B. Structural Performance: Provide precast architectural concrete units and connections capable of withstanding the following design loads within limits and under conditions indicated:
 - 1. Dead Loads: <Insert applicable dead loads.>
 - 2. Live Loads: <Insert applicable live loads.>
 - 3. Wind Loads: <Insert applicable wind loads or wind-loading criteria including basic wind speed, importance factor, and exposure category.>
 - 4. Earthquake Loads: <Insert applicable earthquake design data including seismic coefficient and importance factor.>
 - 5. Design framing system to maintain clearances at openings, to allow for construction tolerances, and to accommodate live load deflection of primary building structure as follows:
 - a. Upward and downward movement of 1/2 inch.

1.04 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements specified for each:

- A. Product Data: For each type of product indicated.
- B. Design Mixes: For each concrete mix.
- C. Shop Drawings: Detail fabrication and installation of precast architectural concrete units. Indicate member locations, plans, elevations, dimensions, shapes, cross sections, limits of each finish, and types of reinforcement, including special reinforcement.
 - 1. Indicate separate face and backup mix locations and thicknesses.
 - 2. Indicate locations and extent and treatment of dry joints if two-stage casting is proposed.
 - 3. Indicate welded connections by AWS standard symbols. Detail loose and cast-in

- hardware, inserts, connections, and joints, including accessories.
 - 4. Indicate locations and details of anchorage devices to be embedded in other construction.
 - 5. Indicate locations and details of thin brick units and joint treatment.
 - 6. Comprehensive engineering analysis signed and sealed by the qualified professional engineer responsible for its preparation.
- D. Samples: For each type of finish indicated on exposed surfaces of precast architectural concrete units, in sets of 3, illustrating full range of finish, color, and texture variations expected; approximately 12 by 12 by 2 inches.
- E. Samples for each thin brick unit required, including special shapes, showing the full range of colors, textures, and dimensions expected.
- 1. Grout Samples for Initial Selection: Color charts consisting of actual sections of grout showing the manufacturer's full range of colors.
- F. Welding Certificates: Copies of certificates for welding procedures and personnel.
- G. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.
- H. Material Certificates: Signed by manufacturers certifying that each of the following items complies with requirements:
- 1. Concrete materials.
 - 2. Reinforcing materials and prestressing tendons.
 - 3. Admixtures.
 - 4. Bearing pads.
 - 5. Water-absorption test reports.
 - 6. Thin brick units and accessories.

1.05 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
- 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. AASHTO: M251
 - 3. ACI: 211.1, 211.2, 216/TMS 0216.1, 305R, 306.1, 318.
 - 4. AISI: 1018-1020.
 - 5. ANSI: A118.6, 108.10.
 - 6. APA: Architectural Precast Concrete-Color and Texture Selection Guide.
 - 7. ASTM: A27, A36, A47, A82, A108, A123A, A184, A185, A276, A283, A307, A416, A496, A497, A500, A572, A615, A618, A666, A675, A706, A767, A775, A884, C33, C42, C67, C144, C150, C260, C330, C494, C567, C618, C979, C1088, C1017, C1107, C1240, D412, F593.
 - 8. AWS: D1.1, D1.4.
 - 9. CRSI: Manual of Standard Practice.
 - 10. DOD: P-21035A.
 - 11. FS: TT-P-664.
 - 12. PCI: MNL 117, MNL 120, MNL 124.
 - 13. SSPC: PA 1, Paint 20, Paint 25, SP 3.
- B. Installer Qualifications: An experienced installer who has completed precast architectural

concrete work similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.

- C. Fabricator Qualifications: A firm that complies with the following requirements and is experienced in manufacturing precast architectural concrete units similar to those indicated for this Project and with a record of successful in-service performance.
1. Assumes responsibility for engineering precast architectural concrete units to comply with performance requirements. This responsibility includes preparation of Shop Drawings and comprehensive engineering analysis by a qualified professional engineer.
 2. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of precast architectural concrete that are similar to those indicated for this Project in material, design, and extent.
 3. Participates in PCI's Plant Certification program and is designated a PCI-certified plant for Group A, Category A1-Architectural Cladding and Load Bearing Units [or in APA's Plant Certification Program for Production of Architectural Precast Concrete Products and is designated an APA-certified plant].
 4. Has sufficient production capacity to produce required units without delaying the work.
 5. Is registered with and approved by authorities having jurisdiction.
- D. Design Standards: Comply with ACI 318 and the design recommendations of PCI MNL 120, "PCI Design Handbook-Precast and Prestressed Concrete."
- E. Quality Control Standard: For manufacturing procedures and testing requirements, quality control recommendations, and dimensional tolerances for types of units required, comply with PCI MNL 117, "Manual for Quality Control for Plants and Production of Architectural Precast Concrete Products."
- F. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code-Steel"; and AWS D1.4, "Structural Welding Code-Reinforcing Steel."
- G. Calculated Fire-Test-Response Characteristics: Where indicated, provide precast architectural concrete units whose fire resistance has been calculated according to [PCI MNL 124, "Design for Fire Resistance of Precast Prestressed Concrete,"] [ACI 216.1/TMS 0216.1, "Standard Method for Determining Fire Resistance of Concrete and Masonry Construction Assemblies,"] and is acceptable to authorities having jurisdiction.
- H. Sample Panels: Before fabricating precast architectural concrete units, produce sample panels to establish the approved range of selections made under sample Submittals. Produce a minimum of 3 sets of full-scale sample panels, approximately 48 inches long by 48 inches high, to demonstrate the expected range of finish, color, and texture variations.
1. Locate panels where directed by the Engineer.
 2. In presence of the Engineer damage part of an exposed-face surface for each finish, color, and texture, and demonstrate materials and techniques proposed for repair of surface blemishes to match adjacent undamaged surfaces.
 3. Maintain sample panels during construction in an undisturbed condition as a standard for judging the completed Work.
 4. Demolish and remove sample panels when directed

- I. Preinstallation Conference: Conduct conference at Project site to comply with requirements of Division 1 Section "Project Meetings."

1.06 PRODUCT DELIVERY, STORAGE, AND HANDLING:

- A. Deliver precast architectural concrete units to Project site in such quantities and at such times to ensure continuity of installation. Store units at Project site to prevent cracking, distorting, warping, staining, or other physical damage, and so markings are visible.
- B. Lift and support units only at designated lifting and supporting points as shown on Shop Drawings.

1.07 SEQUENCING:

- A. Furnish anchorage items to be embedded in or attached to other construction without delaying the work. Provide setting diagrams, templates, instructions, and directions, as required, for installation.

PART 2 - PRODUCTS

2.01 MOLD MATERIALS:

- A. Molds: Provide molds and, where required, form-facing materials of metal, plastic, wood, or another material that is nonreactive with concrete and dimensionally stable to produce continuous and true precast concrete surfaces within fabrication tolerances and suitable for required finishes
- B. Form Liners: Units of face design, texture, arrangement, and configuration indicated.

2.02 REINFORCING MATERIALS:

- A. Reinforcing Bars: ASTM A 615/A 615M, Grade 60, deformed.
- B. Low-Alloy-Steel Reinforcing Bars: ASTM A 706/A 706M, deformed.
- C. Galvanized Reinforcing Bars: ASTM A 767/A 767M, Class II zinc coated, hot-dip galvanized after fabrication and bending, as follows:
 - 1. Steel Reinforcement: [ASTM A 615/A 615M, Grade 60] [ASTM A 706/A 706M], deformed.
- D. Epoxy-Coated Reinforcing Bars: ASTM A 775/A 775M or ASTM A 934/A 934M, as follows:
 - 1. Steel Reinforcement: [ASTM A 615/A 615M, Grade 60] [ASTM A 706/A 706M], deformed.
- E. Steel Bar Mats: ASTM A 184/A 184M, assembled with clips, as follows:
 - 1. Steel Reinforcement: [ASTM A 615/A 615M, Grade 60] [ASTM A 706/A 706M], deformed bars.
- F. Plain-Steel Wire: ASTM A 82, [as drawn] [galvanized].
- G. Deformed-Steel Wire: ASTM A 496.

- H. Epoxy-Coated-Steel Wire: ASTM A 884/A 884M, Class A coated, [plain] [deformed].
- I. Plain-Steel Welded Wire Fabric: ASTM A 185, fabricated from [as-drawn] [galvanized] steel wire into flat sheets.
- J. Deformed-Steel Welded Wire Fabric: ASTM A 497, flat sheet.
- K. Epoxy-Coated-Steel Welded Wire Fabric: ASTM A 884/A 884M, Class A coated, [plain] [deformed].
- L. Supports: Manufacturer's bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars and welded wire fabric in place according to CRSI's "Manual of Standard Practice," PCI MNL 117, and as follows:
 - 1. For uncoated reinforcement, use [all-plastic] [CRSI Class 1 plastic-protected] [CRSI Class 2 stainless-steel] bar supports.
 - 2. For epoxy-coated reinforcement, use [CRSI Class 1A epoxy-coated or other dielectric-polymer-coated wire] [all-plastic] bar supports
 - 3. For zinc-coated reinforcement, use [galvanized wire or dielectric-polymer-coated wire] [all-plastic] bar supports.

2.03 PRESTRESSING TENDONS:

- A. Prestressing Strand: ASTM A 416/A 416M, Grade 250 or 270, uncoated, 7-wire, low-relaxation strand.

2.04 CONCRETE MATERIALS:

- A. Portland Cement: ASTM C 150, Type I or Type III, [gray] [and] [white], of same type, brand, and source.
 - 1. Standard gray portland cement may be used for nonexposed backup concrete.
- B. Normal-Weight Aggregates: Except as modified by PCI MNL 117, ASTM C 33, with coarse aggregates complying with Class 5S.
 - 1. Face-Mix Coarse Aggregates: Selected, hard, and durable; free of material that reacts with cement or causes staining.
 - a. Gradation: [Uniformly graded] [Gap graded] [To match design reference sample].
 - 2. Face-Mix Fine Aggregates: Selected, natural or manufactured sand of the same material as coarse aggregate, unless otherwise approved by the Engineer.
- C. Lightweight Aggregates: ASTM C 330.
- D. Coloring Admixture: ASTM C 979, synthetic mineral-oxide pigments or colored water-reducing admixtures, temperature stable, nonfading, and alkali resistant.
- E. Water: Potable; free from deleterious material that may affect color stability, setting, or strength of concrete and complying with chemical limits of PCI MNL 117.
- F. Air-Entraining Admixture: ASTM C 260, certified by manufacturer to be compatible with other required admixtures.
- G. Water-Reducing Admixture: ASTM C 494, Type A.

- H. Retarding Admixture: ASTM C 494, Type B.
- I. Water-Reducing and Retarding Admixture: ASTM C 494, Type D.
- J. High-Range, Water-Reducing Admixture: ASTM C 494, Type F.
- K. High-Range, Water-Reducing and Retarding Admixture: ASTM C 494, Type G.
- L. Plasticizing Admixture: ASTM C 1017.
- M. Fly Ash Admixture: ASTM C 618, Class C or F.
- N. Metakaolin Admixture: ASTM C 618, Class N.
- O. Silica Fume Admixture: ASTM C 1240.

2.05 STEEL CONNECTION MATERIALS:

- A. Carbon-Steel Shapes and Plates: ASTM A 36/A 36M.
- B. Carbon-Steel Headed Studs: ASTM A 108, AISI 1018 through AISI 1020, cold finished; AWS D1.1, Type A or B, with arc shields.
- C. Carbon-Steel Plate: ASTM A 283/A 283M.
- D. Malleable Steel Castings: ASTM A 47.
- E. Carbon-Steel Castings: ASTM A 27/A 27M, Grade 60-30.
- F. High-Strength, Low-Alloy Structural Steel: ASTM A 572/A 572M.
- G. Carbon-Steel Structural Tubing: ASTM A 500, Grade B.
- H. Wrought Carbon-Steel Bars: ASTM A 675/A 675M, Grade 65.
- I. Deformed-Steel Wire or Bar Anchors: ASTM A 496 or ASTM A 706/A 706M.
- J. Carbon-Steel Bolts and Studs: ASTM A 307, Grade A; carbon-steel, hex-head bolts and studs; carbon-steel nuts; and flat, unhardened steel washers.
- K. Finish: For exterior steel items, steel in exterior walls, and items indicated for galvanizing, apply zinc coating by [hot-dip process according to ASTM A 123/A 123M, after fabrication, and ASTM A 153/A 153M, as applicable] [electrodeposition according to ASTM B 633, SC 3].
 - 1. Galvanizing Repair Paint: High-zinc-dust-content paint with dry film containing not less than 94 percent zinc dust by weight, and complying with DOD-P-21035A or SSPC-Paint 20.
 - 2. Shop-Primed Finish: Prepare surfaces of nongalvanized steel items, except those surfaces to be embedded in concrete, according to requirements in SSPC-SP 3 and shop-apply [lead- and chromate-free, rust-inhibitive primer, complying with performance requirements in FS TT-P-664] [SSPC-Paint 25] according to SSPC-PA 1.

- L. Reglets: [PVC extrusions.] [Stainless steel.] [Copper.] [Reglets are specified in Section 07600, Flashing and Sheet Metal.]
- M. Welding Electrodes: Comply with AWS standards.
- N. Accessories: Provide clips, hangers, plastic shims, and other accessories required to install precast architectural concrete units.

2.06 STAINLESS-STEEL CONNECTION MATERIALS:

- A. Stainless-Steel Plate: ASTM A 666, Type 304, of grade suitable for application.
- B. Stainless-Steel Bolts and Studs: ASTM F 593, alloy 304 or 316, hex-head bolts and studs; stainless-steel nuts; and flat, stainless-steel washers.
- C. Stainless-Steel Headed Studs: ASTM A 276.

2.07 BEARING PADS:

- A. Provide bearing pads for precast architectural concrete units as follow
 - 1. Elastomeric Pads: AASHTO M 251, plain, vulcanized, 100 percent polychloroprene (neoprene) elastomer, molded to size or cut from a molded sheet, 50 to 70 Shore A durometer, minimum tensile strength 2250 psi per ASTM D 412.
 - 2. Random-Oriented, Fiber-Reinforced Elastomeric Pads: Preformed, randomly oriented synthetic fibers set in elastomer. Surface hardness of 70 to 90 Shore A durometer.
 - 3. Cotton-Duck-Fabric-Reinforced Elastomeric Pads: Preformed, horizontally layered cotton-duck fabric bonded to an elastomer. Surface hardness of 80 to 100 Shore A durometer.
 - 4. Frictionless Pads: Tetrafluoroethylene, glass-fiber reinforced, bonded to mild-steel plate, of type required for in-service stress.
 - 5. High-Density Plastic: Multimonomer, nonleaching, plastic strip.

2.08 GROUT MATERIALS:

- A. Sand-Cement Grout: Portland cement, ASTM C 150, Type I, and clean, natural sand, ASTM C 144. Mix at ratio of 1 part cement to 2-1/2 parts sand, by volume, with minimum water required for placement and hydration.
- B. Nonmetallic, Nonshrink Grout: Premixed, nonmetallic, noncorrosive, nonstaining grout containing selected silica sands, portland cement, shrinkage-compensating agents, plasticizing and water-reducing agents, complying with ASTM C 1107, of consistency suitable for application.

2.09 THIN BRICK UNITS AND ACCESSORIES:

- A. Thin Brick Units: ASTM C 1088, Grade Exterior, Type TBX, [not less than 1/2 inch] [3/4 inch] [1 inch] thick, and as follows:
 - 1. Face Size: Standard, 2-1/4 inches high by 8 inches long.
 - 2. Face Size: Modular, 2-1/4 inches high by 7-1/2 to 7-5/8 inches long.
 - 3. Face Size: Engineer modular, 2-3/4 to 2-13/16 inches high by 7-1/2 to 7-5/8 inches long

4. Face Size: Closure modular, 3-1/2 to 3-5/8 inches high by 7-1/2 to 7-5/8 inches long.
 5. Face Size: Utility, 3-1/2 to 3-5/8 inches high by 11-1/2 to 11-5/8 inches long.
 6. Where shown to "match existing," provide face brick matching color, texture, and face size of existing adjacent brickwork.
 7. Special Shapes: Include corners, edge corners, and end edge corners.
 8. Initial Rate of Absorption: Less than 30 g/30 sq. in. per minute when tested per ASTM C 67.
 9. Efflorescence: Provide brick that has been tested according to ASTM C 67 and is rated "not effloresced."
 10. Surface Coloring: Brick with surface coloring, other than flashed or sand-finished brick, shall withstand 50 cycles of freezing and thawing per ASTM C 67 with no observable difference in the applied finish when viewed from 10 feet
 11. Face Color and Texture: [Match Architect's samples] [Medium brown, wire cut] [Full-range red, sand molded] [Gray, velour].
 12. Back Surface Texture: Scored, combed, wire roughened, or ribbed.
- B. Setting Mortar: Portland cement, ASTM C 150, Type I, and clean, natural sand, ASTM C 144. Mix at ratio of 1 part cement to 4 parts sand, by volume, with minimum water required for placement.
- C. Latex-Portland Cement Pointing Grout: ANSI A118.6 and as follows: Select one or both types of grout from first two subparagraphs below.
1. Dry-grout mixture, factory prepared, of portland cement, graded aggregate, and dry, redispersible, ethylene-vinyl-acetate additive for mixing with water; uniformly colored
 2. Commercial portland cement grout, factory prepared, with liquid styrene-butadiene rubber or acrylic-resin latex additive; uniformly colored.
 3. Colors: [As indicated by manufacturer's designations] [Match Engineer's samples] [As selected by Engineer from manufacturer's full range].

2.10 CONCRETE MIXES:

- A. Prepare design mixes for each type of concrete required. Delete subparagraph below if fly ash or silica fume is not permitted. Revise percentage to suit Project.
1. Limit use of fly ash and silica fume to not exceed, in aggregate, 25 percent of portland cement by weight.
- B. Design mixes may be prepared by a qualified independent testing agency or by qualified precast plant personnel at precast architectural concrete fabricator's option.
- C. Limit water-soluble chloride ions to the maximum percentage by weight of cement permitted by ACI 318.
- D. Normal-Weight Concrete Face and Backup Mixes: Proportion mixes by either laboratory trial batch or field test data methods according to ACI 211.1, with materials to be used on Project, to provide normal-weight concrete with the following properties:
1. Compressive Strength (28 Days): 5000 psi or greater
 2. Maximum Water-Cementitious Materials Ratio: 0.45.
- E. Water Absorption: 12 to 14 percent by volume, tested according to PCI MNL 117.
- F. Lightweight Concrete Backup Mixes: Proportion mixes by either laboratory trial batch or field test data methods according to ACI 211.2, with materials to be used on Project, to provide

lightweight concrete with the following properties:

1. Compressive Strength (28 Days): 5000 psi or greater.
 2. Unit Weight: Calculated equilibrium unit weight of 115 lb/cu. ft., plus or minus 3 lb/cu. ft., according to ASTM C 567.
- G. Add air-entraining admixture at manufacturer's prescribed rate to result in concrete at point of placement having an air content complying with PCI MNL 117.
- H. When included in design mixes, add other admixtures to concrete mixes according to manufacturer's written instructions.

2.11 MOLD FABRICATION:

- A. Molds: Accurately construct molds, mortar tight, of sufficient strength to withstand pressures due to concrete-placement operations and temperature changes and for prestressing operation
1. Place form liners accurately to provide finished surface texture indicated. Provide solid backing and supports to maintain stability of liners during concreting. Coat form liner with form-release agent.
- B. Maintain molds to provide completed precast architectural concrete units of shapes, lines, and dimensions indicated, within fabrication tolerances specified.
1. Edge and Corner Treatment: Uniformly [chamfered] [radiused].

2.12 THIN BRICK FACINGS:

- A. Place form liner templates accurately to provide grid for thin brick facings. Provide solid backing and supports to maintain stability of liners while placing thin bricks and during concreting.
- B. Securely place thin brick units face down into form liner pockets.
- C. Completely fill joint cavities between thin brick units with sand-cement mortar, and place precast concrete backing mix while sand-cement mortar is still fluid enough to ensure bond
1. Mix and install grout according to ANSI 108.10. Completely fill joint cavities between thin brick units with grout, and compress into place without spreading grout onto faces of thin brick units. Remove excess grout immediately to prevent staining of brick.
 2. Tool joints to a [slightly concave] [grapevine] [V-]shape when pointing grout is thumbprint hard.
- D. Clean faces and joints of brick facing.

2.13 FABRICATION:

- A. Cast-in Anchors, Inserts, Plates, Angles, and Other Anchorage Hardware: Fabricate anchorage hardware with sufficient anchorage and embedment to comply with design requirements. Accurately position for attachment of loose hardware, and secure in place during precasting operations. Locate anchorage hardware where it does not affect position of main reinforcement or concrete placement.
- B. Furnish loose steel plates, clip angles, seat angles, anchors, dowels, cramps, hangers, and other hardware shapes for securing precast architectural concrete units to supporting and

adjacent construction.

- C. Cast-in reglets, slots, holes, and other accessories in precast architectural concrete units to receive windows, cramps, dowels, reglets, waterstops, flashings, and other similar work as indicated.
- D. Cast-in openings larger than 10 inches in any dimension.
- E. Reinforcement: Comply with recommendations in CRSI's "Manual of Standard Practice" and PCI MNL 117 for fabricating, placing, and supporting reinforcement.
 - 1. Clean reinforcement of loose rust and mill scale, earth, and other materials that reduce or destroy the bond with concrete.
 - 2. Accurately position, support, and secure reinforcement against displacement during concrete-placement and consolidation operations. Completely conceal support devices to prevent exposure on finished surfaces.
 - 3. Place reinforcement to maintain at least 3/4-inch minimum coverage. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position while placing concrete. Direct wire tie ends away from finished, exposed concrete surfaces.
 - 4. Install welded wire fabric in lengths as long as practicable. Lap adjoining pieces at least one full mesh and lace splices with wire. Offset laps of adjoining widths to prevent continuous laps in either direction.
- F. Reinforce precast architectural concrete units to resist handling, transportation, and erection stresses.
- G. Prestress tendons for precast architectural concrete units by either pretensioning or posttensioning methods. Comply with PCI MNL 117.
 - 1. Delay detensioning or posttensioning of precast, prestressed architectural concrete units until concrete has reached its indicated minimum design release compressive strength as established by test cylinders cured under the same conditions as concrete.
- H. Mix concrete according to PCI MNL 117 and requirements in this Section. After concrete batching, no additional water may be added.
- I. Place face mix to a minimum thickness after consolidation of the greater of 1 inch or 1.5 times the maximum aggregate size, but not less than the minimum reinforcing cover.
- J. Place concrete in a continuous operation to prevent seams or planes of weakness from forming in precast concrete units. Comply with requirements in PCI MNL 117 for measuring, mixing, transporting, and placing concrete.
 - 1. Place backup concrete to ensure bond with face mix concrete.
- K. Thoroughly consolidate placed concrete by internal and external vibration without dislocating or damaging reinforcement and built-in items. Use equipment and procedures complying with PCI MNL 117.
- L. Comply with ACI 306.1 procedures for cold-weather concrete placement.
- M. Comply with ACI 305R recommendations for hot-weather concrete placement.
- N. Identify pickup points of precast architectural concrete units and orientation in structure with permanent markings, complying with markings indicated on Shop Drawings. Imprint or

permanently mark casting date on each precast architectural concrete unit on a surface that will not show in finished structure.

- O. Cure concrete, according to requirements in PCI MNL 117, by moisture retention without heat or by accelerated heat curing using low-pressure live steam or radiant heat and moisture.
- P. Discard precast architectural concrete units that are warped, cracked, broken, spalled, stained, or otherwise defective unless repairs are approved by the Engineer.

2.14 FABRICATION TOLERANCES:

- A. Fabricate precast architectural concrete units straight and true to size and shape with exposed edges and corners precise and true so each finished panel complies with the following product tolerances:
 - 1. Overall Height and Width of Units, Measured at the Face Exposed to View: As follows:
 - a. 10 feet or under, plus or minus 1/8 inch.
 - b. 10 to 20 feet, plus 1/8 inch, minus 3/16 inch.
 - c. 20 to 40 feet, plus or minus 1/4 inch.
 - d. Each additional 10 feet, plus or minus 1/16 inch.
 - 2. Overall Height and Width of Units, Measured at the Face Not Exposed to View: As follows:
 - a. 10 feet or under, plus or minus 1/4 inch.
 - b. 10 to 20 feet, plus 1/4 inch, minus 3/8 inch.
 - c. 20 to 40 feet, plus or minus 3/8 inch.
 - d. Each additional 10 feet, plus or minus 1/8 inch.
 - 3. Total Thickness or Flange Thickness: Plus 1/4 inch, minus 1/8 inch.
 - 4. Rib Thickness: Plus or minus 1/8 inch.
 - 5. Rib to Edge of Flange: Plus or minus 1/8 inch.
 - 6. Distance between Ribs: Plus or minus 1/8 inch
 - 7. Variation from Square or Designated Skew (Difference in Length of the Two Diagonal Measurements): Plus or minus 1/8 inch per 72 inches or 1/2 inch total, whichever is greater.
 - 8. Length and Width of Block-outs and Openings within One Unit: Plus or minus 1/4 inch.
 - 9. Location and Dimension of Block-outs Hidden from View and Used for HVAC and Utility Penetrations: Plus or minus 3/4 inch.
 - 10. Dimensions of Haunches: Plus or minus 1/4 inch.
 - 11. Haunch Bearing Surface Deviation from Specified Plane: Plus or minus 1/8 inch.
 - 12. Difference in Relative Position of Adjacent Haunch Bearing Surfaces from Specified Relative Position: Plus or minus 1/4 inch.
 - 13. Bowing: Plus or minus L/360, maximum 1 inch.
 - 14. Local Smoothness: 1/4 inch per 10 feet.
 - 15. Variation between Adjacent Thin-Brick-Facing Products: 1/16 inch.
 - 16. Warping: 1/16 inch per 12 inches of distance from the nearest adjacent corner.
 - 17. Tipping and Flushness of Plates: Plus or minus 1/4 inch.
 - 18. Dimensions of Architectural Features and Rustications: Plus or minus 1/8 inch.
- B. Position Tolerances: For cast-in items measured from datum line location, as indicated on Shop Drawings.
 - 1. Weld Plates: Plus or minus 1 inch.
 - 2. Inserts: Plus or minus 1/2 inch.

3. Handling Devices: Plus or minus 3 inches
4. Reinforcing Steel and Welded Wire Fabric: Plus or minus 1/4 inch where position has structural implications or affects concrete cover; otherwise, plus or minus 1/2 inch.
5. Reinforcing Steel Extending out of Member: Plus or minus 1/2 inch of plan dimensions.
6. Tendons: Plus or minus 1/4 inch, vertical; plus or minus 1 inch, horizontal
7. Location of Rustication Joints: Plus or minus 1/8 inch.
8. Location of Opening within Panel: Plus or minus 1/4 inch.
9. Flashing Reglets: Plus or minus 1/4 inch.
10. Flashing Reglets at Edge of Panel: Plus or minus 1/8 inch.
11. Reglets for Glazing Gaskets: Plus or minus 1/8 inch.
12. Electrical Outlets, Hose Bibs: Plus or minus 1/2 inch.
13. Haunches: Plus or minus 1/4 inch.
14. Allowable Rotation of Plate, Channel Inserts, Electrical Boxes: 2-degree rotation or 1/4 inch maximum over the full dimension of the unit.

2.15 FINISHES:

- A. Finish exposed-face surfaces of precast architectural concrete units to match approved design reference sample and as follows:
 1. Design Reference Sample: <Insert description and identify fabricator and code number of sample.>
 2. PCI and APA's "Architectural Precast Concrete-Color and Texture Selection Guide," of plate numbers indicated.
 3. Smooth-Surface Finish: Provide surfaces free of pockets, sand streaks, and honeycombs, with uniform color and texture.
 4. Textured-Surface Finish: Impart by form liners or inserts to provide surfaces free of pockets, streaks, and honeycombs, with uniform color and texture.
 5. Bushhammer Finish: Use power or hand tools to remove matrix and fracture coarse aggregates.
 6. Retarded Finish: Use chemical retarding agents applied to concrete forms and washing and brushing procedures to expose aggregate and surrounding matrix surfaces after form removal.
 7. Abrasive-Blast Finish: Use abrasive grit, equipment, application techniques, and cleaning procedures to expose aggregate and surrounding matrix surfaces.
 8. Acid-Etched Finish: Use acid and hot-water solution, equipment, application techniques, and cleaning procedures to expose aggregate and surrounding matrix surfaces.
 9. Honed Finish: Use continuous mechanical abrasion with fine grit, followed by filling and rubbing procedures.
 10. Polished Finish: Use continuous mechanical abrasion with fine grit, followed by filling and rubbing procedures.
 11. Sand-Embedment Finish: Use selected stones placed in a sand bed in bottom of mold, with sand removed after curing.
 12. Finish exposed [top] [bottom] [and back] surfaces of precast architectural concrete units to match face-surface finish.
- B. Finish exposed [top] [bottom] [and back] surfaces of precast architectural concrete units by smooth, steel-trowel finish.
- C. Finish unexposed surfaces of precast architectural concrete units by float finish.

2.16 SOURCE QUALITY CONTROL:

- A. The Authority will employ an independent testing agency to evaluate precast architectural concrete fabricator's quality-control and testing methods.
 - 1. Allow the Authority's testing agency access to material storage areas, concrete production equipment, concrete placement, and curing facilities. Cooperate with the Authority's testing agency and provide samples of materials and concrete mixes as may be requested for additional testing and evaluation.
- B. Quality-Control Testing: Test and inspect precast concrete according to PCI MNL 117 requirements.
- C. Strength of precast concrete units will be considered deficient if units fail to comply with ACI 318 requirements.
- D. Testing: If there is evidence that the strength of precast concrete units may be deficient or may not comply with ACI 318 requirements, the Authority will employ an independent testing agency to obtain, prepare, and test cores drilled from hardened concrete to determine compressive strength according to ASTM C 42.
 - 1. A minimum of three representative cores will be taken from units of suspect strength, from locations directed by the Engineer.
 - 2. Cores will be tested in an air-dry condition.
 - 3. Strength of concrete for each series of 3 cores will be considered satisfactory if the average compressive strength is equal to at least 85 percent of the 28-day design compressive strength and no single core is less than 75 percent of the 28-day design compressive strength.
 - 4. Test results will be made in writing on the same day that tests are performed, with copies to the Engineer, Contractor, and precast concrete fabricator. Test reports will include the following:
 - a. Project identification name and number.
 - b. Date when tests were performed.
 - c. Name of precast concrete fabricator.
 - d. Name of concrete testing agency.
 - e. Identification letter, name, and type of precast concrete unit or units represented by core tests; design compressive strength; type of break; compressive strength at breaks, corrected for length-diameter ratio; and direction of applied load to core in relation to horizontal plane of concrete as placed.
- E. Patching: If core test results are satisfactory and precast concrete units comply with requirements, clean and dampen core holes and solidly fill with precast concrete mix that has no coarse aggregate, and finish to match adjacent precast concrete surfaces.
- F. Defective Work: Precast architectural concrete units that do not comply with requirements, including strength, manufacturing tolerances, and finishes, are unacceptable. Replace with precast concrete units that comply with requirements.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine substrates and conditions for compliance with requirements for installation tolerances, true and level bearing surfaces, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.
- B. Do not install precast concrete units until supporting concrete has attained minimum design compressive strength.

3.02 INSTALLATION

- A. Install clips, hangers, and other accessories required for connecting precast architectural concrete units to supporting members and backup materials.
- B. Install precast architectural concrete. Provide temporary supports and bracing as required to maintain position, stability, and alignment as units are being permanently connected.
 - 1. Install bearing pads as precast concrete units are being erected.
 - 2. Maintain horizontal and vertical joint alignment and uniform joint width as erection progresses.
 - 3. Remove projecting hoisting devices and use sand-cement grout to fill voids within recessed hoisting devices flush with surface of concrete.
- C. Anchor precast architectural concrete units in position by bolting, welding, grouting, or as otherwise indicated. Remove temporary shims, wedges, and spacers as soon as possible after anchoring and grouting are completed.
- D. Welding: Perform welding in compliance with AWS D1.1 and AWS D1.4, with qualified welders.
 - 1. Protect precast architectural concrete units and bearing pads from damage by field welding or cutting operations and provide noncombustible shields as required.
 - 2. Repair damaged steel surfaces by cleaning and applying a coat of galvanizing repair paint to galvanized surfaces.
 - 3. Repair damaged steel surfaces by cleaning and repriming damaged painted surfaces.
- E. At bolted connections, use lock washers or other acceptable means to prevent loosening of nuts.
- F. Grouting Connections: Grout connections where required or indicated. Retain grout in place until hard enough to support itself. Pack spaces with stiff grout material, tamping until voids are completely filled. Place grout to finish smooth, level, and plumb with adjacent concrete surfaces. Keep grouted joints damp for not less than 24 hours after initial set. Promptly remove grout material from exposed surfaces before it affects finishes or hardens.

3.03 ERECTION TOLERANCES:

- A. Install precast architectural concrete units level, plumb, square, and true, without exceeding the following noncumulative erection tolerance
 - 1. Plan Location from Building Grid Datum: Plus or minus 1/2 inch.
 - 2. Plan Location from Centerline of Steel: Plus or minus 1/2 inch.
 - 3. Top Elevation from Nominal Top Elevation: As follows:
 - a. Exposed Individual Panel: Plus or minus 1/4 inch.
 - b. Nonexposed Individual Panel: Plus or minus 1/2 inch.
 - c. Exposed Panel Relative to Adjacent Panel: 1/4 inch.
 - d. Nonexposed Panel Relative to Adjacent Panel: 1/2 inch.
 - 4. Support Elevation from Nominal Support Elevation: As follows:

- a. Maximum Low: 1/2 inch.
- b. Maximum High: 1/4 inch.
- 5. Maximum Plumb Variation over the Lesser of Height of Structure or 100 Feet: 1 inch.
- 6. Plumb in Any 10 Feet of Element Height: 1/4 inch.
- 7. Maximum Jog in Alignment of Matching Edges: 1/4 inch.
- 8. Joint Width (Governs over Joint Taper): Plus or minus 1/4 inch.
- 9. Maximum Joint Taper: 3/8 inch.
- 10. Joint Taper in 10 Feet: 1/4 inch.
- 11. Maximum Jog in Alignment of Matching Faces: 1/4 inch.
- 12. Differential Bowing or Camber, as Erected, between Adjacent Members of Same Design: 1/4 inch.

3.04 FIELD QUALITY CONTROL:

- A. Testing: The Authority will engage a qualified independent testing and inspecting agency to perform field tests and inspections
- B. Field welds and connections using high-strength bolts will be subject to tests and inspections.
- C. Testing agency will report test results promptly and in writing to Contractor and the Engineer.
- D. Remove and replace work that does not comply with specified requirements.
- E. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of corrected work with specified requirements.

3.05 REPAIRS:

- A. Repair exposed exterior surfaces of precast architectural concrete units to match color, texture, and uniformity of surrounding precast architectural concrete if permitted by the Engineer.
- B. Remove and replace damaged precast architectural concrete units if repairs do not comply with requirements.

3.06 CLEANING:

- A. Clean exposed surfaces of precast concrete units after erection to remove weld marks, other markings, dirt, and stains.
 - 1. Wash and rinse according to precast concrete fabricator's written recommendations. Protect other work from staining or damage due to cleaning operations.
 - 2. Do not use cleaning materials or processes that could change the appearance of exposed concrete finishes.

END OF SECTION

THIS PAGE NOT USED

SECTION 04050

MORTAR, GROUT AND MASONRY ACCESSORIES

PART 1 - GENERAL

1.01 SUMMARY OF WORK

- A. This section specifies furnishing mortar, grout, and accessories for masonry work, including brick masonry, concrete unit masonry, granite and other stone masonry. The installation of such material is specified in the various masonry sections.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Brick masonry: Section 04215.
- B. Concrete unit masonry: Section 04220.
- C. Precast concrete panels: Section 03415.
- D. Seals and sealants: Section 07900.
- E. Flashing and sheetmetal: Section 07600.
- F. Miscellaneous metals: Section 05500.
- G. Concrete formwork: Section 03100.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Shop Drawings:
 - a. Manufacturer's data: Recommendations for use of materials, preparation of substrate, limitations and special instructions for materials necessary to the work.
 - b. Granite: Section 04415.
 - 2. Samples:
 - a. Three of each type of the following products used in the work:
 - 1) Mortars: Cured samples showing color of each type.
 - 2) Accessories: Representative samples of each type.
 - 3) Certification.

1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ASTM: A36, A82, A153, A276, A666, A775, C114, C144, C150, C207, C270, C476, C665, C780, C881, C1019, D570, D638, D695, D1525, D2000, D2240, F593, F594.
 - 3. FS: HH-I-521.
- B. Source Quality Control:
 - 1. Obtain mortar ingredients of a uniform quality, including color for exposed masonry, from one manufacturer for each cementitious component and from one source or producer for each aggregate.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to job site in their original unopened containers clearly labeled with manufacturer's name and brand designation, referenced specification number, type and class as applicable.
- B. Store products so as to prevent water intrusion, dampness and deterioration. Store loose materials sand and aggregates so as to prevent intrusion of foreign materials.
- C. Handle products so as to prevent breakage of containers and damage to products.

1.06 JOB CONDITIONS:

- A. Environmental Requirements:
 - 1. Do not use materials or aggregates that are covered with frost. Do not mix mortar when the temperature is below that specified for masonry work.
 - 2. Provide protective covering and heat as specified for masonry work.
 - 3. Perform work under environmental conditions consistent with manufacturer's recommendations for materials being used in the work.

PART 2 - PRODUCTS

2.01 MORTAR AND GROUT MATERIALS:

- A. Cement:
 - 1. ASTM C150, Type I, portland cement, packaged in one-cubic-foot waterproof bags.
 - a. For exterior walls, use low alkali cement; maximum 0.60 percent total alkali when tested according to ASTM C114.
 - b. For below grade use type II cement and lime.
 - 2. Cement for brick masonry:
 - a. Factory-prepared, color-blended with nonstaining, inorganic coloring pigment.
 - b. Pigments not to exceed 10 percent of weight of cement.
 - c. Pigment blended in such quantity to produce cured mortar color matching face brick when mixed with hydrated lime and fine aggregate.
- B. Hydrated Lime:
 - 1. ASTM C207, Type S.
 - 2. Uniform color for similar work.
- C. Fine Aggregate: Clean, sharp, masonry sand, ASTM C144. For joints less than 1/4 inch, grade aggregate with 100 percent passing the Number 16 sieve.
- D. Water: Potable.
- E. Pigment: As necessary to produce colored mortar matching color of brick unless otherwise indicated.
- F. Admixtures: Do not add admixtures including air-entraining agents, accelerators, retarders, water repellent agents, antifreeze compounds, or other admixtures unless otherwise indicated.

2.02 MORTAR AND GROUT MIXES:

- A. Mortar Mixes for Brick Masonry: ASTM C270, types as follows:
 - 1. Type S: For exterior loadbearing masonry and for masonry in contact with earth, proportioned by volume as follows:
 - a. Portland cement: One part.
 - b. Hydrated lime: 1/4 to 1/2 part.
 - c. Fine aggregate: Not less than 2-1/2 nor more than three times sum of volumes of cement and lime.
 - d. Pigment: As necessary to produce colored mortar matching color of brick unless otherwise indicated.
 - 2. Type N: For interior non loadbearing masonry, proportioned by volume as specified for Type S, except 1/2 to 1-1/4 parts hydrated lime.
 - 3. Color: As shown or as selected by the Engineer.
- B. Mortar Mixes for Concrete Unit Masonry: As specified for brick masonry, except pigment not required.
- C. Grout: For setting steel lintels and similar items, grouting mortar composed of one-part portland cement and two parts fine aggregate with sufficient lime putty added to obtain quick set.
- D. Preshrunk Mortar: Dry, premixed, ready-to-use formulation.

2.03 ACCESSORIES:

- A. Continuous joint reinforcement:
 - 1. Accessories for Brick and Concrete Unit Masonry:
 - a. Prefabricated continuous-reinforcing tie system fabricated of wire conforming to ASTM A82. Flush-welded cross ties, nine-gauge wire, hot-dip galvanized after fabrication in accordance with ASTM A153, Class B2, 1.50 ounces for side and cross rods.
 - b. Fabricate joint reinforcement in straight lengths of not less than 10 feet of truss design with continuous diagonal cross ties spaced maximum 16 inches o.c.
 - 1) Make width of unit 1-1/2 inches to two inches less than thickness of wall.
 - 2) For multi-wythe wall, provide one side rod for each face shell of masonry more than four inches in width; plus one side rod for each wythe of masonry four inches or less in width.
 - 3) At cavity walls, provide integral drips on cross rods. Where horizontal joints of outer wythe does not align with back-up joints, provide adjustable two-piece tab design to engage the outer wythe by at least 1-1/2 inches.
 - c. Corner reinforcement: Prefabricated, shop-welded corner-L and intersection-T units matching the continuous wall units.
 - d. Spacing: See related work sections.
 - 2. Dovetail anchors:
 - a. Flexible, adjustable or corrugated 1-inch wide dovetail anchors of 12 gauge galvanized steel. Place anchors every 16 inches in height of wall at intersections of masonry walls and concrete, and for masonry furring of concrete. Dovetail slots are specified in Section 03100, by same manufacturer of anchors.
 - 3. Wall plugs:
 - a. Galvanized 26-gauge corrugated metal, approximately three inches long and of standard manufacture, where necessary for attaching other work.

4. Z-type rigid-steel anchors: Steel, ASTM A36, 1/4-inch thick by 1-1/2 inches wide by 28 inches long, galvanized; with one two-inch opposing 90-degree bend at each end.
5. Corrugated-steel anchors: 14 gauge by 1-1/4 inches by 20 inches with one two-inch 90-degree bend, with 18 inches of corrugation.
6. Steel framing anchors: Fabricated of 3/16-inch galvanized wire tie and galvanized flat-steel strap one-inch wide by 22 gauge or 3/4-inch wide by 12 gauge.
7. Weep-hole tubes: 3/8-inch OD, medium density, nonstaining, polyethylene tubes of lengths ensuring complete panel penetration and unobstructed flow. Fire-resistant compressible filler: Inorganic, non-asbestos mineral fiber safing insulation, with foil facing to impede smoke passage; moisture resistant, mildew-proof and vermin-proof, noncorrosive and nondeteriorating; UL-listed; meeting ASTM C665 and FS HH-I-521 Type III, except for identification marking.
8. Control joint gasket: Solid styrene-butadiene-rubber compound per ASTM D2000, 2AA-805, factory extruded into shapes for use with standard sashblock to provide stability to masonry walls at expansion and control joints; minimum shear strength 540 psi, durometer hardness 80 (plus or minus 5) per ASTM D2240. Provide T-shape and X-shape for vertical joints as appropriate, flat shape beneath load-relieving angles.
9. Cavity Drainage System: 1 inch thick by 10 inches high by 5 feet long section of high density polyethylene or nylon mesh designed to allow moisture to flow downward in cavity joint.
10. Masonry Cell Insulation: Molded polystyrene Insulation Units - Rigid, cellular thermal insulation formed by the expansion of polystyrene - resin beads or granules in a closed mold to comply with ASTM 578, Type I. Provide specially shaped units designed for installing in cores of masonry units.

B. Steel lintels: Section 05500.

C. Masonry lintels: Section 04220.

D. Flashing: Section 07600.

PART 3 - EXECUTION

3.01 MIXING OF MORTAR:

- A. Mix mortar materials in an approved clean mechanical mixer for at least three minutes and not more than five minutes with a minimum amount of water to produce workable consistency.
- B. Mortar which has stiffened because of evaporation of water may be retempered by adding water as needed to restore necessary consistency. Use mortar within 2-1/2 hours of initial mixing.
- C. Use an approved method of measuring materials and mortar that will control and accurately maintain specified proportions throughout the work. Shovel measure is prohibited. Measure sand in damp, loose condition.
- D. Apply pre-shrunk mortar in accordance with the manufacturer's instructions.
- E. For alteration and restoration work, tint or modify mix to match mortar of existing masonry.
- F. The Engineer may direct a test of the mortar in accordance with ASTM C780 and a test of the grout for compressive strength per ASTM C1019 to establish compliance with specified requirements.

END OF SECTION

SECTION 04215
BRICK MASONRY

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing brick masonry.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Mortar, grout and masonry accessories: Section 04050.
- B. Miscellaneous metal: Section 05500.
- C. Seals and sealants: Section 07900.
- D. Demolition: Section 02220.
- E. Concrete Unit Masonry: Section 04220.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Samples:
 - 1. Three sets of each type of the following products used in the work:
 - a. Face brick: Assemble each set to show the complete variation and percentage proportion of color, texture and other variable properties of appearance.
 - 1) Size and shape for general use.
 - 2) Special shapes and sizes used in the work.
 - b. Common brick.
 - 2. Brick panels:
 - a. Construct sample masonry panels of exposed brick masonry, of size not less than four feet square by eight inches thick incorporating reinforcement, flashing, face brick and backup units. Construct sample panel on site, with face brick facing same direction as major facade of the work.
 - b. If necessary to produce an acceptable standard of appearance and workmanship, construct additional panels until approved.
 - c. Use types of material, color variation, mortar, bond, thickness and tooling of joints, method of laying and workmanship typical and standard for the installation. Clean sample panel as specified for finished work.
 - d. Maintain panels in good condition and protect from moisture penetration until completion of masonry work and removal is directed.
- B. Certification.

1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.

2. BIA: Technical Notes on Brick Construction No. 7B.
 3. ASTM: C62, C216.
- B. Source Quality Control:
1. All brick used in the work to be from the same run.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to the job site in good condition.
- B. Keep products dry. Prevent contact with soil.
- C. Handle products so as to prevent chipping and breaking.

1.06 JOB CONDITIONS:

- A. Environmental Requirements:
1. The following are prohibited:
 - a. Use of products that are covered with frost.
 - b. Erection of masonry when temperature is below 40F or tending to fall below 40F, unless suitable fireproof protective covering and heat are provided to maintain work and materials above 40F.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. General:
1. For alteration and restoration work:
 - a. Provide bricks of same size, type, grade and appearance as existing brick work.
 - b. Brick salvaged under Section 02220 may be used if approved.
- B. Face Brick:
1. ASTM C216, Type FBS, Grade SW, wire-cut.
 2. Size 2-1/4 inches by 3-5/8 inches by 7-5/8 inches.
 3. Color: To match existing
 4. Special shapes: 100-percent solid for the following locations:
 - a. Flat header wall caps.
 - b. End units on rowlock header wall caps.
 - c. Corners of soldier courses.
 - d. Corbels.
 - e. Pierced screen walls.
 - f. Where construction would result in exposed cores.
 - g. Where shown.
- C. Common Brick:
1. ASTM C62, wire-cut; Grade SW.
 2. First quality, hard grade, standard size.
- D. Cleaning Solution:
1. Formulated for cleaning new brick work, containing no acid.

2. Type which will not stain, discolor or otherwise adversely affect surfaces with which it comes into contact.
- E. Asphalt-Coated Copper Flashing: 5-oz./sq/ft. (2-kg/sq/m) copper sheet coated with flexible asphalt. Use only where flashing is fully concealed in masonry.
1. Available Products:
 - a. Advanced Building Products Inc.; Cop-R-Cote
 - b. AFCO Products, Inc.; Cop-R-Cote
 - c. Hohmann & Barnard, Inc.; H & B C-Coat Flashing.
 - d. Phoenix Building Products; Type ACC-Asphalt Bituminous Coated.
 - e. Polytime manufacturing Corp.; Coated Copper Flashing.
 - f. Sandell manufacturing Co., Inc.; Coated Copper Flashing.
 - g. York Manufacturing, Inc.; Copperseal.
- F. Accessories: Section 04050.
- G. Steel Lintels and Shelf Angles: Section 05500.

PART 3 - EXECUTION

3.01 PREPARATION:

- A. Remove dirt, debris, oil, grease and other foreign matter from surfaces to receive brick masonry.
- B. Built-In Work:
 1. Verify and coordinate locations of chases and openings for pipes, conduit, ducts and locations of flashing and weep holes.
 2. Establish layout lines and verify proper setting of bucks and frames.

3.02 ERECTION:

- A. Construct masonry as recommended in BIA Technical Notes on Brick Construction Number 7B, Water Resistance of Brick Masonry Construction and Workmanship Part III of III.
- B. Erect new masonry to conform to approved sample panels. For alteration and restoration work, match existing masonry.
- C. Erect adjoining walls simultaneously. Do not erect walls more than five feet above adjoining walls. Toothing is prohibited. Cover and protect tops of unfinished walls. Protect cavities from mortar and debris.
- D. Plumb piers and walls. Level brick courses using uniform joint thickness. Use power-driven, masonry saws for cutting material. Build external corners square, unless otherwise shown.
- E. Provide structural and pattern bonding as shown or as specified.
- F. Place reinforcement and build in openings for pipes, conduits, ducts, chases and other work as shown.

- G. Grout and set in place steel lintels furnished by other trades for openings in masonry walls.
- H. Install flashing, reglets and weep holes over lintels and where shown. Lap joints in flashing four inches minimum and bond with mastic. Install through-wall flashing to within ½ inch of inside and outside faces of wall. Set flashing in full bed of mortar and trowel full bed of mortar to ensure complete contact.
- I. Use facing brick for exposed brickwork. Select face brick from various stock piles so that they may be integrated to prevent segregating color ranges and bricks from different runs. Use same color mortar proportions throughout work.
- J. Prior to laying face brick, lay out work so that bond and design are maintained plumb and level and joints are of uniform width throughout the work.
- K. Do not use segments of bricks less than one half in size at corners or at openings. Use same sizes of bricks or same sizes of brick segments in same course at each side of jambs of openings or piers. Where cutting of units is necessary, use motor driven masonry saw.
- L. Thoroughly drench brick with water just before laying. Cover brick uniformly with mortar, shove and press into place, with no voids in wall joints, at window frames or at door frames.
- M. Where dovetail anchors are required, provide anchors vertically at each slot, maximum 16 inches on center and solidly fill in joints against concrete with mortar. Ensure that joints at anchors and bond courses are filled.
- N. Unless otherwise shown, use 3/8-inch concave joints, carefully tooled to form smooth, dense surface. Avoid burrs at intersections and mortar discoloration.
- O. Lay face brick from exterior with bed joints, head joints and collar joints full and level, faces plumb, joints uniform and bonds accurate.
- P. For alteration and restoration work, provide beds, coursing and face joints to match existing brick masonry precisely.
- Q. Place continuous joint reinforcement in courses 16 inches on center as shown. Use specially fabricated sections at corners and intersections.
- R. Provide expansion and control joints in masonry walls as shown. Ensure that joints are straight, uniform and of thickness shown. Ensure that clear joints are free of water, mortar and other obstructions. Leave continuous open joint for caulking and sealing in accordance with Section 07900. Provide cavity drainage system on top of the flashing inside the cavity. Drainage system shall be continuous at cell cavity flashing.
- S. Masonry anchors and accessories: In accordance with Sections 04050 and 04220.
- T. Accessories: Section 04050.
- U. Fill jambs of hollow metal frames solid with grout, as laying of brick progresses.
- V. As the work progresses, clean masonry with stiff brush before mortar sets.
- W. Install steel lintels where shown on Contract Documents or approved shop drawings.

3.03 REPAIRING, POINTING AND CLEANING:

A. Repairing:

1. Remove and replace units that are loose, chipped, broken, stained or otherwise damaged; or if units do not blend properly with adjoining units. Install item units to match adjoining units and in fresh mortar, pointed to eliminate evidence of replacement.

B. Pointing:

1. When approved, point holes in joints of exposed brick masonry surfaces by completely filling with preshrunk mortar.
 - a. Pre-wet joint and holes before pointing.
 - b. Tool to match adjacent joints. Protect from premature drying.
2. Correct defective joints by cutting out mortar and solidly refilling with new mortar.
3. Point exposed raked joints of brick masonry with mortar and tool to match approved sample panel.
4. Pre-wet holes and joints before pointing. Protect masonry from premature drying.

C. Cleaning:

1. After pointing, wet exposed brick-masonry surfaces and clean with soap-and-water solution applied with stiff-fiber brushes leaving masonry clean, free of mortar daubs and with tight mortar joints throughout. The use of acid is prohibited.
2. Allow masonry walls to cure at least three weeks in summer and five weeks in winter before final cleaning.
3. Test clean methods on sample wall panel; leave 1/2 panel uncleaned for comparison purposes. Obtain approval of sample cleaning before proceeding with cleaning of masonry.
4. Begin cleaning at top and work down.
 - a. Remove as much mortar from brick as is possible with scrapers or wire brushes; taking care not to discolor mortar or brick.
 - b. Dampen walls thoroughly with water to prevent loose materials from being drawn into pores of dry brick below and to prevent build-up of dry detergents.
5. Clean surfaces thoroughly with specified cleaning solution. Rinse and flush with clean water immediately after cleaning.
6. Leave work in first class condition, free from mortar stain or other defacement.

3.04 CONTROL AND EXPANSIONS JOINTS

A. General: Install control and expansion joint materials in unit masonry as masonry progresses. Do not allow materials to span control and expansion joints without provision to allow for inplane wall or partition movement.

B. Form control joints in concrete masonry using one of the following methods:

1. Fit bond-breaker strips into hollow control in ends of concrete masonry units on one side of control joint. Gill resultant core with grout and rake out joints in exposed faces for application fo sealant.
2. Install preformed control-joint gaskets designed to fit standard sash block.
3. Install interlocking units designed for control joints. Install bond-breaker strips at joint. Keep head joints free and clear of mortar or rake out joint for application of sealant.
4. Install temporary foam-plastic filler in head joints and remove filler when unit masonry is complete for application of sealant.

- C. Form expansion joints in brick masonry as follows:
1. Build flanges of metal expansion strips into masonry. Lap each joint 1 inch (100mm) in direction of water flow. Seal joints below grade and at junctures with horizontal expansion joints if any.
 2. Build flanges of factory-fabricated, expansion-joint units into masonry.
 3. Build in compressible joint fillers.
 4. Form open joint full depth of brick wythe and of width indicated, but not less than 3/8 inch (10mm) for installation of sealant and backer rod specified in Division 7 Section "Joint Sealants."
- D. Provide horizontal, pressure-relieving joints by either leaving an air space or inserting a compressible filler of width required for installing sealant and backer rod specified in Division 7 Section "Joint Sealants," but not less than 3/8 inch (10 mm).
1. Locate horizontal, pressure-relieving joints beneath shelf angles supporting masonry.

END OF SECTION

SECTION 04220

CONCRETE UNIT MASONRY

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing concrete unit masonry and glazed concrete masonry.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Mortar, grout and masonry accessories: Section 04050.
- B. Brick masonry: Section 04215.
- C. Miscellaneous metal: Section 05500.
- D. Flashing and sheet metal: Section 07600.
- E. Seals and sealants: Section 07900.
- F. Concrete reinforcement: Section 03200.
- G. Cast-in-place structural concrete: Section 03300.
- H. Structural precast concrete: Section 03400.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Samples for Initial Selection: Samples in small-scale form showing the full range of colors and textures available for each different exposed masonry unit required.
- B. Samples:
 - 1. Three sets of each type of the following products used in the work.
 - a. Concrete masonry units (CMU):
 - 1) Lightweight.
 - 2) Normal weight.
 - 3) Special shapes.
 - 4) Glazed.
 - b. Precast lintels.
 - c. CMU lintels.
 - 2. Concrete masonry panels:
 - a. Construct sample panels for exposed work only. Build panels not less than four feet square by eight inches thick, incorporating reinforcement and concrete masonry units. See Section 04215 for brick panels. Construct one panel of concrete glazed and unglazed masonry units.
 - b. Use types of material, color variation, mortar, bond, tooling of joints, method of laying and workmanship shown or specified.
 - c. Maintain panels in good condition and protect from moisture penetration until completion of masonry work and removal is directed.
 - d. Approval of mock ups is for color, texture and blending of masonry unit; relationship of mortar and sealant colors to masonry unit colors; tooling of joints; and aesthetic qualities of workmanship.
 - e. Maintain panel in good condition and protect from moisture penetration until completion of masonry work. Panel may remain as part of finished work after approval.

- C. Shop Drawings: Show fabrication and installation details for the following:
 - 1. Comply with ACI 315, "Details and Detailing of Concrete Reinforcement." Show elevations of reinforced walls.
- D. Certification.

1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. NCMA: TEK Manual for Concrete Masonry Design and Construction.
 - 3. ASTM: A615, C33, C55, C90, C129, C150, C744, E119.
 - 4. ACI: 315, 530.1-99.
 - 5. UL: Fire Resistance Directory.
- B. Source Limitations for Masonry Units: Obtain exposed masonry units of a uniform texture and color, or a uniform blend within the ranges accepted for these characteristics, through one source from a single manufacturer for each product required.
- C. Fire-Resistance Ratings: Where indicated, provide materials and construction identical to those of assemblies with fire-resistance ratings determined per ASTM E119 by a testing and inspecting agency, by equivalent concrete masonry thickness, or by another means, as acceptable to authorities having jurisdiction.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to jobsite in good condition.
- B. Keep products clean and dry. Prevent contact with soil.
- C. Handle products so as to prevent chipping and breakage.

1.06 JOB CONDITIONS:

- A. Environmental Requirements:
 - 1. The following are prohibited:
 - a. Use of products that are covered with frost.
 - b. Erection of masonry when the temperature is below 40F or tending to fall below 40F, unless suitable fireproof protection covering and heat are provided to maintain work and materials above 40F.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. CMU:
 - 1. General:
 - a. Nominal dimensions:
 - 1) Face size: 7-5/8 inches by 15-5/8 inches.
 - 2) Thickness: As shown.
 - b. For exposed work, units of uniform medium texture, free from defects and of uniform dimensions. Furnish special units as necessary.
 - c. Units having UL Fire Resistance Directory ratings to achieve fire ratings for walls as required by local building codes and as shown.

- d. Units free from iron and other substances that will stain plaster or paint.
 - 2. Lightweight CMU:
 - a. Hollow, lightweight loadbearing concrete units: ASTM C90, Type I.
 - b. Solid, lightweight loadbearing concrete units: ASTM C90, Type I.
 - c. Lightweight concrete brick: ASTM C55, Type I, Grade N.
 - d. Aggregate: Limited to expanded shale or slate.
 - e. Hollow, light-weight non-load bearing concrete units: ASTM C129, Type 1
 - 3. Normal-weight CMU:
 - a. Solid loadbearing units: ASTM C90, Type I.
 - b. Exposed alteration and restoration work: Units of same type, grade, size, color variation, texture and appearance as existing masonry work.
 - 4. Concrete fill for CMU bond beams and reinforced masonry unit cores: Class 3500; maximum aggregate size, 3/4 inch, and in accordance with Section 03300.
- B. Glazed CMU:
- 1. Prefaced or glazed concrete masonry units shall conform to the requirements specified above for C90 concrete masonry units, and the facing to the following requirements:
 - a. Glazing (Facing): ASTM C744.
- C. Lintels:
- 1. General:
 - a. Provide lintels of same height and width, texture and density as CMU and 16 inches longer than width of opening, free of cracks and chipped and broken edges.
 - b. Concrete:
 - 1) Portland cement in accordance with Section 03300: ASTM C150, Type I.
 - 2) Reinforcing steel bars in accordance with Section 03200: ASTM A615, Grade 60.
 - 3) Aggregate: ASTM C33, graded from 1/8 inch to 3/8 inch.
 - 2. Precast lintels: Class 3500 concrete in accordance with Section 03400, reinforced full length with No. 5 reinforcing bars in accordance with Section 03200, one at top and one at bottom for each four inches nominal width, and No. 2 ties at eight inches on center at each end, unless otherwise shown.
 - a. CMU lintels:
 - b. Lightweight loadbearing lintel-type CMU complying with specified requirements.
 - c. Filled with Class-3000 concrete minimum in accordance with Section 03300 and reinforced in accordance with Section 03200 for width and span as specified for precast lintels, unless otherwise shown.
 - 3. Steel Lintels: Section 05500.
- D. Masonry Accessories: Section 04050.
- E. Cleaning Solution: Section 04215.
- F. Mortar and Grout: Sections 04050 and 03300.

PART 3 - EXECUTION

3.01 PREPARATION:

- A. Clean foreign substances which would affect bond of mortar from surfaces to receive CMU.

- B. Built-In Work.
 - 1. Verify locations of chases and openings for pipes, conduits and ducts.
 - 2. Establish locations for walls and partitions; verify that door frames and other built-in work provided by others are or can be properly located.

3.02 ERECTION:

- A. Erect exposed CMU masonry work to conform to approved sample panel.
- B. Use of loadbearing and non-loadbearing units shall be governed by locations and purposes to be served. Except as otherwise shown, follow these general uses:
 - 1. Loadbearing: Backup loadbearing masonry walls and for bearing partitions.
 - 2. Non-loadbearing: Furring, non-bearing partitions and backup non-loadbearing masonry walls.
 - 3. Solid: Where specifically required by drawings, for fireproofing structural steel and for partitions with fire ratings.
- C. Erect adjoining walls simultaneously. Do not erect walls more than five feet above adjoining walls. Tothing is prohibited. Cover and protect the tops of unfinished walls.
- D. Plumb piers, walls and partitions. Level courses using uniform joint thickness for interior work, build external corners with bullnose units.
- E. Place reinforcement and build in openings for pipes, conduits, ducts, chases, frames and other work as shown.
- F. Grout in accordance with Sections 04050 and 03300 and set in place miscellaneous steel lintels furnished by other trades for openings in masonry walls in accordance with Section 05500. Provide eight-inch minimum bearing on adjacent masonry unless otherwise indicated.
- G. As the work progresses, keep masonry clean by stiff brushing with fiber brush. Do not wet units before laying up. Unless otherwise shown, lay units in running bond.
 - 1. Set cored units with cells vertical, unless manufactured with horizontal cores. Open ends not permitted.
 - 2. Lay out so that at jambs and internal and external angles, the headers in alternate courses are at least 2 inches long. Use "Z shapes if necessary , especially with glazed masonry units.
 - 3. Lay units out so that no cut piece is less than 5 inches long; not less that 2 inches high
 - 4. Lay concrete units up suitable for painting. See finish schedules.
- H. Prevent smearing mortar on surface of exposed units. If mortar smears occur, remove while soft.
- I. Carefully cut faces of units for electrical or other outlets and cut-out backs for conduit and other piping. Where possible, use full-size units. Do not use portions of units shorter than four inches. Perform cutting with power-driven masonry saws.
- J. Build partitions straight, plumb, true to line and uniform in thickness unless shown otherwise. Anchor partitions at junctions with CMU exterior walls using Z-type steel anchors, rigid or corrugated, Z-bar anchors vertically 24 inches on center maximum unless otherwise shown. Use dovetail anchors spaced not over 16 inches on vertical centers where partitions abut concrete walls or concrete columns and steel framing anchors where partitions abut steel

columns. Start partitions on concrete slabs and extend to structure above, except where shown to be erected only to ceiling.

- K. Use CMU or precast lintels except where steel lintels are shown. Use precast lintels for four-inch CMU partitions. For other CMU partitions and walls, use lintels fabricated at plant or at jobsite from concrete-masonry lintel units. Provide eight-inch minimum bearing on adjacent masonry unless otherwise indicated.
- L. Fill cells of CMU with mortar in accordance with Section 04050, adjacent to openings and around built-in and embedded items.
- M. Place prefabricated continuous joint reinforcement in alternate horizontal joints above grade and each horizontal joint below grade. Terminate each side of expansion joints. Use specially fabricated sections at corners and intersections.
- N. Fill cells solid with grout in accordance with Sections 04050 and 03300 where vertical reinforcement is installed within CMU walls.
- O. Fill heads and jambs of hollow metal frames solid with mortar in accordance with Section 04050, as laying of units progresses.
- P. Tooling joints:
 - 1. After mortar has attained initial set, finish and compact with non-staining metal jointing tool, forcing mortar tight against masonry units and closing all hair line cracks and crevices.
 - 2. All interior and exterior joints tooled concave type, except as stated below or noted otherwise.
 - a. At wall faces to receive other facing materials having mortar backing, strike joints flush.
 - b. At concealed joints and joints on cavity side of cavity walls, strike flush.
- Q. Mortar Bedding in accordance with Section 04050:
 - 1. Hollow units shall be laid with full mortar coverage on horizontal and vertical face shells, except that webs shall also be bedded in all courses of piers, columns, and pilasters, and in the starting course of footings and solid foundation walls, and where adjacent to cells or cavities to be reinforced and/or filled with mortar or grout.
 - 2. Solid units laid with full head and bed joints.
 - 3. Masonry units:
 - a. Laid in beds of mortar of such plasticity and fullness and spread with trowel so that pressing and shoving units will obviate dashing or slushing joints after units are laid. Mortar shall not be "furrowed".
 - b. In cavity walls, mortar shall be beveled on cavity side to prevent protruding mortar fins and subsequent dropping of mortar into cavity.
 - c. For interior and exterior faces of walls, prior to placing units, one end of each stretcher shall be fully covered with mortar.
 - d. For any wall thickness, leave no voids whatever, except space in cavity walls.
- R. Top of Non-Loadbearing Partitions: Build non-loadbearing interior partitions full height of story to underside of solid floor or roof structure above, unless shown otherwise. Build as follows depending on the movement requirements of floor or structure above, and as shown:
 - 1. Install fire resistant compressible filler in joint between top of partition and underside of structure above.
 - 2. Fill top joint with mortar in accordance with Section 04050, after dead-load deflection of structure above approaches final position.

- S. Installation of Masonry Accessories:
1. Wall anchors:
 - a. Space Z-type rigid-steel anchors at intersections of loadbearing CMU walls and control joints.
 - b. Space corrugated-steel anchors 16 inches on centers vertically at control joints located not more than two feet from intersections of CMU walls.
 2. Steel framing anchors: Install anchors to attach CMU walls to structural steel building frame at 16 inches on centers horizontally and vertically. Weld anchors to structural steel so as to achieve full strength of anchor system.
 3. Soldier-course anchors: Install corrugated-steel anchors in horizontal mortar joints of soldier coursing, except where continuous wall reinforcement is used. Space anchors 24 inches on centers horizontally.
 4. Flashing: Install flashing to provide positive keying to mortar.
 5. Weep holes: Install at two feet on centers at terminations of through-wall flashing, base flashings, lintels, or relief angles, and as shown.
 6. Control joint gasket: Install in sash-type CMU and between wythes in accordance with manufacturer's instructions and as shown. Seal weather side of control joints with sealant and backup rod as specified in Section 07900.
- T. Bond Beams:
1. Provide bond beams in walls where shown.
 2. Construct similar to CMU lintels, except beams to be continuous, except at control joints.

3.03 POINTING AND CLEANING:

- A. Pointing:
1. When approved, point holes in joints of exposed CMU masonry surfaces by completely filling with preshrunk mortar.
 2. Point exposed raked joints of CMU masonry with mortar and tool to match approved samples panels.
- B. Cleaning:
1. After pointing, wet and clean exposed CMU masonry surfaces with soap-and-water solution, applied with stiff-fiber brushes leaving masonry clean, free of mortar daubs and with tight mortar joints throughout. The use of acid is prohibited.
 2. Allow masonry walls to cure at least three weeks in summer and five weeks in winter before cleaning.
 3. Begin cleaning at top and work down.
 4. Remove as much mortar from masonry as is possible by hand with wooden paddles and nonmetallic scraper hoes or chisels or stiff bristle brushes taking care not to deface masonry units.
 5. Remove specific stains by cleaning method indicated in NCMA TEK 8-2 applicable to type of stain present on exposed surfaces.
 6. Clean surfaces thoroughly and carefully with specified cleaning solution.
 7. Rinse and flush with clean water immediately after cleaning.
 8. Leave work in clean condition, free from mortar stain or other defacement.

END OF SECTION

SECTION 05091

RAIL WELDING

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. The work specified in this section shall include the fabrication of continuous welded rail (CWR) strings by electric flash-butt welding, including testing, inspection, and qualification of welding and welders.
- B. The work specified in this section shall also include movement of rail from the manufacturer to the Design-Builder's welding plant, from the welding plant to the welded string storage location and from the storage location to the final placement in track location.

1.02 RELATED SECTIONS

Section 05651- General Track Construction
Section 05652 - Ballasted Track Construction
Section 05656 - Running Rail

1.03 REFERENCES

- A. American Railway Engineering and Maintenance-of-Way Association (AREMA) Manual for Railway Engineering, Vol. I, Chapter 4, Specification for Fabrication of Continuous Welded Rail
- B. ASTM E18
- C. ASTM E109
- D. ASTM E142
- E. ASTM E164
- F. ASTM E709
- G. AWS D1.1
- H. USNRC Rules and Regulations, Title 10, Atomic Energy, Part 20.
- I. ASNT SNT-TC-1A Recommended Guidelines for Qualification and Certification of Non-Destructive Testing Personnel.

1.04 SUBMITTALS

- A. The Design-Builder shall submit procedures and documentation in accordance with the Section 01330 and as follows.
- B. Approval of the following items shall be obtained prior to production welding
 - 1. Identification of welding plant with internal shear and major items of equipment to be used.
 - 2. Standards of welding machine performance as recommended by the manufacturer.

3. Oscillograph record of each qualification weld showing number and duration of preheat impulses, flashing time, upset current time, platen travel during flashing, and platen travel distance for upset cycle.
 4. Report of test results of each qualification weld.
 5. Schedule showing string number, length, proposed stockpile location and installation location.
- C. Production weld approval shall be based on these items:
1. Oscillograph records of production welds.
 2. Production welding record.
- D. Deliver five each taper gauges graduated in hundredths of an inch, with cases, to the Authority Representative. Taper gauges shall become Authority property.
- E. Deliver four each 36 inch steel straight edges, as manufactured by L. S. Starrett Company of Athol, Massachusetts, or approved equal, to the Authority Representative. Straight edges shall become Authority property.

1.05 QUALITY ASSURANCE

Quality Assurance/Quality Control shall be in accordance with the Design-Builder's Construction Quality Management Plan.

- A. The Design-Builder shall inspect rail for straightness at the manufacturer's plant.
- B. Plant Qualification
- C. General
1. Using the welding plant, personnel and procedures proposed for production welding, make six qualification welds, three for each type of rail.
 2. The qualification welds shall be made in the presence of the Authority Representative.
 3. Weld tests shall provide sufficient detail to establish capability of the welding apparatus and procedures to meet specified welding requirements with the rail supplied.
- D. Qualification Weld Testing - The six qualification welds shall be tested by radiography, hardness testing, metallurgical testing and ultrasonic testing in the following manner:
1. Radiography:
 - a. Radiography shall be conducted in accordance with ASTM E142 using short wave length radiation. The use of nuclear by products for radiography shall be in accordance with USNRC Rules and Regulations, Title 10, Atomic Energy, Part 20. The transportation, handling and storage of hazardous materials used in the examination of welds shall be performed only by or under the supervision of a person of proven experience and ability, operating under a proper license.
 - b. Film shall be capable of producing sharp images, and be free of processing and mechanical defects. High speed, coarse-grained film is prohibited. Fine films shall be used covering head, web and each side of base as shown on **Exhibit 05091-A**. Identify each film by contract number, rail identification, date of test, name of testing agency and the view.

- c. Acceptance of the weld shall be based on the weld having full penetration, complete fusion and being free of flaws. A letter shall accompany each film plate bearing information given on the film, certifying compliance with ASTM E142 and stating whether or not the weld satisfies specified requirements.
 - d. Radiograph plates shall be compared to ultrasonic scans to determine the ability of ultrasonic equipment to identify inclusions or other weld defects. If necessary, compare radiograph plates with ultrasonic scans using the ultrasonic reference blocks. Results of this comparison shall be made in a separate report and include recommended ultrasonic equipment to be used and sensitivity requirements.
2. Hardness testing:
- a. Hardness testing shall be in accordance with current AREMA "Specification for Fabrication of Continuous Welded Rail" and "Specification for the Quality Assurance of Electric Flash-butt Welding of Rail."
 - b. The hardness test shall be performed in accordance with ASTM E18, using a 150kgf diamond sphere conical penetrator. Hardness and location shall be recorded.
3. Metallurgical Tests:
- a. A one foot specimen of each weld shall be sectioned longitudinally through the centerline of the rail. Each specimen shall be etched to enable observation of the hardness pattern, metallurgical properties and the heat affected zone.
 - b. An acceptable weld as determined by the metallurgical test shall meet the following criteria:
 - 1) Steel shall consist of fine-grained pearlite structure with small interlamellar spacing.
 - 2) The hardness pattern in the etched section shall have a uniform distribution.
 - 3) The heat affected zone shall be parallel and fully extended on both sides of the weld.
 - 4) The weld joint shall be planar.
 - 5) Uniform zone of plastic deformation resulting from upset operation shall extend equally on both sides of the weld point.
 - c. An 8x10 black and white photograph and a description of the metallurgical properties including grain structure and distribution shall be submitted.
4. Ultrasonic test, slow bend test and magnetic particle test in accordance with the AREMA Manual.
5. All test samples are to be permanently marked for identification and returned to the Authority Representative at the completion of testing.

1.06 DELIVERY, STORAGE AND HANDLING

- A. It shall be the Design-Builder's responsibility to make all arrangements for shipment and handling of the rail. The Design-Builder shall:
 - 1. Coordinate unwelded rail stick movement from the manufacturer's plant to the welding site by rail and truck as necessary.
 - 2. Obtain any required permits from state, regional or local jurisdictions.
 - 3. Make arrangements for loading, unloading and stacking rail sticks.
- B. Handle and store rail so that it is not damaged either before or after welding.
 - 1. Stacking of sticks shall be as approved by the Authority Representative and layers shall be separated by wood lathing.
 - 2. Rail shall be handled in a manner that prevents damage to fasteners, rail and structures.

3. Rail shall not be dropped or dragged on the trackbed. The use of rollers is required.

PART 2 - PRODUCTS

2.01 RAIL FOR CONTINUOUS WELDED RAIL

Rail for the Work shall be furnished by the Design-Builder in accordance with the Standard Specification Section 05656, Running Rail.

PART 3 - EXECUTION

3.01 PREPARATION FOR WELDING

- A. The welding plant may be set up on Authority property as approved by the Authority Representative.
- B. Rail welding shall be in accordance with the current AREMA Manual "Specification for Fabrication of Continuous Welded Rail", "Specification for the Quality Assurance of Electric Flash-butt Welding of Rail" and as specified herein.
- C. Rail for installation in this Contract shall be welded in accordance with a string schedule approved by the Authority Representative. Strings shall be designed in order to minimize field connections and to the maximum length practical for fabrication and handling. The schedule shall show the following for each string.
 1. The string designation.
 2. The track name where the string will be placed.
 3. The begin and end track station where the string will be located.
 4. Whether the string will be in the left or right rail when facing up station.
 5. The rail type in the string or for each portion of a string.
 6. Where there is more than one rail type in a string, the track station where rail types join in a string.
 7. The end of the string where welding will begin.The track names and stationing systems shown on the Track Alignment Plan and Profile drawings shall be used in the string schedule.
- D. The string designation shall be a unique code identification for each string that indicates
 1. The track
 2. Left or right rail
 3. A consecutive sequential number or letter system that increases with increasing track station.
- E. Rails shall be welded using an electric flash butt welding plant equivalent to the Chessie System plant at Russell, KY or Amtrak Plant at New Haven, CT. An equivalent portable plant may be set up within the contract area.
- F. Rails shall be stacked and fed into the welder so that when the resulting rail string is stored and subsequently placed in track, rail brands for both rails will face to the right when looking up stationing.
- G. Rail Inspection Prior to Welding
 1. Inspect each rail end prior to welding for deviations from lateral line in either direction and for upsweep, downsweep or droop.

2. Rail with upsweep, downsweep or droop and rail failing to comply with the tolerances shown on **Exhibit 05091-B** shall be cut back a sufficient distance to achieve the required alignment. Rails shall be cut clean and within 1/32 inch of square by means of rail saws or abrasive cutting discs.
 3. Torch cutting of rail is prohibited. Cutting shall be done at no additional cost to the Authority.
- H. Rail End Preparation for Welding: Immediately prior to welding, all rail ends shall be wire brushed to remove mill scale or other dirt which might hinder the flow of electric current.
- I. Alignment in Weld Machine:
1. Alignment of the rail in the welding machine shall be done on the head of the rail.
 2. Vertical alignment shall provide for a flat running surface within 0.01 inch between the abutting rail ends.
 3. Horizontal alignment shall distribute head width differences evenly between each side of the head. No horizontal offset shall exceed 0.03 inch on either side of the head. No horizontal offset shall exceed 0.10 inch on either side of the base of the rail.

3.02 WELDING OF RAILS

- A. All welding procedures shall be approved prior to use and as a minimum shall be in accordance with the following:
1. Forge welds to point of no further plastic deformation with upset of 5/8 inch minimum.
 2. Each weld to achieve full penetration, complete fusion, and be free of flaws and inclusions.
- B. Record welding machine performance with an oscillograph recorder or computer printout.
1. Record platen movement and current impulses.
 2. The oscillograph record shall be compared with the approved procedure record from the qualification welds. If the record indicates performance which is not in conformance with the approved procedure, the weld will be rejected.
 3. The recorder shall be calibrated each day.
- C. If flashing is interrupted with less than 1/2 inch of flashing distance remaining before upsetting, the rails shall be reclamped and flashing initiated again.
- D. Grinding shall be done immediately following welding at an elevated temperature.
- E. Welds shall be ground to meet the following finishing tolerances:
1. A finished deviation of not more than plus or minus 0.005 inch of the parent section of the rail head shall be allowed.
 2. The weld at the top and sides of the rail head shall be finished to plus or minus 0.010 inch of the parent section.
 3. The bottom and sides of rail base shall be finished to within plus or minus 0.010 inch of the parent section.
 4. The web zone, underside of head, web, top of base, both fillet each side, shall be finished to within 1/8 inch of parent contour or closer but shall not be deeper than parent section.
 5. Finishing shall eliminate all cracks visible to the unaided eye.
 6. All notches created by offset conditions or twisted rails shall be eliminated by grinding to blend the variations on both sides of the head and base for a distance of 18 inches.
 7. All fins on the weld due to grinding and/or shear drag shall be removed prior to final inspection.

3.03 WELD QUALITY

- A. Inspection of Welds: Each weld shall be examined by the magnetic particles method, ultrasonic examination method and by the visual method as follows:
1. Magnetic Particle Examination:
 - a. Magnetic particle inspection shall be performed using the dry powder method in accordance with ASTM E709, with the rail at a temperature of less than 800 deg. F.
 - b. To be acceptable the particles shall form a regular longitudinal pattern indicating homogeneity of the weld and freedom from defects, surface irregularities and internal discontinuities.
 2. Ultrasonic Examination:
 - a. Ultrasonic examination shall be performed by an independent testing agency under contract to the Authority who will perform ultrasonic examination to the following standards:
 - b. Subsequent to the magnetic particle inspection, all welds will be ultrasonically inspected in accordance with ASTM E164.
 - c. Ultrasonic test equipment will be capable of detecting a 3/64 inch discontinuity, 6-1/2 inches below the top rail. The sensitivity and resolutions of the proposed equipment shall use appropriate area amplitude and distance amplitude reference blocks made of material similar to the rail steels being tested.
 - d. All equipment will be equipped with a distance amplitude correction feature. The equipment will be calibrated daily using an 11W calibration block made of rail steel.
 - e. All welds giving fault indication in ultrasonic testing shall be cut out and the rails rewelded according to these specifications.
 - f. The Design-Builder shall provide a weather resistant enclosure with adequate ventilation and light for ultrasonic inspection.
 3. Visual Inspection for Final Alignment of Finished Welds:
 - a. The combined vertical offset and crown camber at ambient temperature shall not exceed 0.060 inches as shown on **Exhibit 05091-C, Fig. 1.**
 - b. No dip camber shall be allowed as shown on **Exhibit 05091-C, Fig. 2.**
 - c. Combined horizontal offset and horizontal kink camber at ambient temperature shall not exceed 0.060 inches as shown on **Exhibit 05091-C, Fig. 3.**
 - d. Welds shall be free of cracks, fins, and sharp edges.
- B. Correction of Defective Welds: Each production weld failing to meet all acceptance criteria will be considered defective. This shall include welds considered defective by the Authority contracted Ultrasonic Inspector.
1. Defective welds shall be cut out by means of rail saw or abrasive disc.
 2. Use extra initial flash to burn off cut surface, reclamp, and reweld.
 3. Rewelds shall be inspected as specified for initial welds.
- C. Submit Production Welding Records to the Authority Representative at the end of each days production.
1. Oscillograph record of each weld and reweld.
 2. Production welding record in accordance with **Exhibit 05091-D and 05091-E.**
- D. Marking of Rail Strings:
1. Mark each end and on both sides of the rail web every 100 feet of each rail string with a paint suitable for application to steel and which is weather resistant for a period of two years.
 2. High strength rail shall be marked with orange paint.
 3. Standard rail shall be marked with white paint.

4. Each string shall be marked on both ends with its string designation code and the respective beginning and ending station shown on the string schedule.
 - a. When two or more strings are welded into one longer string, then, where the ends of two strings join, the strings shall be marked with their string designation codes and the respective beginning and ending station shown on the string schedule.
5. The end of the string where welding began shall be marked to show that is the end where welding began. The welding shall begin on the end shown on the string schedule. The string designation code and the beginning of welding mark shall be coordinated to permit correlation of each weld with the Production Welding Record.

PART 4 - MEASUREMENT AND PAYMENT

4.01 MEASUREMENT

No separate measurement of work specified in this Section will be made.

4.02 PAYMENT

Compensation for work specified in this Section will be included in the price of the work of which it is a part.

SECTION 05120

STRUCTURAL STEEL

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies structural steel work.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Finish painting for structural steel: Section 09920.

1.03 QUALITY ASSURANCE:

- A. Options:
 - 1. Substitution of rolled shapes for welded sections and vice versa is permitted, provided that shapes and sections to be substituted are approved and comply with the following:
 - a. Keep depth, width, average or mean thickness, web shear area, moments of inertia, torsional constant and warping constant to be at least equal to those for shape or section shown. Maintain clearances and other dimensions shown as critical.
 - b. Have steel shapes, plates and bars conform to same ASTM designation as material for which substitution is made.
- B. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. AWS: D1.1.
 - 3. AASHTO: Interim 1981 Fracture Control Plan; Standard Specifications for Highway Bridges, including supplements. Where conflict occurs between AWS and AASHTO, AASHTO governs.
 - 4. AISC:
 - a. Specification for Structural Steel Buildings-Allowable Stress Design and Plastic Design.
 - b. Manual of Steel Construction-Allowable Stress Design.
 - c. Code of Standard Practice for Steel Buildings and Bridges.
 - d. Allowable Stress Design Specification for Structural Joints using ASTM A325 or A490 Bolts.
 - e. Specifications for Architecturally Exposed Structural Steel.
 - 5. ASNT: Recommended Practice SNT-TC-1A.
 - 6. SSPC: SP-6, SP-10.
 - 7. ANSI: B27.2.
 - 8. MS: MIL-P-21035.
 - 9. FS: TT-P-645
 - 10. ASTM: A6, A27, A36, A108, A109, A123, A148, A153, A242, A307, A325, A370, A449, A490, A500, A501, A514, A517, A572/572M, A588, A668, A673, A709, A780, B663, B766.
- C. Source Quality Control:
 - 1. Testing and inspection:

- a. Nondestructive-test requirements for welded members, perform the following:
 - 1) Tension butt welds in fracture-critical nonredundant members and member components of structures subject to repetitive dynamic loading: 100 percent of welds inspected by radiographic and ultrasonic examination.
 - 2) Butt welds of flange material for compression and tension splices: 100 percent of welds inspected by ultrasonic examination.
 - 3) Butt welds for web splices beginning at point of maximum stress: 40 percent of welds inspected by ultrasonic examination.
 - 4) Fillet welds connecting web plates to flange plates: 25 percent of welds inspected by magnetic particle inspection.
 - 5) For all other fillet-weld connections: 10 percent of welds inspected by magnetic particle inspection.
 - 6) The Engineer may designate additional items to be inspected by radiography.
 - b. Mill testing:
 - 1) For identified stock materials provide three specimens from each heat number, one for tension test, one for bend test and one for Charpy V-notch impact test.
 - 2) Cut, machine and test specimens in accordance with ASTM A370.
 - 3) Perform Charpy V-notch impact test for tension flanges and other tension components of aerial structures in accordance with Table 05120-1.
 - c. Bolts:
 - 1) The Engineer will randomly select at least five bolts for test purposes from each bin of bolts furnished.
- D. Qualification of Welding Personnel and Procedures:
- 1. Prior to qualifying welding personnel and welding procedures, confirm an agreement with the Engineer as to procedural details, sequence of welding, handling of materials to be inspected, and approval of electrodes, wire, flux and other welding materials and equipment.
 - 2. Employ welding personnel whose qualification is certified in accordance with AWS D1.1. Such certification is to remain in force for the duration of the welding operations under this Contract.
 - 3. Do not start fabrication until qualification has been successfully completed.
- E. Qualification of Nondestructive-Testing Personnel:
- 1. Nondestructive testing of fracture-critical members to be conducted by personnel qualified as NDT Level II or Level III in accordance with ASNT SNT-TC-1A.
 - 2. Level-II technicians to be supervised by Level III-personnel.
- F. Stock Material:
- 1. For qualification of welding personnel and procedures and for quality-assurance testing, use only stock materials which can be identified as having been rolled from a given heat and for which certified mill tests can be produced.
 - 2. When stock material is proposed, inform the Engineer of such intention at least 10 days in advance of commencing fabrication to permit sampling and testing. Select identified material from as few heats as possible.
- G. Welder's Identification Mark (for Fabrication Shops):

1. Assign each welder and welding operator an identification mark to stamp on pieces he has welded.
2. Have welder or welding operator place his identification mark by metal-die stamp in letters 3/8-inch high in position that identification of welder or operator will appear adjacent to each of his welds in finally assembled members for ready reference to radiographic films and for identification by the Engineer.

H. Elevator Hoistways:

1. Fabricate framing not to exceed 1/8-inch deviation from dimensions shown throughout. Perform straightening where necessary.

1.04 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

A. Shop Drawings:

1. Structural details: Include the following:
 - a. Bills of materials giving complete information for fabrication and erection of component parts of structures including material and finish information.
 - b. Details of location, type, sizes of bolts and welds and for welded structures details of welding as specified.
 - c. Structural computations for Contractor-designed work certified by a professional engineer registered in the jurisdiction where the work is to be performed.
2. Match marks:
 - a. Provide diagram showing match marks for connecting structural parts assembled in shop for purpose of drilling or reaming holes in field connections.
3. Welding:
 - a. Complete shop details of qualification test specimens.
 - b. Include information on specimen identification, number of pieces and welding procedure specification, type of material, sizes of pieces and welds and other variables affecting detail or tests.
4. Erection Plan:
 - a. Details of methods of erection proposed to be used, including calculated stresses for proposed erection certified by a professional engineer registered in the jurisdiction where the work will be performed. Do not proceed until approval has been received.
5. Manufacturer's test procedures for bolts.

B. Certification:

1. Certified mill test reports of structural steel at least 10 days prior to start of fabrication.
2. Certified quality-assurance testing and inspection reports.
3. Certification verifying that welding personnel have been qualified in accordance with AWS D1.1 and as specified above under Qualifications of Welding Personnel and Procedures.
4. Manufacturer's certification that bolts meet approved testing.
5. Certification of nondestructive-testing personnel.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. General:
 - 1. Load, transport, unload and store structural materials so as to keep them clean and free from damage.
 - 2. Store material on platforms, skids or other supports above the ground and ensure proper drainage and protection from corrosion.

- B. Steelwork:
 - 1. When handling and shipping steelwork, prevent bending, scraping or over stressing members.
 - 2. Block projecting parts likely to be bent or damaged during handling with wood or other approved material
 - 3. Replace pieces bent or damaged unless repair is approved.
 - 4. Indicate weight on members weighing more than three tons by means of paint contrasting with shop coat.

- C. Bolts and Nuts:
 - 1. Ship small parts such as bolts, nuts, washers, pins, fillers and small connecting plates or angles in boxes, crates or barrels.
 - 2. Pack separately bolts of each length and diameter and loose nuts or washers of each size.

- D. Paint:
 - 1. Have paint materials delivered in manufacturer's original sealed containers, bearing manufacturer's label and name, specification identification number where applicable as well as month and year of manufacture.

1.06 JOB CONDITIONS:

- A. Environmental Requirements:
 - 1. Welding:
 - a. When welding during cold weather, avoid chilling weld metal within zone of welding influence and avoid restraining manual functions of welder or welding operator.
 - b. When temperature where steel is stored is more than 20F below that of welding shop, move steel to be welded into shop sufficiently in advance of welding to allow it to attain shop temperature prior to welding.
 - c. Steel to be free of moisture. Dry as necessary by application of heat not exceeding 100F.
 - d. Do not weld when shop temperature is below 40F.
 - 2. Painting:
 - a. Apply paint when temperature of steel and paint is above 40F and temperature is forecast to remain above 40F until paint has dried.
 - b. Painting steel at a temperature which can cause blistering, porosity or conditions otherwise detrimental to life of paint is prohibited. When paint is applied in hot weather or thinned in cold weather, ensure that specified thickness of paint coating is obtained.
 - c. Application of paint in rain, wind, snow, fog or mist or when steel surface temperature is below dew point is prohibited, unless otherwise approved. If painting in damp or cold weather is unavoidable, provide protective covering and heat steel and surrounding air to 40F minimum. Maintain this temperature until weather conditions permit discontinuance.

PART 2- PRODUCTS

2.01 MATERIALS:

- A. General Requirements for Rolled-Steel Plates, Shapes and Bars: ASTM A6.
- B. Carbon-Steel Plates, Shapes and Bars: ASTM A36, ASTM A709, Grade 36.
- C. High-Strength, Low-Alloy, Structural-Steel Plates, Shapes and Bars: ASTM A242.
- D. High-Strength, Low-Alloy, Structural, Columbium-Vanadium Structural Steel: ASTM A572/A572M.
- E. Corrosion-Resistant Structural Steel: ASTM A242., A588
- F. High-Strength, Low-Alloy, Corrosion-Resistant Structural-Steel Shapes, Plates, and Bars: ASTM A588.
- G. Low-Carbon Steel Bolts and Nuts: ASTM A307, Grade A or B.
- H. High-Strength Carbon-Steel Bolts, Nuts and Washers for Structural Joints: ASTM A325; for bolts over one-inch diameter, ASTM A449.
- I. High-Strength Alloy-Steel Bolts, Nuts and Washers for Structural Joints: ASTM A490.
- J. Round Washers Other Than Those In Contact With High-Strength Bolt Heads And Nuts: ANSI B27.2, Type B.
- K. Beveled Washers:
 - 1. Square, smooth and sloped to make contact surfaces of bolt head and nut parallel.
 - 2. Diameter of hole in square beveled washers as follows:
 - a. For bolts less than one-inch diameter: 1/16-inch larger than bolt size.
 - b. For bolts larger than one-inch diameter: 1/8-inch larger than bolt size.
- L. Carbon-Steel Forgings: ASTM A668, Class C.
- M. Alloy-Steel Forgings: ASTM A668, Class G.
- N. Structural-Steel Tubing:
 - 1. Structural framing for elevator hoistways: ASTM A500, Grade B.
 - 2. Other structural tubing: ASTM A501.
- O. High-Strength Steel Casting: ASTM A148, metal type as shown.
- P. Mild-To-Medium-Strength Carbon-Steel Castings: ASTM A27, grade as shown.
- Q. Shear Connectors:
 - 1. Cold-rolled carbon-steel strip.
 - 2. Stud-welding fasteners with upset head developing tensile strength of 65,000 psi-minimum and yield strength of 52,000-psi minimum.
 - 3. Complying otherwise to the following:

- a. Cold-finished bars, Grade 1015, Grade 1018 or Grade 1020, semi-killed or fully killed: ASTM A108.
 - b. Low-carbon steel suitable for welding: ASTM A109.
 - 4. Stud welding conforming to AWS D1.1.
 - 5. Sizes and shapes: As shown.
 - 6. Lengths to be after-weld lengths.
 - 7. Studs arc-welded to parent metal as shown.
 - 8. Before welding, parent-metal surface to be free from rust, oil, paint, plating and other foreign matter.
 - 9. Heat treat parent metal where needed to develop full weld strength.
- R. Galvanizing:
 - 1. Steel products specified as galvanized to be hot-dip galvanized after fabrication in accordance with the following:
 - a. Zinc coatings on products fabricated from rolled, dressed and forged steel shapes, plates and strips: ASTM A123.
 - b. Zinc coating on iron and steel hardware: ASTM A153.
 - c. Zinc coating on assembled steel products: ASTM A123.
 - d. Zinc-coating weight: Two ounces per square foot minimum.
 - e. Zinc-dust zinc-oxide primer conforming to MS MIL-P-21035 applied in accordance with ASTM A780 in two coats for repairs to damaged surfaces after removal of loose or cracked zinc coating.
- S. Electroplated Zinc Coating: ASTM B663 for type specified.
- T. Cadmium Plating: ASTM B766 for type specified.
- U. Paint for Shop Prime Coating: FS TT-P-645.
- V. Cleaning Solution: Muriatic acid solution, specific gravity 1.18, prepared in a solution of one-part muriatic acid and five parts water.

PART 3 - EXECUTION

3.01 FABRICATION:

- A. Workmanship and finish to best commercial practice accomplished in structural or bridge shops.
- B. Straightening Material:
 - 1. Use rolled material that, before being laid off or worked, is straight within tolerances specified in ASTM A6.
 - 2. Perform straightening where necessary by approved methods which will not overstress material.
 - 3. Do not heat-shrink low-alloy structural steel.
 - 4. Achieve fabrication tolerances which will result in full bearing.
 - 5. Perform straightening, planing and connecting of portions of members in bearing assemblies and in direct bearing after fabrication as necessary to provide full bearing assemblies and bearing areas.
- C. Cutting:

1. Flame-cut edges of members subject to dynamic loading by mechanically guided torch or by hand. Remove nicks by grinding to depth not exceeding 1/4 inch.
2. Shape re-entrant corners notch-free to radius of 1/2-inch minimum.
3. Perform flame cutting so that metal does not carry stress during cutting operation.
4. Direct flame so that remaining material is not damaged.

D. Planing and Facing:

1. Plane to depth of 1/4 inch sheared edges of plates more than 5/8-inch thick which will carry calculated stress.
2. Face and bring abutting joints to even bearing where shown.
3. Fabricate floor beams, stringers and girders having end connection angles to exact length back-to-back of connection angles.
4. For compression joints depending on contact, prepare bearing surfaces to a common plane by milling, sawing or other approved means.
5. Where end connections are faced, ensure that finished thickness of angle is not less than that shown.

E. Bolt Holes:

1. Punch or drill holes for bolts.
2. Subpunch or subdrill and ream assemblies using steel template for alignment of connections as necessary. Flame cutting is prohibited.
3. Subdrill or subpunch holes 3/16-inch less than nominal diameter of bolt; drill or ream holes 1/16-inch greater than nominal diameter of bolt.

F. Connections:

1. Except where welded or ASTM A307 bolted connections are shown, use ASTM A325 or ASTM A490 bolts for shop connections.
2. Unless otherwise shown, bolt field connections using ASTM A325 or ASTM A490 bolts in accordance with AISC Specifications for Structural Joints.
3. Use of ASTM A490 bolts for dynamic or fluctuating loadings is prohibited.

G. Plates:

1. Bent plates: For load carrying cold-bent plates, use identified stock and arrange direction of bending at right angles to direction of rolling. Ensure radius of bend, measured on concave face of metal, is not less and preferably more than the following:

Angle of Plate Bend in Degrees	Minimum Radius
61 - 90	1.0T*
91 - 120	1.5T*
121 - 150	2.0T*

*T = Plate thickness.

2. Sheared plates: For gusset plates or connection plates, use sheared plates designed to resist applied loads in more than one direction in plane of plate.

3.02 WELDING:

- A. Perform welding in accordance with AWS D1.1.

- B. Perform procedure and sequence of welding so as to avoid needless distortion and to minimize stresses. Straighten transverse warpage of flanges, if necessary, by controlled heating along outside face.
- C. Make allowance in shop for expected weld shrinkage in laying out and assembling members. Trim members to size when most or all of welding has been completed.
- D. Complete butt welds in flange joints before flanges are assembled on web. Use extension blocks on such joints when making ends of butt welds, removing extension blocks only upon completion and cooling of weld. Ensure ends of welds are finished smooth and flush with edges of abutting parts. Use double-V-flange butt welds, unless otherwise shown. Back puddle all end craters.
- E. Make welds in web plates where shown.
- F. Prior to ultrasonic or radiographic testing of butt welds of flanges and webs, grind or machine weld reinforcement of joint to remove irregularities of weld surface so that it merges smoothly with base surface; one side for ultrasonic testing and both sides for radiographic testing.
- G. Ensure that welded joints which are to be radiographed are free of paint, scale and grease. Grind off welded ripples and surface irregularities on both sides of joint. Grind perpendicular to length of weld and to such a degree that resulting radiographic contrast due to remaining irregularities cannot mask or be confused with that of objectionable defect and so that weld surface will merge smoothly into adjoining surface.
- H. Repair defective welds by chipping or melting out such defects from one or both sides of joint removing no more weld metal than necessary to correct defect. Reweld and have weld retested radiographically.
- I. Welded Structures Subjected to Dynamic Loads:
 1. Do not use backup bars for fracture-critical nonredundant members or member components, as defined by AASHTO on Interim 1981 Fracture Control Plan.
 2. Avoid use of backup bars elsewhere, unless explicitly permitted by original design.
 3. When use of backup bars is unavoidable because of practicality but not explicitly permitted by original design, remove backup bar after welding is completed and affected surfaces of weld metal and base metal is ground flush. Roughness of ground surfaces to be similar to that of surrounding unaffected plate surface.

3.03 BOLTING:

- A. Connections using high-strength steel bolts in accordance with AISC Specifications for Structural Joints using ASTM A325 or ASTM A490 bolts.
- B. Assemble high-strength bolted parts so that they fit solidly together when assembled. Do not use gaskets or other compressible materials.
- C. Remove scale, dirt, burrs and other defects likely to prevent proper seating when assembling joint surfaces, including those adjacent to washers.
- D. Remove oil, paint, lacquer and galvanizing from contact surfaces of friction joints.

- E. Use two nuts on unfinished bolts and turned bolts in tension.
- F. Tightening Bolts:
 - 1. Tighten ASTM A325 or A490 bolts to bolt tension not less than proof load given in AISC Specifications for Bolts.
 - 2. If approved, tighten by means of properly calibrated wrenches or turn-of-nut method.
 - 3. When tightening, place hardened washer under nut or bolt head, depending on which element is turned in tightening operation.
 - 4. Calibrate torque wrenches daily by tightening bolt assembly in device capable of indicating actual bolt tension.
 - 5. Install three bolts minimum from each lot.
 - 6. Nuts or bolts to be in tightening motion when torque is measured.
 - 7. Adjust power wrenches to cut-out or stall at required tension.
- G. Arrange bolts so that heads show in areas exposed to public view.

3.04 SHOP ASSEMBLY:

- A. Undertake complete or progressive shop assembly of continuous plate and box girders, rigid frames, bents and towers when shown. Obtain approval of progressive shop-assembly procedure.
- B. Clean surfaces of metals in contact with each other with high speed wire brushes before assembling.
- C. Assemble parts to line and fit; drill or ream bolt holes while assembled. Hand reaming is prohibited unless approved.

3.05 SHOP PRIME PAINTING:

- A. Clean steel surfaces in accordance with SSPC SP-6 or SP-10.
- B. Shop Painting:
 - 1. Shop paint structural-steel work which will be left bare in finished structures.
 - 2. Do not shop paint the following:
 - a. Surfaces within three inches of joints to be field welded.
 - b. Galvanized surfaces and surfaces to be galvanized.
 - c. Contact surfaces: Apply rust-inhibitive treatment to such surfaces; remove by means of appropriate solvent prior to assembly.
 - d. Surfaces to be encased in concrete or in fire-protection material.
 - e. Weathering steel.
 - 3. Use paint-spraying equipment, if approved, with type of spray gun recommended by paint manufacturer for paint being applied.
 - 4. Use brushes of good quality bristle. Nylon brushes and roller coaters are prohibited.
 - 5. Neutralize areas of welding which are to be painted by applying specified cleaning solution. Wash neutralized area thoroughly with clean water and allow to dry before painting.
 - 6. Apply shop prime coat at minimum wet-film thickness of three mils. Give surfaces which will be inaccessible after assembly or erection three coats of paint before assembly.

7. Caulk small cracks, cavities and open seams around stiffeners and connections with pasty mixture of red lead and linseed oil or approved caulking putty and allow to dry before applying full shop coat.
8. Apply stripe coat of paint to edges, corners, bolts, welds and other sharp edges before giving steel full shop coat of paint. Apply stripe coat at least one-inch beyond area to be striped and allow to dry before applying full shop coat.
9. Paint erection marks and weight on each member after shop coat has dried.
10. Complete shop painting and ensure paint has completely dried prior to shipment of steel.

3.06 ERECTION:

- A. Install anchor bolts accurately in positions shown.
- B. If anchor bolts are cast in substructure masonry during its construction, ensure that each bolt is firmly held in its correct position and elevation by suitable templates.
- C. If approval is given for installing anchor bolts in preformed holes or in drilled holes in concrete or masonry, use approved nonshrink, nonstaining grout to secure them in place.
- D. Set bearing assemblies to lines and grades shown and adjust to horizontal position shown.
- E. Erect steel structures true and plumb following match marks.
- F. Use temporary bracing to support loads to which structures may be subjected including erection equipment and their operations. Leave bracing in place as long as safety requires.
- G. Report immediately to the Engineer errors in shop fabrication or deformation resulting from handling or transportation which prevent proper erection and fitting of parts.
- H. As erection progresses perform sufficient bolting of work to support dead load, wind load and erection load. Perform permanent bolting when enough alignment has been accomplished to ensure that as much of structure as possible will be supported by such fastening work.
- I. Ensure that holes are not enlarged and that metal in vicinity of holes is not disturbed by drifting during assembly.
- J. Enlargement of holes to accept bolts for connections is prohibited unless approved. Make enlargement by reaming not by burning. Avoid hand reaming.
- K. Do not field weld main stress members.
- L. Bond premolded elastic filler with adhesive to structural framing at elevator hoistways.

3.07 NONDESTRUCTIVE TESTING OF FIELD WELDS:

- A. Perform pertinent testing specified for source quality control.

3.08 FIELD TOUCH-UP PAINTING:

- A. Retouch surfaces where shop coat has been damaged using paint and paint-film thickness identical to original shop coat.

- B. After erection, clean field bolts, nuts and adjacent areas and apply coat of paint identical to original shop coat.
- C. Finish painting for structural steel in accordance with Section 09920.

TABLE 05120-1

BASE METAL CHARPY V-NOTCH REQUIREMENTS ^a FOR FRACTURE-CRITICAL MEMBERS				
ASTM	Thickness, Inches (mm)	Zone 1 ^b	Zone 2 ^c	Zone 3 ^d
A36	Up to 4 inches (101.6)	25 at 70F (33.9 Nm at 21.1C)	25 at 40F (33.9 Nm at 4.4C)	25 at 10F (33.9 Nm at minus 12.2C)
A572 ^e	Up to 4 inches (101.6) mechanically fastened	25 at 70F (33.9 Nm at 21.1C)	25 at 40F (33.9 Nm at 4.4C)	25 at 10F (33.9 Nm at minus 12.2C)
	Up to 2 inches (50.8) welded	25 at 70F (33.9 Nm at 21.1C)	25 at 40F (33.9 Nm at 4.4C)	25 at 10F (33.9 Nm at minus 12.2C)
A588 ^e	Up to 4 inches (101.6) mechanically fastened	25 at 70F (33.9 Nm at 21.1C)	25 at 40F (33.9 Nm at 4.4C)	25 at 10F (33.9 Nm at minus 12.2C)
	Up to 2 inches (50.8) welded	25 at 70F (33.9 Nm at 21.1C)	25 at 40F (33.9 Nm at 4.4C)	25 at 10F (33.9 Nm at minus 12.2C)
	Over 2 inches to 4 inches (50.8 to 101.6) welded	30 at 70F (40.7 Nm at 21.1C)	30 at 40F (40.7 Nm at 4.4C)	30 at 10F (40.7 Nm at minus 12.2C)
A514 ^f	Up to 4 inches (101.6) mechanically fastened	35 at zero degree F (47.5 Nm at minus 17.8C)	35 at zero degree F (47.5 Nm at minus 17.8C)	35 at minus 30F (47.5 Nm at minus 34.4C)
	Up to 2-1/2 inches (63.5) welded	35 at zero degree F (47.5 Nm at minus 17.8C)	35 at zero degree F (47.5 Nm at minus 17.8C)	35 at minus 30F (47.5 Nm at minus 34.4C)
	Over 2-1/2 inches to 4 inches (63.5) welded	45 at zero degree F (61.0 Nm at minus 17.8C)	45 at zero degree F (61.0 Nm at minus 17.8C)	Not permitted

^a CVN impact testing to be P-plate frequency testing in accordance with ASTM A673. Code Charpy test pieces with respect to heat/plate number and record such code on mill-test report of steel supplier with test result. If directed, package broken pieces from each test (three specimens, six halves) and forward to the quality-assurance organization of the jurisdictional authority. Use average of three tests. If energy value for more than one of three specimens is below minimum average requirements or if energy value for one of three specimens is less than 2/3 of specified minimum requirements, retest and obtain energy value from each of three retest specimens equal to or exceeding specified minimum average requirement.

- *b Zone 1: Minimum service temperature zero degree F (minus 17.8C) and above.
- *c Zone 2: Minimum service temperature from minus 1F to minus 30F (minus 28.3C to minus 34.4C).
- *d Zone 3: Minimum service temperature from minus 31F to minus 60F (minus 35C to minus 51.1C).
- *e If the yield strength of the material exceeds 65 ksi (448.159MPa), reduce temperature for CVN value for acceptability by 15F (8.3C) for each increment of 10 ksi (68.947MPa) above 65 ksi (448.159MPa). Yield strength is value given in certified mill-test report.
- *f ASTM A517 Charpy requirements are the same as for ASTM A514.

SECTION 05210

STEEL JOISTS

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing steel joists.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Bearing plates and miscellaneous steel framing: Section 05120.
- B. Field painting: Section 09920.

1.03 QUALITY ASSURANCE:

- A. Reference Codes and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. AWS: D1.1.
 - 3. SJI (Steel Joint Institute): Standard Specifications and Load Tables for Series-K Open-Web Steel Joist, Series-LH Longspan Steel Joists and Joist Girders.
 - 4. SSPC: Steel Structures Painting Manual.
 - 5. FS: TT-P-645.
- B. Qualification of Welding Personnel:
 - 1. Employ welding personnel whose qualification is certified in accordance with AWS D1.1. Such certification is to remain in force for the duration of the welding operations under this Contract.

1.04 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings:
 - 1. Detailed joist and erection drawings showing erection marks, SJI-designation numbers, locations and spacing; bearing-plate and anchor-bolt layouts; bridging details and connections; shop coating; and details necessary for installation. Drawings to be signed and sealed by a professional engineer registered in the jurisdiction where the work will be performed.
- B. Certification:
 - 1. Certificate verifying compliance with SJI specifications.
 - 2. Certification that welding personnel are currently qualified in accordance with AWS D1.1, and as specified above under Qualification of Welding Personnel.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Load, transport, unload and store steel joists by means which will prevent damage.
- B. Use waterproof coverings during transit and storage to protect shop coats and prevent corrosion.
- C. Store off the ground preferably supported by their end bearings.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Steel Joists: Designations shown, fabricated in accordance with SJI requirements. Extended ends and ceiling extensions designed to support loads shown.
- B. Shop Coating: In accordance with FS TT-P-645 and SSPC recommendations of the Steel Structures Painting Manual, except that asphalt coating is prohibited for joists specified to be field-painted.
- C. Bridging: Member sizes, end anchorages and accessories in accordance with SJI requirements.
- D. Bearing plates and miscellaneous steel framing: Section 05500.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install steel joists and bridging in accordance with SJI recommendations.
- B. Ensure that bearing plates are set in accordance with approved working drawings. Install joists of proper designations at locations shown.
- C. Perform welding in accordance with AWS D1.1. Burning of holes, undercutting or other operations which reduce strength of joists are prohibited.
- D. Permanently secure bridging and decking before applying construction or design loads to steel-joist installation.
- E. Ensure that construction loads, such as stacked materials, do not exceed designed capacity of the installation.
- F. Repair or replace damaged joists as directed.

3.02 FIELD PAINTING:

- A. Repair shop coating where damaged. Remove welding flux, rust and other foreign matter. Coat welded and damaged areas with coating to match shop-applied coating.
- B. Use joists with asphalt coating only in areas which have ceilings.
- C. Paint joists exposed to view in completed project in accordance with Section 09920.

3.03 FIELD QUALITY CONTROL:

- A. Inspect steel joists for broken welds, bent chords or web members and other damage harmful to structural integrity of joists.
- B. Verify size, spacing, top-chord alignment and level, and tightness of fasteners.
- C. Monitor field welding for compliance with AWS D1.1 requirements.

END OF SECTION

SECTION 05310

METAL DECKING

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing metal roof decking.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Touch up and field painting of metal deck: Section 09920.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. AISI Specifications for the Design of Light-Gauge Cold-Formed Steel Structural Members.
 - 3. AWS: D1.1.
 - 4. SDI (Steel Deck Institute): Design Manual for Floor Decks and Roof Decks.
 - 5. ASTM: A653/A653M.
- B. Qualification of Welding Personnel:
 - 1. Employ welding personnel whose qualification is certified in accordance with AWS D1.1. Such certification is to remain in force for the duration of the welding operations under this Contract.

1.04 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings:
 - 1. Include details of fabrication and erection including materials, dimensions, methods of joining, welding, accessories, fastenings and openings through decking.
- B. Samples:
 - 1. Three of each type of the following products used in the work.
 - a. Decking: Six inches by width of material.
 - b. Accessories.
 - c. Fasteners.
- C. Certification:
 - 1. Certification that welding personnel have been qualified in accordance with AWS D1.1.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products in good condition.
- B. Store products so as to preclude corrosion, deterioration and damage.

- C. Handle products so as to prevent damage.

1.06 JOB CONDITIONS:

- A. Do not apply construction loads, such as roofing materials and aggregate, in excess of the live loads for which the deck is designed.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Steel Decking:
 - 1. Galvanized: ASTM A653/A653M, Coating G60 or G90, gauge as shown.
 - 2. Where terne-coated stainless steel is to be installed over decking, fabricate decking with clear space between ribs 1/2-inch wide maximum.
- B. Accessories:
 - 1. Types shown or necessary to complete installation, such as 14-gauge recessed sump pans for roof drains, cover plates where panels abut or change direction and closure plates.
 - 2. Same gauge and finish as decking, unless otherwise shown or specified.
- C. Fasteners: As shown on approved shop drawings.

2.02 FABRICATION:

- A. Deck units countersunk at ends to form smooth, flush top surface at overlapping ends, except for 12-gauge and 14-gauge material.
- B. Deck units having interlocking side laps, in standard width and longest practicable lengths
- C. Steel Roof Deck: Gage and depth as shown.
- D. Metal Forming (corrugated):
 - 1. Maximum Flexural Working Stress: 33,000 psi.
 - 2. Maximum Roof Deflection: 1/240 of span, c/c of supports, under live load.
 - 3. Maximum Floor Deflection: 1/360 of span, c/c of supports, under live load.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Erect steel decking and accessories in accordance with approved shop drawings and manufacturer's recommendations.
- B. Place decking units on the supporting steel, align and adjust to final position before permanently fastening.
- C. If supporting beams are not in proper alignment or at correct elevation to provide bearing and alignment of deck units; do not place decking units in deficient areas until necessary corrections have been made.

- D. Continue decking over three or more spans.
- E. Perform welding in accordance with AWS D1.1.
- F. Use electric-arc welding to weld deck panels to end supports as shown on the Contract Drawings or on approved shop drawings. Where panel ends meet, provide minimum two-inch overlap and weld to fuse ends of units together.
- G. Crimp side joints of adjacent panels and weld at intervals not exceeding three feet.
- H. Remove burrs and sharp edges.
- I. Where welding occurs through deck, use welding washers and plug welds to ensure proper attachment.
- J. Cut bevels and perform other special cutting and fitting at jobsite.
- K. Provide necessary support framing and reinforcement and openings for items penetrating deck panels.
- L. Coordinate cutting of openings for work of other trades with trades involved.
- M. Do not hang mechanical equipment or other loads from steel deck.
- N. Repair areas where galvanizing has been damaged by welding or cutting operations using cold galvanizing compound acceptable to the Engineer.
- O. Clean galvanized roof sheets with zinc oxide residue or evidence of rusting with solvent and apply zinc-rich paint to restore corrosion resistance.

3.02 CLEAN-UP:

- A. Clean up rubbish and debris caused by this work and remove from site.
- B. Leave decks and areas surrounding work in broom-clean condition.

END OF SECTION

THIS PAGE NOT USED

SECTION 05500

MISCELLANEOUS METAL

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing miscellaneous metal, with the exception of ornamental (architectural) metal and metalwork provided as a part of mechanical, electrical and construction systems.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Concrete, concrete fill and nonshrink grout: Section 03300.
- B. Structural steel: Section 05120.
- C. Handrails and Railings: Section 05521.
- D. Gratings and Floor Plates: Section 05531.
- E. Field painting: Section 09920.
- F. Concrete formwork: Section 03100.
- G. Concrete reinforcement: Section 03200.
- H. Wire Mesh Partitions: Section 10605
- I. Grounding and Bonding: Section 16060

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings: Detail fabrication and erection of each metal fabrication indicated.
 - 1. Include plans, elevations, sections, and details of metal fabrications and their connections. Show anchorage and accessory items. Provide templates for anchors and bolts specified for installation under other Sections.
 - 2. Manufacturer's standard drawings may be submitted in lieu of Contractor-prepared shop drawings if manufacturer's standard drawings show required details.
- B. Certification:
 - 1. Certification that welding personnel are currently qualified in accordance with AWS D1.1.
 - 2. Mill Certificates: Signed by manufacturers of stainless-steel sheet certifying that products furnished comply with requirements for corrosion resistance of Type 316 stainless steel.

1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. AWS: D1.1.
 - 3. AISC: Specification for Structural Steel for Buildings-Allowable Stress Design and Plastic Design (Do not use plastic design).
 - 4. SSPC: SP 11, Paint 12.

5. FED STD: 595.
6. MS: MIL-P-21035.
7. FS: A-A-462, FF-B-588, FF-H-116, FF-P-395, FF-S-325, RR-T-650, TT-P-86.
8. ASTM: A36, A53, A74, A108, A123, A167, A193, A229, A242, A276, A307, A313, A325, A413, A490, A501, A536, A570, A572, A588, A666, A780, A786/A786M, B 221, B 632, B633, D412, D1187, E488, F 593, F 594, F1554.
9. AGA: The Design and Fabrication of Galvanized Products.
10. ANSI: A14.3
11. ASME: A 17.1, B18.6.3, B18.21.1, B18.22.1.

B. Qualifications of Welding Personnel:

1. Welding: Qualify procedures and personnel according to the following:
 - a. AWS D1.1, "Structural Welding Code--Steel."
 - b. AWS D1.2, "Structural Welding Code--Aluminum."
 - c. AWS D1.3, "Structural Welding Code--Sheet Steel."
 - d. Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification. Such certification is to remain in force for the duration of the welding operations under this Contract.

C. Fabricator Qualifications: A firm experienced in producing metal fabrications similar to those indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.

D. Coordinate installation of anchorages for metal fabrications. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

1.05 PROJECT CONDITIONS:

- A. Field Measurements: Where metal fabrications are indicated to fit walls and other construction, verify dimensions by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
 1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating metal fabrications without field measurements. Coordinate construction to ensure that actual dimensions correspond to established dimensions. Allow for trimming and fitting.

1.06 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products undamaged.
- B. Store products so as to prevent rust.
- C. Handle products so as to prevent damage.
- D. After completion of factory testing, package and ship hatches as directed.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. General Requirements:
 - 1. Insofar as practicable, furnish similar products of a single manufacturer.
 - 2. Metal Surfaces, General: For metal fabrications exposed to view in the completed Work, provide materials with smooth, flat surfaces without blemishes. Do not use materials with exposed pitting, seam marks, roller marks, rolled trade names, or roughness.

2.02 FERROUS METALS:

- A. Structural steel: Plates, shapes, bars and angles, ASTM A36.
- B. Rolled-Steel Floor plate: ASTM A786/A786M; Fabricate raised-pattern floor plates from rolled-steel floor plate, galvanized after fabrication, of thickness and in pattern indicated below:
 - 1. Thickness: Minimum 1/4 inch, unless otherwise shown or calculated.
 - 2. Pattern: No. 2, or as selected from manufacturer's standard patterns; flat back.
- C. High-strength low-alloy structural steel:
 - 1. ASTM A242.
 - 2. Resistance to atmospheric corrosion: Four times that of carbon steel, minimum.
- D. Load-carrier beams: ASTM A588.
- E. Structural tubing: ASTM A501.
- F. Steel Pipe: ASTM A 53, standard weight (Schedule 40), unless another weight is indicated or required by structural loads.
- G. Stainless-Steel Sheet, Strip, Plate, and Flat Bars: ASTM A666, Type 304. Type 316L for corrosive environments.
- H. Stainless-Steel Bars and Shapes: ASTM A276, Type 304. Type 316L for corrosive environments.
- I. Hot-rolled carbon steel sheets and strips: ASTM A570.
- J. Pipe, Pipe Sleeves and Pipe Fittings:
 - 1. Cast iron: ASTM A74, service weight.
 - 2. Steel: ASTM A53, galvanized unless otherwise shown or specified.
- K. Guard Chain: ASTM A413, Class Grade 28, galvanized steel, 9/32-inch thick, complete with stainless-steel eyes, spring-loaded catches and mounting components.

2.03 ALUMINUM:

- A. Aluminum Extrusions: ASTM B221, Alloy 6063
- B. Aluminum-Alloy Rolled Tread Plate: ASTM B632/B 632M, Alloy 6061.

- C. Cast Aluminum.

2.04 COATINGS:

- A. Shop Primer for Ferrous Metal: Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with performance requirements in FS TT-P-664; selected for good resistance to normal atmospheric corrosion, compatibility with finish paint systems indicated, and capability to provide a sound foundation for field-applied topcoats despite prolonged exposure.
- B. Zinc-rich paint: MS MIL-P-21035.
- C. Electrodeposited zinc coating: ASTM B63
- D. Galvanizing repair compound: Stick form, melting point 600F to 650F, GALVABAR or equal.
- E. Bituminous coating: Cold-applied asphalt mastic complying with SSPC Paint 12, except containing no asbestos fibers, or cold-applied asphalt emulsion complying with ASTM D1187.

2.05 FASTENERS:

- A. General: Provide Type 304 or 316 stainless-steel fasteners for exterior use and zinc-plated fasteners with coating complying with ASTM B 633, Class Fe/Zn 5, where built into exterior walls. Select fasteners for type, grade, and class required.
- B. Screws: Material, type and size to suit the purpose; steel, except stainless, cadmium-plated.
 - 1. Stainless steel, ASTM A193, Alloy S30400.
- C. Machine bolts: Material, type and size best suited to the purpose. Minimum tensile strength 60,000 psi.
 - 1. Carbon steel: ASTM A307, Grade B, galvanized.
 - 2. Stainless steel: ASTM A193, Class 1A.
- D. Toggle bolt: FS FF-B-588.
- E. Drive stud: FS FF-S-325, Group 6.
- F. Expansion shield: FS FF-S-325 Group I, Type 2, Class 2, Style 1; Group II, Type 3, Class 1; Group IV, Type 1; best suited to the purpose.
- G. Screw anchors: Lead or plastic for wood or metal screws.
- H. Anchor-bolt sleeve: Corrugated high-density polyethylene plastic.
- I. Powder actuated: FS FF-P-395.
- J. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E 488, conducted by a qualified independent testing agency.
 - 1. Material: Alloy Group 1 or 2 stainless-steel bolts complying with ASTM F593 and nuts complying with ASTM F594.

K. Internally Threaded Steel Anchor: ASTM A108.

2.06 CONCRETE AND GROUT:

A. Nonshrink Grout: Section 03300.

B. Concrete Fill: Normal weight, minimum 3,000 psi structural concrete as required in Section 03300, except limit the max. coarse aggregate size to #8.

1. Non-slip aggregate: Fused aluminum oxide grits or crushed emery, factory graded and packaged, rust-proof, non glazing and unaffected by moisture and cleaning materials.
2. Surface hardener: Water-soluble, inorganic fluosilicate compound for curing, hardening and dustproofing fresh concrete.

2.07 FABRICATION, GENERAL:

A. Shop Assembly: Preassemble items in shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.

B. Shear and punch metals cleanly and accurately. Remove burrs.

C. Ease exposed edges to a radius of approximately 1/32 inch, unless otherwise indicated. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.

D. Weld corners and seams continuously to comply with the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove welding flux immediately.
4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.

E. Provide for anchorage of type indicated; coordinate with supporting structure. Fabricate and space anchoring devices to secure metal fabrications rigidly in place and to support indicated loads.

F. Cut, reinforce, drill, and tap metal fabrications as indicated to receive finish hardware, screws, and similar items.

G. Fabricate joints that will be exposed to weather in a manner to exclude water, or provide weep holes where water may accumulate.

H. Allow for thermal movement resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening up of joints, overstressing of components, failure of connections, and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

- I. Form exposed work true to line and level with accurate angles and surfaces and straight sharp edges
- J. Remove sharp or rough areas on exposed traffic surfaces.
- K. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible. Use exposed fasteners of type indicated or, if not indicated, Phillips flat-head (countersunk) screws or bolts. Locate joints where least conspicuous.

2.08 LADDERS:

- A. General: Fabricate ladders for locations shown, with dimensions, spacings, details, and anchorages as indicated.
 - 1. Comply with ANSI A14.3, unless otherwise indicated.
 - 2. For elevator pit ladders, comply with ASME A17.1.
- B. Siderails: Continuous, 1/2-by-2-1/2-inch steel flat bars, with eased edges.
- C. Bar Rungs: 3/4-inch diameter steel bars, spaced 12 inches o.c., unless shown otherwise.
- D. Fit rungs in centerline of side rails; plug-weld and grind smooth on outer rail faces.
- E. Support each ladder at top and bottom and not more than 48 inches o.c. with welded or bolted steel brackets. Size brackets to support design loads specified in ANSI A14.3.
- F. Provide nonslip surfaces on top of each rung by coating with abrasive material metallurgically bonded to rung by a proprietary process.
- G. Galvanize ladders, including brackets and fasteners, in exterior locations and in areas with corrosive environments:

2.09 LADDER SAFETY CAGES:

- A. General: Fabricate ladder safety cages to comply with ANSI A14.3. Assemble by welding or riveting.
- B. Primary Hoops: 5/16-by-4-inch steel flat bar hoops. Provide at tops and bottoms of cages and spaced not more than 20 feet o.c.
- C. Secondary Intermediate Hoops: 5/16-by-2-inch steel flat bar hoops, spaced not more than 48 inches o.c. between primary hoops.
- D. Vertical Bars: 5/16-by-2-inch steel flat bars secured to each hoop, spaced approximately 9 inches o.c.
- E. Fasten assembled safety cage to ladder rails and adjacent construction by welding or riveting, unless otherwise indicated.
- F. Galvanize ladder safety cages, including fasteners, in exterior locations and in areas with corrosive environments.

2.10 SHIP'S LADDERS:

- A. General: Design in accordance with AISC Specification for Structural Steel for Buildings-Allowable Stress Design, NAAMM Metal Stairs Manual and applicable OSHA requirements.
 - 1. Minimum live load for stairs: 100 psf.
 - 2. Stringers: At platforms and landings, extend stringers around perimeters. Close ends with continuously welded closure plates, ground smooth and flush.
- B. Provide ship's ladders where shown or indicated. Fabricate of open-type construction with structural-steel channel or steel plate stringers, steel pipe handrails, and steel bar grating treads, unless otherwise indicated. Provide brackets and fittings for installation.
- C. Treads, platforms and landings fabricated of steel plate with nonslip surface or steel grating, as shown.
- D. As far as practicable, holes for rivets, bolts and screws located in concealed positions.
- E. Galvanize ship's ladder, including fasteners, in exterior locations and in areas with corrosive environments.
- F. Comply with applicable requirements in Section 05520 for steel pipe railings.

2.11 SAFETY TREAD:

- A. FS RR-T-650, Type C, metallic, nonskid, class and style as shown.
- B. Drilled and countersunk to receive flathead screws.

2.12 STEEL LINTELS:

- A. Fabricated of structural steel.
- B. Multiple members riveted or welded back-to-back or separated by spacers.
- C. Shop-painted, except hot-dip galvanized after fabrication where used in exterior walls.

2.12 SHELF ANGLES:

- A. Fabricate shelf angles from steel angles of sizes indicated and for attachment to concrete framing. Provide horizontally slotted holes to receive 3/4-inch bolts, spaced not more than 6 inches from ends and 24 inches o.c., unless otherwise indicated.
- B. For cavity walls, provide vertical channel brackets to support angles from backup masonry and concrete. Align expansion joints in angles with indicated control and expansion joints in cavity-wall exterior wythe.
- C. Galvanize shelf angles to be installed in exterior walls.
- D. Furnish wedge-type concrete inserts, complete with fasteners, to attach shelf angles to cast-in-place concrete.

2.13 CORNER GUARD, CURB ANGLE AND BUMPER:

- A. Fabricated of structural steel.

- B. Shop-painted.

2.14 CAST NOSING:

- A. Cast aluminum: Cross-hatched units, 4 inches wide with 1-inch lip, for casting into concrete steps
- B. Apply bituminous paint to concealed bottoms, sides, and edges of units set into concrete.

2.15 BOLLARDS:

- A. Pipe: Black Steel, ASTM A53, Type E, Grade A, Schedule 80, sized as shown, with 1/4-inch steel-plate cap welded all around and weld ground smooth
- B. Eyebolt: 1/4-inch diameter steel rod with 1/2-inch diameter eye.
- C. Concrete fill: Section 03300, Class 3000.
- D. Coating:
 - 1. Shop paint.
 - 2. Finish paint: Aliphatic system as specified in Section 09920.
 - 3. Hot-dip galvanize exterior bollards in accordance with ASTM A123 before bonderizing and shop priming.
- E. Chain: Guard chain, galvanized and painted to match bollard.

2.16 MISCELLANEOUS ITEMS:

- A. Fabricate metal items indicated on the drawings from materials shown or, if not otherwise described, from steel or from galvanized steel wherever exposed to the weather or in contact with concrete or masonry.
- B. Make miscellaneous items to the size and configuration indicated, welded or bolted at joints to develop full strength equal to a continuous member, and in every way complete for the intended purpose and finished in appearance.
- C. Pylon-Base Ring: Structural steel, galvanized after fabrication.
- D. Eye: ASTM A572, Grade 50, one-inch diameter steel rod, welded, galvanized after fabrication.

2.17 FINISHES:

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
 - 1. Finish metal fabrications after assembly.
- B. Galvanizing:
 - 1. Clean ferrous metal thoroughly before applying zinc coating.
 - 2. Apply zinc coating to products after fabrication, by hot-dip method, using coating weighing not less than 2.0 ounces per square foot.
- C. Shop Paint:

1. Ferrous metal thoroughly cleaned as recommended by primer manufacturer and in accordance with SSPC SP11 and, except for items to be encased in concrete, given prime coat of paint.
 2. Zinc yellow iron-oxide primer or red-lead base primer applied so as to thoroughly cover surfaces without leaving runs or sags.
- D. Stainless Steel: Remove tool and die marks and stretch lines or blend into finish. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.
- E. Aluminum: AA-M10 (Mechanical Finish: as fabricated, unspecified).
- F. Non-Slip Abrasive Surfaces: SLIP-NOT as manufactured by the W. S. Molnar Company or approved equal. Fabricate from steel plate or bar with abrasive material metallurgically bonded to steel by a proprietary process. Provide material with coefficient of friction of 0.6 or higher when tested according to ASTM C1028.

PART 3 - EXECUTION

3.01 PREPARATION:

- A. Remove foreign substances from surfaces to receive metal items.
- B. Protect surrounding surfaces from damage while performing the work of this section.

3.02 INSTALLATION, GENERAL:

- A. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing metal fabrications to in-place construction. Include threaded fasteners for concrete and masonry inserts, toggle bolts, through-bolts, lag bolts, wood screws, and other connectors.
- B. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal fabrications. Set metal fabrications accurately in location, alignment, and elevation; with edges and surfaces level, plumb, true, and free of rack; and measured from established lines and levels.
- C. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.
- D. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.
- E. Field Welding: Comply with the following requirements:
 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 2. Obtain fusion without undercut or overlap.
 3. Remove welding flux immediately.

4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.
- F. Corrosion Protection: Coat concealed surfaces of aluminum that will come into contact with grout, concrete, masonry, wood, or dissimilar metals with a heavy coat of bituminous paint.

3.03 INSTALLING NOSINGS:

- A. Center nosings on tread widths.
- B. For nosings embedded in concrete steps or curbs, align nosings flush with riser faces and level with tread surfaces.

3.04 INSTALLING BOLLARDS:

- A. Anchor bollards in concrete with pipe sleeves preset and anchored into concrete. After bollards have been inserted into sleeves, fill annular space between bollard and sleeve solidly with nonshrink, nonmetallic grout, mixed and placed to comply with grout manufacturer's written instructions. Slope grout up approximately 1/4 inch toward bollard.

3.05 PAINTING AND REPAIRING COATED SURFACES:

- A. Before erection or enclosing construction, paint items that support masonry or will be concealed in finished work, except items encased in concrete.
- B. Where shop coat is abraded or burned by welding, clean and touch-up.
- C. Touch-up primed surfaces with same material as coating.
- D. Where aluminum parts come in contact with concrete or steel, coat contact surfaces of aluminum with bituminous coating.
- E. Coat field welds and repair damage to zinc-coated surfaces in accordance with ASTM A780 and as follows:
 1. Wire-brush areas to be coated to bright metal.
 2. Apply galvanizing repair compound at rate of two ounces per square foot.

END OF SECTION

SECTION 05511

METAL STAIRS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing Adjust list below to suit Project steel stairs with concrete-filled treads, industrial stairs with steel floor plate treads, industrial stairs with steel grating treads.
- B. Related Work Specified Elsewhere:
 - 1. Cast-In-Place Structural Concrete: Section 03300.
 - 2. Handrails and Railings: Section 05521.
 - 3. Miscellaneous Metal: Section 05500.
 - 4. Field Painting: Section 09920.

1.02 PERFORMANCE REQUIREMENTS:

- A. Structural Performance: Provide metal stairs capable of withstanding the following structural loads without exceeding the allowable design working stress of the materials involved, including anchors and connections. Apply each load to produce the maximum stress in each component of metal stairs.
 - 1. Treads and Platforms of Metal Stairs: Capable of withstanding a uniform load of 100 lbf/sq. ft. or a concentrated load of 300 lbf on an area of 4 sq. in., whichever produces the greater stress; or higher load if required by the jurisdictional authority where the stair is installed.
 - 2. Stair Framing: Capable of withstanding stresses resulting from loads specified above in addition to stresses resulting from railing system loads.
 - 3. Limit deflection of treads, platforms, and framing members to L/360 or 1/4 inch, whichever is less or as required by the jurisdictional authority where the stair is installed.
- B. Metal stairs shall be designed in accordance with AISC's "Specification for Structural Steel for Buildings-Allowable Stress Design," NAAMM's "Metal Stairs Manual" and applicable OSHA requirements.

1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each.
 - 1. Product Data: For metal stairs and the following:
 - a. Prefilled metal-pan stair treads.

- b. Precast concrete treads.
 - c. Nonslip aggregates and nonslip-aggregate finishes.
 - d. Steel floor plate.
 - e. Grout.
2. Shop Drawings: Show fabrication and installation details for metal stairs. Include plans, elevations, sections, and details of metal stairs and their connections. Show anchorage and accessory items. Provide templates for anchors and bolts specified for installation under other Sections.
 3. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
 4. Samples for Initial Selection: Manufacturer's color charts or sections of units showing the full range of colors and patterns for the following products
 5. Samples for Verification: For the following products. Prepare Samples from the same material to be used for the Work.
 - a. Stair treads with nonslip-aggregate surface finish.
 - b. Floor plate treads.
 - c. Grating treads.
 6. Welding Certificates: Copies of certificates for welding procedures and personnel.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 1. Comply with codes and regulations of the jurisdictional authorities.
 2. ADA: Americans with Disabilities Act.
 3. AGA: The Design and Fabrication of Galvanized Products.
 4. AISC: Specification for Structural Steel for Buildings-Allowable Stress Design
 5. ASME: B18.2.1, B18.6.3, B18.21.1, B18.22.1.
 6. ASTM: A36, A82, A90, A123, A143, A153, A185, A283, A307, A366, A384, A500, A510, A563, A611, B633, C1028, C1107, D1187, E488, F593, F594.
 7. AWS: D1.1, D1.3.

8. FS: TT-P-664
 9. MS: MIL-P-21305.
 10. NAAMM: Metal Bar Grating Manual for Steel, Stainless Steel, and Aluminum Gratings and Stair Treads, Metal Finishes Manual for Architectural and Metal Products, Metal Stairs Manual.
 11. SSPC: Paint 12, PA-1, SP 3, SP 6/NACE No. 3.
- B. Installer Qualifications: Arrange for metal stairs specified in this Section to be fabricated and installed by the same firm.
- C. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of metal stairs (including handrails and railing systems) that are similar to those indicated for this Project in material, design, and extent.
- D. Fabricator Qualifications: A firm experienced in producing metal stairs similar to those indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.
- E. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code--Steel," and AWS D1.3, "Structural Welding Code--Sheet Steel."

1.05 COORDINATION:

- A. Coordinate installation of anchorages for metal stairs. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

PART 2 -PRODUCTS

2.01 FERROUS METALS:

- A. Metal Surfaces, General: Provide metal free from pitting, seam marks, roller marks, and other imperfections where exposed to view on finished units. Do not use steel sheet with variations in flatness exceeding those permitted by referenced standards for stretcher-leveled sheet.
- B. Steel Plates, Shapes, and Bars: ASTM A36.
- C. Steel Tubing: Cold-formed steel tubing complying with ASTM A500.
- D. Rolled-Steel Floor Plate: ASTM A 786/A 786M, rolled from plate complying with ASTM A 36/A 36M or ASTM A 283/A 283M, Grade C or D.
- E. Steel Bars for Gratings: ASTM A36.
- F. Wire Rod for Grating Crossbars: ASTM A510.

- G. Uncoated, Cold-Rolled Steel Sheet: Commercial quality, complying with ASTM A366/A366M; or structural quality, complying with ASTM A611, Grade A, unless another grade is required by design loads.
- H. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.

2.02 FASTENERS:

- A. General: Provide zinc-plated fasteners with coating complying with ASTM B633, Class Fe/Zn 25 for exterior use, and Class Fe/Zn 5 where built into exterior walls. Select fasteners for type, grade, and class required.
- B. Bolts and Nuts: Regular hexagon-head bolts, ASTM A307, Grade A; with hex nuts, ASTM A563; and, where indicated, flat washers.
- C. Machine Screws: ASME B18.6.3.
- D. Lag Bolts: ASME B18.2.1.
- E. Plain Washers: Round, carbon steel, ASME B18.22.1.
- F. Lock Washers: Helical, spring type, carbon steel, ASME B18.21.1.
- G. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E 488, conducted by a qualified independent testing agency.
 - 1. Material: Carbon-steel components zinc-plated to comply with ASTM B 633, Class Fe/Zn 5.
 - 2. Material: Alloy Group 1 or 2 stainless-steel bolts complying with ASTM F593 and nuts complying with ASTM F594.

2.03 COATINGS:

- A. Shop Primer for Ferrous Metal: Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with performance requirements in FS TT-P-664, selected for good resistance to normal atmospheric corrosion, compatibility with finish paint systems indicated, and capability to provide a sound foundation for
- B. Galvanizing (zinc-coating by hot-dipped process): ASTM A90, ASTM A123, or ASTM A143, ASTM A153 or ASTM A384, as applicable.
- C. Zinc-rich paint: MS MIL-P-21305.
- D. Galvanizing Repair Compound: Stick form, melting point 600-degree F to 650-degree F, GALVABAR or equal.

2.04 CAST ABRASIVE NOSINGS:

- A. Fabricate units from cast iron in sizes and configurations indicated and in lengths

necessary to accurately fit openings or conditions. Provide units with an integral corundum or silicon carbide abrasive finish. See Section 05500, "Miscellaneous Metals."

- B. Provide anchors for embedding units in concrete, either integral or applied to units, as standard with manufacturer.
- C. Apply bituminous paint to concealed bottoms, sides, and edges of units set into concrete.
- D. Provide a cross-hatched surface texture, unless other surfaces are indicated.

2.05 GROUT:

- A. Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C1107. Provide grout specifically recommended by manufacturer for interior and exterior applications.

2.06 CONCRETE FILL AND REINFORCING MATERIALS:

- A. Concrete Materials and Properties: Comply with requirements in Section 03300, "Cast-in-Place Concrete" for normal-weight, ready-mixed concrete with a minimum 28-day compressive strength of 3000 psi, limit the max. coarse aggregate size to #8, unless higher strengths are indicated.
- B. Nonslip-Aggregate Finish: Factory-packaged and graded abrasive aggregate made from fused, aluminum-oxide grits or crushed emery; rustproof and nonglazing; unaffected by freezing, moisture, or cleaning materials.
- C. Welded Wire Fabric: ASTM A185, 6 by 6 inches--W1.4 by W1.4, unless otherwise indicated.
- D. Surface Hardener: Water-soluble, inorganic fluosilicate compound for curing, hardening and dustproofing fresh concrete.

2.07 PRECAST CONCRETE TREADS:

- A. Concrete Materials and Properties: Comply with requirements in Section 03300, "Cast-in-Place Concrete" for normal-weight, ready-mixed concrete with a minimum 28-day compressive strength of 5000 psi and a total air content of not less than 4 percent or more than 6 percent.
- B. Reinforcing Wire Fabric: Galvanized, welded wire fabric, 2 by 2 inches by 0.062-inch-diameter wire; comply with ASTM A185 and ASTM A82, except for minimum wire size.

2.08 FABRICATION, GENERAL:

- A. Fabricate and prepare products required to be galvanized in accordance with recommendations of AGA.
- B. Provide complete stair assemblies, including metal framing, hangers, struts, clips, brackets, bearing plates, and other components necessary to support and anchor stairs and platforms on supporting structure. Delete subparagraphs below if not

required.

1. Join components by welding, unless otherwise indicated.
 2. Use connections that maintain structural value of joined pieces.
 3. Fabricate treads and platforms of exterior stairs so finished walking surfaces slope to drain.
- C. NAAMM Stair Standard: Comply with "Recommended Voluntary Minimum Standards for Fixed Metal Stairs" in NAAMM AMP 510, "Metal Stairs Manual," for class of stair designated, unless more stringent requirements are indicated.
1. Architectural class, where indicated.
 2. Commercial class, unless otherwise indicated.
 3. Service class, unless otherwise indicated.
 4. Industrial class, where indicated.
- D. Shop Assembly: Preassemble stairs in shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation
- E. Form exposed work true to line and level with accurate angles and surfaces and straight sharp edges. Shear and punch metals cleanly and accurately. Remove sharp or rough areas on exposed surfaces.
- F. Ease exposed edges to a radius of approximately 1/32 inch, unless otherwise indicated. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.
- G. Weld connections to comply with AWS and the following:
1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 2. Obtain fusion without undercut or overlap.
 3. Remove welding flux immediately.
 4. Weld exposed corners and seams continuously, unless otherwise indicated.
 5. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.
- H. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible. Use exposed fasteners of type indicated or, if not indicated, Phillips flat-head (countersunk) screws or bolts. Locate joints where least conspicuous.

- I. Fabricate joints that will be exposed to weather in a manner to exclude water, or provide weep holes where water may accumulate.

2.09 STEEL-FRAMED STAIRS:

- A. Stair Framing: Fabricate stringers of structural-steel channels, plates, or a combination of both, as indicated. Provide closures for exposed ends of stringers. At platforms and landings, extend stringers around perimeters. Close ends with continuously welded closure plates, ground smooth and flush. Construct platforms of structural-steel channel headers and miscellaneous framing members as indicated. Bolt or weld headers to stringers; bolt or weld framing members to stringers and headers. If using bolts, fabricate and join so bolts are not exposed on finished surfaces.
 1. Where masonry walls support metal stairs, provide temporary supporting struts designed for erecting steel stair components before installing masonry.
- B. Metal Risers, Subtread Pans, and Subplatforms: Form to configurations shown from steel sheet of thickness necessary to support indicated loads, but not less than 0.0677 inch.
 1. Steel Sheet: Uncoated cold-rolled steel sheet, unless otherwise indicated.
 2. Directly weld metal pans to stringers; locate welds on side of subtreads to be concealed by concrete fill. Do not weld risers to stringers.
 3. Attach cast abrasive nosings to risers. Make nosings full width of tread, with noses flush with riser faces and level with tread surfaces.
- C. Steel Floor Plate Treads, Risers, and Platforms: Form to configurations shown from abrasive-surface floor plate of thickness necessary to support indicated loads, but not less than 1/4 inch.
 1. Abrasive-Surface Floor Plate: Fabricate from steel plate, with abrasive material metallurgically bonded to steel by a proprietary process. Provide material with coefficient of friction of 0.6 or higher when tested according to ASTM C1028.
 - a. Products: Subject to compliance with requirements, provide one of the following: 1) Mebac; IKG Borden. 2) SLIP-NOT; W. S. Molnar Company. 3) Or equal.
 2. Form treads with integral nosing and back edge stiffener. Weld steel supporting brackets to stringers and weld treads to brackets.
 3. Fabricate platforms with integral nosings matching treads and weld to platform framing.
- D. Floor Grating Treads and Platforms: Form to configurations shown from metal bar grating; fabricate to comply with NAAMM MBG 531, "Metal Bar Grating Manual for Steel Stainless Steel, and Aluminum Gratings and Stair Treads."
 1. Fabricate treads and platforms from welded steel grating or pressure-locked steel

grating with bearing bars and crossbars of sizes to meet the required loads.

2. Surface: Serrated.
3. Finish: Galvanized.
4. Fabricate grating platforms with nosing matching that on grating treads. Provide toeplates at open-sided edges of grating platforms. Weld grating to platform framing.

2.10 STAIR HANDRAILS AND RAILINGS:

- A. General: Comply with applicable requirements in Section 05521.
 1. Railings may be bent at corners, rail returns, and wall returns, instead of using prefabricated fittings.
 2. Connect railing posts to stair framing by direct welding, unless otherwise indicated.

2.11 FINISHES:

- A. General:
 1. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
 2. Finish metal stairs after assembly.
- B. Galvanizing:
 1. Clean ferrous metal thoroughly before applying zinc coating.
 2. Apply zinc coating to products after fabrication, by the hot-dip method, using coating weighing not less than two ounces per-square-foot.
- C. Preparation for Shop Priming: Prepare uncoated or non-alvanized ferrous-metal surfaces to comply with minimum requirements indicated below for SSPC surface-preparation specifications and environmental exposure conditions of installed items:
 1. Interiors (SSPC Zone 1A): SSPC-SP 3, "Power Tool Cleaning."
- D. Apply shop primer to non-galvanized surfaces of gratings, frames, and supports, except those with galvanized finishes and those to be embedded in concrete or masonry, unless otherwise indicated. Comply with SSPC-PA 1, "Paint Application Specification No. 1," for shop painting.
 1. Do not apply primer to galvanized surfaces.
 2. Stripe paint corners, crevices, bolts, welds, and sharp edges.
 3. For items shown or indicated to receive paint: Section 09920.

PART 3 - EXECUTION

3.01 INSTALLATION, GENERAL:

- A. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing metal stairs to in-place construction. Include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.
- B. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal stairs. Set units accurately in location, alignment, and elevation, measured from established lines and levels and free from rack.
- C. Install metal stairs by welding stair framing to steel structure or to weld plates cast into concrete, unless otherwise indicated.
- D. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.
- E. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.
- F. Field Welding: Comply with the following requirements:
 - 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 - 2. Obtain fusion without undercut or overlap.
 - 3. Remove welding flux immediately.
 - 4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.
- G. Install precast treads with adhesive supplied by manufacturer.

3.02 INSTALLING METAL STAIRS WITH GROUTED BASEPLATES:

- A. Clean concrete and masonry bearing surfaces of bond-reducing materials, and roughen to improve bond to surfaces. Clean bottom surface of baseplates.
- B. Set steel stair baseplates on wedges, shims, or leveling nuts. After stairs have been positioned and aligned, tighten anchor bolts. Do not remove wedges or shims but, if protruding, cut off flush with edge of bearing plate before packing with grout.
 - 1. Use nonmetallic, nonshrink grout, unless otherwise indicated.
 - 2. Pack grout solidly between bearing surfaces and plates to ensure that no voids remain.

3.03 INSTALLING STEEL RAILINGS AND HANDRAILS:

- A. Adjust handrails and railing systems before anchoring to ensure matching alignment at abutting joints. Space posts at spacing indicated or, if not indicated, as required by design loads. Plumb posts in each direction. Secure posts and railing ends to building construction as follows:
 - 1. Anchor posts to steel by welding directly to steel supporting members.
 - 2. Anchor handrail ends to concrete and masonry with steel round flanges welded to rail ends and anchored with postinstalled anchors and bolts.
- B. Attach handrails to wall with wall brackets. Provide bracket with 1-1/2-inch clearance from inside face of handrail and finished wall surface. Locate brackets as indicated or, if not indicated, at spacing required to support structural loads. Secure wall brackets to building construction as follows:
 - 1. For concrete and solid masonry anchorage, use drilled-in expansion shields and hanger or lag bolts.
 - a. For hollow masonry anchorage, use toggle bolts.

3.04 PAINTING AND REPAIRING COATED SURFACES:

- A. Before erection or enclosing construction, paint items that support masonry or will be concealed in finish work, except items encased in concrete.
- B. Where shop coat is abraded or burned by welding, clean and touch-up.
- C. Touch-up primed surfaces with same material as coating.
- D. Where aluminum parts come in contact with concrete or steel, coat contact surfaces of aluminum with bituminous coating.
- E. Coat field welds and repair damage to zinc-coated surfaces in accordance with ASTM A780 and as follows:
 - 1. Wire brush areas to be coated to bright metal.
 - 2. Apply galvanizing repair compound at rate of two ounces per-square-foot.

END OF SECTION

**SECTION 05521
HANDRAILS AND RAILINGS**

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing pipe and tube handrails and railings.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Miscellaneous Metal: Section 05500.
- B. Metal Stairs: Section 05511.
- C. Ornamental Metal: Section 05700.
- D. Field Painting: Section 09920
- E. Wire Mesh Partitions: Section 10605
- F. Grounding and Bonding: Section 16060

1.03 PERFORMANCE REQUIREMENTS:

- A. General: In engineering handrails and railings to withstand structural loads indicated, determine allowable design working stresses of handrail and railing materials based on the following: Retain only those requirements below that apply to materials specified in Part 2.
 - 1. Structural Steel: AISC S335, "Specification for Structural Steel Buildings Allowable Stress Design and Plastic Design with Commentary."
 - 2. Cold-Formed Structural Steel: AISI SG-673, Part I, "Specification for the Design of Cold-Formed Steel Structural Members."
- B. Structural Performance of Handrails and Railings: Provide handrails and railings capable of withstanding the following structural loads without exceeding allowable design working stresses of materials for handrails, railings, anchors, and connections:
 - 1. Top Rail of Guards: Capable of withstanding the following loads applied as indicated or higher if required by the jurisdictional authority where installed
 - a. Concentrated load of 200 lbf applied at any point and in any direction.
 - b. Uniform load of 50 lbf/ft. applied horizontally and concurrently with uniform load of 100 lbf/ft. applied vertically downward.
 - c. Concentrated and uniform loads above need not be assumed to act concurrently.
 - 2. Handrails Not Serving As Top Rails: Capable of withstanding the following loads applied as indicated or higher if required by the jurisdictional authority where installed:
 - a. Concentrated load of 200 lbf applied at any point and in any direction.
 - b. Uniform load of 50 lbf/ft. applied in any direction.
 - c. Concentrated and uniform loads above need not be assumed to act concurrently.
 - 3. Infill Area of Guards: Capable of withstanding a horizontal concentrated load of 200 lbf applied to 1 sq. ft. at any point in system, including panels, intermediate rails, balusters, or other elements composing infill area or higher if required by the jurisdictional authority where installed.
 - a. Load above need not be assumed to act concurrently with loads on top rails in determining stress on guard.

- C. Thermal Movements: Provide handrails and railings that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints; overstressing of components, failure of connections, and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
 - 1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.
- D. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

1.04 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Product Data: For the following:
 - 1. Manufacturer's product lines of handrails and railings.
 - 2. Grout, anchoring cement, and paint products.
- B. Shop Drawings: Show fabrication and installation of handrails and railings. Include plans, elevations, sections, component details, and attachments to other Work.
 - 1. For installed handrails and railings indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- C. Samples for Initial Selection: Manufacturer's color charts showing the full range of colors available for products with factory-applied color finishes.
- D. Samples for Verification: For each type of exposed finish required, prepared on components indicated below and of same thickness and material indicated for the Work. If finishes involve normal color and texture variations, include sample sets showing the full range of variations expected.
 - 1. 6-inch-long sections of each distinctly different linear railing member, including handrails, top rails, posts, and balusters.
 - 2. Fittings and brackets.
 - 3. Assembled sample of railing system, made from full-size components, including top rail, post, handrail, and infill. Show method of finishing members at intersections. Sample need not be full height.
- E. Product Test Reports: From a qualified testing agency indicating products comply with requirements, based on comprehensive testing of current products.
- F. Welding Certificates: Copies of certificates for welding procedures and personnel.

1.05 ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ADA: Americans with Disabilities Act.
 - 3. AGA: The Design and Fabrication of Galvanized Products.
 - 4. AISC: S335.
 - 5. AISI: SG-673, Part I.
 - 6. ASTM: A36, A53, A90, A123, A143, A153, A384, A500, A780, B633, C1107, D256, D635, D638, D695, D790, E488, E548.

7. AWS: D1.1, D1.3.
 8. FED STD: 595.
 9. FS: A-A-462, FF-B-588, FF-H-116, FF-P-395, FF-S-325, TT-P-644.
 10. NAAMM: Metal Finishes Manual for Architectural and Metal Products, Pipe Railing Manual.
 11. SSPC: PA 1, Paint 5, SP 6, SP 7.
- B. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of handrails and railings that are similar to those indicated for this Project in material, design, and extent.
- C. Testing Agency Qualifications: An independent testing agency with the experience and capability to conduct the testing indicated, as documented according to ASTM E548.
- D. Welding: Qualify procedures and personnel according to AWS D1.1 "Structural Welding Code-Steel, and AWS D1.3," Structural Welding Code-Sheet Steel".
- E. Source Limitations: Obtain each type of handrail and railing through one source from a single manufacturer.

1.06 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products undamaged.
- B. Store handrails and railings in a dry, well-ventilated, weathertight place.
- C. Handle products so as to prevent damage.

1.07 PROJECT CONDITIONS:

- A. Field Measurements: Verify handrail and railing dimensions by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating handrails and railings without field measurements. Coordinate construction to ensure that actual dimensions correspond to established dimensions.

1.08 COORDINATION:

- A. Coordinate installation of anchorages for handrails and railings. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

1.09 SCHEDULING:

- A. Schedule installation so handrails and railings are mounted only on completed walls. Do not support temporarily by any means that does not satisfy structural performance requirements.

PART 2 - PRODUCTS

2.01 FERROUS METALS:

- A. Metal Surfaces, General: Provide metal free from pitting, seam marks, roller marks, stains, discolorations, and other imperfections where exposed to view on finished units.
- B. Steel and Iron: Provide steel and iron in the form indicated, complying with the following requirements:
 - 1. Steel Pipe: ASTM A53; finish, type, and weight class as follows
 - a. Black finish, unless otherwise indicated.
 - b. Galvanized finish for exterior installations and where indicated. Type E, Grade A, standard weight (Schedule 40) for rails and extra heavy weight (Schedule 80) for posts, unless another grade and weight are required by structural loads.
 - 2. Steel Tubing: Cold-formed steel tubing, ASTM A500, Grade A, unless another grade is required by structural loads.
 - 3. Steel Plates, Shapes, and Bars: ASTM A36.
- C. Brackets, Flanges, and Anchors: Cast or formed metal of same type of material and finish as supported rails, unless otherwise indicated.

2.02 FIBERGLASS REINFORCED PLASTIC (FRP) NON-CONDUCTIVE RAILINGS:

- D. Fabricated from isophthalic-polyester or vinyl ester resin poltruded fiberglass components with polyurethane UV coating, flame retardant per ASTM E4 Class I, meeting the structural performance requirements and with the following minimum properties:
 - 1. Compressive Stress, ASTM D695: 30,000 psi.
 - 2. Tensile Stress, ASTM D638: 30,000 psi.
 - 3. Flexural Stress, ASTM D790: 30,000 psi.
 - 4. Flexural Modulus, ASTM D790: 1.6×10^6 psi.
 - 5. Flamability: Self-extinguishing.
 - 6. Color: Manufacturer's standard unless otherwise indicated.

2.03 WELDING MATERIALS, FASTENERS, AND ANCHORS:

- A. Welding Electrodes and Filler Metal: Provide type and alloy of filler metal and electrodes as recommended by producer of metal to be welded and as required for color match, strength, and compatibility in fabricated items.
- B. Fasteners for Anchoring Handrails and Railings to Other Construction: Select fasteners of type, grade, and class required to produce connections suitable for anchoring handrails and railings to other types of construction indicated and capable of withstanding design loads.
 - 1. For steel handrails, railings, and fittings, use plated fasteners complying with ASTM B633, Class Fe/Zn 25 for electro-deposited zinc coating.
- C. Fasteners for Interconnecting Handrail and Railing Components: Use fasteners fabricated from same basic metal as fastened metal, unless otherwise indicated. Do not use metals that are corrosive or incompatible with materials joined.
 - 1. Provide concealed fasteners for interconnecting handrail and railing components and for attaching them to other work, unless otherwise indicated.
 - 2. Provide Phillips flat-head machine screws for exposed fasteners, unless otherwise indicated.

- D. Cast-in-Place and Post-installed Anchors: Anchors of type indicated below, fabricated from corrosion-resistant materials with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E488 conducted by a qualified independent testing agency.
 - 1. Cast-in-place anchors.
 - 2. Expansion anchors.

- E. Anchoring Devices:
 - 1. Toggle bolt: FS FF-B-588.
 - 2. Drive Stud: FS FF-S-325, Group 6.
 - 3. Expansion Shield: FS FF-S-325, Group I, Class 2, Style 1; Group II, Type 3, Class 1, Group IV, Type 1; best suited to the purpose.
 - 4. Screw Anchors: Lead or plastic for wood or metal screws.
 - 5. Anchor-bolt sleeve: Corrugated high-density polyethylene plastic.
 - 6. Powder actuated: FS FF-P-395.

2.04 COATINGS:

- A. Shop Primer for Ferrous Metal: Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with performance requirements in FS TT-P-664; selected for good resistance to normal atmospheric corrosion, compatibility with finish paint systems indicated, and capability to provide a sound foundation for field-applied topcoats despite prolonged exposure.

- B. Shop Primer for Galvanized Steel: Zinc-dust, zinc-oxide primer formulated for priming zinc-coated steel and for compatibility with finish paint systems indicated, and complying with SSPC-Paint 5.

- C. Galvanizing (zinc-coating by hot-dipped process): ASTM A90, ASTM A123, or ASTM A143, ASTM A153 or ASTM A384, as applicable.

- D. Galvanizing Repair Compound: Stick form, melting point 600-degree F to 650-degree F, GALVABAR or equal.

- E. Bituminous Paint: Cold-applied asphalt mastic complying with SSPC-Paint 12, except containing no asbestos fibers, or cold-applied asphalt emulsion complying with ASTM D 1187.

2.05 GROUT AND ANCHORING CEMENT:

- A. Nonshrink, Nonmetallic Grout: Premixed, factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C1107. Provide grout specifically recommended by manufacturer for interior and exterior applications.

- B. Erosion-Resistant Anchoring Cement: Factory-packaged, nonshrink, nonstaining, hydraulic-controlled expansion cement formulation for mixing with water at Project site to create pourable anchoring, patching, and grouting compound. Provide formulation that is resistant to erosion from water exposure without needing protection by a sealer or waterproof coating and that is recommended by manufacturer for exterior use.

2.06 FABRICATION, GENERAL:

- A. Fabricate and prepare products required to be galvanized in accordance with recommendations of AGA.

- B. Fabricate handrails and railings to comply with requirements indicated for design, dimensions, member sizes and spacing, details, finish, and anchorage, but not less than that required to support structural loads.
- C. Assemble handrails and railings in the shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.
- D. Form changes in direction of railing members as follows:
 - 1. By bending.
 - 2. By radius bends of radius indicated on approved shop drawings.
- E. Form simple and compound curves by bending members in jigs to produce uniform curvature for each repetitive configuration required; maintain cylindrical cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of handrail and railing components.
- F. Welded Connections: Fabricate metal handrails and railings for connecting members by welding. Cope components at perpendicular and skew connections to provide close fit, or use fittings designed for this purpose. Weld connections continuously to comply with the following:
 - 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 - 2. Obtain fusion without undercut or overlap.
 - 3. Remove flux immediately.
 - 4. At exposed connections, finish exposed surfaces smooth and blended so no roughness shows after finishing and welded surface matches contours of adjoining surfaces.
- G. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, flanges, miscellaneous fittings, and anchors to interconnect handrail and railing members to other work, unless otherwise indicated.
- H. Provide inserts and other anchorage devices for connecting handrails and railings to concrete or masonry work. Fabricate anchorage devices capable of withstanding loads imposed by handrails and railings. Coordinate anchorage devices with supporting structure.
- I. For railing posts set in concrete, provide preset sleeves of steel not less than 6 inches long with inside dimensions not less than $\hat{A}1/2$ inch greater than outside dimensions of post, and steel plate forming bottom closure, unless indicated otherwise on approved shop drawings.
- J. For removable railing posts, fabricate slip-fit sockets from steel tube whose ID is sized for a close fit with posts; limit movement of post without lateral load, measured at top, to not more than one-fortieth of post height. Provide socket covers designed and fabricated to resist being dislodged.
 - 1. Provide chain with eye, snap hook, and staple across gaps formed by removable railing sections at locations indicated. Fabricate from same metal as railings.
- K. Shear and punch metals cleanly and accurately. Remove burrs from exposed cut edges.
- L. Ease exposed edges to a radius of approximately 1/32 inch, unless otherwise indicated. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing the Work.

- M. Cut, reinforce, drill, and tap components, as indicated, to receive finish hardware, screws, and similar items.
- N. Provide weep holes or another means to drain entrapped water in hollow sections of handrail and railing members that are exposed to exterior or to moisture from condensation or other sources.
- O. Fabricate joints that will be exposed to weather in a watertight manner.
- P. Close exposed ends of handrail and railing members with prefabricated end fittings.
- Q. Provide wall returns at ends of wall-mounted handrails, unless otherwise indicated. Close ends of returns, unless clearance between end of railing and wall is 1/4 inch or less.
- R. Toe Boards: Where indicated, provide toe boards at railings around openings and at edge of open-sided floors and platforms. Fabricate to dimensions and details indicated on approved shop drawings.

2.07 FABRICATION, PIPE RAILINGS AND RAILING GATES:

- A. Pipe: Black steel, ASTM A53, Type E, Grade A, standard weight (Schedule 40) for rails and extra heavy weight (Schedule 80) for posts, unless another grade and weight are required by structural loads, 1 inch nominal ID unless otherwise shown on approved shop drawings. Fabricated in accordance with NAAMM," Pipe Railing Manual" and as shown on approved shop drawings.
- B. Plates, shapes and bars: Structural Steel.
- C. Intersections neatly coped, fully welded and ground smooth.
- D. Heated and bent smoothly, without distortion.
- E. Galvanized after fabrication.
- F. Hardware:
 - 1. Hinges: FS FF-H-116, Type 2127H, US2H finish.
 - 2. Cane bolt: FS A-A-462.
 - 3. Double-acting latch:
 - a. Shop fabricated.
 - b. Housing and strike: Steel, ASTM A36.
 - c. Turn piece and bolt: Bronze, US10B
 - d. Spring: Phosphor bronze.

2.08 FABRICATION, HANDRAILS:

- A. Pipe: Black steel, ASTM A53, Type E, Grade A, standard weight (Schedule 40), 1 inch nominal ID, unless otherwise indicated on approved shop drawings.
- B. Returned to walls at ends with quarter-round bends, with wall flanges welded to bends.
- C. Wall brackets included.
- D. Galvanized after fabrication.

- E. Bonderized and shop primed.

2.09 FINISHES, GENERAL:

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- C. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.10 STEEL FINISHES:

- A. Galvanized Handrails and Railings: Hot-dip galvanize exterior steel and iron handrails and railings to comply with ASTM A123. Hot-dip galvanize hardware for exterior steel and iron handrails and railings to comply with ASTM A153/A153M.
- B. Galvanizing: Hot-dip galvanize items as indicated to comply with applicable standard listed below:
 - 1. ASTM A123, for galvanizing steel and iron products.
 - 2. ASTM A153/A153M, for galvanizing steel and iron hardware.
- C. Fill vent and drain holes that will be exposed in finished Work, unless indicated to remain as weep holes, by plugging with zinc solder and filing off smooth.
- D. For galvanized handrails and railings, provide galvanized fittings, brackets, fasteners, sleeves, and other ferrous components.
- E. Preparation for Shop Priming: After galvanizing, thoroughly clean handrails and railings of grease, dirt, oil, flux, and other foreign matter, and treat with metallic-phosphate process.
- F. Preparation for Shop Priming: Prepare uncoated ferrous-metal surfaces to comply with minimum requirements indicated below for SSPC surface-preparation specifications and environmental exposure conditions of installed handrails and railings:
 - 1. Exteriors (SSPC Zone 1B): SSPC-SP 6, "Commercial Blast Cleaning."
 - 2. Interiors (SSPC Zone 1A): SSPC-SP 7, "Brush-off Blast Cleaning." Apply shop primer to prepared surfaces of handrail and railing components, unless otherwise indicated. Comply with requirements in SSPC-PA 1, "Paint Application Specification No. 1," for shop painting. Primer need not be applied to surfaces to be embedded in concrete or masonry.
 - 3. Do not apply primer to galvanized surfaces.
 - 4. Stripe paint edges, corners, crevices, bolts, and welds.

PART 3 - EXECUTION

3.01 INSTALLATION, GENERAL:

- A. Fit exposed connections together to form tight, hairline joints.

- B. Perform cutting, drilling, and fitting required to install handrails and railings. Set handrails and railings accurately in location, alignment, and elevation; measured from established lines and levels and free from rack.
 - 1. Do not weld, cut, or abrade surfaces of handrail and railing components that have been coated or finished after fabrication and that are intended for field connection by mechanical or other means without further cutting or fitting.
 - 2. Set posts plumb within a tolerance of 1/16 inch in 3 feet.
 - 3. Align rails so variations from level for horizontal members and from parallel with rake of steps and ramps for sloping members do not exceed 1/4 inch in 12 feet.
- C. Adjust handrails and railings before anchoring to ensure matching alignment at abutting joints. Space posts at interval indicated, but not less than that required by structural loads.
- D. Where pipe railing is mounted on concrete, attach by means of bolts and expansion shields. If concrete surface upon which posts are to be set is low, use full-size steel shims to bring railing to correct elevation.
- E. Fastening to In-Place Construction: Use anchorage devices and fasteners where necessary for securing handrails and railings and for properly transferring loads to in-place construction.

3.02 RAILING CONNECTIONS:

- A. Welded Connections: Use fully welded joints for permanently connecting railing components. Comply with requirements for welded connections in "Fabrication" Article whether welding is performed in the shop or in the field.
- B. Expansion Joints: Install expansion joints at locations indicated but not farther apart than required to accommodate thermal movement. Provide slip-joint internal sleeve extending 2 inches beyond joint on either side, fasten internal sleeve securely to one side, and locate joint within 6 inches of post.

3.03 ANCHORING POSTS:

- A. Use steel pipe sleeves preset and anchored into concrete for installing posts. After posts have been inserted into sleeves, fill annular space between post and sleeve with the following anchoring material, mixed and placed to comply with anchoring material manufacturer's written instructions:
- B. Form or core-drill holes not less than 5 inches deep and 3/4 inch larger than OD of post for installing posts in concrete. Clean holes of loose material, insert posts, and fill annular space between post and concrete with the following anchoring material, mixed and placed to comply with anchoring material manufacturer's written instructions:
 - 1. Nonshrink, nonmetallic grout.
- C. Cover anchorage joint with flange of same metal as post, attached to post as follows:
 - 1. Welded to post after placing anchoring material.
- D. Leave anchorage joint exposed; wipe off surplus anchoring material; and leave 1/8-inch build-up, sloped away from post.
- E. Anchor posts to metal surfaces with oval flanges, angle type, or floor type as required by conditions, connected to posts and to metal supporting members as follows:
 - 1. For steel pipe railings, weld flanges to post and bolt to metal supporting surfaces.
 - 2. Install removable railing sections, where indicated, in slip-fit metal sockets cast in

concrete.

3.04 ANCHORING RAILING ENDS:

- A. Anchor railing ends into concrete and masonry with round flanges connected to railing ends and anchored into wall construction with postinstalled anchors and bolts.
- B. Anchor railing ends to metal surfaces with flanges bolted to metal surfaces.
 - 1. Weld flanges to railing ends.

3.05 ATTACHING HANDRAILS TO WALLS:

- A. Attach handrails to wall with wall brackets. Provide bracket with 1-1/2-inch clearance from inside face of handrail and finished wall surface.
- B. Locate brackets not more than four feet on centers, or less if required to support structural loads.
- C. Secure wall brackets to building construction with 3/8-inch bolts and expansion shields, powder actuated fasteners or toggle bolts, as applicable.

3.06 PAINTING AND REPAIRING COATED SURFACES:

- A. Before erection or enclosing construction, paint items that support masonry or will be concealed in finish work, except items encased in concrete.
- B. Where shop coat is abraded or burned by welding, clean and touch-up.
- C. Touch-up primed surfaces with same material as coating.
- D. Where aluminum parts come in contact with concrete or steel, coat contact surfaces of aluminum with bituminous coating.
- E. Coat field welds and repair damage to zinc-coated surfaces in accordance with ASTM A780 and as follows:
 - 1. Wire brush areas to be coated to bright metal.
 - 2. Apply galvanizing repair compound at rate of two ounces per-square-foot.

3.07 PROTECTION:

- A. Protect finishes of handrails and railings from damage during construction period with temporary protective coverings approved by railing manufacturer. Remove protective coverings at the time of Substantial Completion.
- B. Restore finishes damaged during installation and construction period so no evidence remains of correction work. Return items that cannot be refinished in the field to the shop; make required alterations and refinish entire unit, or provide new units.

END OF SECTION

SECTION 05531

GRATINGS AND FLOOR PLATES

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section includes providing steel gratings, corrosion-resistant gratings, and underground safety walk gratings and floor plates.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Structural Steel: Section 05120.
- B. Miscellaneous Metal: Section 05500.
- C. Metal Stairs: Section 05511.
- D. Handrails and Railings: Section 05521.

1.03 PERFORMANCE REQUIREMENTS:

- A. Structural Performance: Provide gratings capable of withstanding the following structural loads without exceeding the allowable design working stress of the materials involved, including anchors and connections:
 - 1. Steel gratings: For walkways, ventilation shafts, light wells and other locations subject to possible vehicular traffic: Capable of withstanding AASHTO HS-20-44 load or higher load if required by the jurisdictional authority where the grating is installed.
 - 2. Steel gratings: For track drainage pumping stations and other locations subject to foot traffic only: Capable of withstanding a uniform load of 250 lbf/sq. Ft. Limit deflection to 1/200 of span.
 - 3. Corrosion-resistant gratings: Capable of withstanding a uniform live load as shown or specified.

1.04 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Product Data: For the following:
 - 1. Gratings.
 - 2. Clips and anchorage devices for gratings.
 - 3. Paint products (if applicable).
- B. Shop Drawings: Show fabrication and installation details for gratings. Include plans, elevations, sections, and details of connections. Show anchorage and accessory items. Provide templates for anchors and bolts specified for installation under other Sections.
 - 1. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- C. Mill Certificates: Signed by manufacturers of stainless-steel sheet certifying that products furnished comply with requirements.
- D. Welding Certificates: Copies of certificates for welding procedures and personnel.

- E. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

1.05 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ADA: Americans with Disabilities Act.
 - 3. ASME: B18.21.1, B18.22.1.
 - 4. ASTM: A36, A90, A123, A143, A153, A242, A307, A384, A510, A570, A536, A563, C633, A653, A780, B633, C1028, D1187, E140, E384, F594.
 - 5. AASHTO HS-20-44.
 - 6. AWS: D1.1, D1.3.
 - 7. FS: RR-G-661.
 - 8. MS: MIL-P-21305.
 - 9. NAAMM: MBG 531, MBG 532.
 - 10. SSPC: PA 1, SP 3, SP 6/NACE No. 3, Paint 12
- B. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of gratings that are similar to those indicated for this Project in material, design, and extent.
- C. Fabricator Qualifications: A firm experienced in producing gratings similar to those indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.
- D. Metal Bar Grating Standards: Comply with applicable requirements of the following:
 - 1. Non-Heavy-Duty Metal Bar Gratings: Comply with NAAMM MBG 531, "Metal Bar Grating Manual for Steel, Stainless Steel, and Aluminum Gratings and Stair Treads."
 - 2. Heavy-Duty Metal Bar Gratings: Comply with NAAMM MBG 532, "Heavy-Duty Metal Bar Grating Manual."
- E. Welding: Qualify procedures and personnel according to the following:
 - 1. AWS D1.1, "Structural Welding Code--Steel."
 - 2. AWS D1.3, "Structural Welding Code--Sheet Steel."
 - 3. Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification.

1.06 PROJECT CONDITIONS:

- A. Field Measurements: Where gratings are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
 - 1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating gratings without

field measurements. Coordinate construction to ensure that actual dimensions correspond to established dimensions. Allow for trimming and fitting.

1.07 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products undamaged.
- B. Store products so as to prevent rust.
- C. Handle products so as to prevent damage.

1.08 COORDINATION:

- A. Coordinate installation of anchorages for gratings, grating frames, and supports. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. General Requirements:
 - 1. Insofar as practicable, furnish similar products of a single manufacturer.
 - 2. Metal Surfaces, General: For metal fabrications exposed to view in the completed Work, provide materials with smooth, flat surfaces without blemishes. Do not use materials with exposed pitting, seam marks, roller marks, rolled trade names, or roughness.

2.02 FERROUS METALS:

- A. Steel Plates, Shapes, and Bars: ASTM A36.
- B. High-Strength Low Alloy Structural Steel:
 - 1. ASTM A242.
 - 2. Resistance to atmospheric corrosion: Four times that of carbon steel, minimum.
- C. Wire Rod for Grating Crossbars: ASTM A510.
- D. Uncoated Steel Sheet: ASTM A570, Grade 33.
- E. Galvanized Steel Sheet: ASTM A653, structural quality, Grade 33, with G90 coating.
- F. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy to be welded.
- G. Ductile Iron: ASTM A536.
- H. Grating: Steel, bar and crossbar type as shown, hot-dipped galvanized after fabrication and sizing, FS RR-G-661, Type , Class 1 or 2.

2.03 COATINGS:

- A. Shop Primer for Ferrous Metals: Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with performance requirements in FS TT-P-664; selected for good resistance to normal atmospheric corrosion, compatibility with finish paint systems indicated, and capability to provide a sound foundation for field-applied topcoats despite prolonged exposure.
- B. Zinc-rich paint: MS MIL-P-21305.
- C. Galvanizing (zinc-coating by hot-dipped process): ASTM A90, ASTM A123, or ASTM A143, ASTM A153 or ASTM A384, as applicable.
- D. Galvanizing Repair Compound: Stick form, melting point 600-degree F to 650-degree F, GALVABAR or equal.
- E. Bituminous Coating: Cold-applied asphalt mastic complying with SSPC Paint 12, except containing no asbestos fibers, or cold-applied asphalt emulsion complying with ASTM D1187.

2.04 FASTENERS:

- A. General: Provide Type 304 or 316 stainless-steel fasteners for exterior use and zinc-plated fasteners with coating complying with ASTM B 633, Class Fe/Zn 5, where built into exterior walls. Select fasteners for type, grade, and class required.
- B. Bolts and Nuts: Regular hexagon-head bolts, ASTM A307, Grade A; with hex nuts, ASTM A563; and, where indicated, flat washers.
- C. Plain Washers: Round, carbon steel, ASME B18.22.1.
- D. Lock Washers: Helical, spring type, carbon steel, ASME B18.21.1.
- E. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E 488, conducted by a qualified independent testing agency.
 - 1. Material: Carbon-steel components zinc-plated to comply with ASTM B 633, Class Fe/Zn 5.
 - 2. Material: Alloy Group 1 or 2 stainless-steel bolts complying with ASTM F593 and nuts complying with ASTM F594.

2.05 FABRICATION:

- A. Shop Assembly: Fabricate grating sections in shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.
- B. Form from materials of size, thickness, and shapes indicated, but not less than that needed to support indicated loads.
- C. Shear and punch metals cleanly and accurately. Remove burrs.

- D. Ease exposed edges to a radius of approximately 1/32 inch, unless otherwise indicated.
- E. Fit exposed connections accurately together to form hairline joints.
- F. Welding: Comply with AWS recommendations and the following:
 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 2. Obtain fusion without undercut or overlap.
 3. Remove welding flux immediately. Provide for anchorage of type indicated; coordinate with supporting structure. Fabricate and space anchoring devices to secure gratings, frames, and supports rigidly in place and to support indicated loads.
 4. Fabricate toeplates at height indicated to fit grating units and weld to units in shop, unless otherwise indicated.

2.06 STEEL GRATINGS:

- A. Angles or other structural shapes as supports for grating: Structural steel.
- B. Grating manufactured by electro-pressure welding or pressure-locking process, forming sound welded or pressure-locked joints at intersection of bars and having bars in the same plane.
- C. For walkways, ventilation shafts, light wells and other locations subject to possible vehicular traffic:
 1. Traffic Surface: Plain.
 2. Gratings: Rectangular type subject to loadings identified under "Performance Requirements.
- D. For track bed drainage pumping stations and other locations subject to foot traffic only:
 1. Traffic Surface: Serrated.
 2. Gratings: Rectangular type, unless otherwise shown, subject to loadings identified under "Performance Requirements." Fabricated of 1-1/4-inch by 1/8-inch bearing bars at 1-3/16-inch o.c. and crossbars at 4 inches o.c.
- E. Steel Finish: As follows:
 1. Shop primer applied according to manufacturer's standard practice.
 2. Hot-dip galvanized with a coating weight of not less than two ounces per-square foot of coated surface.
- F. Fabricate removable grating sections with banding bars attached by welding to entire perimeter of each section. Include anchors and fasteners of type indicated or, if not indicated, as recommended by manufacturer for attaching to supports.
 1. Provide not less than four weld lugs for each heavy-duty grating section, with each lug shop welded to two bearing bars.
 2. Provide not less than four saddle clips for each grating section composed of rectangular bearing bars 3/16 inch or less in thickness and spaced 15/16 inch or more o.c., with each clip designed and fabricated to fit over two bearing bars.
 3. Furnish removable steel gratings equipped with locking lugs and provision for bolting to supporting members with stainless steel bolts.
- G. Fabricate cutouts in grating sections for penetrations indicated. Arrange cutouts to permit grating removal without disturbing items penetrating gratings.

1. Edge-band openings in grating that interrupt four or more bearing bars with bars of the same size and material as bearing bars.
- H. Do not notch bearing bars at supports to maintain elevation.

2.07 CORROSION-RESISTANT GRATINGS:

- A. Fabricate from high-strength low alloy structural steel.
- B. Grating manufactured by electro-pressure welding or pressure-locking process, forming sound welded or pressure-locked joints at intersection of bars and having bars in the same plane.
- C. Grating system shall be fabricated to mechanically secure units in place and of such size to permit one-man operation.
- D. Traffic Surface: As shown.
- E. Gratings: Rectangular type, unless otherwise shown, subject to loadings identified under "Performance Requirements." Fabricated of 2-inch by 3/16-inch bearing bars at 5-inch o.c. and with crossbars at end of six-foot long units.
- F. Subject to compliance with requirements, products are manufactured by Blaw-Knox Company, Irving Grating Company, Reliance Steel Products Company or equal.

2.08 FLOOR PLATES:

- A. Steel Floor Plates: Form to configurations shown from abrasive-surface floor plate of thickness necessary to support indicated loads, but not less than 1/4 inch.
1. Abrasive-Surface Floor Plate: SLIP-NOT as manufactured by the W. S. Molnar Company or approved equal:
 - a. Surface Texture: Grade 1, fine.
 - b. Surface: All metal plasma stream deposition process bonds surface to substrate. Anti-slip primarily martensitic steel surface consisting of a random hatch matrix.
 - c. Surface Hardness, Rockwell C Scale, ASTM E 140 and E 384: Minimum of 55.
 - d. Bond Strength, Surface to Substrate, ASTM C 633: Minimum of 4,000 psi.
 - e. Coefficient of Friction, Anti-Slip Surface: Minimum of 0.6.
 - f. UL Listed: Slip-resistant.

2.09 GRATING FRAMES AND SUPPORTS:

- A. Steel Frames and Supports: Fabricate from structural-steel shapes, plates, and bars of welded construction to sizes, shapes, and profiles indicated and as necessary to receive gratings. Miter and weld connections for perimeter angle frames. Cut, drill, and tap units to receive hardware and similar items.
- B. Equip units with integrally welded anchors for casting into concrete or building into masonry.
1. Unless otherwise indicated, space anchors 24 inches o.c. and provide minimum anchor units in the form of steel straps 1-1/4 inches wide by 1/4 inch thick by 8 inches long.
 2. Galvanize frames and supports unless otherwise indicated.

2.10 FINISHES:

- A. General:
 - 1. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
 - 2. Finish gratings, frames, and supports after assembly.
- B. Galvanizing:
 - 1. Clean ferrous metal thoroughly before applying zinc coating.
 - 2. Apply zinc coating to products after fabrication, by the hot-dip method, using coating weighing not less than two ounces per-square-foot.
- C. Preparation for Shop Priming: Prepare uncoated ferrous-metal surfaces to comply with minimum requirements indicated below for SSPC surface-preparation specifications and environmental exposure conditions of installed items:
 - 1. Exteriors (SSPC Zone 1B): SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning".
 - 2. Interiors (SSPC Zone 1A): SSPC-SP 3, "Power Tool Cleaning."
- D. Apply shop primer to uncoated surfaces of gratings, frames, and supports, except those with galvanized finishes and those to be embedded in concrete or masonry, unless otherwise indicated. Comply with SSPC-PA 1, "Paint Application Specification No. 1," for shop painting.

PART 3 - EXECUTION

3.01 INSTALLATION, GENERAL:

- A. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing gratings to in-place construction. Include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.
- B. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing gratings. Set units accurately in location, alignment, and elevation; measured from established lines and levels and free from rack.
- C. Provide temporary bracing or anchors in formwork for items that are to be built into concrete or masonry.
- D. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade the surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.
- E. Field Welding: Comply with the following requirements:
 - 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 - 2. Obtain fusion without undercut or overlap.
 - 3. Remove welding flux immediately.
- F. Corrosion Protection: Coat concealed surfaces of aluminum that will come into contact with grout, concrete, masonry, wood, or dissimilar metals with a heavy coat of bituminous paint.

3.02 INSTALLING GRATINGS:

- A. General: Install gratings to comply with recommendations of referenced metal bar grating standards that apply to grating types and bar sizes indicated, including installation clearances and standard anchoring details.
- B. Attach removable units to supporting members with type and size of clips and fasteners indicated or, if not indicated, as recommended by grating manufacturer for type of installation conditions shown.
- C. Use bolts, screws or locking lugs to secure safety walk gratings; do not weld.
- D. Consecutively number walkway plate covers with steel stamp after screwed to support channels.

3.03 PAINTING AND REPAIRING COATED SURFACES:

- A. Before erection or enclosing construction, paint items that support masonry or will be concealed in finish work, except items encased in concrete.
- B. Where shop coat is abraded or burned by welding, clean and touch-up.
- C. Touch-up primed surfaces with same material as coating.
- D. Where aluminum parts come in contact with concrete or steel, coat contact surfaces of aluminum with bituminous coating.
- E. Coat field welds and repair damage to zinc-coated surfaces in accordance with ASTM A780 and as follows:
 - 1. Wire brush areas to be coated to bright metal.
 - 2. Apply galvanizing repair compound at rate of two ounces per-square-foot.

END OF SECTION

SECTION 05651

GENERAL TRACK CONSTRUCTION

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This section specifies general track construction procedures and requirements including laying continuous welded rail, joining CWR strings, final alignment and inspection. The Design-Builder shall comply with all safety and health regulations. Associated train control and traction power Sections are located elsewhere in this Specification.
- B. Track construction shall include yard and storage tracks as indicated on the Drawings, and specified herein.

1.02 RELATED SECTIONS

- Section 02727 - Ballast
- Section 05091 - Rail Welding
- Section 05652 - Ballasted Track Construction
- Section 05654 - Special Trackwork Construction - Ballasted
- Section 05656 - Rail
- Section 05658 - Track Appurtenances and Other Track Material
- Section 05659 - Special Trackwork
- Section 05660 - Restraining Rail and Lubricators
- Section 06130 - Timber Ties
- Section 06132 - Timber Grade Crossings

1.03 REFERENCES

Pertinent provisions of the following listed standards and publications shall apply to the Work, except as they may be modified herein, and are hereby made part of these Specifications to the extent required.

- 1. American Railway Engineering and Maintenance-of-Way Association, Manual for Railway Engineering, herein referred to as the AREMA Manual.
- 2. American Railway Engineering and Maintenance-of-Way Association, Portfolio of Trackwork Plans, herein referred to as the AREMA Portfolio
- 3. American Society of Testing and Materials (ASTM)

1.04 SUBMITTALS

- A. Submittals shall be in accordance with Section 01330, Submittals of these Specifications.
- B. Submittals shall include certificates of compliance, codes and regulations of the jurisdictional authorities as well as other submittals stipulated in these Specifications.
- C. Provide five each AREMA approved rail thermometers. Two of the five shall be a quick reading digital type. The thermometers shall become WMATA property.
- D. Provide four Geismar RCAT-A1 two-piece combination track levels and gauges, or approved equal, with current calibration. They shall become WMATA property.
- E. Provide three Aldon AL-102 combination rolling track gauge readers and digital track levels, equipped with distance counters and carrying cases, or approved equal, with current calibration. They shall become WMATA property.

- F. Submit method and equipment for transport of rail.
- G. Submit rail end-hardening procedure and the personnel who will perform the end-hardening of the rails in the field.
- H. Submit test reports on two samples of field end-hardened rail which shall be tested by an approved independent laboratory.
- I. Submit for approval detailed procedures of the following items required in connection with laying and joining CWR strings:
 - 1. String schedule showing length and location of strings.
 - 2. Equipment to be used.
 - 3. Procedure for positioning CWR strings in track, setting gaps between strings and initial fastening.
 - 4. Procedure for lining, gauging and profiling of rails, and tightening of anchor bolts.
 - 5. Procedure for joining CWR strings, including method of obtaining correct gap if joined at a different temperature than at which it was laid.
 - 6. Procedure for zero thermal rail stress adjustment and for anchoring CWR strings to zero thermal stress temperature, including control of rail movement and installing rail clips for fastening of rail to plates or D.F. fasteners.
 - 7. Special procedure for closing last string with previously anchored rail or special trackwork.

1.05 QUALITY ASSURANCE

Quality Assurance/Quality Control shall be in accordance with the Design-Builder's Construction Quality Management Plan. Perform all measures necessary to assure quality of the Work. This shall include source quality control and field quality control requirements specified in these Specifications.

PART 2 - PRODUCTS

2.01 MATERIALS

General: All trackwork materials required by the specifications for the track construction, except those furnished by the Authority, shall be furnished by the Design-Builder in accordance with the related section and references.

PART 3 - EXECUTION

3.01 CONSTRUCTION EQUIPMENT

- A. Track gauge, guardrail, restraining rail, flangeway width, curve radii, rail sections and special trackwork components are designed for WMATA Metro Rail Vehicle and Crane Car operation. Modify on-track equipment, as required, to operate over this track without causing damage to the track structure. Damages to the track structure shall be repaired by Design-Builder at the Design-Builder's own expense.
- B. Clearance for the on-track equipment shall conform to the requirements for vehicle clearances.
- C. Design-Builder's equipment shall not exceed the design loads. Further information concerning vehicle characteristics will be provided by the Authority upon request by Design-Builder. Verify that proposed equipment meets these requirements.

3.02 MONUMENTATION

- A. Monuments will be furnished and installed by other trades to establish the centerline of track.
- B. Monuments will be set at all points of change in horizontal alignment including PC and PT, and on tangents and within curves as needed to provide monuments not more than 1,000 feet apart throughout the work. All adjacent monuments will be intervisible. The location of the monuments will be offset outside the track invert section.
- C. The Authority Representative will provide the Design-Builder with identifications and elevations to one thousandth of a foot for all monuments.
- D. The use of controls for survey other than the monumentation described above shall be at the Design-Builder's risk.

3.03 ALIGNMENT AND PROFILE DATA

- A. Track shall be constructed conforming to the alignment and profile data shown on the drawings as modified by the requirements in these specifications.
- B. Alignment information shown on the drawings refers to geometric control points for the track. Alignment is based on the centerline of track, equidistant between gauge sides of the running rails. Profile refers to top of the lower rail in final position.
- C. Construction of embedded shop tracks and direct fixation track shall not begin until final alignment data is available.

3.04 ENGINEERING STATIONING

- A. Engineering stationing is not continuous and is subject to equations.
- B. Engineering stationing is used to reference all geometric control points.
- C. Mathematized alignment data for each track is included in drawings.

3.05 RAIL CANT

- A. Construct track with rails canted at 40 to 1 inclination toward the centerline of track
- B. Construct rail in special trackwork with no cant.
 - 1. Construct the outside rail in track with restraining rail with 40 to 1 cant inclined toward the centerline of track. Construct the inside rail and restraining rail with no cant.

3.06 TRACK GAUGE

- C. Track gauge will be measured between points 5/8 inch below top of rail on the inside faces of the running rails.
- D. Track gauge shall be as follows:
 - 1. Tangent and curves with radius greater than or equal to 350 feet: 4 feet, 8-1/2 inches. The gauge lines shall be equidistant between the centerline of track.
 - 2. Curve of radius less than 350 feet: 4 feet, 9-1/4 inches. The gauge line for the outside rail shall be 2 feet, 4-1/4 inches from the centerline of track.
 - 3. No. 6 Guarded and No. 8 Turnouts: 4 feet, 8-1/2 inches for both tracks.

3.07 TRACK GAUGE TRANSITIONS

- A. Gauge widening at curves shall be done on the tangents and shall be completed at the junction of the tangent and the circular curve. Minimum transition length shall be 15 feet.

3.08 TRACK TOLERANCES

- A. The final gauge, cross level, horizontal and vertical alignment of all tracks shall be as specified within the tolerances as shown in **Exhibit 05651-A** for each specific type and class of track.
- B. Variations of gauge and cross level with respect to tolerances shall be at a rate of change not exceeding 1/8 inch per 31 feet of track.
- C. All rail between the limits shown on the drawings for high strength rail shall be high strength rail. High strength rail may extend beyond the limits shown.
- D. Prior to start of rail installation the Design-Builder shall furnish to the Authority Representative three Aldon AL - 102 Combination Rolling Track Level and Gauge Readers equipped with optional distance counters and carrying cases, or approved equal. Also furnish to the Authority Representative four Geismar RCAT-A1 two-piece combination track levels and gauges.

3.09 CLEARANCE ENVELOPE

- A. The transit car outline in the design of the Metro system is shown in **Exhibit 05651-B** for information.
- B. Equipment proposed for use by the Design-Builder for performance of work under this Contract shall be submitted for approval. The submittal shall include a drawing showing the outline of the proposed equipment superimposed on the transit car outline.

3.10 TYPES OF RAIL

- A. 115 RE rail shall be in accordance with Section 05656, Rail, and shall be used in the following locations.
 - 1. As running rail in yard and storage tracks.
 - 2. As stock rails, switch rails, closure rails, and other rails in special trackwork but not as frog, front and turnout guard rails and not as restraining rail.
- B. 132 RE rail shall be in accordance with Section 05656, Rail, and shall be used in the following locations.
 - 1. As frog guard rails.
 - 2. As front and turnout guard rails in Guarded No. 6 Turnouts.
 - 3. As restraining rail.
- C. Running rail for use in yard and storage tracks shall be either standard carbon or high strength rail (head hardened or fully heat treated) in accordance with Section 05656, Rail, and shall be used where indicated on the Design Drawings. Where the design drawings show high strength rail is to be used in a track, both running rails in the track shall be high strength rail. High strength rail may be used in lieu of standard rail.
- D. Special trackwork rails (stock rails, switch rails, closure rails, frog guard rails, front guard rail, turnout guard rail, etc.) and restraining rail shall be high strength rail (head hardened or fully heat treated) in accordance with Section 05656, Rail.

3.11 RUNNING RAIL REQUIREMENTS

- A. Running rail procurement is covered under Section 05656, Running Rail.
- B. Running rail for use in continuous welded rail (CWR) track shall be welded in accordance to Section 05091, Rail Welding.
- C. Transport and distribute rail:
 - 1. Rail shall be transported and distributed in such a manner and by use of such equipment that bumping or striking of the rail will be avoided. The method and equipment used by the Design-Builder shall be subject to approval by the Authority Representative. Continuous welded rail (CWR) shall be transported and laid in place in an efficient, expeditious manner that will prevent damage to fasteners, rail and structures.
 - 2. Rail should not be dropped or dragged on the track bed. The use of rollers is required to facilitate transporting and reduce the risk of damage to rail, track fasteners, track appurtenances and facilities.
- D. Procedure of laying and joining CWR strings: Submit for Authority Representative's approval the detailed procedure of the following items of work required in connection with laying and joining CWR strings.
 - 1. String schedule showing length and location of strings. Refer to string schedule requirements in Section 05091, Rail Welding.
 - 2. Equipment to be used.
 - 3. Procedure for positioning CWR strings in track, setting of gaps between strings and initial fastening.
 - 4. Procedure for lining and gauging the rails and surfacing the track.
 - 5. Procedure for joining CWR strings including method of obtaining correct gap.
 - 6. Procedure for zero thermal stress adjustment and for anchoring strings to zero thermal-stress temperature, including control of rail movement and installing rail clips for fastening of rail to the standard Pandrol tie plate.
 - 7. Procedure for closing string with previously anchored rail/special trackwork units.
- E. Cutting and drilling of rails:
 - 1. No holes or cuts in the CWR shall be permitted except as shown and specified. Rails shall be cut square and clean by means of rail saws or abrasive cutting disks in accordance with AREMA Manual Chapter 4, Part 2 Specifications. Cut no rail for the installation of a bonded joint within 5 feet of a weld.
 - 2. For insulated and non-insulated running, guard and restraining rail joints and for separator, filler and end blocks for guard and restraining rails, holes shall be located as shown and as directed by the Authority Representative.
 - 3. Holes shall be cylindrical and perpendicular to the rails vertical centerline.
 - 4. Diameter of holes for restraining rail shall be as shown on the drawings.
 - 5. Diameter of holes for running rail and guard rail joints and for guard rail separator and end blocks shall be of the proper diameter for the bolt required.
 - 6. Holes shall be drilled directly through the web of the rail with an approved rail drill.
 - 7. An approved template shall be used as a guide for drilling holes. In no case shall a joint bar be used for this purpose.
 - 8. All rejected rail holes must be saw-cut from the rail. Saw cut shall be made at least 3 inches from the hole.
 - 9. All holes shall be reamed smooth, edges beveled and burrs removed.
 - 10. The process for drilling and deburring holes shall not mechanically or metallurgically damage the rail.
 - 11. Cutting rail or burning holes in rail by use of a torch is prohibited.
 - 12. Accurately space holes for bolting of rail and drill with a rail drill in accordance with the current requirements of AREMA Manual for Railway Engineering, Specifications for Rail Drilling, Bar Punchings and Track Bolts.

- F. Beveling of Rail Ends:
1. Bevel rail ends at non-insulated joints in accordance with current AREMA Standard Plan No. 1005.
 2. Rail ends in insulated joints shall be beveled in accordance with the joint manufacturer's written specifications. Unless otherwise stated in a manufacturer's written specifications, rail ends shall be beveled in accordance with AREMA Standard Plan No. 1005.

G. End-Hardening

1. Rail ends in standard rail and high strength rail with Brinell hardness below 341 shall be shall be end-hardened in the field. Joints bars and their insulating material shall be removed from rail ends during the end-hardening process.

Rail ends that have been end hardened and are found to fail to meet the hardness requirements may be retreated and checked for minimum hardness.

The end-hardening procedure, and the personnel who perform the end-hardening of the rails in the field, shall be subject to approval by the Authority Representative, which will depend upon the acceptance of two samples of field end-hardening performed according to the approved procedure and by the personnel who will perform the field end-hardening. The two samples of field end-hardened rail shall be tested by an approved independent laboratory. The Design-Builder shall notify the Authority Representative 48 hours prior to the performance of field end-hardening of rails.

2. End Hardening Tests:
 - a. The two samples shall be tested for Brinell hardness in accordance with ASTM E10, in a grid pattern on the rail head surface of 1/8 inch increments for a distance of six inches from the end of the rail.
 - b. When Brinell hardness is not directly measured, the hardness results shall be converted using ASTM E140.
 - c. The hardness number and location shall be recorded.
 - d. After the hardness test is performed, one sample shall be sectioned for one foot along the centerline of rail and the other sample shall be sectioned transversely 1/2 inch from the end of rail. These cross sections shall be etched to enable the observation of the hardness pattern.
3. Acceptance Criteria:
 - a. The hardness measured at a spot on the centerline of the head 1/4 inch to 1/2 inch from the end of the rail shall show a Brinell hardness number range of 341 to 401 when decarburized surface has been removed.
 - b. The heat-affected zone defined as the region in which the hardness is above that of the parent metal shall cover the full width of the rail head and extend longitudinally a minimum of 1-1/2 inch from the end of the rail. The effective hardness zone 1/2 inch from the end of the rail shall be at least 1/4 inch deep.
 - c. A report of hardness determination shall be given to the Authority Representative.
 - d. The hardness pattern shall be uniform across the top surface of the rail head.
 - e. The etched cross sections of the rail shall exhibit a uniformly distributed hardness pattern.

3.12 LAYING CONTINUOUS WELDED RAIL

- A. Laying CWR String: The contractor shall submit to the Authority Representative for approval a CWR string laying procedure that includes the following requirements.

1. In the yard, CWR string refers to all running rail lengths per the string welding schedule and individual rail sticks including the minimum length rail stick permitted to be installed.
 2. CWR strings shall be laid on the installed tie plate in accordance with the approved string schedule submitted under Section 05091, Rail Welding.
 3. The temperature of the strings and other data shall be measured and recorded. Information to be recorded shall be as shown on **Exhibit 05651-C (Part 1 of 2) and (Part 2 of 2)**.
 4. The strings shall be laid with a gap between them. The size of the rail laying gap shall consider:
 - a. String(s) length(s),
 - b. Actual rail temperature at time of laying,
 - c. The prescribed zero thermal rail stress temperature,
 - d. The use of Dutchman or other techniques to protect rail ends from damage by on-rail equipment prior to the strings being joined,
 - e. The method of preventing damage due to thermal expansion prior to the rails being fully anchored and ballast cribs and shoulders fully developed.
 - f. Initial Fastening of Rail
 - 1) Prior to use by on-track equipment, fastening the newly laid rail at proper gauge at a number of ties on tangent and curved track.
 5. When and where strings will be anchored, unanchored and vibrated during the rail laying process.
- B. Rail Temperature and Rail Thermometer:
1. Rail temperature shall be determined by means of reliable AREMA standard rail thermometers as specified in Chapter 5 of the AREMA Manual.
 - a. Place two rail thermometers on the shaded side of the rail base next to the web and leave in place until no change in the readings are detected, but not less than ten minutes.
 - b. When determining the actual rail temperature average the temperature readings taken at a minimum of two locations along the rail string..
 2. Deliver five each AREMA approved rail thermometers to the Authority Representative within 30 days after NTP.
 3. Two of the five thermometers shall be a quick reading digital type. Thermometers shall become Authority Property.
- C. Determining Gap Between Rail Ends:
1. The gap between CWR strings, or between CWR and bolted rail shall be determined by the equation:

$$G=(t-T)(L)(K)+Q$$

Where: G=rail gap in inches;

t=zero thermal stress temperature for type of track construction (Sections 05652);

T=Average actual rail temperature at time of laying degrees F.;

L=The length of the rail being laid or the length of the rail being adjusted to the zero thermal stress temperature ;

K=Coefficient of thermal expansion for rail steel, (0.000078 inch per foot per degree F.); and

Q=Rail gap as required by manufacturers of bonded standard joints For insulated joints, Q equals the end post thickness. For AREMA standard bolted joints, as recommended by AREMA for a rail length equal to the string length or 100 feet, which ever is smaller.

3.13 LINING, GAUGING, AND PROFILING CWR

- A. Each CWR string shall be brought to within 1/2 inch or less of final horizontal and vertical alignment before joining, thermal adjustment and anchoring. The procedures specified for ballasted track construction shall be used

3.14 JOINING CWR STRINGS

- A. Yard and secondary track CWR shall be joined by bonded non-insulated joints or, where required by the signal design, bonded insulated joints. CWR joined to turnouts shall be joined by AREMA bolted standard joints or, where required by the signal design, bonded insulated joints.
- B. Joints shall not be placed in the following locations unless specifically shown or specified otherwise:
 - 1. Within 19 feet from the center of bonded or bolted joints in the same rail.
 - 2. Within eight feet of joints in the opposite rail, except when joining turnout rails.
 - 3. Within eight feet of shop welds in the same rail.
- C. Joint Requirements: Joints shall be installed in accordance with Section 05658, Track Appurtenances and Other Track Material.

3.15 ZERO THERMAL RAIL STRESS ADJUSTMENT AND ANCHORING OF CWR

- A. The contractor shall submit to the Authority Representative for approval the procedures for adjusting the rail strings to the zero thermal rail stress temperature and for anchoring the adjusted strings. The procedure shall include the following requirements.
 - 1. The installation of the Pandrol e2056 Spring Clips (or any other rail anchoring devise) shall be considered as anchoring the rail.
 - 2. Rail strings shall not be adjusted until the string is within 1/2 inch or less of the final horizontal and vertical alignment. Method of demonstrating the rail string to be adjusted is within 1/2 inch or less of final horizontal and vertical alignment.
 - 3. Immediately prior to adjusting the string(s), the actual rail string(s) temperature(s) shall be measured.
 - 4. Method of determining the length of rail to be adjusted.
 - 5. Method of calculating each rail string's end and quarter points will move when thermally adjusted.
 - 6. Method of marking the rail and reference points at the string(s) end and quarter points.
 - 7. The rail string shall be fully unanchored and vibrated to relieve thermal rail stresses before marking the rail and reference points.
 - 8. Method of calculating and marking the rail and reference points to demonstrate the amount of rail movement at the string(s) end and quarter points are within the zero thermal stress temperature range specified in Section 05652, Ballasted Track Construction.
 - 9. The method of heating or cooling and vibrating the rail so it will be adjusted uniformly along the rail string. Rail pulling shall not be used.
 - 10. The method the rail string will be fully anchored when the rail string is adjusted uniformly. If the adjustment falls out of the adjustment range while anchoring, anchoring shall cease and not begin again until uniform adjustment has been achieved again within the specified tolerance.
 - 11. When a CWR string closes on and is to join a fully anchored string or existing rail as soon as the adjustment is completed, the fully anchored string or existing rail shall have its anchors removed and vibrated for 300 feet and the 300 feet shall be adjusted and vibrated uniformly to the zero thermal-rail stress temperature at the time the strings are joined. This requirement does not apply when a string closes on a new or existing turnout.

12. If the procedure requires the adjusted rail string to be joined to another anchored string or existing rail or turnout with rail anchoring to occur at a later time, the procedure shall explain how the track and turnouts will be protected from damage resulting from subsequent thermal rail string expansion and contraction.
13. If the procedure requires the adjusted rail string to be fully anchored and the string end to be joined at a later time, the procedure shall require that when the rail end is to be joined, 300 feet of the string shall be unanchored, vibrated, uniformly adjusted and vibrated before joining.
14. The size of gap each type of joint requires after the rail strings are uniformly adjusted.
15. The method of achieving the gap a joint requires when the rail strings are uniformly adjusted to within the rail's zero thermal stress temperature range.
16. If at any time during the thermal adjustment, anchoring and joining process the string falls outside of 1/2" from the final horizontal and vertical alignment, the process shall be stopped, anchors removed, alignment adjusted, and the procedure started again from the beginning.
17. When the second rail of the track is adjusted, anchored and joined, same procedures shall apply with the additional requirement that the temperature of the second rail shall be within 5 F of the rail temperature of the first rail immediately before it was adjusted.
18. When thermally adjusted rail is cut to remove a defect, to install a rail component, etc., then 300 feet of rail in both directions from the cut(s) shall be unanchored, vibrated, thermally adjusted, vibrated, anchored and joined using the same procedures.

- B. Record of Laying, Joining, Zero Thermal Rail Stress Adjustment and Anchoring: A record of rail laying, joining, thermal adjustment and anchoring data shall be made by the Design-Builder and be witnessed and approved by the Authority Inspector, for each installed string of CWR. The record shall be made on and include the data shown on **Exhibit 05651-C (Part 1 of 2)**.

3.16 FINAL ALIGNMENT AND TRACK INSPECTION

- A. The final horizontal and vertical alignment, gauge and cross level shall be within the specified tolerances.
- B. In order to determine the acceptability of finished track, the Authority will make an inspection of the track.
- C. Track deviations, as disclosed by the inspection, which exceed specified tolerances shall be corrected by the Design-Builder at no additional cost to the Authority.

PART 4 - MEASUREMENT AND PAYMENT

4.01 MEASUREMENT:

No separate measurement of work specified in this Section shall be made.

4.02 PAYMENT:

Compensation for work specified in this Section will be included in the price of the work of which it is a part.

TRACK CONSTRUCTION TOLERANCES

TYPE AND CLASS OF TRACK	GAUGE VARIATION	GROSS LEVEL AND SUPERELEVATION VARIATION	VERTICAL TRACK ALIGNMENT		HORIZONTAL TRACK ALIGNMENT	
			TOTAL DEVIATION	MIDDLE ORDINATE IN 62' CHORD	TOTAL DEVIATION	MIDDLE ORDINATE IN 62' CHORD
DIRECT FIXATION, MAIN	± 1/8"	± 1/8"	± 1/4"	± 1/8"	± 1/4"*	± 1/8"
BALLASTED, MAIN	± 1/8"	± 1/8"	± 1/2"	± 1/8"	± 1/2"*	± 1/8"
DIRECT FIXATION, YARD & SECONDARY	± 1/8"	± 1/8"	± 1/2"	± 1/8"	± 1/4"	± 1/8"
BALLASTED, YARD & SECONDARY	+1/4" -1/8"	± 1/4"	± 1/2"	± 1/4"	± 1/2"	± 1/8"

TOTAL DEVIATION IS MEASURED BETWEEN THE THEORETICAL AND ACTUAL ALIGNMENTS AT ANY POINT IN THE TRACK.

* TOTAL DEVIATION IN STATION AREAS SHALL BE 0" TOWARD PLATFORM AND 1/4" AWAY FROM PLATFORM.

SECTION 05652

BALLASTED TRACK CONSTRUCTION

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. The work in this Section shall include the construction of ballasted yard track as indicated on the drawings and as specified in these specifications.
- B. The construction of ballasted track shall include:
 - 1. Preparation of subgrade and placement of subballast and ballast.
 - 2. Hauling of construction materials.
 - 3. Distribution and spacing of ties.
 - 4. Laying, de-stressing and joining of continuous welded rail (CWR) strings
 - 5. Construction of ballasted track
- C. The above construction is encompassing and includes all pertinent trackwork related items associated with track construction such as the standard and insulated joints; rail cutting and stress adjustment; tamping, surfacing lining and gauging and all other operations necessary to construct an acceptable completed track structure.
- D. Unless otherwise shown or specified, trackwork within limits of ballasted special trackwork units is not included in this Section.

1.02 RELATED SECTIONS

Section 02726 - Subballast.
Section 02727 - Ballast.
Section 05091 - Rail Welding.
Section 05651 - General Track Construction.
Section 05654 - Special Trackwork Construction - Ballasted.
Section 05656 - Rail.
Section 05658 - Track Appurtenances and Other Track Material.
Section 05660 - Restraining Rail and Lubricators.
Section 06130 - Timber Ties.
Section 06132 - Timber Grade Crossing.

1.03 REFERENCES

- A. Codes and regulations of the jurisdictional authorities.
- B. American Railway Engineering and Maintenance-of -Way (AREMA), Manual for Railway Engineering, herein referred to as the AREMA Manual are as follows:
 - 1. Chapter 4, Part 1, Rail Drilling, Bar Punching and Track Bolts.
 - 2. Chapter 5, Part 4, Specifications for Track Construction.

1.04 SUBMITTALS

- A. Submittals shall be specified in Section 01330, Submittals. The following submittals shall be made by the Design-Builder:

1. Top of subgrade survey and calculations demonstrating minimum subballast and ballast thicknesses can be in place when the track is set with alignment tolerances.
2. Top of subballast survey and calculations demonstrating minimum ballast thicknesses can be in place when the track is set with alignment tolerances.
3. Detailed descriptions of construction procedures required for the work specified in this Section.
4. Samples required for the work specified in this Section.
5. Test results required for the work specified in this Section.
6. Working Drawings showing the proposed method for temporary fastening of rail during installation.
7. Required rail temperature record forms for rail laying and rail fastening operations.
8. Five thermometers as specified in Section 05651, General Track Construction, Article 3.12, Laying Continuous Welded Rail.

1.05 QUALITY ASSURANCE

- A. Quality Assurance/Quality Control shall be in accordance with the Design-Builder's Construction Quality Management Plan.
- B. In order to determine the acceptability of the installation, the Design-Builder shall make a survey of the completed track, and provide the Authority Representative with a copy for review. Deviations from the drawings which exceed tolerances specified in Section 05651, General Track Construction, shall be corrected by the Design-Builder at no additional cost to WMATA.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. The following track materials shall be furnished by the Design-Builder and any additional items necessary to construct an acceptable, completed track structure.
 1. Subballast
 2. Ballast
 3. Ties
 4. Special Trackwork
 5. Running Rail
 6. Track Appurtenances and Other Track Material
 7. Restraining Rail and Lubricators (as required)
 8. Bumping Posts (as required)

PART 3 - EXECUTION

3.01 GENERAL

- A. All ballasted yard track shall be constructed with Pandrol spring clips, elastic fastener tie plates punched for four 15/16 inch screw spikes.
- B. Track within the limits of ballasted special trackwork units shall be constructed as specified for Special Trackwork Construction.

- C. Ballasted track construction includes constructing new yard tracks to join existing yard tracks and new shop tracks as specified and shown in the contract documents. Also includes smoothing the existing track alignment where the new tracks join.
- D. Ballasted track construction includes placing subballast and ballast, distributing and lining ties; installing, anchoring, and joining CWR strings, raising and lining track; and other incidentals as required and as specified for in Section 05651, General Track Construction, except as modified herein.

3.02 TOLERANCES FOR BALLASTED TRACK

- A. Deviation from the gauge, cross level, horizontal alignment and vertical alignment shall not exceed the tolerance specified.

3.03 PLACEMENT OF SUBBALLAST

- A. Subballast shall be distributed, placed and compacted in accordance with Section 02726, Subballast.
- B. Prior to placement of subballast all trash and debris shall be removed from subgrade.
- C. Subgrade shall be clear and void of tire ruts, large stone or other deleterious objects before placement of subballast.
- D. Subgrade shall be dry and not frozen before placement of subballast.
- E. Prior to placement of subballast, the Design Builder shall survey the top of subgrade and shall prepare and submit to the Authority Representative for approval calculations demonstrating the top of subgrade permits minimum sub-ballast and ballast thicknesses to be in place when the track alignment is within the specified tolerances.

3.04 INITIAL LAYER OF BALLAST

- A. An initial layer of ballast shall be uniformly distributed over the finished subballast and compacted before tie distribution. The ballast shall not be distributed on the roadbed until the subballast has been approved. Subballast fouled or distributed by the Design-Builder's operations shall be repaired by the Design-Builder at no additional cost to the Authority. Subballast shall be dry and not frozen when ballast is placed.
 - 1. Prior to placement of initial layer of ballast, the Design Builder shall survey the top of subballast and shall prepare and submit to the Authority Representative for approval calculations demonstrating the top of subballast permits minimum ballast thickness to be in place when the track alignment is within the specified tolerances.
- B. The initial layer of ballast shall be limited to a total compacted depth that will establish the track top of rail surface at least four inches below final profile and cross slope, with further provision that each compacted lift shall be a maximum depth of four inches.
- C. The ballast depth shall conform to the cross sections shown. Each lift of ballast shall be uniformly spread. Each lift of ballast shall be fully compacted by a self-propelled pneumatic-tired roller or a vibrating compactor.

- D. The self-propelled pneumatic-tired roller shall have a minimum gross weight of nine tons and the vibratory compactor shall have a minimum weight of 5,000 pounds capable of applying a dynamic load of 18,000 pounds or more. The equipment selected by the Design-Builder shall be subject to approval by the Authority Representative.

3.05 DISTRIBUTION AND SPACING OF TIES

- A. All ties shall be carefully distributed and properly spaced on the initial layer of ballast with every fourth tie being a contact rail tie unless otherwise specified or shown.
- B. Care shall be exercised in the placement of contact rail ties to ensure the proper offset for contact rail supports.
- C. Unnecessary handling, distribution and reloading of ties shall be avoided. To the extent practicable, ties shall be distributed in proper position for use without further handling. They shall be unloaded in a manner that will not damage the ties. In no case shall ties be dropped. Ties shall be moved only with tie tongs or by leverage with a bar.
- D. Ties shall be installed radially on curves and at right angles to the centerline of tangent track at the designed spacing prior to rail installation. The lined side can be either side on tangent track but shall be the same side for the full length of a tangent. The line side shall be to the outside of curves. The line ends of timber track ties are offset 4 feet 3 inches from the centerline of track.
- E. Contact rail ties shall be installed to properly support the contact rail on the side of the track as shown on the traction power drawings prepared by the Design Builder. When the contact rail is on the same side as the line side, the contact rail tie end shall be offset 18 inches from the line ends of the timber ties. When the contact rail is on the other side, the ends of the contact rail ties on the line side shall align with the line ends of the track timber ties. The line end shall be lined with the adjacent ties.
- F. Ties damaged as a result of improper handling by the Design-Builder and rejected by the Authority Representative shall be removed and replaced with new ties.
- G. Timber ties shall be adzed only with the Authority Representative's approval.
- H. Timber ties shall be installed with the heartwood face down.
- I. Tie Boring:
 - 1. All timber ties shall be bored in the field. Timber tie boring shall be performed with the heartwood face down. For Pandrols 15/16" diameter screw spikes, 6 inches long to under the washer face, the ties shall be bored with a 3/4 inch pilot hole 5 1/2 inches deep. Holes for the four screw spikes holes in Pandrols standard tie plate shall be bored. Holes for all of the screw spike holes in the special trackwork plates shall be bored. Boring of holes in excess of the number of spikes used will not be permitted.
 - 2. A tolerance of plus or minus 1/16 inch will be permitted in the distance between spike holes. The spike holes shall be located in such a manner that each tie plate will be centered on the tie at a right angle to the rail when the spikes are driven into place. A tolerance of 1/8 inch in the centering of the holes across the width of the tie will be permitted. Timber tie holes shall be treated with pentachlorophenol oil or creosote immediately after boring.

- J. Tie Spacing
 - 1. Ties shall be spaced at 30 inches center-to-center, except where the radius is less than 350 feet, then ties shall be spaced at 24 inches center-to-center.
 - 2. Tie spacing at approach slabs shall be as shown on the design drawings.
 - 3. In curves the tie spacing shall be measured at the outside rail.
 - 4. Tie spacing tolerance shall be of plus or minus 1 inch with no fewer than 41 ties in 100 feet when 30 inch spacing and no fewer than 51 ties in 100 feet when 24 inch spacing.

3.06 LAYING CONTINUOUS WELDED RAIL (CWR)

- A. Laying, anchoring and joining CWR shall be as specified in Section 05651, General Track Construction.
- B. Zero Thermal Stress Temperature
 - 1. The rail shall be anchored at a temperature of 85 deg. F plus 5 deg. for minus 10 deg. F (30 deg. C plus 3 deg. C or minus 6 deg. C).
 - 2. The temperature of opposite rails when anchored shall be within 5 deg. F (3 deg. C) of each other.
- C. Fastening Rail To Ties
 - 1. Materials for fastening rail to ties shall be as specified for Track Appurtenances and OTM.
 - 2. Tie plates shall be installed under running rails on all ties. Spiking pattern shall be 4 screw spikes for each standard Pandrol tie plate. All screw spike holes in special track work plates shall receive screw spikes except for the guard rail plates that receive only 4 screw spikes.
 - 3. Prior to installing tie plates, the contact surfaces of the tie plates shall be cleaned to allow full bearing of the tie plate upon the tie. Tie plates shall be centered on the tie and placed normal to the centerline of the rail so that the outside shoulder of the plate will have full bearing against the base of rail.
 - 4. Spikes shall be started vertically and square and driven straight. Straightening of spikes will not be permitted. Spikes bent during driving shall be withdrawn and the holes plugged with treated tie plugs as specified for Track Appurtenances and OTM.
- D. Rail Anchoring - Installation of Pandrol spring clips shall be considered as anchoring the rail.

3.07 SURFACING AND LINING

- A. Ballasting
- B. Following the assembly of the track, ballast shall be unloaded in the tie cribs and shoulders of the track structure to restrain movement or buckling of the track due to temperature changes. Such ballast unloading shall provide an adequate amount of ballast for the track raise with sufficient surplus to continue to hold the track after the raise.
- C. Surfacing
 - 1. Track surfacing shall be done by methods which will prevent undue bending of the rail or straining of the joints.
 - 2. The amount of track lift shall not exceed four inches nor endanger the horizontal or vertical stability of the track. The track shall be given at least two raises of not less

than one inch nor more than three inches each raise. The maximum amount special trackwork shall be raised is 2 inches.

3. All ties pulled loose during surfacing shall be replaced to full bearing against the rail and properly secured.
4. Track surfacing shall not be permitted until the cribs are filled with ballast and with sufficient surplus to continue to hold the track after the track raise.
5. Track surfacing shall not be permitted and shall cease when the ambient temperature is higher than 95 deg. F.

D. Tamping

1. Tamping of ballast shall be done with approved power tamping equipment of the vibratory squeeze or hydraulic type. Control or cycling of the power tamper shall provide the maximum proper compaction of ballast uniformly along the track.
2. The ballast shall be thoroughly tamped on both sides of the tie from a point 15 inches inside the rails to the ends of the tie, with the exception of contact rail ties where tamping shall be only to a point opposite the ends of the adjacent cross tie. Tamping will not be permitted at the center of the tie outside of the above stated limits. For each tie, tamping shall proceed simultaneously inside and outside both running rails on both sides of the tie.

E. Final Surface and Alignment

1. The final surface and alignment of all track shall be within the specified ballasted track construction tolerances, executed by machines with automatic lining equipment or with combined lifting, lining and tamping equipment. Final tamping and lifting shall be effected by equipment fitted with tamping heads between axles or of arch -bar construction.
2. After the final surfacing and alignment of track is completed the ballast shall be dressed to conform to the ballast section shown and as directed by the Authority Representative. The portion of subballast outside the toe of slope of the ballast shall have a smooth, even surface, sloped as shown.
3. A manual dressing, as directed by the Authority Representative will be required to ensure a one inch clearance between the base of rail and top of ballast.

F. Ballast Compaction

1. Following tamping and lining, but prior to installation of contact rail and insulators, the crib and shoulders of all track shall be compacted by a machine specifically designed to compact the crib and shoulders simultaneously. The compactor shall operate on all shoulders and in those cribs where special trackwork components do not interfere with the operation of the machine. After compaction of ballast no further shaping of the ballast section will be permitted except as directed by the Authority Representative.
2. The crib compacting tool work faces shall measure nine inches by 14 inches with the nine-inch dimension parallel to the rail. Crib compacting tool work faces shall appear as flattened V's when viewed normal to the nine-inch dimension and the depth of the V shall be 3/4-inch plus or minus 1/16-inch. There shall be a minimum of eight crib compacting tools, two on each side of each rail. The shoulder compacting tool work faces shall conform to the designed ballast section outline from 1-1/2 inches beyond the tie ends horizontally to the beginning of the 2:1 shoulder slope, continuous to within six inches of the ballast toe at the subballast. The length of work faces in the direction of travel shall not be less than 33 inches, with flared ends in the direction of travel to avoid plowing of ballast shoulders.

3. The compacting tool work faces shall vibrate with a frequency between 2200 and 3000 Hertz. The vibrational amplitude shall be between 0.058 inch and 0.117 inch. The vibrating work faces shall apply a pressure between 14 psi and 21 psi to the surface of the ballast. The pressure applied shall be the same for all operations and remain constant throughout the job, and shall be monitored by a permanently affixed calibrated pressure gauge. The compacting tools shall be applied to both crib and shoulders for a period of between three and six seconds duration at each crib successively.
- G. Ballast Inspection - The Design-Builder, shall remove a maximum of one percent of the ties, selected at random by the Authority Representative, to allow inspection of the ballast compaction beneath the ties to determine the variables of each piece of tamping and compaction equipment and for spot checking of the production work.

PART 4 - MEASUREMENT AND PAYMENT

4.01 MEASUREMENT:

- A. No separate measurement of work regarding Ballasted Track Construction is specified in this section.

4.02 PAYMENT:

Compensation for work specified in this Section will be included in the price of the work of which it is a part.

END OF SECTION

THIS PAGE NOT USED

SECTION 05654

SPECIAL TRACKWORK CONSTRUCTION - BALLASTED

PART 1 - GENERAL

1.01 SECTION INCLUDES

The work in this Section shall include the construction of ballasted special trackwork as indicated on the Design Drawings and as specified.

1.02 RELATED SECTIONS

Section 02726 - Subballast
Section 02727 - Ballast
Section 05091 - Rail Welding
Section 05651 - General Track Construction.
Section 05652 - Ballasted Track Construction
Section 05656 - Rail
Section 05658 - Track Appurtenance and Other Track Material
Section 05659 - Special Trackwork
Section 06130 - Timber Ties

1.03 REFERENCES

Pertinent provisions of the following listed standards and publications shall apply to the Work, except as they may be modified herein, and are hereby made part of these Specifications to the extent required.

- A. American Railway Engineering and Maintenance-of-Way Association (AREMA), Manual for Railway Engineering herein referred to as AREMA Manual.
- B. American Railway Engineering and Maintenance-of-Way Association (AREMA), Portfolio of Trackwork Plans, herein referred to as the AREMA Portfolio.

1.04 SUBMITTALS

- A. The Design-Builder shall develop and submit for the Authority Representative's approval a detailed installation plan, including sketches, for all special trackwork installation. Particular emphasis should be placed on alignment and clearances, and methods of checking each.
- B. Submittals shall be as specified in Section 01330, Submittals. The following submittals shall be made by the Design-Builder:
 - 1. The name(s) of the suppliers and manufacturers for the special trackwork components.
 - 2. Shop drawings for the various types of special trackwork and supporting drawings.
 - 3. Installation and maintenance instructions by the manufacturer for the various trackwork components.
 - 4. Detailed description of construction procedures required for the work specified in this Section submitted at least 30 calendar days before beginning the work.
 - 5. Test results required for the work specified in this Section and related work specified elsewhere.

1.05 QUALITY ASSURANCE AND SAFETY

- A. Quality Assurance/Quality Control shall be in accordance with the Design-Builder's Construction Quality Management Plan.
- B. In order to determine the acceptability of the installation, the Design-Builder shall make a survey of the special trackwork and provide the Authority Representative with a copy of the report. Deviations from the drawings or specifications which exceed tolerances specified shall be corrected by the Design-Builder at no additional cost to the Authority.
- C. Switch points shall mate and rest under the undercut stock rail and provide a continuous contact with stock rail the length of the machined point rail face adjacent to the stock rail.
- D. Switch points shall bear on all slide plates as shown by grease marks and feeler gauges in the thrown operating position.
- E. Operation of switch point shall be unrestricted and allow for smooth switch machine operation with current draw to suit standard switch machine.
- F. Design-Builder's Work Trains
 - 1. The Design-Builder's work trains shall not operate over special trackwork until it has been assembled, lined and surfaced, and secured in place to the satisfaction of the Authority Representative.
 - 2. Switch points shall be secured to the satisfaction of the Authority Representative before work trains or other on-track equipment are passed over turnouts.

1.06 DELIVERY, STORAGE AND HANDLING

The Design-Builder shall handle all special trackwork materials in such a manner as to prevent damage during loading, transporting, unloading, storing, installing, and other construction activities until the Authority accepts the track.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. The Design-Builder shall supply the special trackwork turnouts and restraining rail as listed on the Design Drawings, including all materials necessary to provide a complete installation.
- B. The following materials in accordance with the bills of materials on the drawings for special trackwork and general track construction shall be furnished as described, including but not limited to:
 - 1. Subballast
 - 2. Ballast
 - 3. Running Rail
 - 4. Track Appurtenances and Other Track Material
 - 5. Special Trackwork
 - 6. Timber Ties
- C. Other materials:
 - 1. Switch stands, connecting rods and associated hardware as shown on the Drawings.
 - 2. Furnish a dry graphite lubricant for application to the riser plates. The lubricant shall have low electrical conducting properties.
 - 3. Furnish switch machines, operating rods and switch machine mountings for power operated turnouts, as described in Division 16 of the Contract Specifications.

4. Furnish all additional track materials required within the special trackwork limits to construct an acceptable, completed special trackwork structure as specified herein.

PART 3 - EXECUTION

3.01 GENERAL

- A. Construction of special trackwork on ballasted track shall be as specified herein and shall comply with the applicable portions of Section 05652, Ballasted Track Construction.
- B. Ballasted special trackwork will be factory assembled on all switch ties. After Authority inspection and approval, the switch will be shipped in one piece, except for long ties.
- C. The remainder of the unit will be disassembled and the switch ties banded into bundles identified as to turnout, crossing and location in accordance with the special trackwork installation drawings prepared by the fabricator.
- D. Lubrication
 1. At the time of installation all sliding surfaces of special trackwork assemblies shall be lubricated with an approved dry-film graphite lubricant.
 2. Vertical switch rod clips shall be greased in accordance with the manufacturer's recommendations.
 3. The specified lubrication shall be maintained as necessary to ensure proper operation of all components throughout the duration of this Contract.
- E. Adjustments
 1. The Design-Builder shall make all mechanical adjustments, including those required for train control and switch machine installation, prior to the final acceptance of special trackwork to ensure that special trackwork units are in alignment to their plates and proper operating condition.
- F. Switch Machine: Switch machines and operating rods will be furnished and installed by the Design-Builder.
- G. Switch Rods: Adjust for throw shown.
- H. Rail Ends: Rail ends to be connected to CWR will be drilled in the field.
- I. Joints
 1. All joints, standard or insulated, to assemble the turnout and to connect a turnout to other trackage shall be furnished and installed by the Design-Builder.

3.02 SUBBALLAST

Subballast shall be as specified in Section 02726, Subballast.

3.03 BALLASTING

- A. Ballast shall be uniformly tamped under both sides of each tie, directly under each running rail and for a distance of 15 inches on both sides of the rail.
- B. The top of the ballast section shall be one inch below the base of rail throughout special trackwork units except in the cribs between the point and heel of the switch rails, where the ballast level shall be three inches below the base of the rail.

- C. Additional clearance at vertical switch rods shall be provided as needed to allow unrestricted movement. The width and slope of the shoulders shall be as shown.

3.04 SWITCH TIES

- A. Switch ties shall be spaced and lined as shown.
- B. Ties shall be lined at right angles to the centerline of the tangent track.
- C. The line side for all turnout units is the side on which the straight stock rail is located. Tie end on the line side are the line ends.
- D. Switch tie spacing shall have a tolerance of plus or minus 1/2 inch with the exception of the switch machine ties which shall have a tolerance of plus or minus 1/4 inch.
- E. Ties shall be adzed only with approval of the Authority Representative.
- F. All ties will be bored for 15/16" screw spikes.
- G. The Design-Builder will adz switch timbers to compensate for minor warpage and thereby provide correct rail surfacing only at the Authority Representative's direction. Adzing shall be at no additional cost to the Authority.

3.05 PLATES

- A. All plates shall be located as shown.
- B. Elastic Fastener (Pandrol plate TPL-P26M or equal) tie plates as specified in Section 05658, Track Appurtenances and Other Track Materials, shall be used at all support locations not having special frog, switch, gauge, guard rail or restraining rail plates.
- C. All plates shown within the limits of ballasted special trackwork will be factory assembled on the switch ties.
- D. Ties will be bored to accommodate all spike locations in all plates except for guard rail plates. Only 4 holes shall be bored for guard rail plates.
- E. Where plates span two or more ties, spikes shall not be installed if the plates will be shipped separate from the ties.
- F. All plates occupying one tie including standard tie plates shall be spiked to the tie.

3.06 SPIKING

Spiking of ballasted special trackwork shall be as specified for ballasted track construction with the following additional requirements:

- A. All spikes holes shall be pre-bored except only four shall be prebored for the guard rail plates.
- B. A sufficient number of 15/16 " screw spikes are to be furnished with each turnout to complete its field assembly.

3.07 ANCHORING

Special trackwork units shall be considered anchored when all Pandrol spring clips are installed and unanchored when no spring clips are installed. When some spring clips are installed, the special trackwork shall be considered as neither anchored nor unanchored.

3.08 TOLERANCE

- A. Tolerances shall conform to the AREMA Portfolio and Manual, unless modified by these specifications and drawings.
- B. The gauge, cross level, and horizontal and vertical alignment of ballasted special trackwork shall be as shown and specified.
- C. Tolerances shall be as specified for ballasted track construction.
- D. Switch points in normal position shall be square within 5/8 inch.
- E. At the Authority Representative's direction, the Design-Builder shall be required to provide some spike lining in the pre-plated tolerances. Minor spike lining will be allowed only after the Design-Builder has demonstrated that the switch points and frogs have been correctly oriented. This shall be at no additional cost to the Authority.

PART 4 - MEASUREMENT AND PAYMENT

4.01 MEASUREMENT

No separate measurement of work specified in this Section shall be made.

4.02 PAYMENT:

Compensation for work specified in this Section will be included in the price of the work of which it is a part.

END OF SECTION

THIS PAGE NOT USED

SECTION 05656

RAIL

PART 1 - GENERAL

1.01 SECTION INCLUDES

This Section specifies manufacture and delivery of standard and high strength (head hardened or fully heat treated) 115RE steel running rail and 132 RE guard and restraining rail for use in transit track.

1.02 RELATED SECTIONS

Section 05091 - Rail Welding
Section 05651 - General Track Construction
Section 05652 - Ballasted Track Construction
Section 05654 - Special Trackwork Construction - Ballasted
Section 05658 - Track Appurtenances and Other Track Material (OTM)
Section 05659 - Special Trackwork

1.03 REFERENCE STANDARDS

Work shall be performed in accordance with the following applicable Codes, Regulations, Reference Standards and Specifications.

- A. The American Railway Engineering and Maintenance-of-Way Association (AREMA), Manual for Railway Engineering, herein referred to as the AREMA Manual, Volume 1, Chapter 4, Rail
- B. American Society for Testing and Materials (ASTM)
 - 1. ASTM E10 Standard Method of Brinell Hardness for Metallic Materials
 - 2. ASTM A578 Ultrasonic Testing

1.04 SUBMITTALS

- A. Mill Inspection:
 - 1. Make specified tests and inspections at the mill prior to shipment.
 - 2. Submit to the Engineer all information required of AREMA Form 401D.
 - 3. Provide free access for the Engineer to all fabrication and test facilities where work is being performed for this Contract.
- B. Provide rail test records, including mechanical properties tests, hardness measurements, ultrasonic test records and all other required test documentation, for informal review during the in-plant inspection.

1.05 QUALITY CONTROL

- A. Quality Assurance/Quality Control shall be in accordance with the Design-Builder's Construction Quality Management Plan.
- B. Develop and maintain a quality control program regulating methods, procedures, and processes to ensure compliance with standards of quality required by the Contract Documents.

- C. Records of all inspection work by the Design-Builder shall be kept complete and available to the Authority Representative during the performance of the Contract; and to such other agencies and for longer periods as may be specified elsewhere in the Contract.
- D. Perform all tests and analyses specified in Chapter 4 of the AREMA Manual and submit the results in accordance with this Section.
- E. Ultrasonically test all rail for internal defects in accordance with ASTM A578.
- F. Testing shall conform to the requirements of the AREMA Specifications for Steel Rails
- G. Make all rail tests and inspections at the mill prior to shipment. Assume full responsibility for all testing indicated. Give the Authority Representative sufficient notice when testing in any form is proposed so that the Authority Representative may witness the tests.
- H. Provide the Authority Representative free entry at all times to the manufacturer's mill to inspect the processing and testing of rail while work on this Contract is being performed.
- I. Perform all tests specified herein at no additional cost.
- J. Testing must be witnessed and certified by a qualified independent testing firm or individual.

1.06 DELIVERY, HANDLING AND STORAGE

- A. Handle rails carefully to avoid damage.
- B. Load rail head up with the branding on all rails facing in the same direction.
- C. Sort and load rails together according to their markings. Do not intermix rails of different markings in loading. If there are not sufficient rails of one marking for a full car, smaller groups consisting of tiers of different markings may be loaded onto one car.
- D. Load all rails of the same radius together in the same or adjacent tiers.
- E. Load rails with adequate wood strips between the tiers or rail to prevent damage in transit.

PART 2 - PRODUCTS

2.01 RAIL

- A. Standard Rail
 - 1. Rail Section and Weight shall be new 115 RE rail section, and shall be in conformance with AREMA Recommended Rail Sections, 115 RE Rail Section and Specifications for Steel Rails
 - 2. Rail shall be suitable for joining into continuous welded strings using both electric flashbutt and exothermic welding methods.
 - 3. The steel shall be cast by a continuous casting process, or by other methods approved by the Authority Representative.

4. Length:
 - a. The standard length of rails shall be either 78 or 80 feet.
 - b. Up to 10 percent of the total tonnage accepted for each individual rolling will be accepted for each individual rolling will be accepted in shorter lengths of 79, 78, 77, 75, 70, 65 and 60 feet.

- B. High Strength (Head Hardened or fully heat treated) Rail - shall meet all of the requirements of Standard Rail and as follows:
 1. shall be either head hardened or fully heat treated.
 2. shall conform to all requirements for high strength rail and for sectional tolerances for trackwork rail specified in the AREMA Manual for Railway Engineering, Chapter 4.
 3. shall have a Brinell Hardness in the range of 341 to 388. A maximum hardness of 388 BHN may be exceeded provided a fully fine pearlitic structure is maintained.
 4. minimum tensile strength: 140,000 psi.
 5. minimum yield strength: 95,000 psi.

PART 3 - EXECUTION

3.01 GENERAL

A mill certificate shall be furnished to the Authority Representative containing the following data:

- The identity of each rail in a charge by heat, ingot and letter.
- The identity of each equivalent sample by heat.
- The dates of all phases of heat treatment for each charge.
- A listing of the accepted and rejected rail in each charge.

PART 4 - MEASUREMENT AND PAYMENT

4.01 MEASUREMENT

No separate measurement of work specified in this Section will be made.

4.02 PAYMENT

Compensation for work specified in this Section will be included in the price of the work of which it is a part.

END OF SECTION

THIS PAGE NOT USED

SECTION 05658

TRACK APPURTENANCES AND OTHER TRACK MATERIAL

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies the installation of track appurtenances as shown and specified. The Work specified herein consists of furnishing and installing bonded insulated joints, bumping posts, tie plates with resilient rail clips, spikes, tie plugs, switch stand, and other track materials required for track construction.
- B. All track appurtenances and other track material (OTM) shall be new and conform to the requirements shown and specified. All materials shall conform to the dimensional requirements for 115 RE rail, as recommended by current AREMA Specifications or as specified.

1.02 RELATED SECTIONS

Section 05651 - General Track Construction
Section 05652 - Ballasted Track Construction

1.03 REFERENCES

- A. Association of American Railroads (AAR) - Signal Manual
- B. American Railway Engineering and Maintenance-of-Way Association (AREMA)
 - 1. AREMA Manual for Railway Engineering
 - 2. AREMA Portfolio of Trackwork Plans
- C. American Society of Testing and Materials (ASTM)
ASTM A66
- D. National Electrical Manufacturers Association (NEMA) - NEMA LI 1 Industrial Laminated Thermosetting Products
- E. American Institute of Steel Construction - Manual of Steel Construction.

1.04 QUALITY ASSURANCE

- A. Quality Assurance Program - Refer to Section 05651, General Track Construction, and conform to the requirements of the Quality Assurance Program.
- B. Testing Laboratory Services - Refer to Section 01410, Testing Laboratory Services
- C. Before permanently installing bonded insulated joints, prequalify each crew and its foreman by testing two samples of each type of bonded joint in accordance with the Longitudinal Compression Test specified herein. Prepare test samples in track. The bonded insulated joints tests shall be performed with one sample using high strength rail and the other sample using standard rail.
 - 1. The two sample joints shall have a 1/4-inch gap between the rail ends.
 - 2. The joints shall be tested in compression. A load shall be applied longitudinally in increments of 25,000 pounds. Each load increment shall be maintained constant until

the longitudinal deflection of the rail ceases before increasing the load to the next increment.

3. The load shall be increased in these increments until a total load of 650,000 pounds is attained or failure occurs. At each increment of loading, the load and differential movement of the rail and joint bars shall be measured to 0.0001 inch and recorded.
 4. The assembled joints may be sawn in half where the rails are butted together. The sawing shall be done in such a manner as to prevent overheating or damage to the bond and the cut shall be perpendicular to the centerline of the top of the rail with a tolerance of plus or minus one degree. A device shall be fabricated so that the reaction at the sawn ends occur only on the face of the joint bars.
 5. At no time shall any of the bonded standard rail joints show any indication of slippage before a compressive load of 650,000 pounds is applied to the joint, nor shall the magnitude of the differential movement be more than 1/8-inch in any direction. At the completion of the test, after the load in the rail has been released, the relative position of rail and joint bar shall be within 1/32-inch of its original value.
 6. The test shall be performed by an approved independent laboratory. Should any sample joint fail to meet the specified requirements of the test, another joint may be tested or a different manufacturers product may be tested as directed by the Authority Representative. For qualification testing, materials required shall be furnished by the Design-Builder at no additional cost to the Authority.
 7. Failure of any test sample disqualifies the responsible foreman for permanent installation work. Assign a new foreman and repeat procedure and test.
 8. Bonded insulated joint bar to conform to:
 - a. Fishing height: plus or minus 1/64 inch
 - b. Length: plus or minus 1/8 inch
 - c. Straightness, as determined by a 36-inch straightedge: plus or minus 1/32 inch
 - d. End post thickness: plus or minus 1/64 inch
 - e. Projection below base of rail - 1/16 inch
 - f. Bolt hole location - as specified in AREMA Manual for Railway Engineering, Chapter 4, for 36-inch joint bar modified to receive 1-1/8 inch bolt.
- D. Equipment: Use equipment that is specifically designed to fasten proprietary bolts in bonded joint installation. Use the same equipment for field installation of bonded joints and for assembling test samples.
- E. Tolerances - Other track material (OTM) to conform to tolerances as per AREMA and as noted below.
1. The Pandrol spring and standard tie plate tolerances shall be such that when two clips and a plate are assembled with a piece of 115 RE rail rolled with zero tolerances in the rail base, the toe load for the spring clips is 2750 +/- 250 pounds.

1.05 SUBMITTALS:

- A. Refer to Section 01300, Submittals.
- B. Certificates of Compliance for materials specified in Part 2, Products
- C. Shop Drawings on:
 1. Bonded insulated joints
 2. Standard joints
 3. Proprietary bolts and fasteners
 4. Hydraulic bumping posts

5. Tie plates
 6. Rail clips
 7. Screw spikes
- D. The Design-Builder, shall in accordance with Specification Section 01300, Submittals, submit shop drawings or detailed catalog cuts of track appurtenances and OTM not fully shown or not in conformance with AREMA Portfolio of Trackwork Plans and Specifications.
- E. Product data on
1. Bonded insulated joints and adhesives
 2. Proprietary bolts and fasteners
 3. Tie plates, rail clips, and screw spikes
 4. Corrosion preventing oil or grease
- F. Certificates and procedure reports
1. Certificates of product conformance
 2. Qualification tests for bonded insulated joints joints
 3. Crew qualification tests for bonded joint installation
 4. Negative return bonding installation procedure
- G. Record of field connections
1. of each bonded insulated joint shall be submitted.

PART 2 - PRODUCTS

2.01 BOLTED JOINTS (INSULATED AND STANDARD)

General Requirements: Johnson "Blue" Vulca Bond, or approved equal, with the following requirements

- A. Insulated joints shall be highly resistant to abrading, cracking, cutting, spalling and fatigue failure under impact loads, and shall exhibit deflection characteristics comparable to standard bolted joints.
- B. Joint bars shall be quenched and tempered carbon steel in accordance with the AREMA Manual.
- C. Joint bars shall be 36 inches in length.
- D. Joint bars shall have six, 1 $\frac{1}{8}$ inch diameter bolt holes.
- E. Joint bars shall provide full web contact. Inside face of insulated joint bars shall have the insulating material pre-bonded and shall be smooth with no stamping or branding.
- F. End posts shall project 1/4 inch, plus or minus 1/16 inch, below the base of rail.
- G. All insulated joints shall be furnished complete with bars, end posts, bushings, washer plates, bolts, nuts and washers.
- H. Bolts and nuts shall conform to the material requirements of current AREMA Specifications for Heat-Treated Carbon-Steel Track bolts and Carbon-Steel Nuts.

- I. Track bolts shall be oval necked and have a nominal diameter of 5½ inches in length in conformance with current AREMA Design for Track Bolts and Nuts.
- J. Spring washers shall be single coil, helical spring washers for 1 inch bolts and shall conform to current AREMA Specifications for Spring Washers.
- K. Flat washers shall be 2¼ inches OD, 1-3/16 inch ID and 1/8 inch minimum thickness and shall conform to current AREMA Specifications.

2.02 BUMPING POSTS

- A. Maintenance Vehicle Bumping Post
 - 1. Steel bumping post, Type WA, Western-Cullen-Hayes, Inc., or approved equal.
 - a. Shock-absorbent head of multiple-spring-and-shockpad design.
 - b. Permit installation by bolting to running rails without anchorage to cross-ties or concrete invert.
 - c. No part extending more than two inches below base of rail.
 - 2. Install at the end of M/W tracks in accordance with the manufacturers requirements.
 - 3. Provided with one coat of manufacturer's standard shop coat applied to exterior surfaces after complete removal of all foreign matter.
 - 4. Furnish the product of an established manufacturer regularly engaged in the production of bumping posts.

2.03 STANDARD TIE PLATES

- A. Pandrol tie plate TPL-P26M for Pandrol Spring Clip e2056 and 5½ inches rail base. Plate shall provide a 40 to 1 rail cant, a width of 7 3/4", minimum length of 15 3/16", a minimum thickness at the rail centerline of 11/16", and four one inch diameter round holes for 15/16" screw spikes as manufactured by Pandrol, Inc., or approved equal.
 - 1. Welding shall not be permitted to fabricate tie plates.
 - 2. The smallest diameter for the screw spike holes shall be at the bottom of the plate.
 - 3. The screw spike holes shall have a one inch diameter at the base of the plate.
 - 4. The tie plate design shall provide a rail clip load of 2750 pounds when assembled with the Pandrol spring clip and a piece of 115 RE rail rolled with zero tolerances on the rail base.

2.04 SPIKES

- A. Screw spikes, as manufactured by Pandrol, Inc., Bridgeport, NJ, or approved equal, shall be 7" in length , 15/16" diameter, hot forged, made from medium carbon steel to meet ASTM A66. The head shall be configured for use with a 7/8" socket.
- B. Cut track spikes shall be 6 inches by 5/8 inch with reinforced throat, and shall conform to current AREMA "Specifications for Soft-Steel Track Spikes" and "Design for Cut Track Spikes".

2.05 TIE PLUGS

Tie plugs shall be treated, five inches in length and conform to current AREMA Specifications for Tie Plugs for 5/8-inch spikes.

2.08 SWITCH STAND

Switch stand for installation on hand throw switch shall be Foster Parallel-Throw, Low-Type, Design 51A as manufactured by L. B. Foster Company, or approved equal.

2.09 SPRING CLIPS

- A. Pandrol type e2056
- B. Two per tie plate

PART 3 - EXECUTION

3.01 PREPARATION

- A. Bolted Joints (Bonded joint and standard joint installation)
 - 1. End-harden rail ends of standard rail as specified in Section 05651, General Track Construction.
 - 2. Remove rail brands which are located in joint bar rail contact areas. All rail brands shall be removed from the rail by grinding for the entire length of the joint bar.
 - 3. Rail welds shall be at least eight feet from the center of the joint.
 - 4. Drill rail holes in conformance with the design drawings, AREMA Specifications and manufacturer's printed instructions using a template as the drilling guide. Debur field drilled holes.
 - 5. Calibrate bolt-tightening equipment by testing three typical bolts in a device capable of indicating actual bolt tension.

3.02 INSTALLATION

- A. Joints
 - 1. Bonded insulated joints shall be installed at all insulated joint locations shown. The exact location will be coordinated with the Design-Builders signal designer.
 - 2. The bonded insulated joint shall be supported by the tie plate arrangement shown in the design drawings.
 - 3. Additional preparation and the installation shall be in accordance with the manufacturer's recommendations. The manufacturer's recommendations will include procedures for sandblasting of rail and heat curing of assembled joints.
 - 4. All bonded joints shall be installed under the direct supervision of a qualified foreman.
 - 5. Bolted Standard Joints
 - a. Standard joints shall be assembled with a full complement of bolts, nuts and spring washers. Before installing joint bars, rail surfaces to be covered by the bars shall be cleansed and coated with an oil or grease approved by the Authority Representative to prevent corrosion.
 - b. Bolts shall be installed and the nuts threaded finger tight.
 - c. Bolt tension shall then be increased to 20,000 to 30,000 lbs. by use of a track wrench or power torque wrench. Bolts shall be tightened starting from the center bolts and working to the end bolts.
 - d. Bolts shall be tightened twice; first, after the track has been brought to approximately true alignment; second, immediately before the completion and final acceptance of the trackwork. Retightened track bolts shall be brought to a tension of 15,000 to 25,000 lbs.

- e. Bolted standard joints used to connect CWR strings shall be installed with negative return bonds as specified in this Section's article for Negative Return Bonding.
6. Bolted Insulated Joints:
- a. Installation shall be in accordance with the manufacturer's recommendations and as directed by the Authority Representative.
 - b. Rail surfaces within the insulated joint bars shall be clean and free of oil, dirt, rust and metal filings.
 - c. Joint Resistance Testing will be as specified in this Section's article for Insulated Joint Resistance Test.
7. Insulated Joint Resistance Test - All testing shall be done by the Authority Representative.
- a. Equipment - The insulated joint resistance test shall be conducted using the following Authority test equipment (See **Exhibit 05658-A**):
 - 1) General Railway Signal (GRS) Track Quality Meter (TQM) 20182-36 GR.1.
 - 2) Standard Resistance Test Fixture.
 - 3) Acceptance Criteria: The insulated joint shall have a minimum resistance of 5,000 ohms.
8. Negative Return Bonding
- a. The Design-Builder shall furnish and install negative return bonds as specified and shown at all bonded standard joints used to join CWR strings.
 - b. Negative Return Bonds: shall include two web type at each location.
 - c. Web Bond: Manufactured Bond, 500 KCMIL, stranded copper, single conductor, 2000 volt, UL Type RHW, 48 inches long insulated, as manufactured by Erico Products, Inc., fastened to rail web with 5/8" compression fastener, Huck Manufacturing Co. C50LR-BR20-16 and terminal lug, Bundy Type, YA34-L, each end.
 - d. The Design-Builder shall install all negative return bonds in accordance with the manufacturer's instructions.
 - e. The Design-Builder shall submit installation procedures for approval.
 - f. The contact surfaces of the running rail web shall be cleaned on each side of mill scale, oil, grease or other foreign matter to near white finish.
 - g. Any raised lettering from the steel mill shall be ground flat with the adjacent surface.
 - h. Each negative return bond shall be installed with sufficient amount of slack to accommodate expansion or contraction.
9. Electrical Testing of Negative Return Bonding
- a. The bond resistance of each negative bonded joint shall be tested by the Design-Builder to verify that it does not exceed 0.000050 ohms.
 - b. The Null Balance method of testing shall be employed utilizing the four terminal arrangement, two potential and two current terminals. The P1 and P2 leads shall be attached to the rail 46 inches apart and equal distance from the ends of the 500 KCMIL cable. The C1 and C2 current leads shall be attached to the rail approximately six inches outside of the P1 and P2 leads. The meter dials shall then be manipulated to achieve a balanced condition of the meter. This procedure is to be followed for each negative return bonded rail joint. The resistance of each bonded rail joint shall be recorded and submitted to the Authority Representative. Bonds which exceed 0.000050 ohms shall be removed, replaced and retested.
10. Record of Field Connections
- a. A record of each bonded standard joint shall be submitted.
 - b. This record shall be in the format shown in **Exhibit 05658-B**.

- B. Bumping Posts:
1. Prior to final acceptance, bumping posts shall be cleaned, sand blasted, primed, painted and lubricated as directed by the Authority Representative. Gauge transitions to provide the required track gauge for bumping posts installations shall be as specified for Section 05651, General Track Construction.
 2. Bumping post shall be installed where shown and specified on the Information Drawings.
 3. Insulated joints shall be installed as shown and specified.
 4. All holes in the running rails for bumping post installation shall be centered 2-7/8 inches above the base of the rail and shall be drilled in conformance with AREMA requirements.
 5. Flame cutting of holes will not be permitted.
 6. Prior to final acceptance, the Design-Builder shall make all adjustments directed by the Authority Representative to ensure that all bumping posts are in proper operating condition and ready for service.

PART 4 - MEASUREMENT AND PAYMENT

4.01 MEASUREMENT:

No separate measurement of work specified in this Section will be made.

4.02 PAYMENT

Compensation for work specified in this Section will be included in the price of the work of which it is a part.

SPECIAL TRACKWORK

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies manufacture, fabrication, shop assembly, inspection, testing, packaging and shipping special trackwork materials.
- B. Special trackwork shall include components for installations in ballasted.
- C. This Section also specifies fabricating and furnishing guarded turnouts as shown and specified.
- D. This Section specifies fabricating and furnishing restraining rail and precurved rail.

1.02 RELATED SECTIONS

Section 05651 - General Track Construction
Section 05652 - Ballasted Track Construction (BTC)
Section 05654 - Special Trackwork Construction - Ballasted
Section 05656 - Rail
Section 05658 - Track Appurtenances and Other Track Material
Section 06130 - Timber Ties

1.03 REFERENCES

Pertinent provisions of the following listed standards and publications shall apply to the Work, except as they may be modified herein, and are hereby made part of these Specifications to the extent required.

- A. American Railway Engineering and Maintenance-of-Way Association, Manual for Railway Engineering, herein referred to as the AREMA Manual.
- B. American Railway Engineering and Maintenance-of-Way Association, Portfolio of Trackwork Plans, herein referred to as the AREMA Portfolio.
- C. American Society of Testing and Materials (ASTM)
- D. Association of American Railroads (AAR) Signal Manual
- E. American Council of Independent Laboratories' Manual of Practice
- F. American Welding Society (AWS)
- G. Industrial Fastener Institute (IFI)

1.04 QUALITY ASSURANCE/CONTROL

- A. Quality Assurance/Quality Control shall be in accordance with the Design-Builder's Construction Quality Management Plan.

- B. Quality Assurance Program - Refer to Section 05651, General Track Construction, and conform to the requirements of the Quality Assurance Program.
- C. Tolerances: Conform to the AREMA Portfolio - Plan No. 1010-89, Permissible Variations in Completed Frogs; Plan No. 1011-84, Permissible Variations in Completed Switches; the AREMA Manual, Section 7, and the AREMA Manual, Section 5, in all aspects unless modified by the contract documents.
- D. Codes, Regulations, Reference Standards and Specifications:
 - 1. Except as modified in the contract documents, design, manufacture, test, assemble, inspect, ship, unload and stack special trackwork in accordance with the AREMA Portfolio and the AREMA Manual.
 - 2. Except as modified in the contract documents, use rail in the special trackwork conforming to the requirements of the AREMA Manual, Chapter 4, and Section 05656, Running Rail.

1.05 TESTING

- A. Notify the Authority in writing not less than 14 days in advance of dates scheduled for any test. The Authority retains the right to witness testing. Do not conduct test until authorized by the Authority.

B.

1.06 PRODUCTION QUALITY CONTROL TESTS OF INSULATION PIECES

- A. Test insulated gauge plates and switch rods in accordance with AAR Signal Manual, Part 14.5.3.

1.07 SUBMITTALS

- A. Refer to Section 01300, Submittals.
- B. Shop drawings for special trackwork components, including the following
 - 1. Insulated curved split switches, including stock rails.
 - 2. Insulated switch rods, including clip assemblies.
 - 3. All insulation materials, parts and assemblies.
 - 4. Closure rails.
 - 5. Frog guard rails.
 - 6. All special plates, including details of components.
 - 7. Switch panel details.
 - 8. Rail braces.
 - 9. Complete layouts and details for all types of turnouts.
 - 10. Installation drawings for each type of assembly used during construction.
- C. Product data:
 - 1. Certification of the procedure used in the depth hardening of frog castings
 - 2. Test data for the rail used in all fabrication for compliance with AREMA and these specifications.
- D. Refer to Section 01322, Certificates and Reports, and submit the following:
 - 1. Certificates of material compliance required by AREMA and this Specification.
 - 2. Test reports of chemical analyses, Brinell hardness, electrical insulation, and other tests required by AREMA and this Specification.
 - 3. Frog depth hardening results

- E. A certified copy of reports on the analyses and tests required by referenced ASTM specifications.
- F. Design-Builder's method for locating all special plates, not in the switch panel, which span two or more ties, drilling the ties and holding the plates in place during shop assembly and inspection.
- G. Configuration and method of fabrication for switches.
- H. Check list or measurement report for all switches and frogs approved by the Authority Representative. This shall show the design size and allowable tolerance required by AREMA, or as shown and specified in these contract documents, as well as the actual size.
- I. Detailed description of the procedure for bonded insert and bonded joint installation approved by the Authority Representative.
- J. Method of packaging and loading each unit approved by the Authority Representative.

1.08 PREASSEMBLY

- A. Completely assemble, prior to shipment, the turnouts in the Design-Builder's fabrication shop for inspection by the Design-Builder's Quality Control (QC) Staff.
- B. Fully bolt and assemble rail joints for all turnouts. For inspection, use temporary joint bars with "C" clamps for shop assembly. Install 3/8 inch end post shim where insulated joint bars are indicated. Do not apply adhesive during this process.
- C. No bracing, wedging, or support blocking will be permitted to hold components to proper gauge and alignment.
- D. Variations from the Authority reviewed shop drawings or other contract documents will constitute noncompliance and will not be accepted for shipment unless or until proper modification are made and reviewed by the Authority.
- E. Make available to the Authority, without charge, the facilities and assistance to examine the work during its progress, and when the product is finished, to satisfy the Authority that the finished product will comply with the contract documents. Provide templates and one yard straight edge or longer, as necessary, to check flangeways, rail end drilling, switch rail planing, and other features of the Work usually checked by templates.
- F. Present material for inspection in a safe area away from excessive noise and manufacturing activities. Provide labor to facilitate inspection of the top, side and bottom of frogs and switches.
- G. With minimal bar pressure acting on the switch rail at rod number 1, 25% or more of the switch point contact length, starting from the tip of the point, shall make positive, firm contact with the ball of the stock rail.
- H. With no pressure acting on the switch rail, the maximum allowable spring back between the switch point and the ball of the stock rail shall be 3/16 inch, measure six inches back from the tip of the point.

- I. For inspection and review, match mark rails in appropriate colors, and sequentially number fasteners or switch ties, in accordance with the Authority reviewed System. Submit the match marking and numbering system on the Contracting Drawings for the Design-Builder's QC Staff before match marking and numbering commences.

PART 2 - PRODUCTS

2.01 GENERAL REQUIREMENTS

- A. Special trackwork materials, including oval-neck track bolts of one-inch nominal diameter, nuts and spring washers, and special trackwork assemblies shall be in accordance with AREMA except as modified on the drawings and specifications.
- B. Rail, switches, frogs and other track material shall be in accordance with AREMA dimensional requirements for 115 RE rail section except as modified on the drawings and specifications. Guard rails and restraining rail shall be in accordance with AREMA dimensional requirements for 132 RE rail section except as modified on the drawings and specifications.
- C. Special trackwork rail shall be high-strength rail (fully heat treated or head hardened) per AREMA requirements and shall meet AREMA sectional tolerances for trackwork rail.
- D. Heel ends of switch rails, and ends of stock, closure and connecting rails shall be beveled in accordance with AREMA requirements.
- E. Cut all rail ends in accordance with AREMA requirements except that tolerance to be taken up in the rail base.
- F. Drill rail ends to receive 36-inch, six-hole joint bars in accordance with AREMA and as shown. Standard joints shall be drilled to allow butting of rail ends. Insulated joints shall be drilled to allow for a 3/8-inch end post. Drill holes in accordance with joint manufacturers instructions, plus or minus 1/32-inch.
- G. All rail shall be in accordance with Section 05656, Running Rail.
 1. Guard and restraining rails: 132 RE section.
 2. All other rail: 115 RE section.
- H. Drill and ream holes with edges beveled.
- I. All joints required for installation shall be new material.
- J. Supply all ties in accordance with Section 06130, Timber Ties.

2.02 STOCK RAILS, CLOSURE RAILS AND CONNECTING RAILS

- A. Length: As shown plus or minus 1/8-inch.
- B. All ends drilled except ends to be connected to CWR which shall be drilled in the field.

2.03 FROGS

- A. Railbound manganese steel construction as shown
- B. Frog casting

1. Depress heel of manganese frog casting in accordance with AREMA Plan 617-89.
2. Depth-harden impact areas of manganese frog castings.

C. Frog inserts

1. Cast inserts of carbon steel in accordance with AREMA Specification M3.
2. Provide inserts of one-piece construction.
3. Provide inserts having full-face contact conforming to configuration of 115 RE rail.
4. Provide available bonding area per inch of length equivalent to that available for bonded standard joints where applicable. Adjust dimensions of bonded inserts to allow for glue and fabric.
5. Ensure the inserts are smooth and straight and do not exceed the following permissible variations:
 - a. Width between rail webs: Plus or minus 1/32-inch of that shown.
 - b. Depth of flangeway groove: Plus or minus 1/16-inch of that shown.
 - c. Length of insert: Plus or minus 1/8-inch of that shown.
 - d. Straightness of all portions of inserts adjacent to rail using 36-inch straightedge: Plus or minus 1/32-inch.
 - e. Finishing height variance of inserts from that required for bonding area: Plus or minus 1/64-inch.

D. Assembly: Prior to delivery, assemble frogs as shown.

1. Bonding adhesive: As manufactured for bonded joint bars by Allegheny Drop Forge Company, Portec, Inc. or equal, applied as directed by the manufacturer to all contact surfaces between inserts and rail.
2. Secure frog, except for insert, with 1-3/8 inch diameter high strength bolts in accordance with AREMA requirements.
3. Assemble inserts with 1-1/8 inch diameter high-strength bolts, ASTM A490, and lock nuts. Position bolt holes in accordance with AREMA Plans 621-89 and 1010-89 and as shown. Bolt holes 1-3/8 inches in diameter plus or minus 1/32- inch.
4. Flat washers: ASTM F436.
5. Equip bolts as shown with one beveled or flat headlock washer and one flat or beveled washer to provide square bearing and to permit tightening of nuts by wrench.
6. Lock nuts: IFI-100 and IFI-101, ASTM A563, Grade C.
7. Tension bolts to between 75 percent and 85 percent of proof load. Exact value as directed by the Authority Representative. Ascertain bolt tension by means of torque wrench. Determine desired torque by test similar to that described in IFI-101.

2.04 FROG GUARD RAILS

A. Length:

1. No. 6 Guarded Turnout - 12' - 6"
2. No. 8 Turnout - 14' - 0"

B. Complete with blocks and bolts as shown.

2.05 SWITCHES

A. Switch Rails: As shown.

1. Switch rails and stock rails: In accordance with Section 05656, Running Rail, and AREMA Plan 221-62, Detail 5100.
 - a. Switch rails may be thick web or constructed with reinforcing bars.
 - b. Stock rail lengths: as shown or as required for switch panel..
2. Bolts, rivets, fittings and spring washers in accordance with Appendix A of the AREMA, Portfolio.

- a. Fabricate five bolt heel joint assembly in accordance with AREMA Plan 221-62 and AREMA Manual.
 - b. Fabricate forged steel rail stops in accordance with AREMA requirements.
- B. Drill stock rails for ballasted special trackwork as shown for switch heaters.

2.06 SWITCH RODS

- A. Switch rods and clips of vertical design, Type MJS, modified as shown.
- 1. Insulated construction.
 - 2. Assembled.
 - 3. Test in accordance with AAR requirements.
 - 4. Length: As shown.
- B. Switch rods must be capable of at least one (1) inch plus/minus adjustment after the initial specified 5 inch throw for No. 8 turnouts and 3-3/4 inch throw for the No. 6 guarded turnout has been set.
- C. Design-Builder's shop drawings shall provide the required spread measurement for each switch rod which are needed to support the specified throw.

2.07 RAIL BRACES

- A. Boltless adjustable brace equal to those formerly manufactured by Bethlehem Steel, modified to permit installation of one inch diameter electric switch heaters on rail web of ballasted turnouts. The hole in the rail brace shall provide 3/26 inch clearance to the one inch diameter heater tube, and shall be of sufficient size to allow the disconnect terminal and anti-creep collar to pass through.
- B. Shop weld rail brace backing blocks to switch plates.
- C. Rail brace backing blocks to permit mounting on 3/4-inch thick flat plates. Allow for modification to fit 1/4-inch recessed gauge plates. Ensure that distance from rail base to horizontal bearing surface of backing block is the same in each case to permit use of standardized wedge.
- D. Clearance between backing block and rail base: Determined by design of selected brace.
- E. Brace shall use left-hand Pandrol spring clips e2056.

2.08 PLATES

- A. Furnish special trackwork units with special plates as shown, fabricated of 3/4-inch thick steel except for the gauge plates and restraining rail plates fabricated of 1 inch thick steel. Steel plates shall be fabricated from ASTM A36 steel in accordance with AREMA requirements.
- B. Plates complete with specified rail base backing blocks, riser plates, rail stops and rail clamp blocks welded thereon.
- C. Riser plates and rail stops fabricated of ASTM A36 steel as shown and as specified.
- D. Punch holes in each plate perpendicular to face. Cut clean without torn or ragged edges.

- E. Straighten plates cold in press or roller until surface and line requirements are met. The following tolerances are not cumulative.
 - 1. Plate thickness: Plus or minus 1/32-inch.
 - 2. Middle ordinate: Place plate on horizontal support. Place straightedge or wire string from one end of plate to the other on the concave side. Measure distance between plate surface and straightedge or stringline. Distance not to exceed 0.001 inch per inch of length with surface upsweep or downsweep uniform.
 - 3. Plate thickness of dual rail stops, single rail stops and riser plates: Plus or minus 1/32-inch.
 - 4. Straightness of edge of dual rail stops, single rail stops and riser plates parallel and adjacent to base of running rail: Plus or minus 1/32-inch.
 - 5. Transverse dimension of dual rail stops: Plus or minus 1/32-inch.
 - 6. Tolerances other than those specified: Plus or minus 1/8-inch.
 - 7. Spike hole locations for ballasted special trackwork: Plus or minus 1/8-inch.
- F. Identification of plates:
 - 1. Stamp with suitably sized characters not less than 1/2-inch in height, located on top surface and plainly visible when assembled.
 - 2. Include Contract Number and identification designation as shown.
- G. Fillet weld rail braces, rail stops, riser plates and rail clamps to their respective plates as shown in accordance with AWS D1.1.
- H. In special trackwork fabricated for ballasted trackwork, seven and three-quarter inch wide elastic fastener tie plates suitable for e2056 Pandrol spring clips shall be used at all support locations not having special frog, switch, gauge, guard or restraining rail plates.

2.09 GAUGE PLATES

- A. Switch gauge plates as shown and as specified for plates.
- B. Insulation shall be a four hole 7-1/2" x 8" x 3/4" epoxy fiberglass splice block fastened to the plate with Huck type compression fasteners. The insulating material shall have a tensile strength of 70 ksi, compressive strength of 100 ksi and a tensile modulus of 3.4×10^6 .

2.10 TURNOUT GUARD RAIL

- A. Length: As shown.
- B. Complete with blocks and bolts as shown.
- C. Type: 132 RE rail.
- D. Planned in accordance with AREMA Plan No. 504-89.

2.11 RAIL JOINTS

- A. Furnish all standard and insulated joints within the turnout

2.12 GUARDED TURNOUTS

- A. Guard Rail Stop:
 - 1. Ductile Iron: ASTM A536, Grade 65-45-12 to fit 115 RE rail and as supplied for NYCTA guarded turnouts.

- a. Ballasted Turnouts:
 - 1) Ductile iron rail stops shall be attached to the tie and plate; three studs with nuts and washers per rail stop. Cast rail stops and house chairs shall be fastened through the ties with 7/8 " diameter double end threaded studs, flat washers and heavy hex nuts. The nuts and washers shall be fastened to the stud on the underside of the tie and on top of the casting similar to NYCTA guarded turnouts.
 - 2. The rail stop shall be backed with a 6" x 2" x 1/2" steel block welded to the rail plate.
- B. Manganese Housing Assembly:
 - 1. Cast manganese steel: AREMA Manual.
 - 2. Housing: Similar to that manufactured for the NYCTA.
 - a. Ballasted track - 5' - 5" long.
 - 3. Housing Chairs: Ductile Iron ASTM A536 Grade 65-45-12, as manufactured for NYCTA.
 - a. Ballasted housing chairs shall be fastened to ties, steel plates and gauge plates similar to ductile iron rail stops.
 - b. The first housing chair number shall be configured for bolting to a 132 RE guard rail which continues ahead of the point of switch as shown.
 - 4. No part of the housing shall extend more than 1-1/2 inches above the top of rail.

2.13 Rail Precurving

- A. All rail before precurving shall be straight.
- B. Perform precurving of rail to conventional railroad industry frog and switch shop procedures in accordance with the track centerline radii shown on the Design Drawings and approved Shop Drawings.
- C. Precurved running rail shall be produced in a manner that final track construction tolerances can be achieved.
- D. The rail shall be uniformly curved such that the deviation of the mid-ordinate offset from the theoretical offset is within the tolerances for straight rail using the appropriate chord distances required in the AREMA Manual Chapter 4, Part 2, Section 2.1.13, Workmanship.
- E. Rail ends shall be cropped as necessary to meet the AREMA tolerances.
- F. After curving, the precurved rail shall be set for inspection on the type of plates (tie, restraining rail or switch plates) and at the plate spacing for which the rail was designed. The bottom of the plates shall be in one plane with no shimming. With no rail fasteners applied, the base of the precurved rail shall lay flat on the plates. Rail fasteners shall not be used to draw the base down flat on the plate nor the plate up flat against the plate.
- G. Identify precurved rail with painted identity numbering per approved shop drawing code at end of each rail. Paint identity number at the top of the base near the web.

2.14 Restraining Rail

- A. Restraining rail shall be fabricated in 40 foot maximum and 20 foot minimum sticks of new high strength 132 RE rail manufactured to trackwork rail section tolerances.
- B. The toe of the restraining rail shall be cut off as shown.

- C. Restraining rail shall be precurved to match each curve as shown on the drawings where centerline radius is less than 350 feet.
- D. Precurved restraining rail shall be marked in accordance with these specifications indicating matching radius of curvature and curve number.
- E. Restraining rail joints shall be furnished complete with 12 inch long filler block and reinforcing bars, 1/2 inch thick per AREMA Plan 325-58 for 115 RE rail and for 132 RE.
- F. One reinforcing bar shall be sized to lock the square bolt heads.
- G. Head locks, spring washers, and nuts shall be included. Washers and headlocks shall bear fully against the rail web and provide a flat bearing surface for the nut and the bolt head.
- H. Headlocks shall be sized to lock the square bolt head.
- I. Washers and headlocks shall be in accordance with AREMA Specifications.
- J. Restraining rail joint, end block and separator block assemblies shall be furnished with filler blocks, shims, appropriate reinforcing bars or washers and headlocks wired together to prevent loss of parts.
- K. Restraining rail tie plates for wood ties shall be fabricated as shown.

PART 3 -EXECUTION

3.01 INSTALLATION

- A. Ballasted Special Trackwork Fabrication
 - 1. Fabrication of special trackwork for ballasted track shall be as specified and shall comply with the applicable related Sections:
 - a. General Track Construction (GTC), Section 05651.
 - b. Ballasted Track Construction (BTC), Section 05652.
 - c. Special Trackwork Construction - Ballasted, Section 05654.
 - d. Track Appurtenances and Other Track Material, Section 05658
 - e. Timber Ties, Section 06130
 - 2. Tolerances
 - a. The gauge, cross level, and horizontal and vertical alignment of ballasted special trackwork shall be as shown and specified. Tolerances shall be as specified for ballasted track construction for BTC. Switch points in normal position shall be square within 5/8 inch
 - b. Prebored holes in ties for screw spikes shall be 3/4 inch diameter and not less than five inches nor more than six inches deep.
 - c. Tolerance of plus or minus 1/16 inch shall be maintained for the distance between screw spike holes.
 - d. Tolerance of plus or minus 1/8 inch shall be maintained in the centering of screw spike holes across the width of the tie.
 - 3. Ties shall be bored for screw spikes, and only screw spikes will be permitted in special trackwork.
 - 4. The number and locations of holes shall conform to the location and number of screw spikes shown for each special plate.
 - 5. Elastic fastener tie plates shall have four screw spikes, one at each corner.
 - 6. Boring of holes in excess of those required will not be permitted.

7. Boring in timber ties shall be performed with the heartwood face down. Holes bored in timber ties shall be treated with pentachlorophenol oil immediately after boring.
8. Holes shall be located so that each tie plate will be centered on the tie at a right angle to the rail.
9. Prior to installing tie plates, the surface of the tie shall be swept clean to allow full bearing of the plate on the tie.
10. Boring and spiking will ensure that the outside shoulder of the plates will have full bearing against the rail base when the rails are at proper line and gauge.
11. Spikes shall be started vertically and square, and shall be installed straight. Straightening of spikes will not be permitted. Spikes bent during installation shall be withdrawn and the holes plugged (with treated tie plugs if wood, as per manufacturers instruction if composite). Screw spikes shall be installed firmly to the top surface of the plates.
12. All special plates, not in the switch panel, which span two or more ties shall not be spiked during shop assembly to preclude un-spiking for disassembly and packaging. The Design-Builder's method for locating these plates, drilling the ties and holding the plates in place during shop assembly and inspection shall be approved by the Authority Representative.

B. Identification Numbers:

1. As shown on the drawing, each turnout has an identification number. This number shall be stamped on a metal tag and the tag affixed to each panel and separate component bundle.
2. Tags shall be made of corrosive-resistant metal such as anodized aluminum or brass. Fastening nails shall be of the same material as the tags. Numbers shall be stamped in characters 1/2 inch minimum in height. Tags shall be a minimum of .050 inches thick, 1-1/4 inches wide and two inches long.

C. Package and label parts and replacement materials in moisture-proof containers suitable for shipment and storage.

D. Attach copies of shipping list in the package and so that the list is readable from the exterior of the package.

PART 4 - MEASUREMENT AND PAYMENT

4.01 MEASUREMENT:

No separate measurement of work specified in this Section will be made.

4.02 PAYMENT

Compensation for work specified in this Section will be included in the price of the work of which it is a part.

END OF SECTION

SECTION 05660

RESTRAINING RAIL AND LUBRICATORS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Furnish, fabrication and installation a restraining rail system.
- B. Furnish and install the lubricators to include concrete pads, lubrication distribution system, track connections and testing.
- C. Furnish and install all required electrical work for the lubrication system.

1.02 RELATED SECTIONS

- A. Section 05651- General Track Construction
- B. Section 05652 - Ballasted Track Construction
- C. Section 05656 - Rail
- D. Section 05658 - Track Appurtenances and Other Track Material (OTM)
- E. Division 16 - Contact Rail Sections

1.03 REFERENCES

- A. Pertinent provisions of the following listed standards and publications shall apply to the Work, except as they may be modified herein, and are hereby made part of these Specifications to the extent required.
 - 1. American Railway Engineering and Maintenance-of-Way Association (AREMA), Manual for Railway Engineering, herein referred to as the AREMA Manual.
 - 2. American Railway Engineering and Maintenance-of-Way Association (AREMA), Portfolio of Trackwork Plans, herein referred to as the AREMA Portfolio.
 - 3. American Society for Testing and Materials (ASTM):
 - 4. National Electric Code (NEC) and regulations of the jurisdictional authorities.
 - 5. Insulated Cable Engineers Association (ICEA)
 - 6. National Electrical Manufacturers Association (NEMA)
 - 7. Institute of Electrical and Electronics Engineers (IEEE)
 - 8. Underwriters Laboratories (UL)
 - 9. Military Specifications (MIL or MILSPEC)

1.04 SUBMITTALS

- A. Submittals shall be as specified in Section 01330, Submittals.
- B. Submit the following to the Authority Representative for approval.

1. Shop drawings for restraining rail components including but not limited to separator blocks, end blocks, shims, bolts, washers, nuts, etc.
 2. The marking scheme for restraining rail identification for installation.
- C. Lubricator Electrical Work:
1. Submit shop drawings and manufacturer's literature.
 2. Submit descriptions and wiring diagrams of equipment.
 3. Submit field test procedures for cable.
 4. Submit flame retardance and smoke density test reports and data for tests performed not more than 12 months prior to submittal, for cables which are identical to the cable furnished.
 5. Provide certified test reports demonstrating that the cable complies in all respects with the requirements of the referenced Standards and Tests, and as modified herein.
 6. Provide certificate of conformance to specified wire requirements. Include certificate with submittal of shop drawings and with each cable shipment.

1.05 QUALITY CONTROL

- A. Quality Assurance/Quality Control shall be in accordance with the Design-Builder's Construction Quality Management Plan.
- B. Develop and maintain a quality control program regulating methods, procedures, and process to ensure compliance with standards of quality required by the Contract Documents.

1.06 DELIVERY, HANDLING AND STORAGE

- A. Restraining rail shall be stacked and banded for shipment according to normal practice. Brackets shall be palletized.
- B. Package small loose parts, i.e. bolts, washers and nuts in secure shipping boxes and kegs.
- C. Lift restraining rail at two points, with the rail weight evenly distributed to each lift point. Handle carefully to avoid damage.
- D. Load restraining rail with adequate wood strips between the tiers of rail to prevent damage in transit.

PART 2 - PRODUCTS

2.01 RESTRAINING RAIL SYSTEM

- A. Rail: 132 RE in accordance with Section 05656 RAIL
- B. Separator Block: Cast Ductile Iron
- C. Shims: ASTM A36

- D. Bolts: 1-3/8" diameter, square head, Type 3, ASTM A325
- E. Nut: Hexagonal, Grade C3, ASTM A563
- F. Steel Base Plate and Stop Block: ASTM A36
- G. Spring Washer: AREMA Manual, Section 4
- H. Flat Washer: Hardened weathering ASTM F436 steel
- I. Screw Spike: As specified in Section 05658, Track Appurtenances and OTM
- J. Pandrol Shoulders: As manufactured by Pandrol, Inc. or approved equal
- K. Joints: As shown; and as specified in Section 05658, Track Appurtenances and OTM
- L. Rail Brace: Boltless adjustable brace similar to those formerly manufactured by Bethlehem Steel for use with left-hand Pandrol Spring Clips, e2056

2.02 LUBRICATORS

- A. Portec AC Protector IV - 800 electric wayside lubricator including all hoses, clamps, fittings and lubricant distribution system. (No substitute or "or Equal" lubricator will be approved).
 - 1. The lubricator housing shall have two mounting brackets on each side to provide for anchoring with 1/2" expansion anchors into a concrete base pad.
 - 2. No electrically conductive materials that are a part of the lubricator system shall be installed closer than two feet to any running rail. Non-conducting grease fittings shall be installed on all grease hoses.
- B. Concrete: ASTM C94, 3500 psi with entrained air.
- C. Steel Rebar: ASTM 615, Grade 60.
- D. Cast Iron: ASTM A532.
- E. Ductile Iron: ASTM A536
- F. Malleable Iron: ASTM A47.
- G. Stainless Steel 304: ASTM A240, A276.

2.03 LUBRICATOR ELECTRICAL WORK

- A. Liquid-tight Flexible Conduit and Fittings: Applicable requirements of UL 360, flexible galvanized steel core, extruded liquid-tight neoprene or PVC jacket overall.
 - 1. Sizes up to 1-1/4 inch provided with continuous copper bonding conductor, spiral wound between convolutions.
 - 2. Sizes 1-1/2 inch and above provided with separate grounding conductor.
- B. Conduit Connector Fittings:
 - 1. UL 514B, material and finish similar to that of conduit with which they are to be used.
 - 2. For enclosures, cabinets, boxes and gutters in electrical rooms: Threaded nylon

insulated bushing and locknut.

C. Cable:

1. UL-labeled as Type RHW-2 or XHHW-2, 600 volts; copper, size as shown; 10AWG and smaller, solid or stranded; 8AWG and larger, Class B stranded.
2. Standards: Except as modified, cable complying in all respects with ICEA S-68-516, NEMA WC8 or ICE S-66-524, NEMA WC7, as appropriate.
3. Nonmetallic Jacket: Chlorosulfonated polyethylene, cross-linked polyolefin or heavy-duty neoprene, as follows:
 - a. Chlorosulfonated polyethylene complying with ICEA S-68-518, NEMA WC8.
 - b. Cross-linked polyolefin or heavy-duty neoprene with the following requirements when tested in accordance with Part 6 of ICEA S-68-516.
 - 1) Tensile strength: 1800 psi minimum.
 - 2) Elongation at rupture: 150 percent minimum.
 - 3) After air oven aging of 168 hours at 100 deg. C, tensile strength at least 100 percent of unaged value and elongation at least 80 percent of unaged value.
 - 4) After immersion for 18 hours in ASTM D471 Oil No. 2 at 121 deg. C, tensile strength and elongation at least 80 percent of original values.
 - c. Jacket material free of PVC and PVC-based compounds.
4. Flame Retardancy: Cable passing vertical flame test as described in IEEE 383. Cable size for testing: Smaller than #1/0. Comply with UL and ICEA S-68-516.
5. Smoke Generation: Single and multi-conductor cable jacket materials demonstrating low-smoke generation when tested in accordance with ASTM E662.
6. Applied Voltage Testing:
 - a. All cable to be given applied voltage dielectric strength test, after six-hour water-immersion test in accordance with the following test procedures:
 - 1) Polyethylene insulated conductors: In accordance with the paragraphs 6.14.1, 6.14.2, 6.14.5 and 3.5.2 of ICEA S-66-524.
 - 2) Other conductors: In accordance with paragraphs 3.5.2, 6.27.1, and 6.27.2 of ICEA S-68-516.

D. Connectors and Terminal Lugs: UL 486 with the following additional requirements:

1. For 10 AWG and smaller conductor cable: Pressure type tin-plated copper connectors having nonflammable and self-extinguishing insulation grip with temperature rating equal to that of the conductor insulation.
2. For 8 AWG to 4/0 AWG conductor cable: Compression type tin-plated copper connectors and terminal lugs having nylon insulating sleeve or heat shrinkable insulator for insulation grip.
3. Hardware: High strength silicon, bronze, corrosion resistant, non-magnetic, and electrolytic action free when in contact with copper.

E. Bundling Straps: Self-locking steel barb on one end, with tapered strap of self-extinguishing nylon, temperature rating minus 65 deg. F to plus 250 deg. F.

F. Insulating Tape:

1. Plastic tape: Vinyl plastic with rubber-based pressure-sensitive adhesive, pliable at zero degree F with the following minimum properties when tested in accordance with ASTM D1000
 - a. Thickness: 8.5 mils.
 - b. Breaking strength: 20 pounds per inch width.
 - c. Elongation: 200 percent.

- d. Dielectric breakdown: 10,000volts.
 - e. Insulation resistance, indirect method of electrolytic corrosion: 1,000,000 megohms.

- G. Grounding and Bonding Equipment: UL 467, IEEE 80, with the following additional requirements:
 - 1. Grounding conductor: Insulated conductor, size as shown and in accordance with NEC Tables 250-94 and 250-95 as applicable. Insulated conductor complying with the requirements specified for single conductor cable.
 - 2. Terminal lugs:
 - a. For 4/0 AWG and smaller conductors: Copper compression terminal lugs.
 - 3. Ground connector:
 - a. Type as shown or equal.
 - b. Copper alloy body and silicon bronze bolt, nut and lock washer with interlocking clamp.
 - 4. Jumpers: Copper braided or leaf-type flexible jumper, size as necessary.

- H. Sealing compound:
 - 1. FS TT-S-227, two component, fast-setting, polymeric sealing compound to provide watertight seal between concrete and conduit, between cable and conduit.
 - 2. Pour-type for horizontal and gun-grade for vertical or overhead application.
 - 3. When cured, sealant to have rubber-like flexibility allowing minimum movement of conduit and cable in temperature range of minus 40 deg. F to plus 150 deg. F without loss of watertight seal.
 - 4. Pot life: 15 minutes.
 - 5. Minimum ambient temperature for application: 35 deg.F.
 - 6. Initial cure: 15 minutes.
 - 7. Final cure: Seven days.
 - 8. Hardness, Durometer A: 20-35.
 - 9. Seal between conduit and single-conductor cable to withstand water pressure of 70 psi without leakage.
 - 10. Fox Industries, Type FX-571-G or equal.

- I. GFI Circuit Breaker:
 - 1. NEMA AB1.
 - 2. Ground fault interrupter circuit breaker: As shown (see Information Drawing TW-19-RR) and as specified. Overcurrent trip device coordinated to provide selective tripping under overload conditions.

- J. Expansion Bolt Anchors: Stainless Steel 304 in accordance with ASTM A276.

- K. Grounding stud: Manganese bronze, ASTM B138, Alloy No. 675 hard, 3/8 inch high; Evedur GSI, American Brass Company or Equal.

- L. Cable splice and tap-insulating/sealing kit: Suitable for use on 600-volt, 90C cables, material compatible with cable insulation and jacket, meeting the seal test requirements of ANSI C119.1.
 - 1. Heat-shrinkable tubing UL-approved, flame-retardant, corrosion-resistant thick-wall tubing with factory-applied sealant for field insulation on in-line splices and taps to provide a watertight seal and insulating encapsulation, with the following additional requirements:
 - a. Material: Cross-linked polyolefin.

- b. Shrink ratio: 3 to 1 (min.)
- c. Physical properties:
 - 1) Ultimate tensile strength: 2,350 psi, ASTM D41
 - 2) Ultimate elongation: 350% minimum, ASTM D412
 - 3) Hardness, Shore D: 42, ASTM D2240.
 - 4) Water absorption: 0.02%, ASTM D570, Method 6.1.
 - 5) Specific gravity: 1.2, ASTM D792.
- d. Electrical properties:
 - 1) Dielectric strength: 450 volts per mil, ASTM D149.
 - 2) Volume resistivity: 1×10^{15} ohm cm, ASTM D257.
- e. Thermal properties:
 - 1) Continuous operating temp.: -55 to +135 deg. C.
 - 2) Air oven aging (14 days @ 175 deg. C):
 - a) Tensile strength: 2,680 psi.
 - b) Elongation: 375%.
 - 3) Low temperature flexibility (4 hours @ -55 deg. C): No cracking when flexed.
 - 4) Heat shock (4 hours @ 250 deg. C): No cracking, flowing or dripping.
- f. Chemical properties:
- g. Corrosivity: Non-corrosive, MIL-I-23053/15.
- h. Fungus resistance: Non-nutrient, ASTM G21.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Restraining Rail System
 - 1. Shop weld rail brace stop block and Pandrol shoulders to restraining rail plate.
 - 2. Install restraining rail system where shown. Install one restraining rail plate and brace on each tie between the end limits of the restraining rail.
 - 3. Fasten plate to the ties in accordance with the requirements of Section 05653, Ballasted Track Construction using four screw spikes.
 - 4. Drill the running rail and restraining rail for the spacer blocks and joints when both rails are at the same temperature between 70 and 85 F. The prescribed drilling may be made when the running rail is fully anchored providing the running rail has been thermally adjusted as specified.
 - 5. Holes shall be cylindrical, of the diameter shown and drilled with an approved rail drill.
 - 6. Use an approved template as a guide for drilling holes.
 - 7. All holes drilled in the 115 RE running rail and 132 RE restraining rail for spacer blocks or joints shall be cold worked using the Railroad Cold Expansion process by Fatigue Technology, Inc., Seattle, Washington, or approved equal. The process shall be performed in accordance with the manufacturer's instructions by a crew whose supervisor has been trained by the manufacturer.
 - 8. Cut rail only as necessary to meet the following criteria:
 - a. The rail length between an insulated joint and a standard joint shall be 20 feet.
 - b. The minimum length between two standard joints is 20 feet and the maximum length is 40 feet.
 - c. The minimum rail length adjacent to an end section shall be 15 feet.
 - d. The number of 40foot rail lengths shall be maximized.
 - 9. Rails shall be cut square and clean by means of rail saw or abrasive cutting disks. Rail end beveling shall be performed at all rail cuts and shall be in accordance with

- current AREMA Manual requirements for Beveling or Slotting of Rail Ends and AREMA Portfolio Plan No. 1005.
10. Locate restraining rail insulated joints between the same fastener plates as the insulated joints in the adjacent running rail. Join rail as shown.
 11. Assemble all non-insulated joints as shown.
 12. Install bolts and nuts finger tight before tensioning bolts to 20,000 to 25,000 pounds by use of a track wrench or power torque wrench, starting from the center bolts and working to the end bolts. Immediately before the completion and acceptance of work, retighten track bolts to a tension of 15,000 to 25,000 pounds.
 13. Insulated joints shall be assembled with all components shown without rail gaps.
 14. Install the restraining rail so that the flangeway is 1-7/8 inches plus or minus 1/8 inch measured 5/8 inch below the top of the running rail. Tighten the restraining rail hold down bolts to 75 percent of the proof load for the size of the bolt used.

B. Lubricators

1. Install lubricator in accordance with the manufacturer's recommendations where shown and as specified herein.
2. Mount lubricator to the concrete using expansion anchors and 1/2 " diameter bolts.
3. Install track assemblies and grease distribution system to the inbound track and outbound track in accordance with the manufacturer's recommendations.
4. The train detection system that initiates the release of lubricant shall be configured to release to the appropriate restraining rail when the train is moving in the normal direction.
5. Install grease hoses in accordance with the manufacturer's recommendations. Anchor hoses to ties with appropriate clips at a minimum spacing of 10 feet.
6. Perform electrical work as specified in the technical specification for electrical work.
7. At the completion of installation, the Lubricator Reservoir shall be filled with an appropriate lubricant approved by the Authority Representative.
8. Test lubricator system for proper application of lubricant as specified by the manufacturer and approved by the Authority Representative.

C. Lubricator Electrical Work:

1. The Design-Builder shall carefully examine all contract drawings and specifications and be responsible for the proper fitting of materials and equipment at each location as indicated, without substantial alteration. In as much as the drawings are generally diagrammatic and because of the small scale of the drawings, it is not possible to indicate all offsets, fittings and accessories which may be required. Furnishing such fittings and accessories as may be required to meet such conditions shall be at no additional cost to the Authority.
2. The Design-Builder shall verify exact location , size and extent of all existing utilities, obstructions, and/or other conditions which may affect the proposed work under the project. The Design-Builder shall take every precaution to prevent damage to existing work and shall repair any damage as a result of this Work.
3. Conduit:
 - a. Install conduit and fittings where conduit runs are shown.
 - b. Install exposed conduit parallel or perpendicular to the running rails as shown and avoid interference with existing work.
 - c. Thread and ream the ends of field-cut conduit to remove rough edges. Use locknuts and bushings at conduit entrance to boxes, cabinets and equipment enclosures.
 - d. Bend conduit so that bends are free from cuts, dents and other damage.
 - e. Support horizontal conduit with one-hole pipe straps or individual pipe hangers.

- f. Apply lead -free conductive antiseize compound to threaded conduit joints.
 - g. Use minimum of 18-inch long liquid -tight flexible conduit connection to equipment subject to vibration.
 - h. Rod and swab conduit after installation, removing water and foreign matter.
 - i. Waterproof conduit connections.
4. Cable:
- a. Install cable as shown.
 - b. Use nylon straps to bundle and secure wire and cable in panelboards.
 - c. Use a minimum bending radius 12 times outer diameter of cable. Where shown, use shorter bending radius as permitted by NEC, Appendix H of ICEA S-66-524, NEMA WC7 and cable manufacturer.
 - d. To facilitate pulling cable, use UL-listed lubricant recommended by cable manufacturer.
 - e. Connect cables to equipment using integral mechanical connectors or compression connectors.
 - f. Identify feeder terminations to lubricators using nonmetallic fiberboard tags or plastic labels.
 - g. Attach tags to cable with slip-free plastic lacing or nylon bundling straps. Tags shall designate the panelboard name and circuit numbers serving lubricators.
 - h. Splicing of power cables is not permitted. An exception may be granted by the Authority Representative only in extraordinary conditions. Authorization for such an exception must be obtained from the Authority Representative in advance of making a splice. Any such exception must be fully documented and recorded on as-built drawings. The splice must be made watertight as shown.
5. Wire connection accessories:
- a. Secure connections or terminal lugs to the conductor to engage all strands equally.
 - b. Do not rupture insulation nor expose bare conductors.
 - c. Install compression connectors and terminal lugs using tools and pressure recommended by the manufacturer. Indent mark connectors and terminal lugs with number of die used for installation.
 - d. Apply anticorrosion joint compound to connectors, terminal lugs and bolting pads before installation.
6. Grounding and bonding:
- a. Ground Connections:
 - 1) Use terminal lug to connect grounding conductor to equipment enclosure.
 - 2) Use continuous grounding conductor without splices.
 - b. Equipment grounding conductor: Provide equipment grounding conductor for single-phase branch circuits.
 - c. Bond metallic ac equipment enclosures to equipment grounding conductor in ac power feeder.
7. Connect branch circuit wires as shown.
8. Make power cable connections to circuit breakers, new molded case circuit breakers and neutral and ground bus bars in panelboards and enclosed circuit breakers by means of integral mechanical connectors as shown. If such items are not furnished with integral mechanical connectors, make connections using compression connectors.
9. On cable splices, taps and terminations cover connectors with electrical putty , wrapped with three layers of plastic tape or final layer or rubber tape and then install

watertight encapsulation as follows and under the supervision of kit manufacturer's representative or using a factory-certified installation technician, proficient in field installation of heat-shrinkable sealing kits.

10. Use heat-shrinkable tubing for encapsulation of new splices, taps and terminations.
11. Field Quality Control:
 - a. After completion of installation and filling the reservoir with an approved lubricant, demonstrate proper performance of all equipment in the presence of the Authority Representative.
 - b. Test all metallic equipment enclosures, galvanized rigid steel conduits and liquid-tight flexible conduits for continuity to the grounding system.
 - c. Test nongrounded conductors for insulation resistance to ground of 10 megohms. When cable shows unsteady insulation resistance of less than 10,000 ohms, perform high potential test at 80 percent of factory ac test voltage or as recommended by cable manufacturer.
 - d. Test continuity of conductors using ohmmeter.
 - e. Test circuits for connection in accordance with the wiring diagram.
 - f. Check connections to circuit breakers for tightness.
 - g. Molded Case Circuit Breakers: Perform pole-to-pole and pole-to-ground insulation resistance tests with 1000 volt d.c. megger. Insulation resistance to be 50 megohms minimum.

PART 4 - MEASUREMENT AND PAYMENT

4.01 MEASUREMENT:

- A. Measurement of work specified in this Section will be made in the following manner:
 1. No separate measurement.

4.02 PAYMENT:

- A. Compensation for work specified in this Section will be made in the following manner:
 1. Included in the price of the work of which it is a part.

SECTION 05661

CONTACT RAIL AND APPURTENANCES FOR TRACTION POWER

PART 1: GENERAL

1.01 SUMMARY

- A. This section specifies designing, fabricating, testing and furnishing a composite contact rail system, including the composite contact rail, splice joints, expansion joints, end approaches, terminal lugs, and all appurtenances as shown and specified.
- B. Related Sections:
 - 1. Section 16127 - Contact Rail System Installation For Traction Power
- C. Payment and Measurement:

Compensation for work specified in this section will be made in the following manner:

 - 1. Work performed by the Contractor pursuant to fabricating and delivering contact rail, splice joints, expansion joints, end approaches, terminal lugs, nuts, bolts and miscellaneous hardware: Lump sum.

1.02 REFERENCES

- A. Codes, regulations, references standards and specifications:

1.03 SYSTEM DESCRIPTION

A. Composite Contact Rail

1. The composite contact rail shall consist of a steel base rail, with one aluminum extrusion fastened to each side of the web area of the base rail, continuous over the finished length.

B. Appurtenances

1. Appurtenances include expansion joints, end approaches, cast parts, terminal lugs, disconnect switch, nuts, bolts, and miscellaneous hardware.

1.04 SUBMITTALS

A. Shop Drawings

1. The Contractor shall submit for approval shop drawings for fabrication of the components and assemblies of the composite contact rail and appurtenances. No fabrication or manufacture shall be performed prior to drawing approval.

B. Certification:

1. Certification that composite contact rail and appurtenances furnished meet or exceed specified requirements
2. Certified test reports.

1.05 QUALITY ASSURANCE

A. Electrical Tests

1. Splice Joint DC Resistance
 - a. Two sections of the composite rail, each 36 inches or more in length, shall

be joined together. At a constant room temperature the resistance across the joint shall be measured in accordance with NEMA CCI and compared to an equal length of unjointed composite rail at the same temperature.

- b. If the resistance across the jointed rail exceeds the resistance of the unjointed rail the joint design will be rejected.

2. Composite Rail and Splice Joint Thermal Cycle

- a. Using the same jointed and unjointed sections used in the dc-resistance test, the specimens shall be cycled thermally for a minimum of ten cycles. Each thermal cycle shall consist of lowering the rail temperature to minus 5C and measuring the resistance of the specimens, then raising the temperature of the specimens to plus 117C and measuring the resistance again for a minimum of ten cycles.
- b. If at any time the resistance of the jointed or unjointed sections exceeds the requirements of these specifications, the design will be rejected.

3. Composite Rail and Splice Joint Assembly Salt-spray Test

- a. Using the same jointed and unjointed sections used in the dc resistance test, perform a 500-hour salt-spray test in accordance with the requirements of ASTM B117.
- b. If, at the end of the test, the resistance of either specimen increases by more than five percent, the design will be rejected.

4. Electrical Characteristics

- a. The assembled composite contact rail shall have an electrical resistance not greater than 0.002 ohms per 1,000 feet at 20 degrees C.
- b. The composite rail shall be capable of conducting 5,000 amperes dc continuous with a temperature rise not to exceed 40 degrees C above 30 degrees C ambient in still air.
- c. The rail shall be capable of withstanding a fault current of 135,000 amperes dc, or equivalent ac, for 100 milliseconds without mechanical or thermal damage.
- d. The Contractor shall submit certification of the electrical characteristics of the composite contact rail.

B. Testing of Terminal Lugs

- 1. Two assemblies from each lot of terminal lugs shall be tested. Failure of any assembly to pass the following tests will cause rejection of the entire lot.
- 2. A completed compression connection shall provide electrical resistance not

greater than an equivalent length of uncut cable when measured between the distal end of the cable and the connector tongue.

3. Bare conductors shall be used for performing tests.
4. Resistance measurement shall be taken before and after the tests specified below.
5. The test connections shall then be subjected to a sustained tension of 5,000 psi of the nominal conductor cross sectional area for a period of three hours. At the end of three hours, there shall be no increase in electrical resistance of the connection beyond that specified. There shall be no slipping of the conductor in the connector nor deformity or loosening of the connection.

C. For codes, regulation, references, standards and specifications, refer to Article 1.02 above.

PART 2: PRODUCTS

2.01 MATERIALS

A. Composite Contact Rail

1. Steel Base Rail

- a. The steel base rail shall be new No. 1 or No. 2 rail conforming to the current requirements of the AREA Manual for Railway Engineering for continuous cast rail. No. 2 rails will be accepted for not more than 15 percent, by weight, of the total base rail furnished.
- b. The standard length of the steel base rail shall be 39 feet at a temperature of 60F. Shorter lengths, varying in increments of one foot from 39 to 25 feet, will be accepted for a maximum of 11 percent, by weight.
- c. A maximum variation of plus-or-minus ½ inch of the stated length for each rail will be permitted.

2. Aluminum Extrusions

- a. The aluminum extrusions shall be of a uniform cross section and shall conform to the alloy and temper requirements of ANSI H35.1, Type A6101-T6 and shall also conform to the requirements of ASTM B317, Type B.
- b. The extrusions shall be formed to permit maximum clamping force with the steel base rail and the cable terminal lugs to create the maximum electrical contact area. In addition, they shall permit rail tongs to grasp the head of the steel base rail for lifting the composite rail without damage to the aluminum extrusions.
- c. Sufficient clearance at the base shall be provided to permit mounting of the contact rail protection cover assembly, clearing insulator ears and

other appurtenances. Sufficient clearance shall be provided at the rail head to mount the specified contact rail heater supplied in other contract.

3. Splice Joint

- a. The splice joint assembly shall consist of two aluminum alloy extrusions of the same material specified for composite rail aluminum extrusion, except that the internal contour of the splice joint extrusion shall conform to the external contour of the composite rail aluminum extrusion to ensure proper vertical and horizontal alignment of the composite rail sections.
- b. The splice joint assembly shall provide ample contact surface for the transfer of electrical current across the joint and the joint shall have a resistance no greater than that of an equal length of composite rail.
- c. The splice joint extrusions shall be predrilled as shown to accept four 7/8-inch diameter steel compression fasteners, as manufactured by the Huck Manufacturing Company, or equal.
- d. The assembled splice joint shall be capable of withstanding a 25,000-pound longitudinal tension force across the joint without exceeding the yield point of its components.

B. Appurtenances

1. Expansion Joints

- a. The expansion joint assembly shall consist of the following;
 - 1) Two bars of medium carbon steel, ASTM A27, Grade 65-35 or malleable iron, ASTM A47, Grade 32510.
 - 2) Two sections of steel base rail as shown.
 - 3) Aluminum extrusions.
 - 4) Accessories as shown.
- b. The aluminum extrusions shall be bolted to each base rail to allow the attachment of a splice joint assembly on each section.
- c. The internal contour of the expansion joint bars shall conform to the external contour of the modified steel base rail sections to ensure proper alignment horizontally and vertically and to create a smooth passage across the joint for the collector shoe. The assembled modified steel base rail sections shall be predrilled as shown.
- d. The expansion joint assembly shall be designed to accommodate 12 inches of movement for each 1,000 feet of composite contact rail.

2. End Approaches

- a. The end approaches shall consist of sections of steel base rail as specified, cut and welded to provide a smooth transition for the collector shoe onto the composite contact rail as shown.
- b. The end approaches shall be supplied in lengths of five-feet six-inches. The mating end of each end approach shall contain sufficient length of aluminum extrusion bolted to the web to allow the attachment of a splice joint assembly.
- c. The end approaches shall be predrilled as shown.

3. Cast Parts

- a. Cast parts for the composite rail assembly, including expansion joints, shall be manufactured as shown and as specified.
- b. Castings shall be free of cracks, flaws, blemishes, scale, or any other defect that would be detrimental to the service for which they are intended. The finish surface shall be smooth and shall fit all adjoining parts accurately. Grinding will be permitted to ensure the specified fit.
- c. Medium Steel Castings
 - 1) Steel for casting shall be medium steel made by the open-hearth, basic oxygen or electric-furnace process, ASTM A27, Grade 65-35.
 - 2) All castings shall be fully annealed by heating to a temperature above the transformation range and, after being held for a proper time at this temperature, cooled slowly and uniformly in the furnace.
 - 3) Steel castings shall be free from defects such as cracks, machining flaws, porosity or excessive shrinkage and shall be finished to a true and homogenous surface.
- d. Malleable-iron castings
 - 1) Parts cast from malleable iron shall conform to ASTM A47, Grade 32510.

4. Terminal Lugs

- a. Terminal lugs shall be compression-type lugs compatible with 1,000-KCMIL, 427-strand cable. Terminal lugs shall be 98 percent pure copper. The entire lug shall be hot-dip, tin-coated, 0.3 mils minimum thickness. Tongues shall not be less than two inches square by ½ inch thick and drilled for a 5/8-inch diameter fastener.

5. Disconnect Switch

- a. Outdoor, moisture-resistant, single-pole, single-throw, bolted pressure type/no-load-break, manually operated mechanism for operation on 750 volts dc.
- b. In accordance with ANSI C37.34.
- c. Continuous current rating: 1200 amperes dc minimum with temperature rise not exceeding 50C over 30C ambient.
- d. Dielectric withstand voltage from switch and mounting base across open contacts: 3000 volts dc minimum for one minute.
- e. Momentary fault current rating: 160,000 amperes dc with rate of rise of 10 amperes per micro-second.
- f. Terminals equipped with lugs for connection of two 1000 KCMIL, 427 strand, copper cables on each side.
- g. Designed to prevent opening or closing by gravity or vibration or of its own accord.
- h. Insulating operating-handle mechanism with mechanical latch to prevent accidental opening or closing and capable of being padlocked in open or closed position.
- i. Enclosure:
 - 1) NEMA Type 3R in accordance with ICS 6.
 - 2) Capable of withstanding 200-pounds force without damage to switch or enclosure.
 - 3) Minimum three-inch clearance to exposed terminals of switch in open and closed positions.
 - 4) Material: Fiberglass, 1/8-inch minimum thickness.
 - 5) Size: To fit within limits imposed by yard conditions and clearances.
 - 6) Cover: Designed to provide easy access to switch. Equipped with stainless steel piano hinge and hasp.
 - 7) Cable openings: Compatible with switch terminals; furnished with Type GRE sealing bushings suitable for 1000 KCMIL cable, O.Z. Gedney Manufacturing Co., Inc., or equal.
 - 8) Flanges and mounting hardware: Furnished as necessary to

mount enclosure on concrete base and to mount switch in enclosure. Three point latching hardware for cover.

6. Nuts, Bolts, and Miscellaneous Hardware
 - a. All nuts, bolts, and flat washers shall be manufactured in accordance with ASTM A325.
 - b. The dimensional data and type hardware for all nuts, bolts and miscellaneous parts shall be as shown on drawings. Steel bolts, nuts, and washers shall be galvanized as specified below.
 - c. Cotter pins shall conform to ASTM B134, and ANSI B18.8.1
7. Galvanizing
 - a. Bolts and miscellaneous hardware to be galvanized shall be coated in accordance with ASTM A153.
 - b. Parts to be galvanized shall be hot-dip galvanized after fabrication, in accordance with ASTM A123, unless otherwise specified.
 - c. Before galvanizing, the finished parts shall be pickled or sandblasted and the scale and adhering impurities thoroughly removed. The pickling shall be done in properly diluted sulfuric acid, after which the parts shall be thoroughly cleaned in cold, running water.
 - d. Sand-blasting shall meet or exceed Steel Structure Painting Council SSPC-SP-6, except that the maximum grit size shall be SAE No. G-18.
 - e. The parts shall then be immersed in a solution of either zinc chloride or hydrochloric acid. Immediately following thorough drying, the parts shall be dipped into the zinc bath before corrosion starts again.
8. Tolerances for Fits.

Tolerances for fits shall be in accordance with ANSI B4.1.

2.02 FABRICATION

- A. Composite Contact Rail
 1. Method of Assembly
 - a. Prior to final assembly of the aluminum extrusions to the steel base rail, the contact surfaces of the steel base rail shall be sandblasted to near white finish in accordance with Steel Structures Painting Council SSPC-SP-10.
 - b. After sandblasting, the surfaces of both the steel base rail and the

aluminum extrusions shall be cleaned of all oil, grease and other foreign matter.

- c. The aluminum extrusions shall be free of aluminum oxide at the time of application of the oxide-inhibiting paste.
- d. Following the cleaning process, all mating surfaces shall receive a liberal and evenly distributed coating of oxide-inhibiting paste, Dearborn Chemical Product NO-OX-1D or equal. Oxide-inhibiting paste shall also be applied to all interface surfaces of the fasteners.
- e. After application of the oxide-inhibiting paste, the aluminum extrusions shall be permanently attached to the steel base rail on maximum 19-inch centers with 5/8-inch diameter steel compression fasteners, as manufactured by the Huck Manufacturing Company or equal.
- f. The installed fastener shall provide a minimum 19,000-pound clamping force. The fastening system shall maintain the aluminum extrusions in stable, intimate electrical contact with the steel base rail under all conditions of thermal expansion and contraction from zero degree to 150F.
- g. The assembled composite rail sections shall be predrilled on each end to accept a splice joint assembly as shown. After assembly all excess oxide-inhibiting paste shall be removed from each rail.

PART 3: EXECUTION - Not Used

END OF SECTION

THIS PAGE NOT USED

SECTION 05810

EXPANSION JOINT COVER ASSEMBLIES

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing expansion joint cover assemblies.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Cast-In-Place Structural Concrete: Section 03300.
- B. Expansion Joint Systems: Section 05811.
- C. Flashing and Sheet Metal: Section 07600.
- D. Seals and Sealants: Section 07900.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements specified for each:
 - 1. Product data for each type of expansion joint cover assembly specified, including manufacturer's product specifications, installation instructions, details of construction relative to materials, dimensions of individual components, profiles, and finishes.
 - 2. Shop drawings showing fabrication and installation of expansion joint cover assembly including plans, elevations, sections, details of components, joints, splices, and attachments to other units of Work.
 - 3. Samples for initial selection purposes in the form of manufacturer's color charts, actual units, or sections of units showing full range of colors, textures, and patterns available for each exposed metal and elastomeric material of expansion joint cover assembly indicated.
 - 4. Samples for verification purposes in full-size units of each type of expansion joint cover assembly indicated; in sets for each finish, color, texture, and pattern specified, showing full range of variations expected in these characteristics.
 - a. Install elastomeric material for joints samples to verify color selected.

1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ADA: Americans with Disabilities Act.
 - 3. AAMA: 603.8, 605.2, 606.1, 607.1, 608.1
 - 4. ANSI/UL: 263.
 - 5. ASTM: A167, B209, B221, B455, C920, D2000, E119, E1399.
 - 6. NAAMM: Metal Finishes Manual.
 - 7. NFPA: 251.
 - 8. UBC: 43-1.
- B. Single-Source Responsibility: Where practical, obtain expansion joint cover assemblies specified in this Section from one source from a single manufacturer. Coordinate compatibility with expansion joint cover assemblies specified in other sections.
- C. Fire-Test-Response Characteristics: Where indicated, provide expansion joint cover assemblies identical to those assemblies whose fire resistance has been determined per ANSI/UL 263, NFPA 251, U.B.C. 43-1, or ASTM E119, including hose stream test of vertical wall assemblies, by a testing and inspecting agency acceptable to authorities having jurisdiction.
 - 1. Fire-Resistance Ratings: Not less than the rating of adjacent construction.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Aluminum: ASTM B221, alloy 6063-T5 for extrusions; ASTM B209, alloy 6061-T6, sheet and plate.
 - 1. Protect aluminum surfaces to be placed in contact with cementitious materials with a protective coating.
- B. Stainless Steel: ASTM A167, Type 304 with 2B finish, unless indicated otherwise, for plates, sheet, and strips.
- C. Extruded Preformed Seals: Single or multicellular elastomeric profiles as classified under ASTM D2000, designed with or without continuous, longitudinal, internal baffles. Formed to fit compatible frames, in color indicated or, if not indicated, as selected by the Engineer from manufacturer's standard colors.
- D. Preformed Sealant: Manufacturer's standard elastomeric sealant complying with ASTM C920, Use T, factory-formed and -bonded to metal frames or anchor members; in color indicated or, if not indicated, as selected by the Engineer from manufacturer's standard colors.
 - 1. Joints 2 Inches Wide and Less: Withstand plus or minus 35 percent movement of the joint width without failure.
 - 2. Joints Greater Than 2 Inches to 4 Inches Wide: Withstand plus or minus 50 percent movement of the joint width without failure.
- E. Seismic Seals: Typically for exterior application, two single-layered elastomeric profiles, one interior and one exterior, as classified under ASTM D2000; retained in a set of compatible frames, in color indicated or, if not indicated, as selected by the Engineer from manufacturer's standard colors. At manufacturer's option, omit interior profile for interior application.
- F. Fire Barriers: Designed for indicated or required dynamic structural movement without material degradation or fatigue when tested according to ASTM E1399. Tested in maximum joint width condition with a field splice as a component of an expansion joint cover per ANSI/UL 263, NFPA 251, U.B.C. 43-1, or ASTM E119, including hose stream test of vertical wall assemblies by a nationally recognized testing and inspecting agency acceptable to authorities having jurisdiction.
- G. Accessories: Manufacturer's standard anchors, fasteners, set screws, spacers, flexible moisture barrier and filler materials, drain tubes, lubricants, adhesive, and other accessories compatible with material in contact, as indicated or required for complete installations.

2.02 EXPANSION JOINT COVER ASSEMBLIES:

- A. General: Provide expansion joint cover assemblies of design, basic profile, materials, and operation indicated on approved shop drawings. Provide units comparable to those indicated or required to accommodate joint size, variations in adjacent surfaces, and dynamic structural movement without material degradation or fatigue when tested according to ASTM E1399. Furnish units in longest practicable lengths to minimize number of end joints. Provide hairline mitered corners where joint changes directions or abuts other materials. Include closure materials and transition pieces, tee-joints, corners, curbs, cross-connections, and other accessories as required to provide continuous joint cover assemblies.
- B. Moisture Barrier: Provide manufacturer's continuous, standard, flexible vinyl moisture barrier under covers at locations indicated on approved shop drawings.

- C. Fire-Rated Joint Covers: Provide expansion joint cover assemblies with manufacturer's continuous, standard, flexible fire barrier seals under covers at locations indicated on approved shop drawings to provide fire-resistive rating not less than the rating of adjacent construction.
- D. Coverless Fire Barrier: Provide manufacturer's continuous standard flexible fire barrier seals at locations indicated on approved shop drawings to provide fire-resistive rating not less than the rating of adjacent construction.
- E. Metal Floor-to-Floor Joint Cover Assemblies: Provide continuous extruded metal frames of profile indicated with seating surface and raised floor rim or exposed trim strip to accommodate flooring and concealed bolt and anchors embedded in concrete. Provide assemblies formed to receive cover plates of design indicated and to receive filler materials (if any) between raised rim of frame and edge of plate. Furnish depth and configuration to suit type of construction and to produce a continuous flush wearing surface with adjoining finish floor surface.
 - 1. Partially Concealed Cover: Provide one frame on each side of joint, designed to accommodate manufacturer's floor cover plate and filler.
 - 2. Exposed Cover: Provide one frame on each side of joint, designed to support floor plate and filler
 - 3. Flat Cover Plates: Provide cover plates of profile and wearing surface indicated. Extend flat plates to lap each side of joint.
 - a. Filler Insert: Furnish abrasive-resistant flexible gasket filler between edge of cover plate and raised rim of frame to accommodate required movement
 - 4. Fixed Cover Plates: Attach one side of the cover plate to a frame or finished wearing surface, with other side resting on other frame or finished wearing surface to allow free movement.
 - 5. Self-Centering Cover Plates: Concealed centering device with the cover plate secured in or on top of frames as to have free movement on both sides.
 - 6. Floor Cover Plate Wearing Surfaces: Provide cover plates with the following type of wearing surfaces.
 - a. Plain.
 - b. Fluted.
 - c. Recessed to receive full thickness of flooring material.
 - d. Abrasive plate.
 - e. Adhesive filled plate.
 - f. Adhesive strip plate.
- F. Floor-to-Wall Joints: Provide one frame on floor side of joint only. Provide wall side frame where required by manufacturer's design.
 - 1. Angle Cover Plates: Attach angle cover plates for floor-to-wall joints to wall with countersunk, flat-head exposed fasteners secured to drilled-in-place anchor shields, unless otherwise indicated, at spacing recommended by joint cover manufacturer.
- G. Wall, Ceiling, and Soffit Joint Cover Assemblies: Provide interior wall and ceiling expansion joint cover assemblies of same design and appearance. Provide exterior wall and soffit expansion joint cover assemblies of same design and appearance. Provide wall expansion joint cover assemblies compatible with floor expansion joint cover assemblies design and appearance.
 - 1. Fixed Metal Cover Plates: Provide a concealed, continuously anchored frame fastened to wall, ceiling, or soffit only on one side of joint. Extend cover to lap each side of joint and to permit free movement on one side. Attach cover to frame with cover in close contact with adjacent finish surfaces.
 - 2. Floating Metal Cover Plates: Cover plate secured in or on top of frames to permit free movement on both sides.
 - 3. Self-Centering Cover Plates: Concealed centering device with the cover plate secured in or on top of frames to permit free movement on both sides.

4. Flexible Filler: Secure the approved flexible filler between frames to compress and expand with movement.
- H. Joint Cover Assemblies with Preformed Seals: Provide joint cover assemblies consisting of continuously anchored aluminum extrusions and continuous extruded preformed seals of profile indicated or required to suit types of installation conditions shown. Furnish extrusions designed to be embedded in or attached to concrete with lugs. Vulcanize or heat-weld splices (if any) to ensure hermetic joint condition.
1. Cover Plate: Include extruded aluminum cover plate fastened to one side of joint and extend plate to lap each side of joint to permit free movement with cover in close contact with adjacent contact surfaces.
- I. Joint Cover Assemblies with Elastomeric Sealant: Provide continuous cover joint assemblies consisting of elastomeric sealant factory-bonded to extruded aluminum frames of profile indicated or required to suit types of installation conditions shown. Provide frames for floor joints with means for embedding in or anchoring to concrete without using exposed fasteners and that will result in exposed surfaces of sealant and aluminum frames finishing flush with adjacent finished floor surface without exposing anchors.
- J. Compression Seals: Preformed, elastomeric extrusions having internal baffle system in sizes and profiles shown or as recommended by the manufacturer. Provide lubricant and adhesive for installation recommended by the manufacturer.
- K. Foam Seal: Nonextruded, low-density, cross-linked, nitrogen-blown ethylene vinyl acetate polyethylene copolymer foam. Provide adhesive for installation recommended by the manufacturer.

2.03 METAL FINISHES:

- A. General: Comply with NAAMM "Metal Finishes Manual" for finish designations and application recommendations, except as otherwise indicated. Apply finishes to products in factory after fabrication. Protect finishes on exposed surfaces before shipment.
- B. Aluminum Finishes: Finish designations prefixed by AA conform to the system established by the Aluminum Association for designating aluminum finishes.
1. Mill Finish: AA-M10 (unspecified mill finish).
 2. Class II, Clear-Anodized Finish: AA-M12C22A31 [Mechanical Finish: as fabricated, nonspecular; Chemical Finish: etched, medium matte; Anodic Coating: Class II Architectural, clear film thicker than 0.4 mil].
 3. Class I, Clear-Anodized Finish: AA-M12C22A41 [Mechanical Finish: as fabricated, nonspecular; Chemical Finish: etched, medium matte; Anodic Coating: Class I Architectural, clear film thicker than 0.7 mil] complying with AAMA 607.1.
 4. Class II, Color-Anodized Finish: AA-M12C22A32/A34 [Mechanical Finish: as fabricated, nonspecular; Chemical Finish: etched, medium matte; Anodic Coating: Class II Architectural, film thicker than 0.4 mil with integral color or electrolytically deposited color].
 5. Class I, Color-Anodized Finish: AA-M12C22A42/A44 [Mechanical Finish: as fabricated, nonspecular; Chemical Finish: etched, medium matte; Anodic Coating: Class I Architectural, film thicker than 0.7 mil with integral color or electrolytically deposited color] complying with AAMA 606.1 or AAMA 608.1.
 - a. Color: As selected by the Engineer from within standard industry colors and color density range.
 6. Baked Enamel Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: chemical conversion coating, acid chromate-fluoride-phosphate pretreatment; Organic Coating: as specified below). Apply baked enamel complying with paint manufacturer's specifications for cleaning, conversion coating, and painting.
 - a. Organic Coating: Thermosetting modified acrylic enamel primer/topcoat

system complying with AAMA 603.8 except with minimum dry film thickness of 1.5 mils, medium gloss

- b. Color: As selected by the Engineer from manufacturer's standard colors.
 - 7. High-Performance Organic Coating: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: chemical conversion coating, acid chromate-fluoride-phosphate pretreatment; Organic Coating: as specified below). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturer's instructions.
 - a. Fluoropolymer Two-Coat Coating System: Manufacturer's standard two-coat thermocured system, composed of specially formulated inhibitive primer and fluoropolymer color topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; complying with AAMA 605.2.
 - b. Fluoropolymer Three-Coat Coating System: Manufacturer's standard three-coat thermocured system composed of specially formulated inhibitive primer, fluoropolymer color coat, and clear fluorocarbon topcoat, with both color coat and clear topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; complying with AAMA 605.2.
 - 1) Resin Manufacturers: Subject to compliance with requirements, provide fluoropolymer coating systems containing resins produced by one of the following manufacturers:
 - a) Ausimont USA, Inc. (Hylar 5000).
 - b) Elf Atochem North America, Inc. (Kynar 500).
 - c) Or equal.
 - 2) Color and Gloss: As selected by the Engineer from manufacturer's standard choices for color and gloss. Retain below for covers in contact with masonry or concrete.
 - 8. Factory-Primed Concealed Surfaces: Protect concealed metal surfaces to be placed in contact with concrete or masonry with a shop coat of manufacturer's standard primer on the contact surfaces.
- C. Stainless Steel Finishes: Comply with NAAMM "Metal Finishes Manual" for recommendations relative to application and designations of finishes.
- 1. Bright, Cold-Rolled Unpolished Finish: AISI No. 2B finish.
 - 2. Bright, Directional Polish: AISI No. 3 finish.
- D. Factory Finish: Manufacturer's standard factory finish.

PART 3 - EXECUTION

3.01 PREPARATION:

- A. Manufacturer's Instructions: In addition to requirements of these specifications, comply with manufacturer's instructions and recommendations for phases of Work, including preparing substrate, applying materials, and protecting installed units.
- B. Coordinate and furnish anchorages, setting drawings, templates, and instructions for installation of expansion joint cover assemblies to be embedded in or anchored to concrete or to have recesses formed into edges of concrete slab for later placement and grouting-in of frames.
- C. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary to secure expansion joint cover assemblies to in-place construction, including threaded fasteners with drilled-in expansion shields for masonry and concrete where anchoring members are not embedded in concrete. Provide fasteners of metal, type, and size to suit type of construction indicated and provide for secure attachment of expansion joint cover assemblies.

3.02 INSTALLATION:

- A. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required to install expansion joint covers. Install joint cover assemblies in true alignment and proper relationship to expansion joints and adjoining finished surfaces measured from established lines and levels. Allow adequate free movement for thermal expansion and contraction of metal to avoid buckling. Set floor covers at elevations to be flush with adjacent finished floor materials. Locate wall, ceiling, roof, and soffit covers in continuous contact with adjacent surfaces. Securely attach in place with required accessories. Locate anchors at interval recommended by manufacturer, but not less than 3 inches from each end and not more than 24 inches on center.
- B. Continuity: Maintain continuity of expansion joint cover assemblies with a minimum number of end joints and align metal members mechanically using splice joints. Cut and fit ends to produce joints that will accommodate thermal expansion and contraction of metal to avoid buckling of frames. Adhere flexible filler materials (if any) to frames with adhesive or pressure-sensitive tape as recommended by manufacturer.
- C. Extruded Preformed Seals: Install seals complying with manufacturer's instructions and with minimum number of end joints. For straight sections provide preformed seals in continual lengths. Vulcanize or heat-weld field splice joints in preformed seal material to provide watertight joints using procedures recommended by manufacturer. Apply adhesive, epoxy, or lubricant-adhesive approved by manufacturer to both frame interfaces before installing preformed seal. Seal transitions according to manufacturer's instructions.
- D. Elastomeric Sealant Joint Assemblies: Seal end joints within continuous runs and joints at transitions according to manufacturer's directions to provide a watertight installation.
- E. Seismic Seals: Install interior seals in continual lengths; vulcanize or heat-weld field splice joints in interior seal material to provide watertight joints using manufacturer's recommended procedures. Install exterior seal in standard lengths. Seal transitions and end joints according to manufacturer's instructions.
- F. Fire Barriers: Install fire barriers, including transitions and end joints, according to manufacturer's instructions so that fire-rated construction is continuous.

3.03 CLEANING AND PROTECTION:

- A. Do not remove protective covering until finish work in adjacent areas is complete. When protective covering is removed, clean exposed metal surfaces to comply with manufacturer's instructions.

END OF SECTION

SECTION 05811

EXPANSION JOINT SYSTEMS

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing exterior (pedestrian and vehicular) traffic joints, exterior (wall and ceiling) joints, exterior soffit joints, interior (pedestrian and vehicular) traffic joints, interior (wall and ceiling) joints and interior soffit joints.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Cast-In-Place Structural Concrete: Section 03300.
- B. Expansion Joint Cover Assemblies: Section 05810.
- C. Flashing and Sheet Metal: Section 07600.
- D. Seals and Sealants: Section 07900.

1.03 DEFINITIONS:

- A. Architectural Joint System: Any filler or cover used to span, fill, cover, or seal a joint, except expanding foam seals and poured or foamed in-place sealants.
- B. Cyclic Movement: Periodic change between widest and narrowest joint widths in an automatically mechanically controlled system.
- C. Fire Barriers: Any material or material combination, when fire tested after cycling, designated to resist passage of flame and hot gases through a movement joint.
- D. Maximum Joint Width: Widest linear gap a joint system tolerates and performs its designed function without damaging its functional capabilities.
- E. Minimum Joint Width: Narrowest linear gap a joint system tolerates and performs its designed function without damaging its functional capabilities.
- F. Movement Capability: Value obtained from the difference between widest and narrowest widths of a joint opening typically expressed in numerical values (inches) or a percentage of nominal value of joint width.
- G. Nominal Joint Width: Width of linear gap indicated as representing the conditions existing when architectural joint systems will be installed or, if no nominal joint width is indicated, a width equal to the sum of maximum and minimum joint widths divided by two.

1.04 PERFORMANCE REQUIREMENTS:

- A. General: Provide factory-fabricated architectural joint systems capable of withstanding the types of loads and of accommodating the kinds of movement, and the other functions for which they are designed including those specified below, without failure. Types of failure include those listed in Appendix X3 of ASTM E1399.
 - 1. Vehicular Traffic Joints: Support vehicular traffic across joint.

2. Pedestrian Traffic Joints: Support pedestrian traffic across joint.
3. Exterior Joints: Maintain continuity of weather enclosure.
4. Joints in Fire-Resistance-Rated Assemblies: Maintain fire-resistance ratings of assemblies.
5. Joints in Smoke Barriers: Maintain integrity of smoke barrier.
6. Joints in Acoustically Rated Assemblies: Inhibit passage of airborne noise.
7. Other Joints: Where indicated, provide joint systems that prevent penetration of water, moisture, and other substances deleterious to building components or content.
8. Seismic Joints: Remain in place on exposure to seismic activity (movement).
9. Joints in Surfaces with Architectural Finishes: Serve as finished architectural joint closures.

1.05 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 1. Product Data: Include manufacturer's product specifications, construction details, material and finish descriptions, and dimensions of individual components and seals.
 2. Shop Drawings: For each joint system specified, provide the following:
 - a. Placement Drawings: Include line diagrams showing entire route of each joint system, plans, elevations, sections, details, joints, splices, locations of joints and splices, and attachments to other Work. Where joint systems change planes, provide Isometric Drawings depicting how components interconnect to achieve continuity of joint covers and fillers.
 3. Samples for Initial Selection: Manufacturer's color charts consisting of units or sections of units showing the full range of colors, textures, and patterns available for each exposed metal and elastomeric material of joint system indicated.
 - a. Include similar Samples of material for joints and accessories involving color selection.
 4. Samples for Verification: Full-size units 6 inches long of each type of joint system indicated; in sets for each finish, color, texture, and pattern specified, showing the full range of variations expected in these characteristics.
 5. Product Test Reports: From a qualified testing agency indicating architectural joint systems comply with requirements, based on comprehensive testing of current products.

1.06 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 1. Comply with codes and regulations of the jurisdictional authorities.
 2. AAMA: 606.1, 607.1, 608.1, 2603, 2604, 2605.
 3. ADA: Americans with Disabilities Act.
 4. ASTM: A666, B36, B209, B221, B455, E119, E814, E1399, E1612, E1783.
 5. NAAMM: Metal Finishes Manual for Architectural and Metal Products.
 6. UL: 2079.
- B. Source Limitations: Where practical, obtain architectural joint systems through one source from a single manufacturer. Coordinate compatibility with adjoining joint systems specified in other Sections.

- C. Fire-Test-Response Characteristics: Where indicated, provide joint systems incorporating fire barriers that are identical to those of assemblies tested for fire resistance per ASTM E 119, ASTM E 814, or UL 2079, including hose-stream test of vertical wall assemblies, by a testing and inspecting agency acceptable to authorities having jurisdiction.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Aluminum: ASTM B221, alloy 6063-T5 for extrusions; ASTM B209, alloy 6061-T6 for sheet and plate.
 - 1. Apply manufacturer's standard protective coating on aluminum surfaces to be placed in contact with cementitious materials.
- B. Stainless Steel: ASTM A666, Type 304 with No. 2B finish, unless otherwise indicated, for plates, sheet, and strips.
- C. Preformed Seals: Single or multicellular extruded elastomeric seals designed with or without continuous, longitudinal, internal baffles. Formed to be installed in frames or with anchored flanges, in color indicated or, if not indicated, as selected by the Engineer from manufacturer's standard colors.
- D. Preformed Silicon-Foam Sealant System: Section 07900.
- E. Strip Seals: Elastomeric membrane or tubular extrusions with a continuous longitudinal internal baffle system throughout complying with ASTM E 1783; used with compatible frames, flanges, and molded-rubber anchor blocks.
- F. Compression Seals: Preformed, elastomeric extrusions having internal baffle system complying with ASTM E1612 in sizes and profiles indicated or as recommended by manufacturer.
- G. Preformed Cellular Foams: Nonextruded, low-density, crosslinked, nitrogen-blown ethylene-vinyl-acetate copolymer, Neoprene, or polyurethane extruded, compressible foam.
- H. Fire Barriers: Any material or material combination, when fire tested after cycling, designated to resist the passage of flame and hot gases through a movement joint.
- I. Accessories: Manufacturer's standard anchors, clips, fasteners, set screws, spacers, flexible moisture barrier and filler materials, drain tubes, lubricants, adhesives, and other accessories compatible with material in contact, as indicated or required for complete installations.

2.02 EXPANSION JOINT SYSTEMS:

- A. General: Provide joint systems of design, basic profile, materials, and operation indicated on approved shop drawings. Provide units with the capability to accommodate joint widths indicated and variations in adjacent surfaces.
 - 1. Furnish units in longest practicable lengths to minimize number of end joints. Provide hairline mitered corners where joint changes directions or abuts other materials.

2. Include closure materials and transition pieces, tee-joints, corners, curbs, cross-connections, and other accessories as required to provide continuous joint systems.
3. Frames for Strip Seals: Designed with semiclosed cavity that provides a mechanical lock for seals of type indicated.
4. Public Arena Seals: Non-slip seals designed for installation on treads and risers and to lie flat with adjacent surfaces, and complying with ADA guidelines for public areas.
5. Cyclic-Movement-Test-Response Characteristics: No evidence of visual fatigue, inability to cycle between designated joint widths, or other types of failure as determined by testing products identical to those indicated per ASTM E 1399 including Appendix X3.
6. Fire-Resistance Ratings: Provide manufacturer's standard fire barrier with a rating not less than that of adjacent construction.
7. Moisture Barrier: Provide manufacturer's standard unit.

2.03 FINISHES, GENERAL:

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

2.04 ALUMINUM FINISHES:

- A. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
- B. Mill Finish: AA-M10 (Mechanical Finish: as fabricated; no other applied finish unless buffing is required to remove scratches, welding, or grinding produced in fabrication process).
- C. Class II, Clear Anodic Finish: AA-M12C22A31 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class II, clear coating 0.010 mm or thicker) complying with AAMA 607.1.
- D. Class I, Clear Anodic Finish: AA-M12C22A41 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, clear coating 0.018 mm or thicker) complying with AAMA 607.1.
- E. Class II, Color Anodic Finish: AA-M12C22A32/A34 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class II, integrally colored or electrolytically deposited color coating 0.010 mm or thicker).
- F. Class I, Color Anodic Finish: AA-M12C22A42/A44 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, integrally colored or electrolytically deposited color coating 0.018 mm or thicker) complying with AAMA 606.1 or AAMA 608.1.
 1. Color: As selected by the Engineer from the full range of industry colors and color densities.

- G. Baked-Enamel Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Apply baked enamel complying with paint manufacturer's specifications for cleaning, conversion coating, and painting.
 - 1. Organic Coating: Thermosetting, modified-acrylic enamel primer/topcoat system complying with AAMA 2603 except with a minimum dry film thickness of 1.5 mils, medium gloss.
 - 2. Color: As selected by the Engineer from manufacturer's full range.

- H. High-Performance Organic Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
 - 1. Fluoropolymer Two-Coat System: Manufacturer's standard two-coat, thermocured system consisting of specially formulated inhibitive primer and fluoropolymer color topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; complying with AAMA 2604.
 - 2. Fluoropolymer Three-Coat System: Manufacturer's standard three-coat, thermocured system consisting of specially formulated inhibitive primer, fluoropolymer color coat, and clear fluoropolymer topcoat, with both color coat and clear topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; complying with AAMA 2605.
 - a. Color and Gloss: As selected by the Engineer from manufacturer's full range.

2.05 STAINLESS STEEL FINISHES:

- A. Remove tool and die marks and stretch lines or blend into finish.
- B. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.
- C. Bright, Cold-Rolled, Unpolished Finish: No. 2B finish.
- D. Bright, Directional Polish: No. 4 finish.
- E. Satin, Directional Polish: No. 6 finish.
- F. Mirrorlike Reflective, Nondirectional Polish: No. 8 finish.
- G. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

PART 3 - EXECUTION

3.01 PREPARATION:

- A. Prepare substrates according to architectural joint system manufacturer's written instructions.

- B. Coordinate and furnish anchorages, Placement Drawings, and instructions for installing joint systems to be embedded in or anchored to concrete or to have recesses formed into edges of concrete slab for later placement and grouting-in of frames.
- C. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary to secure joint systems to in-place construction, including threaded fasteners with drilled-in expansion shields for masonry and concrete where anchoring members are not embedded in concrete. Provide fasteners of metal, type, and size to suit type of construction indicated and to provide for secure attachment of joint systems.

3.02 INSTALLATION:

- A. Comply with manufacturer's written instructions for handling and installing architectural joint assemblies and materials, unless more stringent requirements are indicated.
- B. Coordinate installation of architectural joint assembly materials and associated work so complete assemblies comply with assembly performance requirements.
- C. Terminate exposed ends of exterior architectural joint assemblies with factory-fabricated termination devices to maintain waterproof system.
- D. Install factory-fabricated transitions between building expansion joint cover assemblies and roof expansion joint assemblies to provide continuous, uninterrupted, watertight construction.
- E. Coordinate the size of joint opening at the time joint segments are set in position (distance between joint segments) with the temperature of the structure and the designed joint movement.
- F. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required to install joint systems.
 - 1. Install joint cover assemblies in true alignment and proper relationship to joints and adjoining finished surfaces measured from established lines and levels.
 - 2. Allow adequate free movement for thermal expansion and contraction of metal to avoid buckling.
 - 3. Set covers in horizontal surfaces at elevations that place exposed surfaces flush with adjoining finishes.
 - 4. Locate covers in continuous contact with adjacent surfaces.
 - 5. Securely attach in place with required accessories.
 - 6. Locate anchors at interval recommended by manufacturer, but not less than 3 inches from each end and not more than 24 inches o.c.
- G. Continuity: Maintain continuity of joint systems with a minimum number of end joints and align metal members. Cut and fit ends to produce joints that will accommodate thermal expansion and contraction of metal to avoid buckling of frames. Adhere flexible filler materials, if any, to frames with adhesive or pressure-sensitive tape as recommended by manufacturer.
- H. Extruded Preformed Seals: Install seals to comply with manufacturer's written instructions and with minimum number of end joints.
 - 1. For straight sections, provide preformed seals in continuous lengths.
 - 2. Vulcanize or heat-weld field splice joints in preformed seal material to provide watertight joints using procedures recommended by manufacturer.

3. Apply adhesive, epoxy, or lubricant adhesive approved by manufacturer to both frame interfaces before installing preformed seals.
 4. Seal transitions according to manufacturer's written instructions.
 5. Install foam seals with adhesive recommended by manufacturer and heat seal all splices.
- I. Joint Systems with Seals: Seal end joints within continuous runs and joints at transitions according to manufacturer's written instructions to provide a watertight installation.
 - J. Seismic Seals: Install interior seals in continuous lengths. Install exterior seal in standard lengths and vulcanize or heat-weld field splice joints to provide watertight joints using manufacturer's recommended procedures. Seal transitions and end joints according to manufacturer's written instructions.
 - K. Fire Barriers: Install fire barriers to provide continuous, uninterrupted fire resistance throughout length of joint, including transitions and end joints.

3.03 CLEANING AND PROTECTION:

- A. Do not remove protective covering until finish work in adjacent areas is complete. When protective covering is removed, clean exposed metal surfaces to comply with manufacturer's written instructions.

END OF SECTION

THIS PAGE NOT USED

SECTION 06100
ROUGH CARPENTRY

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies rough carpentry for wood blocking, roof sheathing, rooftop equipment bases and support curbs, miscellaneous lumber and accessories.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Wood Preservative Treatment: Section 06075.
- B. Roof Accessories: Section 07730.
- C. Flashing and Sheet Metal: Section 07600.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
- B. Product Data for metal framing anchors and construction adhesives.

1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
- B. Comply with codes and regulations of the jurisdictional authorities.
 - 1. ALSC: NGR.
 - 2. DOC PS20.
 - 3. AWPA C2, C9, C20, C27, M4.
 - 4. UL.
 - 5. APA.
 - 6. FS FF-N-105.
 - 7. CAB NER-272.
 - 8. ASME A153, A307, A563, A653, B18.6.1, B18.2.1

1.05 DELIVERY, STORAGE, AND HANDLING:

- A. Keep materials under cover and dry. Protect from weather and contact with damp or wet surfaces. Stack lumber, plywood, and other panels. Provide for air circulation within and around stacks and under temporary coverings.
 - 1. For lumber and plywood pressure treated with waterborne chemicals, place spacers between each bundle to provide air circulation.

PART 2 - PRODUCTS

2.01 LUMBER, GENERAL:

- A. Lumber Standards: Comply with DOC PS 20, "American Softwood Lumber Standard," and with applicable grading rules of inspection agencies certified by American Lumber Standards Committee's (ALSC) Board of Review.
- B. Dressed sizes of green lumber are larger than dry lumber under DOC PS 20. Where nominal sizes are indicated, provide actual sizes required by DOC PS 20 for moisture content specified. Where actual sizes are indicated, they are minimum dressed sizes for dry lumber.

2.02 WOOD-PRESERVATIVE-TREATED MATERIALS:

- A. General: Where lumber or plywood is indicated as preservative treated or is specified to be treated, comply with applicable requirements of AWPA C2 (lumber) and AWPA C9 (plywood). Mark each treated item with the Quality Mark Requirements of an inspection agency approved by ALSC's Board of Review.
 - 1. Do not use chemicals containing chromium or arsenic.
- B. Pressure treat aboveground items with waterborne preservatives to a minimum retention of 0.25 lb/cu. ft.. After treatment, kiln-dry lumber and plywood to a maximum moisture content of 19 and 15 percent, respectively. Treat indicated items and the following:
 - 1. Wood cants, nailers, curbs, equipment support bases, blocking, stripping, and similar members in connection with roofing, flashing, vapor barriers, and waterproofing.
 - 2. Wood sills, sleepers, blocking, furring, stripping, and similar concealed members in contact with masonry or concrete.
 - 3. Wood framing members less than 18 inches above grade.
 - 4. Complete fabrication of treated items before treatment, where possible. If cut after treatment, apply field treatment complying with AWPA M4 to cut surfaces. Inspect each piece of lumber or plywood after drying and discard damaged or defective pieces.

2.03 FIRE-RETARDANT-TREATED MATERIALS:

- A. General: Where fire-retardant-treated wood is indicated, comply with applicable requirements of AWPA C20 (lumber) and AWPA C27 (plywood). Identify fire-retardant-treated wood with appropriate classification marking of UL; U.S. Testing; Timber Products Inspection, Inc.; or another testing and inspecting agency acceptable to authorities having jurisdiction.
 - 1. Research or Evaluation Reports: Provide fire-retardant-treated wood acceptable to authorities having jurisdiction and for which a current model code research or evaluation report exists that evidences compliance of fire-retardant-treated wood for application indicated.
- B. Interior Type A: For interior locations, use chemical formulation that produces treated lumber and plywood with the following properties under conditions present after installation:
 - 1. Bending strength, stiffness, and fastener-holding capacities are not reduced below values published by manufacturer of chemical formulation under elevated temperature and humidity conditions simulating installed conditions when tested by a qualified independent testing agency.
 - 2. No form of degradation occurs due to acid hydrolysis or other causes related to treatment.
 - 3. Contact with treated wood does not promote corrosion of metal fasteners.

2.04 DIMENSION LUMBER:

- A. General: Provide dimension lumber of grades indicated according to the ALSC National Grading Rule (NGR) provisions of the inspection agency indicated.

2.05 MISCELLANEOUS LUMBER:

- A. General: Provide lumber for support or attachment of other construction, including rooftop equipment curbs and support bases, cant strips, bucks, nailers, blocking, furring, grounds, stripping, and similar members.
- B. Fabricate miscellaneous lumber from dimension lumber of sizes indicated and into shapes shown.
- C. Moisture Content: 19 percent maximum for lumber items not specified to receive wood preservative treatment.

2.06 ROOF SHEATHING:

- A. General: Where structural-use panels are indicated for the following concealed types of applications, provide American Plywood Association (APA)-performance-rated panels complying with requirements designated under each application for grade, span rating, exposure durability classification, and edge detail (where applicable).
 - 1. Thickness: Provide panels meeting requirements specified but not less than thickness indicated.
 - 2. Span Ratings: Provide panels with span ratings required to meet "Code Plus" provisions of APA Form No. E30, "APA Design/Construction Guide: Residential & Commercial."

2.07 FASTENERS:

- A. General: Provide fasteners of size and type indicated that comply with requirements specified in this Article for material and manufacture.
 - 1. Where rough carpentry is exposed to weather, in ground contact, or in area of high relative humidity, provide fasteners with a hot-dip zinc coating per ASTM A 153 or of Type 304 stainless steel.
- B. Nails, Wire, Brads, and Staples: FS FF-N-105.
- C. Power-Driven Fasteners: CABO NER-272
- D. Wood Screws: ASME B18.6.1
- E. Lag Bolts: ASME B18.2.1.
- F. Bolts: Steel bolts complying with ASTM A 307, Grade A; with ASTM A 563 hex nuts and, where indicated, flat washers.

2.08 METAL FRAMING ANCHORS:

- A. General: Provide galvanized steel framing anchors of structural capacity, type, and size indicated and as follows:
 - 1. Research or Evaluation Reports: Provide products for which model code research or evaluation reports exist that are acceptable to authorities having jurisdiction and that

evidence compliance of metal framing anchors for application indicated with building code in effect for Project.

2. Allowable Design Loads: Provide products with allowable design loads, as published by manufacturer, that meet or exceed those indicated. Manufacturer's published values shall be determined from empirical data or by rational engineering analysis, and demonstrated by comprehensive testing performed by a qualified independent testing agency.
- B. Galvanized Steel Sheet: Hot-dip, zinc-coated steel sheet complying with ASTM A 653, G60 coating designation; structural, commercial, or lock-forming quality, as standard with manufacturer for type of anchor indicated.

PART 3 - EXECUTION

3.01 INSTALLATION, GENERAL:

- A. Discard units of material with defects that impair quality of rough carpentry and that are too small to use with minimum number of joints or optimum joint arrangement.
- B. Set rough carpentry to required levels and lines, with members plumb, true to line, cut, and fitted.
- C. Fit rough carpentry to other construction; scribe and cope as required for accurate fit. Correlate location of furring, nailers, blocking, grounds, and similar supports to allow attachment of other construction.
- D. Apply field treatment complying with AWPA M4 to cut surfaces of preservative-treated lumber and plywood.
- E. Securely attach rough carpentry work to substrate by anchoring and fastening as indicated, complying with the following:
 1. Counsel of American Building Officials: CABO NER-272 for power-driven staples, P-nails, and allied fasteners.
 2. Published requirements of metal framing anchor manufacturer.
- F. Use common wire nails, unless otherwise indicated. Select fasteners of size that will not fully penetrate members where opposite side will be exposed to view or will receive finish materials. Make tight connections between members. Install fasteners without splitting wood; predrill as required.
- G. Use hot-dip galvanized or stainless-steel nails where rough carpentry is exposed to weather, in ground contact, or in area of high relative humidity.

3.02 WOOD GROUNDS, NAILERS, BLOCKING, AND SLEEPERS:

- A. Install wood nailers, blocking, and sleepers where shown and where required for screeding or attaching other work. Form to shapes shown and cut as required for true line and level of attached work. Coordinate locations with other work involved.
- B. Attach to substrates to support applied loading. Recess bolts and nuts flush with surfaces, unless otherwise indicated. Build into masonry during installation of masonry work. Where possible, anchor to formwork before concrete placement.

 1. AREMA Manual for Railway Engineering
 2. AREMA Portfolio of Trackwork Plans
 3. AREMA Specifications for Ties
 4. AREMA Specification for Preservatives
 5. AREMA Specification for Treatment
 6. AREMA Records of Treatment and Reports of Inspection.
- B. American Wood Preserver 's Association (AWPA)
 1. AWPA Standard C6
 2. AWPA Standard M3

1.04 SUBMITTALS

- A. Submittals shall be made on accordance with Section 01300, Submittals
- B. Documentation
 1. Proposed method of delivery. Submit not late than 60 days prior to delivery.
 2. Proposed anti-splitting devices and location in tie.
 3. Proposed manner of marking treated ties to indicate compliance with specifications.
 4. Certificate of Compliance with AWPA Standard M3 for tie treatment.

1.05 QUALITY ASSURANCE

- A. Inspection:
 1. The Engineer will inspect in accordance with pertinent sections of the AREMA Manual, as modified herein.
 2. Acceptance criteria: Failure to meet any pertinent part of AREMA requirements or these specifications constitutes cause for rejection.
 3. Averaging of dimensions, with respect to measurement for size acceptance, is not permitted.

4. Provide suitable equipment, facilities and assistance required by the Engineer to effect inspections.
5. Inform the Engineer when treated wood is ready for inspection.
6. Do not deliver material until inspected and approved for shipment by the Engineer.
7. Final inspection and approval of ties will occur as a part of the final inspection of installed ballasted track.

1.06 DELIVERY, STORAGE AND HANDLING

- A. It shall be the Contractor's responsibility to make all arrangements for storage, shipment and handling of the ties.
- B. Tie stacks shall not exceed 20 layers each.
- C. Ties will be stacked with branding visible.
- D. Ties shall be handled in a manner that prevents damage.
- E. Ties shall not be dropped or dragged on the trackbed.

PART 2 - PRODUCTS

2.01 TIMBER CROSS TIES, CONTACT RAIL TIES AND SWITCH TIES

- A. Furnish timber for cross ties in accordance with AREMA Volume 1, Chapter 30 Ties, Section 1.1 and as specified in this section. Furnish timber for contact rail ties and switch ties in accordance with AREMA Volume 1, Chapter 30 Ties, Section 2.1 and as specified in this section.
 1. The kind of wood for all ties shall be Oaks.
 2. Cross ties shall be 7-inch grade.
 3. The top of all ties shall be the 9" horizontal face furthest from the heartwood so that the heartwood faces down.
 4. Crossties shall be 8' - 6" long.
 5. Contact rail ties shall be 10' - 0" long.
 6. Switch ties shall be the length shown on the contract drawings.
 7. The length tolerance for all ties after seasoning and treatment is plus 1" and minus 1/2".
 8. Tie No. 1 and Tie No. 2 shown on the contract drawings shall not be wider than 9" after seasoning and treatment.

PART 3 - EXECUTION

3.01 REQUIREMENTS

- A. General Requirements:
 1. All ties shall be new.
 2. Physical requirements in accordance with the AREMA manual, as modified herein.
 3. AREMA 7" Grade.
 4. All ties shall be Oak wood species.
 5. Sawed top, bottom and sides.
 6. Free of checks over two inches deep or extending more than eight inches from end of tie.

- B. Anti-splitting devices shall be nail plates in accordance with the AREMA Manual, as modified herein.
1. Minimum size 5 - 1/2 inches x 7 inches.
 2. Nail plates shall be installed by a method or machine that presses them into the end of the tie. Hammer installation of nail plates is not allowed and will be a cause for the rejection of the ties.
 3. Incise all sides prior to treatment to a depth of 3/4 inch. Thickness of incisor teeth shall not exceed 7/32 inch.
 4. Free of knots greater than 1/2 inch diameter for areas indicated in the AREMA Manual.
- C. Individual Requirements:
1. Cross ties:
 - a. Length: Eight feet six inches.
 - b. Straightness: A cross tie will be considered straight when a line along a side from the middle of one end to the middle of the other end is everywhere more than 2-3/4 inches from the top and bottom of the tie.
 2. Contact rail ties:
 - a. Length: Ten feet.
 - b. Free of knots greater than 1/2 inch diameter in area of contact rail insulator, i.e., 100 through 110 inches from line end.
 - c. AREMA Size 5 requirements apply to contact rail insulator area.
 - d. Straightness: A contact rail tie will be considered straight when a line along one side from the middle of one end to the middle of the other end is everywhere more than two inches from both sides.
 3. Switch ties:
 - a. Switch ties within Special Trackwork, as shown on the drawings.
 - b. Length: As shown.
 - c. Free of knots greater than 1/2 inch diameter for areas indicated in the AREMA Manual.
 - d. Straightness: A contact rail tie will be considered straight when a line along the top from the middle of one end to the middle of the other end is everywhere more than two inches from both sides.
- D. Preservative Treatment:
1. All timbers shall be bored for screw spikes. The holes shall be treated with copper naphthenate.
 2. Ties shall be treated in accordance with the requirements of AWPA Standard C6 for Cross Ties and Switch Ties. Conditioning prior to treatment shall be in accordance with Paragraph 3.2, Boulton Drying Process, of the above standard.
 3. Immediately following conditioning, the ties shall be pressure treated. Because of the environmental problems and other reasons, alternative preservative used shall be copper naphthenate. The minimum quality control requirements shall be in accordance with AWPA Standard M3. The treating company shall furnish a Certificate of Compliance with this standard, and shall certify the treatment according to the foregoing Specification.
 4. The Authority Engineer will determine when ties are ready for treatment.
 5. Use only tested and approved preservatives.
 6. Stamp each treated tie to indicate compliance with these specifications.
 7. Complete AREMA or AWPA forms for treatment of ties.

PART 4 - MEASUREMENT AND PAYMENT

4.01 MEASUREMENT:

- A. Measurement of work specified in this section will be made in the following manner:
1. No separate measurement.

4.02 PAYMENT:

- A. Compensation for work specified in this section will be in the following manner:
1. Included in the price of the work of which it is a part.

END OF SECTION

SECTION 06132

TIMBER GRADE CROSSINGS

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. The section specifies furnishing solid timber panel grade crossings as shown on the Contract Drawings. Solid timber panel grade crossings shall be in accordance with the current requirements of the AREMA "Guidelines for the Construction or Reconstruction of Highway - Railway Crossings" except as modified herein.

1.02 RELATED SECTIONS

- A. General Track Construction: Section 05651
- B. Ballasted Track Construction: Section 05652

1.03 REFERENCES

- A. American Railway Engineering and Maintenance-of-Way Association (AREMA):
 - 1. AREMA Manual for Railway Engineering
 - 2. AREMA Portfolio of Trackwork Plans
 - 3. AREMA "Guidelines for the Construction or Reconstruction of Highway - Railway Crossings"
 - 4. AREMA Specification for Preservatives
 - 5. AREMA Specification for Treatment
 - 6. AREMA Records of Treatment and Reports of Inspection
- B. American Wood Preserver 's Association (AWPA)
 - 1. AWPA Standard C6
 - 2. AWPA Standard M3

1.04 SUBMITTALS

- A. Submittals shall be made on accordance with Section 01330, Submittals
 - 1. Crossing panel layout for each grade crossing location.
 - 2. Shop drawings of field and gauge sections, filler blocks and modified restraining rail plate. Show fit to rail, show flangeway, and show clearances to Pandrol plate, screw spikes and e-Clip.
 - 3. Shop drawing or product data sheets for spiraled dowel pins and washer head lag screws.
 - 4. Product data for mastic to fill the counter bore holes.
 - 5. Details for insulated joints, and track circuit and traction power connections to be located within the crossing area.
- B. Documentation
 - 1. Proposed method of delivery. Submit prior to delivery.
 - 2. Proposed manner of marking treated timbers to indicate compliance with specifications.
 - 3. Certificate of Compliance with AWPA Standard M3 for timber treatment.
 - 4. Report documenting whether conditions warrant use of geotextile fabric and drainage pipes.

1.05 QUALITY ASSURANCE

- A. Quality Assurance/Quality Control shall be in accordance with the Design-Builder's Construction Quality Management Plan.
- B. Inspection:
 - 1. In accordance with pertinent sections of the AREMA Manual, as modified herein.
 - 2. Acceptance criteria: Failure to meet any pertinent part of AREMA requirements or these specifications constitutes cause for rejection.
 - 3. Averaging of dimensions, with respect to measurement for size acceptance, is not permitted.
 - 4. Provide suitable equipment, facilities and assistance required by the Engineer to effect inspections.
 - 5. Inform the Engineer when treated timbers are ready for inspection.
 - 6. Do not deliver material until inspected and approved for shipment by the Engineer.
 - 7. Final inspection and approval will occur as a part of the final inspection of installed ballasted track.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Panels shall be stacked with branding visible.
- B. Panels shall be handled in a manner that prevents damage.
- C. Panels shall not be dropped or dragged on the trackbed.

PART 2 - PRODUCTS

2.01 GENERAL REQUIREMENTS

- A. Furnish timbers in accordance with the requirements, as specified in this section:
- B. Crossing timbers shall be sawed, treated oak made into panels 8 feet in length. Field side sections shall be 20 inches wide consisting of two 10 inch timbers. Gauge side sections shall be 25-1/2 inches wide consisting of three 8-1/2 inch timbers when restraining rail is not used. The gauge panel width on the restraining rail side varies as shown on the contract drawings depending upon the track gauge.
 - 1. Cut bottom corner of the field and gauge sections closest to the rail to provide clearance to the tie plate, screw spikes, and e-Clip when installed. The cut(s) shall be made in a way to minimize weakening of the section and minimizing the loading on the washer head lag screws anchoring the sections to the track tie.
 - 2. The outside ends of end sections shall be beveled. The bevel shall have dimensions of 4 inches measured horizontally and vertically.
- C. Each gauge section not next to a restraining rail shall have a filler block of such size and shape as to provide a snug fit against the rail web and provide a flangeway 2-1/2 inches wide and 3 inches deep.
- D. Each section shall be made up using three 3/4 inch spiral dowel pins. Each section shall be fabricated so that the heartwood for all of the timbers will face down and seat on the top of the timber track ties.

- E. Each section shall have 8 holes for use in anchoring the section to the ties with washer head lag screws. These holes shall be 13/16 inches in diameter and shall have a 2-5/8 inches counter bore 1-1/4 inches deep in the top side.
- F. All cuts and borings shall be made after seasoning and before preservative treatment. Each timber shall be treated with creosote preservative (AWPA P2-01) in accordance with AWPA C6 before assembly into sections. The treatment plant shall meet the requirements of AWPA M3.
- G. Each section shall be anchored in place with 12 inches long, 3/4 inch diameter washer head lag screws. After the lag screw is in place, the counter bore shall be filled with a mastic material.
- H. Sections shall be full depth with the top surface in the plane of the top of rail and the bottom of the section resting directly on the cross tie.

PART 3 - EXECUTION

3.01 REQUIREMENTS

- A. The Contractor shall design and construct the crossings as shown on the Contract Drawings.
 - 1. Grade crossings are to be constructed with new timber grade crossing panels, washer head lag screws, rail, timber ties, standard Pandrol tie plates, rail clips, screw spikes, ballast, sub-ballast, and, where conditions warrant, with geotextile fabric and perforated drain pipes.
 - a. Where restraining rail is required, a modified restraining rail tie plate as shown on the drawings shall be used under the inside rail and restraining rail.
 - 2. Where a new timber grade crossing is to be installed on existing track, new rail, ties, tie plates, rail clips, screw spikes, ballast, sub-ballast, and, where conditions warrant, geotextile fabric and perforated drain pipes shall be installed as directed by the engineer.
 - 3. The design of timber panels for crossings located on curved track shall be modified from what is shown on the drawings and as specified herein so that the flangeway is between 2 1/2 and 3 inches and the gap between abutting sections does not exceed 1/4 inch.
 - 4.
- B. Grade crossing track shall be ballasted track as specified in Section 05652, Ballasted Track Construction, with ties spaced at 19-1/4 inch centers. The 19 1/4 inch tie spacing shall extend for three ties beyond the end of the sections, which also defines the limit of the crossing area.
- C. Field welds and bolted or bonded insulated and non-insulated rail joints shall not be installed within the crossing area. Insulated joints, and track circuit and traction power connections within the crossing area shall be submitted to the Authority Representative for approval. The submittal shall include details showing at least the following.
 - 1. Modifications to the grade crossing panels.
 - 2. Provisions to assure connections are electrically isolated from ground.
 - 3. Provisions to assure insulated joint functions are not compromised by foreign materials.
 - 4. Provide access for maintenance of the connections and insulated joints.

- D. Prior to placing grade crossing timber panels, grade crossing track shall be brought to final alignment and grade and tamped within the tolerances for ballasted yard and secondary track as specified in Section 05651, General Track Construction.
 - 1. Ballast shall be added to provide full cribs and level shoulders.
 - 2. Ballast shall be compacted as specified in Section 05652, Ballasted Track Construction.
 - 3. Rail shall be thermally adjusted and anchored as specified in Section 05651, General Track Construction, and Section 05652, Ballasted Track Construction.
- E. Ties shall be swept clean of all loose ballast and debris prior to placing timbers. The timbers shall then be properly located, so that the heart wood will be on the bottom side.
- F. No shims shall be used between timbers and cross ties.
- G. The timber ties shall be prebored for the timber grade crossing panel's washer head lag screws with 5/8 inch diameter holes that are drilled to a maximum of 6 inches of depth into the timber tie.
- H. All bored holes in timber track ties shall be treated with copper naphthenate immediately after boring.
- I. Two field sections and two gauge sections shall constitute one grade crossing panel.

PART 4 - MEASUREMENT AND PAYMENT

4.01 MEASUREMENT:

- A. Measurement of work specified in this section will be made in the following manner:
 - 1. No separate measurement.

4.02 PAYMENT:

- A. Compensation for work specified in this section will be in the following manner:
 - 1. Included in the price of the work of which it is a part.

END OF SECTION

SECTION 06402

INTERIOR ARCHITECTURAL WOODWORK

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This Section specifies providing wood cabinets, plastic-laminate cabinets, wood countertops, plastic-laminate countertops, solid-surfacing-material countertops.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Rough Carpentry: Section 06100.
- B. Seals and Sealants: Section 07900.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - B. Product Data: For each type of product indicated, including cabinet hardware and accessories, and finishing materials and processes.
 - C. Shop Drawings: Show location of each item, dimensioned plans and elevations, large-scale details, attachment devices, and other components.
 - 1. Show locations and sizes of furring, blocking, and hanging strips, including concealed blocking and reinforcement specified in Section 06100.
 - 2. Show locations and sizes of cutouts and holes for installed in architectural woodwork.
 - D. Samples for Initial Selection: Manufacturer's color charts consisting of units or sections of units showing the full range of colors, textures, and patterns available for each type of material indicated.
 - 1. Plastic laminates.
 - 2. Solid-surfacing materials.
 - E. Samples for Verification: For the following:
 - 1. Plastic-laminate-clad panel products, 8 by 10 inches, for each type, color, pattern, and surface finish.
 - 2. Solid-surfacing materials, 6 inches square.
 - 3. Exposed cabinet hardware and accessories, one unit for each type.
 - F. Certification: Signed by manufacturers of woodwork certifying that products furnished comply with requirements.
 - G. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. AWI: Section 400 & 700, AGS.
 - 3. Builders Hardware Manufacturer's Association (BHMA): A156.9, A256.11, A156.18, B01361, B01521, B02011, B03141, B04071, B04081, B04013, B05091, E07121, E7041, 613, 630, 640
 - 4. ANSI A208.2, Z124.3
 - 5. NEMA LD 3.

- B. Installer Qualifications: An experienced installer who has completed architectural woodwork similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.

- C. Fabricator Qualifications: A firm experienced in producing architectural woodwork similar to that indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.

- D. Quality Standard: Unless otherwise indicated, comply with AWI's "Architectural Woodwork Quality Standards" for grades of interior architectural woodwork, construction, finishes, and other requirements.
 - 1. Provide AWI Quality Certification Program certificate indicating that woodwork complies with requirements of grades specified.

1.05 DELIVERY, STORAGE, AND HANDLING:

- A. Do not deliver woodwork until painting and similar operations that could damage woodwork have been completed in installation areas. If woodwork must be stored in other than installation areas, store only in areas where environmental conditions comply with requirements specified in "Project Conditions" Article.

1.06 PROJECT CONDITIONS:

- A. Environmental Limitations: Do not deliver or install woodwork until building is enclosed, wet work is complete, and HVAC system is operating and maintaining temperature and relative humidity at occupancy levels during the remainder of the construction period.

- B. Field Measurements: Where woodwork is indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
 - 1. Locate concealed framing, blocking, and reinforcements that support woodwork by field measurements before being enclosed and indicate measurements on Shop Drawings.
 - 2. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating woodwork without field measurements. Provide allowance for trimming at site, and coordinate construction to ensure that actual dimensions correspond to established dimensions.

1.07 COORDINATION:

- A. Coordinate sizes and locations of framing, blocking, furring, reinforcements, and other related units of Work specified in other Sections to ensure that interior architectural woodwork can be supported and installed as indicated.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. General: Provide materials that comply with requirements of the AWI quality standard for each type of woodwork and quality grade specified, unless otherwise indicated.
- B. Wood Products: Comply with the following:
 - 1. Medium-Density Fiberboard: ANSI A208.2, Grade MD-Exterior Glue.
- C. High-Pressure Decorative Laminate: NEMA LD 3, grades as indicated, or if not indicated, as required by woodwork quality standard.
 - 1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering high-pressure decorative laminates that may be incorporated into the Work include, but are not limited to, the following:
 - a. Formica Corporation.
 - b. International Paper; Decorative Products Div.
 - c. Wilsonart International; Div. of Premark International, Inc.
- D. Adhesive for Bonding Plastic Laminate: Unpigmented contact cement.
- E. Solid-Surfacing Material: Homogeneous solid sheets of filled plastic resin complying with material and performance requirements in ANSI Z124.3, for Type 5 or Type 6, without a precoated finish.
 - 1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Corian; DuPont Polymers.
 - b. Surell; Formica Corporation.
 - c. Fountainhead; International Paper, Decorative Products Div.
 - d. Gibraltar; Wilsonart International, Div. of Premark International, Inc.

2.02 CABINET HARDWARE AND ACCESSORIES:

- A. Butt Hinges: 2-3/4-inch, 5-knuckle steel hinges made from 0.095-inch-thick metal, and as follows:
 - 1. Semiconcealed Hinges for Flush Doors: BHMA A156.9, B01361.
 - 2. Semiconcealed Hinges for Overlay Doors: BHMA A156.9, B01521.
- B. Back-Mounted Pulls: BHMA A156.9, B02011.
- C. Wire Pulls: Back mounted, 5 inches long, 2-1/2 inches deep, and 5/16 inches in diameter.
- D. Catches: Magnetic catches, BHMA A156.9, B03141.
- E. Adjustable Shelf Standards and Supports: BHMA A156.9, B04071; with shelf rests, B04081.

- F. Shelf Rests: BHMA A156.9, B04013.
- G. Drawer Slides: Side-mounted, full-extension, zinc-plated steel drawer slides with steel ball bearings, BHMA A156.9, B05091, and rated for the following loads:
 - 1. Box Drawer Slides: 100 lbf.
 - 2. File Drawer Slides: 200 lbf.
- H. Door Locks: BHMA A156.11, E07121.
- I. Drawer Locks: BHMA A156.11, E07041.
- J. Grommets for Cable Passage through Countertops: 2-inch OD, black, molded-plastic grommets and matching plastic caps with slot for wire passage.
- K. Exposed Hardware Finishes: For exposed hardware, provide finish that complies with BHMA A156.18 for BHMA finish number indicated. Dark, Oxidized, Satin Bronze, Oil Rubbed: BHMA 613 for bronze base; BHMA 640 for steel base; match Architect's sample.
 - 1. Satin Stainless Steel: BHMA 630.
- L. For concealed hardware, provide manufacturer's standard finish that complies with product class requirements in BHMA A156.9.

2.03 INSTALLATION MATERIALS:

- A. Furring, Blocking, Shims, and Hanging Strips: Softwood or hardwood lumber, kiln-dried to less than 15 percent moisture content.
- B. Anchors: Select material, type, size, and finish required for each substrate for secure anchorage. Provide nonferrous-metal or hot-dip galvanized anchors and inserts on inside face of exterior walls and elsewhere as required for corrosion resistance. Provide toothed-steel or lead expansion sleeves for drilled-in-place anchors.

2.04 FABRICATION, GENERAL:

- A. Interior Woodwork Grade: Provide Custom grade interior woodwork complying with the referenced quality standard.
- B. Wood Moisture Content: Comply with requirements of referenced quality standard for wood moisture content in relation to ambient relative humidity during fabrication and in installation areas.
- C. Complete fabrication, including assembly, finishing, and hardware application, to maximum extent possible, before shipment to Project site. Disassemble components only as necessary for shipment and installation. Where necessary for fitting at site, provide ample allowance for scribing, trimming, and fitting. Retain subparagraph below if Architect will visit woodwork shop and examine work before it is shipped to Project site.
- D. Shop cut openings, to maximum extent possible, to receive hardware, appliances, plumbing fixtures, electrical work, and similar items. Locate openings accurately and use templates or roughing-in diagrams to produce accurately sized and shaped openings.

2.05 PLASTIC-LAMINATE CABINETS AND COUNTERTOPS:

- A. Quality Standard: Comply with AWI Section 400 requirements for laminate cabinets.
- B. AWI Type of Cabinet Construction: Flush overlay.
- C. Laminate Cladding for Exposed Surfaces: High-pressure decorative laminate complying with the following requirements:
 - 1. Horizontal Surfaces Other Than Tops: HGS.
 - 2. Vertical Surfaces: HGS.
 - 3. Edges: HGS.
- D. Materials for Semiexposed Surfaces: Provide surface materials indicated below:
 - 1. Surfaces Other Than Drawer Bodies: Thermoset decorative overlay.
- E. Colors, Patterns, and Finishes: Provide materials and products that result in colors and textures of exposed laminate surfaces complying with the following requirements:
 - 1. Provide selections from laminate manufacturer's full range of colors and finishes in the following categories:
 - a. Solid colors.
 - b. Patterns.

2.06 SOLID-SURFACING-MATERIAL COUNTERTOPS:

- A. Quality Standard: Comply with AWI Section 400 requirements for countertops.
- B. Solid-Surfacing-Material Thickness: 3/4 inch.
- C. Colors, Patterns, and Finishes: Provide materials and products that result in colors of solid-surfacing material complying with the following requirements:
 - 1. Provide selections from manufacturer's full range of colors and finishes.
- D. Fabricate tops in one piece with shop-applied backsplashes and edges, unless otherwise indicated. Comply with solid-surfacing-material manufacturer's written recommendations for adhesives, sealers, fabrication, and finishing.
- E. Drill holes in countertops for plumbing fittings in shop.

PART 3 - EXECUTION

3.01 PREPARATION:

- A. Condition woodwork to average prevailing humidity conditions in installation areas before installation.
- B. Before installing architectural woodwork, examine shop-fabricated work for completion and complete work as required, including removal of packing and backpriming.

3.02 INSTALLATION:

- A. Quality Standard: Install woodwork to comply with AWI Section 1700 for the same grade specified.
- B. Install woodwork level, plumb, true, and straight. Shim as required with concealed shims. Install level and plumb (including tops) to a tolerance of 1/8 inch in 96 inches.
- C. Scribe and cut woodwork to fit adjoining work, and refinish cut surfaces and repair damaged finish at cuts.
- D. Cabinets: Install without distortion so doors and drawers fit openings properly and are accurately aligned. Adjust hardware to center doors and drawers in openings and to provide unencumbered operation. Complete installation of hardware and accessory items as indicated.
 - 1. Install cabinets with no more than 1/8 inch in 96-inch sag, bow, or other variation from a straight line.
 - 2. Fasten wall cabinets through back, near top and bottom, at ends and not more than 16 inches o.c. with No. 10 wafer-head screws sized for 1-inch penetration into wood, blocking, or hanging strips.
- E. Countertops: Anchor securely by screwing through corner blocks of base cabinets or other supports into underside of countertop.
 - 1. Align adjacent solid-surfacing-material countertops and form seams to comply with manufacturer's written recommendations using adhesive in color to match countertop. Carefully dress joints smooth, remove surface scratches, and clean entire surface.
 - 2. Install countertops with no more than 1/8 inch in 96-inch sag, bow, or other variation from a straight line.
 - 3. Secure backsplashes to walls with adhesive.
 - 4. Caulk space between backsplash and wall with sealant specified in Section 07900.

3.03 ADJUSTING AND CLEANING

- A. Repair damaged and defective woodwork, where possible, to eliminate functional and visual defects; where not possible to repair, replace woodwork. Adjust joinery for uniform appearance.
- B. Clean, lubricate, and adjust hardware.

END OF SECTION

SECTION 07110

DAMPPROOFING

PART 1 - GENERAL

1.01 SUMMARY:

- A. This section specifies providing dampproofing.

1.02 DESCRIPTION:

- A. This section specifies providing dampproofing.
- B. Related Work Specified Elsewhere:
 - 1. Cast-in-Place Structural Concrete: Section 03300.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Product data for each type of product specified, including data substantiating that materials comply with requirements for each dampproofing material specified. Include recommended method of application, recommended primer, number of coats, coverage or thickness, and recommended protection course.
- B. Certification:
 - 1. Certification that materials furnished meet specified requirements and are compatible with each other.
 - 2. Certification by dampproofing manufacturer that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).

1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Codes and regulations of the jurisdictional authorities.
 - 2. ASTM: D41, D449.
- B. Demonstration Area:
 - 1. Prepare 100-square foot specimen of typical dampproofing application using specified methods and materials.
 - 2. Location of demonstration area as directed. Dampproofing will be visually and physically examined by the Engineer.
 - 3. If demonstration area is disapproved, prepare additional demonstration area. Do not proceed with dampproofing until demonstration area has been approved. Approved demonstration area will serve as the standard of quality and workmanship for dampproofing work specified in this section.
- C. Installer Qualifications: Engage an experienced Installer who has completed bituminous dampproofing similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to the jobsite in their original unopened containers clearly labeled with manufacturer's name, brand designation, referenced specification number, type and class, as applicable.
- B. Store products in approved dry area, protected from contact with soil and from exposure to the elements. Keep products dry.
- C. Handle products so as to prevent breakage of containers and damage to products.

1.06 JOB CONDITIONS:

- A. Environmental Requirements:
 - 1. Application of dampproofing to unprotected surfaces in wet weather or to surfaces on which ice, frost, water or dampness is visible is prohibited.
 - 2. Application of dampproofing when ambient temperature is below 40F is prohibited.
- B. Substrate: Proceed with dampproofing only after substrate construction and penetrating work have been completed.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Asphalt Primer: ASTM D41.
- B. Asphalt: ASTM D449, Type A.
- C. Portland Cement Grout: Section 04050.

PART 3 - EXECUTION

3.01 PREPARATION:

- A. Do not start dampproofing until requirements for curing concrete have been completed and surfaces have thoroughly dried.
- B. Clean surfaces to be dampproofed of loose and foreign material, concrete fins and dirt.
- C. Moisten and point holes, honeycombs, cracks, cavities and concrete fill with portland cement grout and allow to cure completely before covering. See Section 03300 for curing and protection.

3.02 APPLICATION:

- A. Apply dampproofing, consisting of two prime coats and one seal coat of dampproofing materials, to surfaces shown to receive dampproofing.
 - 1. Apply two coats of primer to surfaces to be dampproofed at rate of one gallon per 100 square feet. Allow first coat to dry thoroughly before second coat is applied.
 - 2. Do not heat prime-coat material for application.

3. After second prime coat has thoroughly dried, brush one coat of hot asphalt as applicable over primed surface at minimum rate of 15 pounds per 100 square feet of surface; fill cracks, voids and crevices.
4. Do not heat asphalt in excess of 400F.
5. Apply dampproofing coat so as to ensure continuous surface free of dull or porous spots. Give dull or porous spots additional coating of hot asphalt.
6. Perform finished work to conform to dimensions shown; do not disfigure other areas or parts of structure by dripping or spreading of materials.

3.03 PROTECTING AND CLEANING:

- A. Protect finish work during application of dampproofing and repair damage.
- B. Remove spots and spattering of the dampproofing from finish work and leave the entire work area in first-class condition.
- C. Remove dampproofing rubbish from the premises and leave spaces in broom-clean condition.

END OF SECTION

SECTION 07125

MEMBRANE WATERPROOFING

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing fluid-applied membrane waterproofing, rubberized-asphalt sheet membrane waterproofing and protection courses.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Cast-in-Place Structural Concrete: Section 03300.
- B. Brick: Section 04215.
- C. Concrete block: Section 04220.
- D. Mortar: Section 04050.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Product Data: Include manufacturer's written instructions for evaluating, preparing, and treating substrate, technical data, and tested physical and performance properties of waterproofing.
- B. Shop Drawings: Show locations and extent of waterproofing. Include details for substrate joints and cracks, sheet flashings, penetrations, inside and outside corners, tie-ins to adjoining waterproofing, and other termination conditions.
 - 1. Include joint and anchorage details, materials and description of sequence of operation.
- C. Samples: Four of each type of the following materials used in the work:
 - 1. Membrane: 12 inches square.
 - 2. Adhesive: Half-pint containers.
 - 3. Butyl gum tape: Small rolls.
 - 4. Hardboard: 12 inches square.
 - 5. Protection board: 12 inches square.
- D. Certification:
 - 1. Certification that materials furnished meet specified requirements and are compatible with each other.
 - 2. Certification that the applicator is approved by the manufacturer.

1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. American Hardboard Association Industry: AHAI Standard 1.
 - 3. FS: TT-S-230.
 - 4. ASTM: A123, C42, C78, C90, C171, C192, C272, C293, E96, D41, D146, D226, D412, D449, D572, D638, D790, D1621, D1668, D4586, E96, E154.
- B. Qualifications of Waterproofing Applicator:
 - 1. Use applicator who is approved by the manufacturer.

2. Employ workers who have had experience in waterproofing of specified type on jobs of similar size and comparable structures. Have approved full-time superintendent or foreman supervise and direct waterproofing operations.
 3. Inform the Engineer of proposed schedules and locations of waterproofing work.
- C. Obtain waterproofing materials, sheet flashings, and protection course through one source from a single manufacturer.
- D. Pre-installation Conference: Conduct conference at Project site. Review requirements for waterproofing, including surface preparation specified under other Sections, substrate condition and pretreatment, minimum curing period, forecasted weather conditions, special details and sheet flashings, installation procedures, testing and inspection procedures, and protection and repairs.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to job site in original unopened containers clearly labeled with manufacturer's name and brand designation, referenced specification number, type and class, as applicable.
- B. Store products in approved dry area with roll goods standing on ends. Protect from contact with soil and from exposure to the elements. Keep products dry.
- C. Handle products so as to prevent breakage of containers and damage to products.

1.06 JOB CONDITIONS:

- A. Environmental Requirements:
1. Application of waterproofing to unprotected surfaces in wet weather or to surfaces on which ice, frost or dampness is visible is prohibited.
 2. Unless otherwise approved, application of waterproofing unless ambient temperature is at least 40F and rising is prohibited.
 3. Maintain rolls of material at a temperature of at least 50F for a period of not less than 24 hours prior to installation.
- B. Provide ventilation in accordance with specified safety requirements.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Asphalt: ASTM D449, Type A.
- B. Asphaltic Primer: ASTM D41
- C. Glass Fabric: ASTM D1668, Type I or III.
- D. Asphalt-Saturated Felt: ASTM D226, Type I.
- E. Asphalt Cement (Asbestos-Free): ASTM D4586.
- F. Waterproof Building Paper: ASTM C171, Regular.

- G. Rubberized-Asphalt Sheet Membrane Waterproofing: Tough, pliable self-adhering waterproofing sheet of polyethylene film, coated on one side with a layer of adhesive-consistency rubberized asphalt, with the following additional requirements:

Characteristic	Value	Test Method
Thickness:		
a. Polyethylene film	4 mils	-
b. Rubberized asphalt	56 mils	-
c. Rubberized asphalt membrane total	60 mils	-
Permeance	0.1 perm	ASTM E96 Method B
Pliability, 180-degree bend over 1/4-inch mandrel at minus 30F	Unaffected	ASTM D146
Peel adhesion, 7 days dry plus 7 days at 120F plus 7 days dry or 7 days wet	5.0 pounds per inch, minimum	FS TT-S-230 Modified
Cycling over crack 15F, crack opened and closed from 0 inches to 1/4 inch	No effect 100 cycles	-
Puncture resistance, membrane	40 pounds minimum	ASTM E154
Tensile strength, membrane	250 pounds per square inch minimum	ASTM D412 Die C Modified

- H. Asphaltic Mastic:
1. Solvent-base, containing synthetic rubber, asphalt and other components, suitable for troweling, as recommended by membrane manufacturer.
 2. Dry-film requirements:
 - a. Aging: No cracking, flowing, crazing, blistering, or delamination when subjected to 192 hours in oxygen bomb at 158F and 300-psi oxygen pressure in accordance with ASTM D572.
 - b. Water permeability: 0.05-perm maximum when applied 1/32-inch thick over kraft paper and tested in accordance with ASTM E96.
 - c. Stress: No cracking or delamination when 1/64-inch thick layer is applied on metal and bent five times 360 degrees at zero F on 1/16-inch mandrel.
- I. Bonding and Joining Materials for Butyl Membrane:
1. Adhesive: For bonding butyl membrane to adjacent surfaces, as recommended by manufacturer of sheeting material.

2. Butyl compound: Self-vulcanizing for splicing joints in butyl membrane, as recommended by manufacturer.
 3. Butyl gum tape: Unvulcanized butyl-gum rubber with polyethylene-backing material for splicing tape, as recommended by membrane manufacturer.
 4. Flexible butyl-sheet rubber for flashings: As recommended by membrane manufacturer and as specified.
- J. Protection Course Materials:
1. Concrete: Section 03300, class as shown.
 2. Concrete block: Section 04220, ASTM C90, Type I.
 3. Common brick: Section 04215, type and grade as shown
 4. Concrete plank: Lightweight, reinforced-concrete plank, tongue-and-groove sides and ends, 16 inches wide, two inches thick, 10 feet long.
 5. Protection board:
 - a. Semi-flexible board, five ply or more, composed of asphaltic core sealed under heat and pressure between two liners of asphalt-saturated kraft paper or felt bonded to independent waterproofing during manufacturing process. Thickness as recommended by manufacturer.
 - b. Extruded, rigid polystyrene-foam board, one-inch thick. Compressive strength 25-psi minimum, ASTM D1621; water absorption 0.1 percent, ASTM C272.
 - c. Portland-cement mortar: Section 04050.
- K. Epoxy-Injection Material for Repair of Leaks: Two-part epoxy-adhesive materials, containing 100-percent solids, having aromatic curing-agent surface M-phenylenediamine and meeting or exceeding the following minimum requirements:
1. Flexure strength: 400 psi in accordance with ASTM D790.
 2. Tensile strength: 1,200 psi in accordance with ASTM D638.
 3. Bond strength: ASTM C293 and as follows:
 - a. Prepare concrete-beam test specimen in accordance with ASTM C192, using concrete mix design for 1-1/2 inch aggregate.
 - b. Break concrete beam in accordance with ASTM C78.
 - c. Bond broken beam using epoxy with bond-line thickness of 20 mils and cure for seven days at constant temperature of 65F.
 - d. After curing, rebreak beam in accordance with ASTM C78.
 - e. Attain specified values of flexure and tensile strength for repaired beam.
 - f. Cores taken for testing in accordance with ASTM C42.
- L. Protection-Board Adhesive: As recommended by the protection-board manufacturer.

2.02 WATERPROOFING SYSTEMS:

- A. Fluid-Applied Membrane System:
1. Asphaltic primer.
 2. Membranes: One of the following:
 - a. Glass fabric.
 - b. Asphalt-saturated felt.
 3. Accessories:
 - a. Asphaltic mastic.
 - b. Asphalt cement.
 - c. Butyl-gum tape.
 - d. Boots.

- e. Iron clamps and bolts: Hot-dip, galvanized, ASTM A123, Grade 100; ASTM A153 Class A.
- B. Rubberized-Asphalt Sheet Membrane System:
 - 1. Asphaltic primer.
 - 2. Rubberized-asphalt membrane.
 - 3. Accessories:
 - a. Asphaltic mastic.

PART 3 - EXECUTION

3.01 PREPARATION:

- A. Place membrane waterproofing after concrete has cured as specified in Section 03300 and surface is completely dry.
- B. Keep surfaces thoroughly dry, immediately before and during application of waterproofing.
- C. Should surface of the concrete become temporarily damp, dry surface.
- D. Remove laitance, dust, dirt, projections, oil, grease and other matter by brooming, scraping, air-hosing or combination of such methods. Surface to be approved prior to application of waterproofing material.
- E. Provide one-inch asphaltic mastic cants (fillets) in internal corners.
- F. Prepare preconstructed protection of courses where shown in accordance with recommendations of membrane manufacturer. Fill holes and grooves.
- G. Treat vertical surfaces with trowel coat of asphalt cement to fill pores and irregularities and level low areas to provide smooth surface for application of membrane waterproofing.

3.02 GENERAL INSTALLATION REQUIREMENTS:

- A. Tightly fit waterproofing to structure without voids or kinks. Upon completion, allow no cuts, holes, pockets, bulges, wrinkles, folds or creases in surfaces of finished waterproofing; if such defects are present, repair by patching as specified. If waterproofing is damaged, punctured or in any way pervious and cannot be effectively patched or repaired, remove and replace to extent necessary to ensure that structure is waterproof.
- B. Mop surfaces to be waterproofed in sections. Begin waterproofing at low point. Allow sufficient fabric for suitable overlap and anchorage at upper edge.
- C. If leaks occur in areas where backfilling has not been placed, cut-out waterproofing and protection and patch as necessary to ensure watertight barrier. Where membrane is inaccessible, stop leaks with epoxy injection.
- D. Cover horizontal surfaces of membrane waterproofing on which backfill is to be placed with portland-cement concrete of class and thickness shown and as specified in Section 03300.

- E. Protect penetrations in membrane, such as pipes, conduits, piles, struts, walers and other braces. Provide sleeves, clamping rings or other approved devices at penetrations and install with counterflashing where shown and mastic tape where needed to ensure watertight joint.
- F. Where shown in concrete floors and roof, fill electrical-bonding notches with asphalt cement finished flush with top of concrete.

3.03 FLUID APPLIED MEMBRANE SYSTEM:

A. General:

1. Approximately 24 hours before first mopping is applied, cover concrete surfaces to be waterproofed with one coat of asphaltic primer at minimum rate of one gallon per 100 square feet. Work primer well into surfaces to achieve uniform coating.
2. Completely cover concrete surfaces so that no concrete is left exposed. On fabric surfaces, apply mopping sufficiently heavy to conceal weave completely. For each mopping use not less than 4-1/2 gallons per 100 square feet of surface.
3. Regulate the work so that installed membrane receives final asphalt mopping before end of day. Thoroughly seal laps.
4. Before applying membrane on exterior of expansion and construction joints, lay strip of waterproof building paper twelve inches wide; extend six inches on each side of joint and secure to surface near edges using approved method.
5. Do not permit one layer of membrane to touch another layer, or concrete surface; separate each by mopped coat of hot asphalt.
6. At edges of membrane, insert membrane into reglets as shown and caulk with approved mixture of asphalt cement, or butyl-gum tape and necessary boots to prevent water intrusion between waterproofing and surface being waterproofed.
7. Where pipes, sleeves for pipes, or drains, penetrate surfaces to be waterproofed, provide synthetic-membrane flashings and two additional plies of membrane extending at least one-foot beyond edge of flashing, set in place with hot moppings of asphalt. Where flashing sleeves are not shown, flash membrane onto pipe or conduit with hot moppings of asphalt and secure with galvanized-iron clamps and bolts or by other approved methods.

B. Heating of Asphalt:

1. Heat asphalt to flow freely not exceeding 350F; stir frequently to avoid local overheating. Provide heating kettles of quality, number and capacity to service work adequately. Keep spare serviceable burners available at site for immediate replacement of malfunctioning burners. Keep kettleman in attendance during operation to ensure that maximum specified temperatures are not exceeded.
2. Employ kettle operators experienced in operating and maintaining type of equipment being used. Provide large metal pans at least one-inch deep under kettle to prevent drippings or fuel leaks from falling on prepared concrete or membraned surfaces. Ensure that each kettle is continuously equipped with calibrated thermometer.
3. Collect strippings from drums daily and remove from site. Set up kettles immediately adjacent to work in progress to reduce carrying distance of hot buckets.
4. Lower hot asphalt with extreme care to avoid endangering workmen in trench or excavation.

C. Two-Ply Work:

1. For first strip of membrane, use half-width; for second, use full-width, lapped full width of first strip.

2. For each succeeding strip, use full-width and overlap so that entire area has two layers of membrane except at joints. Lap joints two inches minimum, producing three plies at such overlaps.
 3. Give entire surface final mopping of hot asphalt. When protective covering is shown, place covering on final mopping of asphalt while still hot.
- D. Three-Ply Work:
1. Proceed as for two-ply work, except use 1/3-width for first strip; for second strip use 2/3-width; and for the third and succeeding strips use full-width. Overlap strips at least two inches, resulting in surface being completely covered by three plies, with four plies at overlaps.
- E. More Than Three-Ply Work:
1. Build in shingle fashion similar to three-ply work by adding as many plies as are shown. In joining membrane waterproofing to waterproofing in place, clean and heat in-place waterproofing before joining new waterproofing to that previously laid and overlap such joints one-foot minimum.
 2. At intersections of walls with horizontal surfaces, and at other locations, lap the greater number of plies of membrane over the other plies a minimum of one foot.
 3. Reinforce waterproofing at angles and expansion joints and at other locations where membrane may be subjected to unusual strain. Reinforce by means of two additional plies of saturated fabric and alternate moppings of asphalt. At angles between floor and wall provide reinforcing strips of sufficient width to extend six inches minimum on floor and four inches up wall. Extend strips at vertical corners five inches minimum on each side of corner.
- F. Patching:
1. Where the Engineer permits patching of defective waterproofing, extend first patching ply 12 inches minimum beyond outermost edge of defective portion.
 2. Extend second and each succeeding ply of patch three inches minimum beyond preceding ply.
 3. For patch area use at least as many new plies as specified for original membrane.

3.04 RUBBERIZED ASPHALT SHEET MEMBRANE SYSTEM:

- A. Prime concrete surfaces as recommended by membrane manufacturer. Do not prime surfaces more than 36 hours prior to applying membrane. Allow primer to dry for one hour or until tack-free. Do not prime metal surfaces, but ensure that they are dry and free of grease, oil, dust, rust and other contaminants.
- B. Apply membrane to clean primed surfaces. Lay membrane from low points or drains toward high points in shingle fashion. Overlap each strip 2-1/2 inches minimum and roll down firmly and completely.
- C. Double-cover inside and outside corners with membrane by applying initial strip of minimum 12-inch width centered along axis of corner. Mortar inside corners; round outside corners.
- D. Double-cover construction and control joints with membrane. Apply double thickness of membrane over sealed expansion joints.

- E. Provide troweled bead of asphaltic mastic as recommended by membrane manufacturer to perimeter of membrane placed in each day's operation and to outside edges of membrane after the membrane is placed.
- F. At areas around drains, posts and other protrusions, install double layer of membrane and coat liberally with asphaltic mastic.
- G. Immediately before covering membrane, inspect carefully and patch holes, tears, misaligned or wrinkled seams and other discontinuities with membrane or mastic. Conduct 24-hour flood test with minimum two-inch head of water on horizontal areas. Repair leaks, using methods recommended by membrane manufacturer.
- H. Place specified protection material on membrane within five days after application. Apply material in accordance with manufacturer's written instructions, as shown and as specified.

3.05 PROTECTION OF WATERPROOFED SURFACES:

- A. Install protection courses as soon as practicable after waterproofing is placed. Do not place loads on exposed membrane waterproofing. Traffic on such exposed membrane waterproofing is prohibited.
- B. Provide temporary protection as required pending installation of permanent protection.
- C. Exercise care in placing protection courses against waterproofing so as not to break, tear, puncture or otherwise damage waterproofing.
- D. Provide protection of waterproofing surfaces as shown and as specified.
 - 1. Concrete: Place concrete protection courses in accordance with the applicable requirements of Section 03300 and as shown.
 - 2. Concrete blocks and common brick: Lay concrete blocks and common brick in portland-cement mortar, as shown and in accordance with the related work sections
 - 3. Concrete plank: Erect concrete plank with tight tongue-and-groove joints as shown.
 - 4. Insulation board:
 - a. Apply protection-board adhesive in accordance with the manufacturer's instructions.
 - b. Fit boards carefully and neatly around pipes and projections and cover up entire surface of waterproofing.
 - 5. Protection board: Affix protection board to membrane surface by butting and taping or lapping and taping in accordance with manufacturer's written instructions and as approved.
 - 6. Backfill: At depths of 10 feet or more from top of structure, excluding reliefs, place layer of sand 12 inches thick over membrane as approved.

3.06 REPAIR OF LEAKS:

- A. Repair areas of concrete which leak, including cracks and other defective areas, and areas where membrane is inaccessible by using injected waterproofing or by repair methods that provide an impervious and watertight envelope around affected areas. Use epoxy-injection method.
 - 1. Epoxy injection:

- a. Commence epoxy-injection work after embankment or other backfill and waterproofing membrane have been placed to full required height on structure and for minimum distance of thirty feet beyond extent of repair area.
- b. Install injection work from interior side of repair areas by port-to-port method. Port spacing: Approximately 1-1/2 times thickness of receiving concrete section.
- c. Preseal intermediate joints to prevent escape of epoxy and complete each repair area for its entire length before commencing work in another area.
- d. Before proceeding, sweep space in vicinity of joint or crack receiving epoxy and leave in a generally clean condition. Remove dirt, laitance and other loose material from areas receiving epoxy by means of compressed-air jet.
- e. At joints and cracks, complete in order floors, walls and ceilings. Proceed with work from port-to-port, beginning at one end of joint. Inject epoxy by means of small nozzle held tightly against port. Continue operation until material begins to exude from next port. Repeat operations from port-to-port until entire area has been treated in one continuous operation. Seal ports as necessary to prevent drips or runout.
- f. Remove ports and finish surface of joints and cracks flush with adjacent concrete surfaces leaving no indentations or evidence of port fittings. Point joint surfaces and remove excess material from adjacent surfaces as necessary to leave joint smooth.
- g. Equip injection pumps with device to positively indicate failure to pump in proper proportions, as well as bypass valves and gauges compatible with pump.
- h. The Engineer may take cores at any location for inspection and testing. When it is determined that epoxy material has not penetrated to sufficient depth or is otherwise unsatisfactory, costs of coring and testing are the responsibility of the Contractor; where tests demonstrate that work is not substandard, costs of coring and testing will be paid by the Authority.
- i. When cores demonstrate that epoxy has penetrated less than 90 percent of crack volume within core, work will be considered defective. Repair defective work by refilling cracks at such locations to achieve at least 90-percent penetration.

END OF SECTION

THIS PAGE NOT USED

SECTION 07210

BUILDING INSULATION

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing building insulation.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Built-Up Roofing: Section 07515.
- B. Flashing and Sheet Metal: Section 07600.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings:
 - 1. Include manufacturer's material, handling, adhesive-mixing and application instructions for each type of product used in the work.
 - 2. Woodnailers, cant strips.
 - 3. Each tapered and flat roof insulation system.
 - a. Show location and spacing of wood nailers and cants that are required for securing insulation and for back nailing of roofing felts. Show a complete description for the procedures for the installation of each phase of the system indicating the type of materials thicknesses, identity codes, sequence of laying insulation, special methods for cutting and fitting of insulation, and special precautions. The drawings shall be based on installation of the insulation in conjunction with the roofing system specified in Section 07515.
- B. Samples:
 - 1. Three of each type of the following materials used in the work:
 - a. Insulation: 12- inch square units; pint container for loose fill.
 - b. Adhesive: Pint containers.
 - c. Fasteners: Six of each type.
 - d. Asphalt: Pint containers.
 - e. Vapor Barrier: 12 inches square.
 - f. Cant strip: 12 inches long.
- C. Certification:
 - 1. Submit certification from manufacturer of insulation verifying that insulation applicator is approved by manufacturer, and has successfully performed at least three satisfactory insulation installations using methods and materials similar to those specified.
 - 2. Certification that materials furnished meet specified requirements and are compatible with each other.
- D. Test Reports:
 - 1. Submit flame spread and smoke developed ratings in accordance with ASTM E84.

1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ASTM: C516, C518, C549, C552, C665, C728, C1289, D41, D226, D312, D2626, D4586, E84.
 - 3. FM: A/S4470, P7825.
 - 4. FS: HH-I-1972/3.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to jobsite in their original unopened containers or wrappings clearly labeled with manufacturer's name and brand designation, referenced specification number, type, class and rating as applicable.
- B. Store products in approved dry area and protect from contact with soil, exposure to the elements and temperatures lower than 40F or higher than 150F. Keep products dry; store rolled goods standing on end.
- C. Handle products so as to prevent breakage of containers and damage to products.

1.06 JOB CONDITIONS:

- A. Environmental Requirements:
 - 1. Application of roof insulation when ambient temperature is lower than 40F or when ice, frost or dampness are visible on the roof decks is prohibited.
 - 2. Maintain temperature of 55F minimum in structure for 48 hours prior to, during and 48 hours after application of wall insulation.
- B. Allowable Roof Loads:
 - 1. During insulation application do not use equipment of weight which exceeds allowable roof load.
- C. Coordinate insulation work with related roofing work.

PART 2 - PRODUCTS

2.01 ROOF INSULATION MATERIALS:

- A. General: Use roof insulation materials acceptable to the roofing manufacturer. See related roofing specifications in other sections.
- B. Insulation Board: One of the following materials for which installed thickness will produce overall average thermal resistance of R-30, including decrease in thermal resistance value due to aging; and which is labeled and classified as a roof deck construction material by UL for use in Fire-Classified metal roof deck assemblies (TGKX), or by FM for use in Class-1 metal-roof-deck construction.
 - 1. Composite polyisocyanurate (including polyurethane) board, ASTM C1289, Type III, factory faced with perlite insulation board on one side and asphalt-saturated felt on the other.

2. Perlite board, ASTM C728, Type 1; except with 35-psi compression resistance at five percent consolidation, and with integral factory-treatment designed to improve bond with built-up roofing membranes.
- C. Tapered Insulation Board: Where roof slope through the use of tapered insulation is required, use approved insulation board as specified above, but factory fabricated so as to provide smooth drainage inclines (1/8-inch, 1/4-inch and 1/2-inch per 12 inches), as shown.
 - D. Asphalt Primer: ASTM D41.
 - E. Steep Asphalt: ASTM D312, Type III, or IV.
 - F. Asphalt-Saturated Felt: ASTM D226, Type I.
 - G. Asphalt Base Sheet: ASTM D2626.
 - H. Asphalt Cement (Asbestos-Free): ASTM D4586.
 - I. Asphalt for Glaze Coats: ASTM D312.
 - J. Adhesive: Manufacturer's standard.
 - K. Wood Nailers and Edges: Preservation treated per Section 06075.
 - L. Cant Strips and Tapered Edge Strips: Pre-fabricated from urethane or mineral aggregate board.
 - M. Nails and Tin Caps for Vapor Barriers: 11-gauge, annular-thread, 3/8-inch head, galvanized roofing nails and flat-disc galvanized-tin caps, 1-3/8 inch minimum diameter or galvanized combination nails and caps with one-inch heads.
 - N. Insulation Nails: Types standard with insulation manufacturer.
 - O. Clips and Fasteners: Types standard with metal-roof deck manufacturer; stainless steel or zinc coated, 18-gauge minimum.

2.02 WALL INSULATION MATERIALS:

- A. Batt Insulation:
 1. Fibrous flexible blankets faced with a reinforced foil-kraft facing vapro retarder.
 2. Complies with ASTM C665, type III, Class B, Category 1.
 3. Fire hazard classification rating of 25/50 or less, per ASTM E84.
 4. Vapor Barrier Facing: Perms mazimum, 0.1 when tested in accordance with ASTM C518.
 5. Thermal Resistance Minimum: R value of II except where indicated otherwise on the drawings. Thickness as indicated on drawings.
- B. Loose-Fill Insulation:
 1. Perlite: ASTM C549, Type IV (water-repellant and dust-control treated).

2.03 PERIMETER AND CAVITY WALL INSULATION:

- A. Rigid Board types of cellular glass or polystyrene insulation with 15 psi compressive strength.

1. Cellar glass (Foamglass): ASTM C552. Minimum R value: 5.0 per inch of thickness
 2. Polystyrene: ASTM C578, Minimum R value: 4.35 per inch of thickness with density of 1.0 lbs. Per cubic foot.
- B. Adhesive and Fastenings: As recommended by the manufacturer.
- C. Insulation inserts for concrete masonry units cores.

PART 3 - EXECUTION

3.01 PREPARATION:

- A. Prepare surfaces smooth, dry, clean, and free of projections, oil, grease, wax, rough mortar, debris and other substances that might prevent proper application of insulation.
- B. Allow decks and wall surfaces to dry thoroughly before application of insulation. Test for dampness per manufacturer's recommendations.
- C. Cut mortar joints flush with masonry walls. Remove fins and projections left after removal of concrete forms.
- D. Back plaster walls with cement mortar, if necessary to obtain smooth surfaces.

3.02 APPLICATION OF ROOF INSULATION:

- A. General Requirements for Application:
1. Apply insulation in direct contact with roof deck or over vapor barrier, as shown. Keep roof-insulation materials dry before, during and after application. Place perlite side of composite insulation face up.
 2. Apply insulation to deck so that continuous longitudinal joints are parallel to short dimension of roof; stagger cross joints by starting alternate courses with half-size insulation boards. Keep insulation 1/2-inch clear of vertical surfaces.
 3. When using multiple layers of insulation, stagger the joints of each succeeding layer in both directions with respect to layer below. Embed succeeding layers firmly in solid mopping of steep asphalt.
 4. Mop sufficient area to provide complete embedment of one board at a time.
 5. Except for strip-mopping on metal decks, use 25 pounds minimum of asphalt per 100 square feet of roof deck for mopping each layer of insulation in place.
 6. Provide treated-wood nailers at edges of roofs and at intersections with vertical surfaces. Provide additional treated-wood nailers at necessary intervals for nailing insulation on non-nailable decks or for nailing roofing felt.
 7. Do not heat steep asphalt above 450F. Do not heat asphalt used for glaze coats above 400F. Apply steep asphalt at no less than 350F. Apply glaze coat at no less than 325F.
- B. Application on Concrete Decks:
1. Completely cover concrete decks with asphalt primer at minimum rate of one gallon per 100 square feet of roof surface.
 2. Vapor barrier:
 - a. Provide vapor barrier consisting of two plies of asphalt-saturated felt with each ply lapped not less than 19 inches and mopped-in with steep asphalt. Vapor barrier, consisting of one layer of asphalt base sheets and weighing not less

- than 35 pounds minimum per 100 square feet, may be provided in lieu of two felt plies. Lap base sheets not less than four inches at sides and ends; solidly mop-in with steep asphalt.
- b. Mop-in vapor barriers at rate of 25 pounds minimum of steep asphalt per 100 square feet. Ensure that vapor barriers are free of wrinkles and buckles. Press air bubbles out to obtain proper adhesion between surfaces.
 - c. At walls, edges and vertical projections, extend vapor barrier six inches to form lap to be wrapped around edge of insulation.
3. Apply insulation as specified under general requirements for application.
 4. If roof slope exceeds one inch per foot, provide wood nailers for nailing insulation to roof deck. Use six nails minimum per eight square feet of insulation.
- C. Application on Steel Decks:
1. Apply insulation so that joints occur on solid bearing surfaces only rather than over open ribs. Apply insulation of the indicated thickness and as required to achieve the roof slopes indicated.
 2. Before insulation is installed, uniformly strip-coat high sections of steel deck with asphalt primer using 1/2-gallon minimum per 100 square feet of roof surface. Allow primer to dry.
 3. Strip-mop high sections of deck using not less than 12 pounds of steep asphalt per 100 square feet of roof surface. Do not permit asphalt to flow into ribs or flutes of decking.
 4. Place insulation while asphalt is still hot and fluid. When multiple layers of insulation are used, mop-in second layer and succeeding layers as specified under general requirements for application.
 5. Fastening of insulation on steel decks:
 - a. If roof slope exceeds one inch per foot, supplement asphalt moppings with mechanical fasteners. Where mechanical fastening is required, provide approved steel-deck, manufacturer's standard, nonpiercing, double-prong steel clips designed to fit into ribs of decking.
 - b. Provide fastener of length necessary to accommodate thickness of insulation and with holding power 120 pounds minimum per fastener.
 - c. Provide clips at the rate of 25 clips minimum per 100 square feet.
- D. Cant Strips and Tapered Edge Strips:
1. Cant strips:
 - a. Where shown or specified, provide 45-degree cant strips at intersections of roof with vertical surfaces extending above roof. Place cant strips on insulation and fit flush against vertical surfaces.
 - b. Where possible, nail cant strips to adjoining surfaces. For installation against non-nailable materials, place cant strips in heavy mopping of steep asphalt or set in asphalt cement.
 - c. Do not install projections, such as vent pipes and braces, through cant strips or within 10 inches from cant strips.
 2. Tapered edge strips:
 - a. Where shown or specified, provide tapered edge strips in right angle formed by junction of roof and wood nailing strips that extend above roof level. Fit strips flush against vertical surfaces of wood nailing strips.
 - b. Where possible, nail edge strips to adjoining surfaces. Where installed against non-nailable materials, apply strips in heavy mopping of steep asphalt or set in asphalt cement.

- E. Protection:
 - 1. Cover each day's application of insulation, which cannot be roofed over, with at least one glaze coat of hot bitumen.
 - 2. Protect open ends of each day's work with temporary water cut-offs; remove cut-offs when work is resumed.
 - 3. Protect open spaces between insulation and parapets or other walls and spaces at curbs, scuttles, expansion joints and similar locations until permanent roofing and flashing is applied. Storing, walking, wheeling or trucking directly on insulation or on roofed surfaces is prohibited; provide smooth, clean board or plank walkways, runways and platforms as necessary.
 - 4. Limit storage loads on platforms and wheeling loads to 40 psf uniformly distributed. Limit size and weight of mechanical equipment used for insulation work so that deflection of roof deck under its use does not exceed 1/240 of deck span.

3.03 APPLICATION OF MASONRY-CELL WALL INSULATION:

- A. Follow manufacturer's recommended installation practices.
- B. Pour loose-fill insulation into cells of concrete masonry units as masonry work progresses. Use approved procedures to ensure complete filling of cells.
- C. Minimize free fall impact and dust formation.

3.04 APPLICATION OF BATT INSULATION:

- A. The vapor barrier facing shall face toward the warm-in-winter side of the space.
- B. Lay batts on top of soffit tightly butted together.
- C. Attach wall mounted batts with, mechanical fasteners as required for permanent installation.

3.05 APPLICATION OF PERIMETER CAVITY WALL INSULATION:

- A. Secure vertical insulation with mechanical fasteners sufficient to permanently retain all insulation in place during subsequent construction operations.
- B. Fitted with tight butt joints with openings for penetrations nearly cut for tight fit.
- C. Placed just prior to subsequent construction operations to prevent damage of insulation left exposed. Coordinate with masonry work. Prevent damage during placement of fill and compaction or concrete against insulation.
- D. Place insulation in concrete masonry unit cores at plant prior to job site delivery.

3.06 CLEAN-UP:

- A. Clean up rubbish and debris caused by this work and remove from site.
- B. Remove drippings of asphalt and adhesives in exposed places on brick, concrete, steel, metal or other surfaces.

END OF SECTION

SECTION 07412
METAL WALL PANELS

PART 1 - GENERAL

1.01 SUMMARY OF WORK

- A. This section includes factory-formed and field-assembled, exposed or concealed-fastener, lap-seam metal wall panels.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. List below only products and construction that the reader might expect to find in this Section but are specified elsewhere.
- B. Delete first subparagraph below if secondary supports are inserted into this Section as part of metal wall panel manufacturers' responsibility.
- C. Division 5 Section "Cold-Formed Metal Framing" for secondary support framing supporting metal wall panels.
- D. Division 7 Section "Metal Roof Panels" for factory-formed metal soffit panels.
- E. Division 7 Section "Sheet Metal Flashing and Trim" for fasciae, copings, flashings and other sheet metal work not part of metal wall panel assemblies.
- F. Division 7 Section "Joint Sealants" for field-applied sealants not otherwise specified in this Section.

1.03 DEFINITIONS

- A. Metal Wall Panel Assembly: Metal wall panels, attachment system components, miscellaneous metal framing, thermal insulation, and accessories necessary for a complete weathertight system.
- B. Steel Sheet Thickness: Minimum thickness of base metal without metallic coatings or painted finishes.

1.04 PERFORMANCE REQUIREMENTS

- A. General: Provide metal wall panel assemblies that comply with performance requirements specified as determined by testing manufacturers' standard assemblies similar to those indicated for this Project, by a qualified testing and inspecting agency.
- B. Air Infiltration: Air leakage through assembly of not more than 0.06 cfm/sq. ft. (0.3 L/s per sq. m) of wall area when tested according to ASTM E 283 at a static-air-pressure difference of 6.24 lbf/sq. ft. (300 Pa).
- C. Water Penetration: No water penetration when tested according to ASTM E 331 at a wind-load design pressure of not less than 6.24 lbf/sq. ft. (300 Pa) and not more than 12 lbf/sq. ft. (575 Pa).
- D. Water Absorption: Maximum 1.0 percent absorption rate by volume when tested according to ASTM C 209.

- E. Structural Performance: Provide metal wall panel assemblies capable of withstanding the effects of gravity loads and the following loads and stresses within limits and under conditions indicated, based on testing according to ASTM E 1592 or ASTM E 330:
 - 1. Wind Loads: Determine loads based on local codes.
 - 2. Deflection Limits: Engineer metal wall panel assemblies to withstand test pressures with deflection no greater than 1/180 of the span and no evidence of material failure, structural distress, or permanent deformation exceeding 0.2 percent of the clear span.
 - a. Test Pressures: 150 percent of inward and outward wind-load design pressures.
- F. Thermal Movements: Provide metal wall panel assemblies that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
 - 1. Temperature Change (Range): 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.
- G. Thermal Performance: Provide insulated metal wall panel assemblies with thermal-resistance value (R-value) indicated when tested according to ASTM C 236.

1.05 SUBMITTALS

- A. Product Data: Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type of metal wall panel and accessory.
- B. Shop Drawings: Show fabrication and installation layouts of metal wall panels; details of edge conditions, joints, panel profiles, corners, anchorages, attachment system, trim, flashings, closures, and accessories; and special details. Distinguish between factory- and field-assembled work.
 - 1. Accessories: Include details of the following items, at a scale of not less than 1-1/2 inches per 12 inches (1:10):
 - a. Flashing and trim.
 - 2. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- C. Coordination Drawings: Exterior elevations drawn to scale and coordinating penetrations and wall-mounted items. Show the following:
 - 1. Wall panels and attachments.
 - 2. Wall-mounted items including doors, windows, louvers, and lighting fixtures.
- D. Samples for Initial Selection: For each type of metal wall panel indicated with factory-applied color finishes.
 - 1. Include similar Samples of trim and accessories involving color selection.
 - 2. Include manufacturer's color charts consisting of strips of cured sealants showing the full range of colors available for each sealant exposed to view.
- E. Samples for Verification: For each type of exposed finish required, prepared on Samples of size indicated below.
 - 1. Metal Wall Panels: 12 inches (300 mm) long by actual panel width. Include fasteners, closures, and other metal wall panel accessories.
 - a. Include four-way joint for composite panels.

2. Trim and Closures: 12 inches (300 mm) long. Include fasteners and other exposed accessories.
3. Vapor Retarders: 6-inch- (150-mm-) square Samples.
4. Accessories: 12-inch- (300-mm-) long Samples for each type of accessory.
5. Exposed Gaskets: 12 inches (300 mm) long.
6. Exposed Sealants: For each type and color of joint sealant required. Install joint sealants in 1/2-inch- (13-mm-) wide joints formed between two 6-inch- (150-mm-) long strips of material matching the appearance of metal wall panels adjacent to joint sealants.

F. Qualification Data: For Installer.

- G. Compatibility and Adhesion Test Reports: From sealant manufacturer indicating the following:
1. Materials forming joint substrates and joint sealant backings have been tested for compatibility and adhesion with joint sealants.
 2. Interpretation of test results and written recommendations for primers and substrate preparation needed for adhesion.

H. Field quality-control test reports.

I. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for the following:

1. Metal Wall Panels: Include reports for air infiltration, water penetration, thermal performance, and structural performance.
2. Insulation and Vapor Retarders: Include reports for thermal resistance, fire-test-response characteristics, water-vapor transmission, and water absorption.

J. Research/Evaluation Reports: For metal-faced composite wall panels.

K. Maintenance Data: For metal wall panels to include in maintenance manuals.

L. Warranties: Special warranties specified in this Section.

1.06 QUALITY ASSURANCE

A. Installer Qualifications: An employer of workers trained and approved by manufacturer.

B. Installer Qualifications: Fabricator of metal-faced composite wall panels.

1. Installer's responsibilities include fabricating and installing metal wall panel assemblies and providing professional engineering services needed to assume engineering responsibility.
2. Engineering Responsibility: Preparation of Shop Drawings and comprehensive engineering analysis by a qualified professional engineer.
3. Engineering Responsibility: Preparation of data for metal wall panels, including Shop Drawings, based on testing and engineering analysis of manufacturer's standard units in assemblies similar to those indicated for this Project.

C. Fabricator Qualifications: Certified by metal-faced composite wall panel manufacturer to fabricate and install manufacturer's wall panel system.

D. Testing Agency Qualifications: Qualified according to ASTM E 329 for testing indicated, as documented according to ASTM E 548.

E. Source Limitations: Obtain each type of metal wall panel through one source from a single manufacturer.

- F. Product Options: Drawings indicate size, profiles, and dimensional requirements of metal wall panels and are based on the specific system indicated. Refer to Division 1 Section "Product Requirements."
 - 1. Do not modify intended aesthetic effects, as judged solely by Architect, except with Architect's approval. If modifications are proposed, submit comprehensive explanatory data to Architect for review.

- G. Preconstruction Compatibility and Adhesion Testing: Submit to joint-sealant manufacturers, for testing indicated below, samples of materials that will contact or affect joint sealants.
 - 1. Use manufacturer's standard test methods to determine whether priming and other specific joint preparation techniques are required to obtain rapid, optimum adhesion of joint sealants to joint substrates.
 - a. Perform tests under environmental conditions replicating those that will exist during installation.
 - 2. Submit no fewer than nine pieces of each type of material, including joint substrates, shims, joint-sealant backings, secondary seals, and miscellaneous materials.
 - 3. Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
 - 4. For materials failing tests, obtain joint-sealant manufacturer's written instructions for corrective measures, including the use of specially formulated primers.

- H. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1 Section "Project Management and Coordination." Review methods and procedures related to metal wall panel assemblies including, but not limited to, the following:
 - 1. Meet with Owner, Architect, testing and inspecting agency representative, metal wall panel Installer, metal wall panel manufacturer's representative, structural-support Installer, and installers whose work interfaces with or affects metal wall panels including installers of doors, windows, and louvers.
 - 2. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
 - 3. Review methods and procedures related to metal wall panel installation, including manufacturer's written instructions.
 - 4. Examine support conditions for compliance with requirements, including alignment between and attachment to structural members.
 - 5. Review flashings, special siding details, wall penetrations, openings, and condition of other construction that will affect metal wall panels.
 - 6. Review governing regulations and requirements for insurance, certificates, and testing and inspecting if applicable.
 - 7. Review temporary protection requirements for metal wall panel assembly during and after installation.
 - 8. Review wall panel observation and repair procedures after metal wall panel installation.
 - 9. Document proceedings, including corrective measures and actions required, and furnish copy of record to each participant.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Deliver components, sheets, metal wall panels, and other manufactured items so as not to be damaged or deformed. Package metal wall panels for protection during transportation and handling.
- B. Unload, store, and erect metal wall panels in a manner to prevent bending, warping, twisting, and surface damage.
- C. Stack metal wall panels horizontally on platforms or pallets, covered with suitable weathertight and ventilated covering. Store metal wall panels to ensure dryness, with positive slope for drainage of water. Do not store metal wall panels in contact with other materials that might

cause staining, denting, or other surface damage.

- D. Protect foam-plastic insulation as follows:
 - 1. Do not expose to sunlight, except to extent necessary for period of installation and concealment.
 - 2. Protect against ignition at all times. Do not deliver foam-plastic insulation materials to Project site before installation time.
 - 3. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

1.08 PROJECT CONDITIONS

- A. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit assembly of metal wall panels to be performed according to manufacturers' written instructions and warranty requirements.
- B. Field Measurements: Verify locations of structural members and wall opening dimensions by field measurements before metal wall panel fabrication and indicate measurements on Shop Drawings.
 - 1. Established Dimensions: Where field measurements cannot be made without delaying the Work, either establish framing and opening dimensions and proceed with fabricating metal wall panels without field measurements, or allow for field trimming of panels. Coordinate wall construction to ensure that actual building dimensions, locations of structural members, and openings correspond to established dimensions.

1.09 COORDINATION

- A. Coordinate metal wall panel assemblies with rain drainage work, flashing, trim, and construction of adjoining work to provide a leakproof, secure, and noncorrosive installation.

1.10 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of metal wall panel assemblies that fail in materials or workmanship within specified warranty period.
 - 1. Failures include, but are not limited to, the following:
 - a. Structural failures, including rupturing, cracking, or puncturing.
 - b. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
 - 2. Warranty Period: One year from date of Substantial Completion.
- B. Special Warranty on Panel Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace metal wall panels that show evidence of deterioration of factory-applied finishes within specified warranty period.
 - 1. Fluoropolymer Finish: Deterioration includes, but is not limited to, the following:
 - a. Color fading more than 5 Hunter units when tested according to ASTM D 2244.
 - b. Chalking in excess of a No. 8 rating when tested according to ASTM D 4214.
 - c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.
 - 2. Finish Warranty Period: 10 years from date of Substantial Completion.
- C. Special Weathertightness Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace metal wall panel assemblies that fail to remain weathertight, including leaks, within specified warranty period.

1. Weathertight Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply for product selection:
1. Basis-of-Design Products: The design for metal wall panel specified is based on the product named. Subject to compliance with requirements, provide either the named product or a comparable product by one of the other manufacturers specified.

2.02 PANEL MATERIALS

- A. Metallic-Coated Steel Sheet Prepainted with Coil Coating: Steel sheet metallic coated by the hot-dip process and prepainted by the coil-coating process to comply with ASTM A 755/A 755M.
1. Zinc-Coated (Galvanized) Steel Sheet: ASTM A 653/A 653M, G90 (Z275) coating designation; structural quality.
 2. Aluminum-Zinc Alloy-Coated Steel Sheet: ASTM A 792/A 792M, Class AZ50 or AZ55 coating designation, Grade 40 (Class AZM150 or AZM165 coating designation, Grade 275); structural quality.
 3. Surface: Embossed finish.
 4. Exposed Finishes: Apply the following coil coating, as specified or indicated on Drawings.
 - a. High-Performance Organic Finish: Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
 - 1) Fluoropolymer Three-Coat System: Manufacturer's standard three-coat, thermocured system consisting of specially formulated inhibitive primer, fluoropolymer color coat, and clear fluoropolymer topcoat, with both color coat and clear topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight, with a minimum total dry film thickness of 1.5 mil (0.038 mm); complying with physical properties and coating performance requirements of AAMA 2605, except as modified below:
 - a) Humidity Resistance: 1000 hours.
 - b) Salt-Spray Resistance: 1000 hours.
 5. Concealed Finish: Apply pretreatment and manufacturer's standard white or light-colored acrylic or polyester backer finish, consisting of prime coat and wash coat with a minimum total dry film thickness of 0.5 mil (0.013 mm).
- B. Panel Sealants:
1. Sealant Tape: Pressure-sensitive, 100 percent solids, gray polyisobutylene compound sealant tape with release-paper backing. Provide permanently elastic, nonsag, nontoxic, nonstaining tape 1/2 inch (13 mm) wide and 1/8 inch (3 mm) thick.
 2. Joint Sealant: ASTM C 920; elastomeric polyurethane, polysulfide, or silicone sealant; of type, grade, class, and use classifications required to seal joints in metal wall panels and remain weathertight; and as recommended in writing by metal wall panel manufacturer.
 3. Butyl-Rubber-Based, Solvent-Release Sealant: ASTM C 1311.
- 2.03 THERMAL INSULATION FOR FACTORY-ASSEMBLED METAL WALL PANELS**
- A. Isocyanurate Insulation: Modified isocyanurate foam using a non-CFC blowing agent, board or foamed-in-place type as indicated, with maximum flame-spread and smoke-developed indexes of 25 and 450, respectively.
1. Closed-Cell Content: 90 percent when tested according to ASTM D 2856.

2.04 MISCELLANEOUS METAL FRAMING

- A. Steel Sheet Components, General: Complying with ASTM C 645 requirements for metal and with ASTM A 653/A 653M, G60 (Z180), hot-dip galvanized zinc coating.
- B. Subgirts: C- or Z-shaped sections fabricated from 0.0598-inch (1.5-mm) bare steel thickness, shop-painted, cold-formed, metallic-coated steel sheet.
- C. Zee Clips: 0.079-inch (2.0-mm) bare steel thickness, cold-formed, galvanized steel sheet.
- D. Base or Sill Angles and Channels: 0.079-inch (2.0-mm) bare steel thickness, cold-formed, galvanized steel sheet.
- E. Hat-Shaped, Rigid Furring Channels: ASTM C 645.
 - 1. Minimum Base Metal Thickness: 0.0312 inch (0.79 mm).
 - 2. Depth: 1-1/2 inches (38 mm).
- F. Cold-Rolled Furring Channels: 0.0538-inch (1.37-mm) bare steel thickness, with minimum 1/2-inch- (13-mm-) wide flange.
 - 1. Depth: 3/4 inch (19 mm).
 - 2. Furring Brackets: Adjustable, corrugated-edge type of steel sheet with minimum bare steel thickness of 0.0312 inch (0.79 mm).
 - 3. Tie Wire: ASTM A 641/A 641M, Class 1 zinc coating, soft temper, 0.0625-inch- (1.59-mm-) diameter wire, or double strand of 0.0475-inch- (1.21-mm-) diameter wire.
- G. Z-Shaped Furring: With slotted or nonslotted web, face flange of 1-1/4 inches (32 mm), wall attachment flange of 7/8 inch (22 mm), minimum bare metal thickness of 0.0179 inch (0.45 mm), and depth required to fit insulation thickness indicated.
- H. Fasteners for Metal Framing: Of type, material, size, corrosion resistance, holding power, and other properties required to fasten steel members to substrates.

2.05 MISCELLANEOUS MATERIALS

- A. Fasteners: Self-tapping screws, bolts, nuts, self-locking rivets and bolts, end-welded studs, and other suitable fasteners designed to withstand design loads. Provide exposed fasteners with heads matching color of metal wall panels by means of plastic caps or factory-applied coating.
 - 1. Fasteners for Wall Panels: Self-drilling or self-tapping, zinc-plated, hex-head carbon-steel screws, with a stainless-steel cap or zinc-aluminum-alloy head and EPDM or neoprene sealing washer.
 - 2. Fasteners for Wall Panels: Self-drilling or self-tapping 410 stainless or zinc-alloy steel hex washer head, with EPDM or PVC washer under heads of fasteners bearing on weather side of metal wall panels.
 - 3. Exposed Fasteners for Composite Panels: Stainless steel.
 - 4. Fasteners for Flashing and Trim: Blind fasteners or self-drilling screws with hex washer head.
 - 5. Blind Fasteners: High-strength aluminum or stainless-steel rivets.
- B. Bituminous Coating: Cold-applied asphalt mastic, SSPC-Paint 12, compounded for 15-mil (0.4-mm) dry film thickness per coat. Provide inert-type noncorrosive compound free of asbestos fibers, sulfur components, and other deleterious impurities.

2.06 FOAMED-INSULATION-CORE METAL WALL PANELS

- A. General: Provide factory-formed and -assembled metal wall panels fabricated from two metal facing sheets and insulation core foamed-in-place during fabrication with joints between panels designed to form weathertight seals. Include accessories required for weathertight installation.
1. Panel Performance:
 - a. Flatwise Tensile Strength: 30 psi (200 kPa) when tested according to ASTM C 297.
 - b. Humid Aging: Volume increase not greater than 6.0 percent and no delamination or metal corrosion when tested for 7 days at 140 deg F (60 deg C) and 100 percent relative humidity according to ASTM D 2126.
 - c. Heat Aging: Volume increase not greater than 2.0 percent and no delamination, surface blistering, or permanent bowing when tested for 7 days at 200 deg F (93 deg C) according to ASTM D 2126.
 - d. Cold Aging: Volume decrease not more than 1.0 percent and no delamination, surface blistering, or permanent bowing when tested for 7 days at minus 20 deg F (29 deg C) according to ASTM D 2126.
 - e. Fatigue: No evidence of delamination, core cracking, or permanent bowing when tested to a 20-lbf/sq. ft. (958-kPa) positive and negative wind load and with deflection of L/180 for 2 million cycles.
 - f. Autoclave: No delamination when exposed to 2-psi (13.8-kPa) pressure at a temperature of 212 deg F (100 deg C) for 2-1/2 hours.
 - g. Fire-Test-Response Characteristics: Class A according to ASTM E 108.
 2. Isocyanurate Insulation-Core Performance:
 - a. Density: 2.0 to 2.6 lb/cu. ft. (32 to 42 kg/cu. m) when tested according to ASTM D 1622.
 - b. Compressive Strength: Minimum 20 psi (140 kPa) when tested according to ASTM D 1621.
 - c. Shear Strength: 26 psi (179 kPa) when tested according to ASTM C 273.
- B. Concealed-Fastener, Foamed-Insulation-Core Metal Wall Panels: Formed with tongue-and-groove panel edges; designed for sequential installation by interlocking panel edges and mechanically attaching panels to supports using concealed clips or fasteners.
1. Basis of design product: Centria Formawall 1000
 2. Products:
 - a. Aluma Shield Industries, Inc., a Member of Metecno Group; [AW-300A Flush Wall Panel.
 - b. Coldmatic Building Systems; Thermawall 1000 HJF, 4000 HJF, or 5000 HJF.
 - c. Galvamet Inc.; Mono, Supra, or Thermal Panel.
 - d. Insulated Panel Systems, Div. of NCI Building Systems; ESP or EWP Wall Panel.
 - e. Metl-Span; CF Flat 200Wall Panel.
 - f. Steelox Systems Inc.; TW-100 Wall Panel.
 3. Facings: Fabricate panel with exterior and interior facings of same material and thickness.
 - a. Material: Zinc-coated (galvanized) steel sheet, 0.359 inch thick.
 - e. Exterior Facing Finish: Fluoropolymer.
 - 1) Color: As selected by Architect from manufacturer's full range.
 - f. Interior Facing Finish: Manufacturer's standard siliconized polyester.
 - g. Exterior Surface: Smooth, flat.
 4. Panel Coverage: 24 inches (610 mm), 30 inches (762 mm), 36 inches (914 mm), 39.37 inches (1000 mm), or 42 inches (1067 mm nominal).
 5. Panel Thickness: 2.0 inches (51 mm).
 6. Thermal-Resistance Value (R-Value): R 14.2

2.07 ACCESSORIES

- A. Wall Panel Accessories: Provide components required for a complete metal wall panel assembly including trim, copings, fasciae, mullions, sills, corner units, clips, flashings, sealants, gaskets, fillers, closure strips, and similar items. Match material and finish of metal wall panels, unless otherwise indicated.
1. Closures: Provide closures at eaves and rakes, fabricated of same metal as metal wall panels.
 2. Backing Plates: Provide metal backing plates at panel end splices, fabricated from material recommended by manufacturer.
 3. Closure Strips: Closed-cell, expanded, cellular, rubber or crosslinked, polyolefin-foam or closed-cell laminated polyethylene; minimum 1-inch- (25-mm-) thick, flexible closure strips; cut or premolded to match metal wall panel profile. Provide closure strips where indicated or necessary to ensure weathertight construction.
- B. Flashing and Trim: Formed from 0.0179-inch- (0.45-mm-) thick, zinc-coated (galvanized) steel sheet or aluminum-zinc alloy-coated steel sheet prepainted with coil coating. Provide flashing and trim as required to seal against weather and to provide finished appearance. Locations include, but are not limited to, bases, drips, sills, jambs, corners, endwalls, framed openings, rakes, fasciae, parapet caps, soffits, reveals, and fillers. Finish flashing and trim with same finish system as adjacent metal wall panels.

2.08 FABRICATION

- A. General: Fabricate and finish metal wall panels and accessories at the factory to greatest extent possible, by manufacturer's standard procedures and processes, as necessary to fulfill indicated performance requirements demonstrated by laboratory testing. Comply with indicated profiles and with dimensional and structural requirements.
1. Form panel lines, breaks, and angles to be sharp and true, with surfaces free from warp and buckle.
 2. Fabricate wall panels with panel stiffeners as required to maintain fabrication tolerances and to withstand design loads.
- B. Fabricate metal wall panels in a manner that eliminates condensation on interior side of panel and with joints between panels designed to form weathertight seals.
- C. Provide panel profile, including major ribs and intermediate stiffening ribs, if any, for full length of panel.
- D. Where indicated, fabricate metal wall panel joints with factory-installed captive gaskets or separator strips that provide a tight seal and prevent metal-to-metal contact, in a manner that will minimize noise from movements within panel assembly.
- E. Sheet Metal Accessories: Fabricate flashing and trim to comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" that apply to the design, dimensions, metal, and other characteristics of item indicated.
1. Form exposed sheet metal accessories that are without excessive oil canning, buckling, and tool marks and that are true to line and levels indicated, with exposed edges folded back to form hems.
 2. Sealed Joints: Form nonexpansion but movable joints in metal to accommodate elastomeric sealant to comply with SMACNA standards.
 3. Conceal fasteners and expansion provisions where possible. Exposed fasteners are not allowed on faces of accessories exposed to view.
 4. Fabricate cleats and attachment devices from same material as accessory being anchored or from compatible, noncorrosive metal recommended by metal wall panel manufacturer.

- a. Size: As recommended by SMACNA's "Architectural Sheet Metal Manual" or metal wall panel manufacturer for application but not less than thickness of metal being secured.

2.09 FINISHES, GENERAL

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical and painted finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- C. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, metal wall panel supports, and other conditions affecting performance of work.
 - 1. Examine primary and secondary wall framing to verify that girts, angles, channels, studs, and other structural panel support members and anchorage have been installed within alignment tolerances required by metal wall panel manufacturer.
 - 2. Examine solid wall sheathing to verify that sheathing joints are supported by framing or blocking and that installation is within flatness tolerances required by metal wall panel manufacturer.
 - 3. For the record, prepare written report, endorsed by Installer, listing conditions detrimental to performance of work.
- B. Examine roughing-in for components and systems penetrating metal wall panels to verify actual locations of penetrations relative to seam locations of metal wall panels before metal wall panel installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Clean substrates of substances harmful to insulation, including removing projections capable of interfering with insulation attachment.
- B. Install fasciae and copings to comply with requirements specified in Division 7 Section "Sheet Metal Flashing and Trim."
- C. Miscellaneous Framing: Install subgirts, base angles, sills, furring, and other miscellaneous wall panel support members and anchorage according to ASTM C 754 and metal wall panel manufacturer's written recommendations.

3.03 METAL WALL PANEL INSTALLATION, GENERAL

- A. General: Install metal wall panels in orientation, sizes, and locations indicated on Drawings.

Install panels perpendicular to girts and subgirts, unless otherwise indicated. Anchor metal wall panels and other components of the Work securely in place, with provisions for thermal and structural movement.

1. Field cutting of metal wall panels by torch is not permitted.
2. Shim or otherwise plumb substrates receiving metal wall panels.
3. Rigidly fasten base end of metal wall panels and allow eave end free movement due to thermal expansion and contraction. Pre-drill panels.
4. Flash and seal metal wall panels with weather closures at eaves, rakes, and at perimeter of all openings. Fasten with self-tapping screws. Do not begin installation until weather barrier and flashings that will be concealed by metal wall panels are installed.
5. Install screw fasteners in pre-drilled holes.
6. Locate and space fastenings in uniform vertical and horizontal alignment.
7. Install flashing and trim as metal wall panel work proceeds.
8. Locate panel splices over, but not attached to, structural supports. Stagger panel splices and end laps to avoid a four-panel lap splice condition.
9. Apply elastomeric sealant continuously between metal base channel (sill angle) and concrete, and elsewhere as indicated or, if not indicated, as necessary for waterproofing.
10. Align bottom of metal wall panels and fasten with blind rivets, bolts, or self-tapping screws. Fasten flashings and trim around openings and similar elements with self-tapping screws.
11. Provide weatherproof escutcheons for pipe and conduit penetrating exterior walls.

B. Fasteners:

1. **Steel Wall Panels:** Use stainless-steel fasteners for surfaces exposed to the exterior and galvanized steel fasteners for surfaces exposed to the interior.
2. **Aluminum Wall Panels:** Use aluminum or stainless-steel fasteners for surfaces exposed to the exterior and aluminum or galvanized steel fasteners for surfaces exposed to the interior.
3. **Copper Wall Panels:** Use copper or stainless-steel fasteners.
4. **Stainless-Steel Wall Panels:** Use stainless-steel fasteners.

C. Metal Protection: Where dissimilar metals will contact each other or corrosive substrates, protect against galvanic action by painting contact surfaces with bituminous coating, by applying rubberized-asphalt underlayment to each contact surface, or by other permanent separation as recommended by metal wall panel manufacturer.

D. Joint Sealers: Install gaskets, joint fillers, and sealants where indicated and where required for weatherproof performance of metal wall panel assemblies. Provide types of gaskets, fillers, and sealants indicated or, if not indicated, types recommended by metal wall panel manufacturer.

1. Seal metal wall panel end laps with double beads of tape or sealant, full width of panel. Seal side joints where recommended by metal wall panel manufacturer.
2. Prepare joints and apply sealants to comply with requirements in Division 7 Section "Joint Sealants."

3.04 FACTORY-ASSEMBLED METAL WALL PANEL INSTALLATION

A. General: Apply continuous ribbon of sealant to panel joint on concealed side of insulated metal wall panels as vapor seal; apply sealant to panel joint on exposed side of panels for weather seal.

1. Fasten insulated metal wall panels to supports with fasteners at each lapped joint at location, spacing, and with fasteners recommended by manufacturer.
2. Arrange and nest side-lap joints so prevailing winds blow over, not into, lapped joints. Lap ribbed or fluted sheets one full rib corrugation. Apply panels and associated items for neat and weathertight enclosure. Avoid "panel creep" or application not true to line.
3. Provide metal-backed washers under heads of exposed fasteners bearing on weather side of insulated metal wall panels.
4. Locate and space exposed fasteners in uniform vertical and horizontal alignment. Use proper tools to obtain controlled uniform compression for positive seal without rupture of

- washer.
 - 5. Provide sealant tape at lapped joints of insulated metal wall panels and between panels and protruding equipment, vents, and accessories.
 - 6. Apply a continuous ribbon of sealant tape to panel side laps and elsewhere as needed to make panels weatherproof to driving rains.
 - 7. Apply snap-on battens to insulated metal wall panel seams to conceal fasteners.
- B. Foamed-Insulation-Core Metal Wall Panels: Fasten metal wall panels to supports with concealed clips at each joint at location, spacing, and with fasteners recommended by manufacturer. Fully engage tongue and groove of adjacent panels.
- 1. Install clips to supports with self-tapping fasteners.

3.05 ERECTION TOLERANCES

- A. Installation Tolerances: Shim and align metal wall panel units within installed tolerance of 1/4 inch in 20 feet (6 mm in 6 m), nonaccumulative, on level, plumb, and location lines as indicated and within 1/8-inch (3-mm) offset of adjoining faces and of alignment of matching profiles.

3.06 FIELD QUALITY CONTROL

- A. Testing Agency: Owner will engage a qualified independent testing and inspecting agency to perform field tests and inspections and prepare test reports.
- B. Water Penetration: Test areas of installed system indicated on Drawings for compliance with system performance requirements according to ASTM E 1105 at minimum differential pressure of 20 percent of inward-acting, wind-load design pressure as defined by ASCE 7, "Minimum Design Loads for Buildings and Other Structures," but not less than 6.24 lbf/sq. ft. (300 Pa).
- C. Water-Spray Test: After completing the installation of 75-foot- (23-m-) by-2-story minimum area of metal wall panel assembly, test assembly for water penetration according to AAMA 501.2 in a 2-bay area directed by Architect.
- D. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect completed metal wall panel installation, including accessories. Report results in writing.
- E. Remove and replace applications of metal wall panels where inspections indicate that they do not comply with specified requirements.
- F. Additional tests and inspections, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

3.07 CLEANING AND PROTECTION

- A. Remove temporary protective coverings and strippable films, if any, as metal wall panels are installed, unless otherwise indicated in manufacturer's written installation instructions. On completion of metal wall panel installation, clean finished surfaces as recommended by metal wall panel manufacturer. Maintain in a clean condition during construction.
- B. After metal wall panel installation, clear weep holes and drainage channels of obstructions, dirt, and sealant.
- C. Replace metal wall panels that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

END OF SECTION

SECTION 07515
BUILT-UP ROOFING

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing built-up roofing.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Thermal insulation, nailers and cants: Section 07210.
- B. Metal counter flashing and other sheet metal: Section 07600.
- C. Roof accessories: Section 07730.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ASTM: D41, D312, D1668, D1863, D2178, , D4586.
 - 3. National Roofing Contractor's Association (NRCA):The NCRA Roofing and Waterproofing Manual.
- B. Single Source: Provide products as produced or recommended by the roofing system manufacturer.

1.04 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings:
 - 1. Include the following:
 - a. Manufacturer's material, handling, and application instructions.
 - b. Step-by-step application procedure proposed.
 - c. Show perimeter details, tapered insulation layout (as applicable), penetration details, drainage details and other typical and special conditions.
 - d. Staging plan showing access points, waste disposal, storage areas, etc.
- B. Certification:
 - 1. Submit certification from manufacturer of roofing, that roofing applicator is approved by manufacturer and has successfully performed at least three satisfactory roofing installations using materials and methods similar to those specified.
 - 2. Certification that materials furnished meet specified requirements and are compatible with each other and with adjacent materials under Related Work Specified Elsewhere.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to jobsite in their original unopened containers clearly labeled with manufacturer's name and brand designation, referenced specification number, type, class and rating as applicable.

- B. Store products in approved dry area with roll goods standing on ends and protect from contact with soil and from exposure to the elements. Keep products dry.
- C. Handle products so as to prevent breakage of containers and damage to products.
- D. Do not exceed designed live load of roof deck when stockpiling materials in areas of work.

1.06 JOB CONDITIONS:

- A. Environmental Requirements:
 - 1. Application of roofing when precipitation is occurring or when ice, frost or dampness is visible on roof decks is prohibited.
 - 2. Application of roofing when ambient temperature is lower than 40F is prohibited, unless otherwise approved.
 - 3. Maintain rolls of felt at 60F minimum 24 hours minimum prior to installation.

1.07 WARRANTY:

- A. One year in addition to the requirements of the General Provisions for a total of two years.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. General:
 - 1. Insofar as practicable, furnish products produced or recommended by a single roofing system manufacturer, including roofing system products specified in other sections.
- B. Thermal Insulation, Nailers and Cants: Section 07210.
- C. Asphalt Primer: ASTM D41.
- D. Asphalt: ASTM D312.
 - 1. Type I, 135F-151F softening point for level to 1/4-inch slope (*use not permitted*)
 - 2. Type II, 158F-176F softening point for 1/4-inch to one-inch slope.
 - 3. Type III, 185F-205F softening point for one-inch to three-inch slope.
 - 4. Type IV, 210F-225F softening point for three-inch to six-inch slope.
- E. Asphalt Cement(Asbestos-Free): ASTM D4586.
- F. Asphalt-Saturated and Coated Organic Felt Base Sheet: ASTM D2626 (*use not permitted*).
- G. Asphalt-Saturated Organic Roofing Felt: ASTM D226, Type I, perforated (*use not permitted*).
- H. Asphalt Glass Felt: ASTM D2178, Type IV or Type VI.
- I. Base Flashing Cap Sheet: Roofing system manufacturer's standard asphalt impregnated and coated composite sheet, glass fiber or polyester reinforced, with or without surface granules.
- J. Aggregate for Surfacing: ASTM D1863, light-colored crushed stone, slag or gravel, opaque to ultraviolet radiation.

- K. Walkway Surface: Homogenous core of asphalt, plasticizers and inert fillers bonded by heat and pressure between two saturated and coated inorganic sheets, with the walking surface finished with gray ceramic granules. Supply in 36-inch wide by 72-inch long sheets, 1/2-inch thick minimum.
- L. Nails: 11-gauge, annular-thread, galvanized roofing nails with 3/8-inch diameter head or combination nail with head one-inch square minimum.
- M. Tin Caps: Flat discs of galvanized sheet steel 28-gauge minimum and 1-3/8 inches minimum diameter.
- N. Combination Nails: Square-head cap 11-gauge, hot-dip galvanized, annular thread with one-inch diameter cap.
- O. Glass-Fiber Fabric: Woven glass cloth, treated with asphalt, ASTM D1668, Type I.
- P. Metal Counter Flashing and Other Sheet Metal: Section 07600.
- Q. Roof Accessories: Section 07730.

PART 3 - EXECUTION

3.01 EXAMINATION AND PREPARATION OF SURFACES:

- A. Clean substrates of dust, debris and other substances detrimental to roofing installation according to roofing system manufacturer's written instructions. Remove sharp projections.
- B. Examine substrates, areas, and conditions under which roofing will be applied, with installer present, for compliance with requirements.
- C. Verify proper secure placement of roof openings, penetrations, insulation, roof accessories and roof drains.
- D. Verify that substrates are smooth, dry, clean and free of projections or debris that might damage roofing materials.
- E. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.02 INSTALLATION:

- A. General: Perform installation in accordance with the NCRA Roofing and Waterproofing Manual unless specified or shown differently.
 1. Apply roofing perpendicular to roof slope progressively and continuously. Provide starter sheets to maintain specified number of felt plies throughout roof. Extend roofing plies to tops of cant strips.
 2. Protect edges of each day's application of felt, except for coated base sheet, with glaze coat of hot Type-III asphalt. Apply glaze coat at minimum rate of 15 pounds of asphalt per 100 square feet of roof surface.
 3. Do not store materials on applied roofing. Provide sufficient crew to complete roofing work on area begun before end of each day's work.

4. Roll felt into bitumen not more than three feet behind mop; broom thoroughly with roofer's smoothing brushes to ensure thorough bonding of sheets to eliminate air pockets, wrinkling and buckling. Felt may be machine applied if approved. Do not lay plies dry and turn back laps for mopping between plies.
5. Heat Types-II, III and IV asphalts 450F maximum; do not keep heated overnight.
6. Apply asphalt at no less than 350F. Use thermometers to check temperature of asphalt during heating and application. Keep kettle operator in attendance during entire operation to ensure that maximum specified temperatures are not exceeded.
7. Provide smooth, clear, board or plank runways and platforms near supports for traffic over partially or completely finished roofing.
8. Follow commercial practice and recommendations of manufacturer and supplier for handling and use of materials, except as otherwise specified.

B. Materials Schedule:

1. Each of the following for each 100 square feet of roof area:

Materials	Specification Amount
Base sheet	1 ply
Felt	3 plies
Asphalt - on deck	25 pounds
Asphalt - between plies	60 pounds
Asphalt - top pouring	60 pounds
Aggregate: One of the following: Slag Gravel or crushed stone	300 pounds 400 pounds

2. Base flashing is additional to the quantities above.

C. Application:

1. For direct application to concrete decks, coat decks uniformly with asphalt primer using not less than one gallon per square of roof area and allow to dry thoroughly.
2. Apply hot Type-III or Type IV asphalt uniformly in a solid mopping over primer or insulation at minimum rate of 25 pounds of asphalt per 100 square feet. On roofs of precast units, apply felt strips four inches or more in width centered over joints of precast units in cold-applied asphalt cement before solid mopping. Apply base sheet in hot asphalt with ends and edges lapped four inches over preceding sheet and sealed with hot asphalt.
3. Apply hot asphalt uniformly to base sheet at minimum rate of 20 pounds per 100 square feet. Apply three felt plies in hot asphalt, shingle fashion, each sheet in each ply lapping 24-3/4 inches over preceding ply. Lap ends of sheets six inches minimum and stagger laps in adjacent courses 12 inches minimum. Mop hot asphalt full lap-width of each ply so that felt never touches felt. Apply not less than 20 pounds of asphalt per 100 square feet between successive plies.
4. On roof slopes greater than one inch per foot, nail each ply of felt on slopes as specified. Correct fishmouths, breaks, blisters and other defects before flood-coating roofing.

5. Flood coat: After felt flashing applications, repairs and corrective actions have been completed and approved, coat entire surface uniformly with hot asphalt, poured from dipper, at minimum rate of 60 pounds per 100 square feet.
 6. Aggregate surfacing: Immediately embed gravel, crushed stone or slag into hot asphalt.
 7. Double surfacing: Provide double surfacing of aggregate in addition to normal requirement under each board of walkway-surface material as follows:
 - a. Apply not less than 80 pounds of hot asphalt poured from dipper per 100 square feet of roof area.
 - b. Embed immediately into hot asphalt 200 pounds minimum of slag or 300 pounds minimum of gravel or crushed stone.
- D. Nailing On Roof Slopes Greater Than One Inch Per Foot:
1. Nail each ply of felt. Run felt perpendicular to roof slope and nail to embedded nailers parallel to slope.
 2. Nail felt to each nailer with two nails spaced approximately two and eight inches from upper edge of felt.
- E. Base Flashing: Follow NRCA Roofing and Waterproofing Manual details and roofing system manufacturer's details.
1. Provide flashing in angles formed where roof decks abut walls, curbs, ventilators, pipes and other vertical surfaces and wherever necessary to make work watertight.
 2. Prime walls and curbs; allow to dry before flashing is applied.
 3. Apply base flashing in two layers: first of asphalt glass felt and topped with base flashing cap sheet cut in strips 12 feet long maximum with reinforced fabric side toward wall.
 4. Extend flashing felt onto roof over membrane six to eight inches from toe of cant. Nail felt 1-1/2 inches from top edge of felt with roofing nails and tin caps at 10-inch maximum spacing.
 5. Seal top of flashing with strip of glass fiber fabric embedded in 1/8-inch thick asphalt cement, extending from one-inch above top of felt to one-inch below nail heads.
 6. Lap ends of felt three inches minimum, staggered in each ply, and seal watertight with asphalt cement. Apply six-inch wide strip of asphalt-saturated felt with asphalt cement to seal lower edge of flashing installation.
 7. Cement felt to underlying surfaces and to each other with asphalt cement applied not less than 1/16-inch thick or 35 pounds per 100 square feet for each coating.
- F. Stripping-In:
1. Strip-in roof-accessory aprons, pipe sleeves and metal flashings as follows:
 - a. Prime surfaces and allow to dry. Strip-in with two layers of asphalt-saturated felt cemented with asphalt cement.
 - b. Extend felt three and six inches, respectively, beyond edge of apron, flange or flashing.
 2. Gravel stops, fascias and scuppers:
 - a. Strip-in with two layers of asphalt-saturated felt, one 10-inch strip and one 12-inch strip.
 - b. Solidly mop strips with hot bitumen.
- G. Roof-Drain Flashing Application:
1. Strip-in roof drain with two layers of asphalt-saturated felt, one 10 inches wide and one 12 inches wide, set in asphalt cement or hot bitumen.
 2. Heavily coat flashing ring of drain with asphalt cement before installing felt flashing. Clamp roofing felt and felt flashing securely in drain clamping ring.

3. Apply trowel coat of asphalt cement width of trowel on top of felt around clamping ring before flood coat and application of aggregate. Embed aggregate into asphalt cement.
- H. Metal Fascias and Flashings:
1. Where metal fascias or other metal flashing extend into built-up roofing, extend felt plies under metal with first two plies turned over succeeding plies and back 12 inches.
 2. After metal flashing is placed, apply two plies of asphalt-saturated felt flashing, set in pitch-base asphalt cement, over that part of metal extending onto roof.
- I. Approval of Flashing: Obtain approval of complete flashing and connections of roofing with other work before applying final coating and surfacing materials.
- J. Traffic Surfaces: Apply walkway-surface material in hot asphalt over double-aggregate surfacing in individual boards with 10-inch separation between each board. Extend separation through top surfacing to provide drain through walkways at level of original surfacing.

3.03 FIELD QUALITY CONTROL:

- A. Tests:
1. The Engineer may cut six-inch by 24-inch test specimens from roof; one specimen for each 5,000 square feet, but not less than one specimen for each roof level or area. In the event of test cuts, immediately restore roof to its original state, using same number of plies and moppings, shingled-out not less than 26 inches on sides of cut.
 2. Should examination and test of specimens disclose lack of specified material or nonconformity to specified requirements, the Engineer may order removal of roofing and replacement as specified, order that additional materials be applied uniformly over entire surface at least to the amount of deficiency disclosed in test specimens or order other corrections to be made.
- B. Prevention of Roof-Drain System Clogging:
1. Prevent asphalt and other roofing materials from entering and clogging roof drains and conductors.
 2. Repair or replace clogged or damaged components as directed.
 3. Remove roof-drain plugs when no work is taking place or during precipitation.
- C. Correct deficiencies in or remove built-up roofing that does not comply with requirements. Repair substrates, reinstall roofing and repair flashings to a condition free of damage and deterioration.
- D. Prevent asphalt and other roofing materials from spilling or migrating onto surfaces of other construction. Clean spillage using cleaning agents and procedures recommended by manufacturer of affected construction.

3.04 CLEAN-UP:

- A. Clean up rubbish and debris caused by this work and remove from the site.
- B. Promptly remove drippings of pitch and asphalt in exposed places on brick, concrete, steel, copper and other surfaces to prevent irreparable damage to exposed finish surfaces.

END OF SECTION

SECTION 07535

ELASTOMERIC MEMBRANE ROOFING

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide fully adhered EPDM roof membrane including all required flashings and terminations on new construction.
- B. Provide expansion joints at junctions with existing buildings that have both EPDM and built-up asphalt roofing.

1.02 QUALITY ASSURANCE

- A. Applicator qualifications: Manufacturer authorized Roofing Contractor
- B. Design Criteria:
 - 1. SPRI: "Wind Load Design Guide for Low Sloped Flexible Membrane Roofing Systems."
 - 2. IBC 2003, Section 1609 Wind Loads.
- C. National Roofing Contractors Association (NRCA): Roofing and Waterproofing Manual.
- D. Material Standards:
 - 1. EPDM Membrane:
 - a. ASTM-D4637, "Standard Specification for EPDM Sheet used in Single-Ply Roofing."
 - b. ASTM-D481, "Standard Specification for Non-vulcanized Rubber Sheet Used as Roof Flashing."

1.03 DESIGN RESPONSIBILITY & CRITERIA

- A. Determine the fastener type and spacing needed to resist uplift pressures based "Wind Load Design Guide for Low Sloped Flexible Membrane Roofing Systems" published by SPRI.
 - 1. Basic Wind Speed (3-sec gust, measured at 33 FT above ground, in Exposure B):
 - a. Minimum 90 MPH.
 - 2. Exposure:
 - a. "B," Urban/Suburban/Wooded.
 - 3. Importance Factor:
 - a. Category II.
 - 4. Roof Height(s) and Parapet Height(s): As indicated.
 - 5. Static Pressure of Building Interior: Less than 0.5 IN water.
- B. Fire resistance rating:
 - 1. UL 790, Class A.
 - 2. Assembly in conformance with fireproofing as specified.

1.04 SUBMITTALS

- A. Shop Drawings:
 - 1. Roof layout showing insulation thicknesses and special details.

2. Profiles of flashing assemblies.
- B. Product Data:
1. Installation Drawings and pertinent details.
 2. Indicate location of expansion joints, crickets, saddles, curbs, safety tiebacks, vents, drains and other penetrations.
 3. Indicate slope amount and direction, location of crickets, and key vertical elevation points.
- C. Samples:
1. 5 IN x 5 IN specimens of sheet goods.
- D. Project information:
1. Meeting minutes from Pre-Construction Conference.
 2. Report by manufacturer's representative that roof has been properly installed.
 3. Report showing physical properties of materials.
- E. Contract Closeout Information:
1. Warranty.
 2. Maintenance Data.
 3. Certificates.

1.05 WARRANTY

- A. 15-year warranty of weather/tightness signed by roofing materials manufacturer.
1. Warranty to include coverage for peak gusts of wind to:
 - a. 55 MPH at 33 FT above ground.
 2. Warranty to include the entire system: membrane, flashings, adhesives, sealants, counterflashings, insulation, fasteners, fastener plates, fastener strips, hard rubber or metal edging, metal termination bars, sheet metal copings and edge metal, and other materials authorized by manufacturer.
- B. 20-year warranty on 70% PVDF (Kynar 500) coatings on edge metal and copings.

1.06 PRE-CONSTRUCTION CONFERENCE

- A. Pre-construction conference, directed by General Contractor, prior to beginning of roofing work to discuss following:
1. Contract Document requirements.
 2. Roof plan.
 3. Roofing and flashing details.
 4. Drain and scupper elevations.
 5. Roofing manufacturer's specifications and details.
 6. UL requirements.
 7. Insulation manufacturer's recommendations.
 8. Available on site storage.
 9. Roof protection from damage by other trades.
- B. Attendance is recommended for:
1. General Contractor.
 2. Roofing contractor's superintendent.
 3. Roofing manufacturer's representative.

4. Sheet metal contractor performing metal flashing work.
 5. Mechanical contractor.
 6. Plumbing contractor.
 7. Deck contractor.
 8. Other trades whose work may effect roofing system.
- C. Minimum two weeks prior to conference, roofing contractor shall forward pertinent information to General Contractor for review.
1. Installation drawings.
 2. Manufacturer product data.
 3. Samples of proposed materials.
 4. Sample warranty.
 5. Other information deemed pertinent for sound and secure application.
- D. Conference shall review specifications, details, application requirements and preliminary work.
- E. Objectives of Pre-construction Conference to include:
1. Review foreseeable methods and procedures related to roofing work.
 2. Tour representative areas of roofing substrates (decks), inspect and discuss condition of substrate, roof drains, curbs, penetrations and other preparatory work performed by others.
 3. Review structural loading limitations of deck and inspect deck for loss of flatness and for required attachment.
 4. Review roofing system requirements (drawings, specifications and other contract documents).
 5. Review required submittals both completed and yet to be completed.
 6. Review and finalize construction schedule related to roofing work and verify availability of materials, installer's personnel, equipment and facilities needed to make progress and avoid delays.
 7. Review required inspection, testing, certifying and material usage accounting procedures.
 8. Review weather and forecasted weather conditions and procedures for coping with unfavorable conditions, including possibility of temporary roofing.
 - a. Review notification procedures for weather or non-working days.
 9. Record discussion of conference including decisions and agreements (or disagreements) reached.
 - a. If substantial disagreements exist at conclusion of conference, determine how disagreements will be resolved and set data for reconvening conference.
- F. Furnish copy of meeting record to each party who may be affected by roofing work, (weather or not they were in attendance) and to Owner and Architect.

1.07 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. Deliver to site in original, unopened containers labeled with the manufacturer's name, brand and installation instructions.
- B. Store cleaners and adhesive products, liquid materials and uncured materials at temperatures between 32 and 90 degF.
- C. When stored at lower temperatures, liquid materials must be srestored to at least 16 degC 60 degF prior to use.

- D. Insulation, sheathing, and cover boards:
 - 1. Store on pallets off the ground.
 - 2. Cover with a breathable membrane.
- E. Lightweight materials shall be weighted down to prevent wind damage.

1.08 JOB CONDITIONS

- A. When positioning membrane sheets, exercise care to locate all field splices away from low spots and out of drain sumps.
 - 1. All field splices should be shingled to prevent bucking of water.
- B. When loading materials onto the roof, the Applicator must comply with the requirements of the Owner to prevent overloading and possible disturbance to the building structure.
- C. Proceed with roofing work only when weather conditions are in compliance with the manufacturer's recommended limitations, and when conditions will permit the work to proceed in accordance with the manufacturer's requirements and recommendations.
- D. The surface on which the insulation or roofing membrane is to be applied shall be clean, smooth, dry, and free of projections or contaminants that would prevent proper application of or be incompatible with the new installation, such as fins, sharp edges, foreign materials, oil and grease.
- E. Contaminants such as grease, fats and oils shall not be allowed to come in direct contact with the roofing membrane.

PART 2 - PRODUCTS

2.01 ROOF SYSTEM

- A. Fully adhered EPDM over Steel Deck:
 - 1. Gypsum Sheathing.
 - 2. Vapor Retarder.
 - 3. Insulation.
 - a. Mechanically fastened or adhered to deck.
 - 4. EPDM Membrane.
- B. All components products made by, or accepted as "compatible" by membrane manufacturer.
- C. Unless otherwise approved by the specifier and accepted by the membrane manufacturer, all products (including insulation, fasteners, fastening plates and edgings) must be manufactured and supplied by the roofing system manufacturer and covered by the warranty.

2.02 SHEATHING

- A. Gypsum Sheathing:
 - 1. Water-resistant gypsum core with fiberglass facings.
 - 2. Minimum Thickness:
 - a. 5/8 IN.
 - 3. Products: "Dens-Deck Roof Board" by Georgia-Pacific, or equal.

2.03 VAPOR RETARDER

- A. 2-plyes of polyethylene, bonded over one layer of scrim reinforcing.
- B. Fire retardant type, with compatible fire retardant adhesive.
- C. Products: "TX-1200 FR" by Griffolyn, or equal.
- D. Minimum Properties:

Minimum Physical Properties - Vapor Retarder		
Property	Test Method	Required Value
Puncture Propagation Tear (Min)	ASTM-D256	26 LBS
Permeance	ASTM-E96	0.036 Perm
Drop Dart	ASTM-D1709, Method B	330 g
Tensile Strength	ASTM-D882	100 LBS / 4,504 PSI
Puncture Strength	ASTM-D4833	16 LBS
Surface Burning Characteristics	ASTM-E84	Class I, Class A

- E. Seam Tape:
 - 1. Self-adhering, asphaltic mastic.
 - 2. Products: "Fab Tape" by Griffolyn, or equal.
- F. Repair Tape, for punctures and other damaged areas:
 - 1. Products: "Griff Tape" by Griffolyn, or equal.

2.04 ROOF INSULATION AND COVER BOARD

- A. General:
 - 1. Furnished by roofing manufacturer.
 - 2. UL listed for assembly indicated.
 - 3. Provide crickets and saddles as required.
 - 4. When applicable, insulation shall be installed in multiple layers with joints staggered.
 - a. The first and second layer of insulation shall be mechanically fastened or adhered to the substrate in accordance with the manufacturer's published specifications.
- B. Polyisocyanurate (PISO) roof insulation:
 - 1. Rigid, closed cell foam core bonded to heavy-duty glass fiber mat facers.
 - 2. Material complying with:
 - 3.

Minimum Physical Properties - Polyisocyanurate Insulation		
Property	Test Method	Required Value
Material Standards	ASTM-C1289	Type II, Class 1
	HH-1-1972	Class 1
Density (nominal)	ASTM-D1622	2 PCF
Long Term Thermal Resistance (LTTR) per unit thickness	CAN / ULC-S770	R greater than or equal to 6.0 per inch
Compressive Strength	ASTM-D1622	20 PSI
Dimensional Stability	ASTM-D2126	2% max., 7 days
Permeance	ASTM-E96	< 1.0 Perm
Water Absorption	ASTM-C209	< 1.5% volume
Service Temperature	-	-100 to +250 degF

3. Tapered Configurations:
 - a. Insulation Thickness (based on R-Value required):
 - 1) Provide insulation thickness as required to attain a minimum average aged RSI-Value R-Value of 19 for entire roof area.
 - 2) Minimum 1 IN thickness at roof drains.
 - b. Taper to provide slope of 1:50 1/4 IN per FT.
4. Products: "Sure-Seal Polyisocyanurate HPH" by Carlisle SynTec, or "Iso 95+ GL:" by Firestone, or equal.

2.05 ROOFING MEMBRANE

- A. EPDM Roofing membrane:
 1. Material: Ethylene propylene diene terpolymer (synthetic rubber) complying with ASTM-4637.
 2. Fire Retardant.
 3. Color: Black.
 4. Thickness: Minimum 60 mil.
 - a. Polyester reinforced, complying with ANSI/RMA IPR-2.
 5. Products: "SureSeal" by Carlisle SynTec, or "Rubergard" by Firestone, or equal.
 6. Minimum Physical Properties:

Minimum Physical Properties - Black, 60mil, Reinforced EPDM Membrane		
Property	Test Method	Required Value
Tolerance on Nominal Thickness (Max)	ASTM-D751	+/- 10%
Thickness over Scrim (Min)	ASTM-D4637	15 mil
Breaking Strength (Min)	ASTM-D751	90 LBS

Ultimate Elongation (Min)	ASTM-D751	250%
Tear Strength (Min)	ASTM-D751	10 LBS
Brittleness Point	ASTM-D2137	-49 degF

- B. Membrane flashings, fasteners, adhesives, tapes, cements and sealants: Roofing manufacturer's standard.

2.06 FASTENERS

- A. Type, spacing and quantity as recommended by manufacturer.
1. Designed to resist uplift forces generated by specified wind speed.
- B. Minimum pullout values per fastener:
1. For use with 22 GA steel decks: 350 LBS each.
- C. Fasteners shall be capable of providing a static back-out resistance of at least 10 IN-LBS.

2.07 WALKWAYS

- A. Molded Walkway Pads:
1. Molded rubber walkway pad with slip-resistant surface.
 2. Color: Black.
 3. Nominal Thickness: 2/16 IN.
 4. Length and Width: 30x30 IN.
 5. Include glue or pressure-sensitive tape as recommended by membrane manufacturer.
 6. Locate where indicated.
 - a. Do not locate within 20 FT of roof edge.

2.08 MISCELLANEOUS ITEMS

- A. Roofing accessories:
1. Use manufacturer's standard prefab accessories where available.
 2. Nailing strips: As detailed and required.
 3. Pipe flashings: Provide for each pipe penetration; include clamps, adhesive and sealants.
 4. Expansion joint covers.
- B. Adhesives, cleaners, and primers: As recommended by roofing manufacturer.
- C. Treated Wood Blocking: Specified in Section 06100.
- D. Other materials as required by manufacturer for complete system warranty.

PART 3 - EXECUTION

3.01 INSPECTION

- A. Inspect entire area to be roofed for acceptability.
- B. Correct, or have corrected, unsatisfactory conditions.

3.02 PREPARATION

- A. Remove standing water from area to be covered prior to starting roofing work.
- B. Install required nailers.
- C. Clear the deck of all debris, ice, water and foreign material prior to installation of any roofing materials.

3.03 INSTALLATION OF ROOFING - GENERAL

- A. Install materials in accordance with manufacturer's instructions and recommendations.
- B. Comply with the manufacturer's instructions for the installation of the membrane roofing system including proper substrate preparation, jobsite considerations and weather restrictions.
- C. Install materials in accordance with procedures required for FM and UL assemblies.

3.04 INSTALLATION OF NAILERS

- A. Install nailers at perimeter of each roof level, curbs, skylights, expansion joints, and similar penetrations.

3.05 INSTALLATION - SHEATHING

- A. Lay sheathing tightly butted and cut to fit around penetrations.
- B. Apply per UL requirements.
- C. Attach sheathing to deck in accordance with roofing manufacturer's recommendations.

3.06 INSTALLATION - VAPOR RETARDER

- A. Install in accordance with manufacturer's instructions.
- B. Ensure that surface beneath vapor retarder is smooth with no sharp projections.
- C. Do not proceed until deficiencies are corrected.
- D. Install in largest practical widths.
- E. Install continuously at locations indicated.
 - 1. Insure that no discontinuities occur, including at seams, penetrations, and edge terminations.
 - 2. Join sections of vapor retarder and seal penetrations with mastic tape.
 - 3. Lap joints 100mm 4 IN and seal with adhesive.
 - 4. Ensure that surfaces to be taped are clean and dry.
- F. Seal around pipes, conduits, curbs, safety tie-backs, and other penetrations with pipe boots in accordance with manufacturer's instructions.

- G. Maintain continuity of vapor retarder over expansion joints.
- H. Repair holes in vapor retarder with self-adhesive tape recommended by manufacturer.
- I. Protect vapor retarder from damage until covered with insulation.

3.07 INSTALLATION - WOOD BLOCKING

- A. Install where indicated or required for proper securement of roofing system.
- B. Securement of wood blocking:
 - 1. Design to resist a minimum of 200 LBS/LF in any direction per SPRI Test Method RE-1.
- C. Install so that top of blocking is substantially flush (+/- 6 mm 1/4 IN) with top of insulation.

3.08 INSTALLATION - INSULATION

- A. Where required thickness of insulation is greater than 2 IN: Install insulation in at least 2 layers.
 - 1. Stagger board joints in successive layers laterally, and longitudinally.
 - 2. Butt joints tightly, and dress top surface of joints as required to preclude ponding at seams.
 - a. Joints shall not exceed 6mm 1/4 IN.
 - b. Joints and gaps greater than 6mm 1/4 IN shall be filled with the same material.
 - 3. Cut insulation neatly to fit around roof penetrations and projections.
- B. Secure insulation to the substrate with the required mechanical fasteners or adhesive in accordance with the manufacturer's specifications.
 - 1. Cut insulation neatly to fit around roof penetrations and projections.
 - 2. Mechanically fasten (or adhere) insulation to deck to UL and FM requirements.
 - a. Fastener shall be attached through all layers of insulation.
- C. Install fasteners in accordance with manufacturer's requirements.

3.09 INSTALLATION - MEMBRANE

- A. Unroll and position membrane without stretching.
 - 1. Allow the membrane to relax for approximately 1/2 hour before bonding.
 - 2. Fold the sheet back onto itself so half the underside of the membrane is exposed.
- B. Position sheets to accommodate contours of roof deck.
 - 1. Shingle splices to avoid bucking water.
- C. Apply the bonding adhesive in accordance with the manufacturer's published instructions, to both the underside of the membrane and the substrate.
 - 1. Allow the adhesive to dry until it is tacky but will not string or stick to a dry finger touch.
 - 2. Roll the coated membrane into the coated substrate while avoiding wrinkles.
 - 3. Brush down the bonded half of the membrane sheet with a soft bristle push broom to achieve maximum contact.

4. Fold back the unbonded half of the membrane sheet and repeat the bonding procedure.
- D. Intall adjoining membrane sheets in the same manner, overlapping edges approximately 100mm 4 IN.
1. Do not apply bonding adhesive to the splice area.
- E. Membrane Splices
1. Overlap adjacent sheets a minimum of 3 IN and adhere with cement, seam tape or other method approved by manufacturer.
 2. Comply with manufacturer's instructions for splicing procedures.
- F. Perimeter Securement:
1. Secure membrane along the perimeter of each roof level, roof section, curb, skylight, interior wall, penthouse, and other penetrations as recommended by membrane manufacturer.
- G. Membrane Flashing:
1. Flash all penetrations and walls with cured EPDM membrane or flashing.
 2. Exceptions:
 - a. Uncured flahsings and pressure sensitive uncured flashing shall be limited to overlaying of vertical seams, flashing of inside and outside corners, scuppers, and other unusually shaped penetrations where the use of cured membrane flashing is.
 - b. Manufacturer's standard pre-manufactured accessories (i.e. pre-molded pipe flashings, peal-n-stock pipa boots, and inside/outside corners, etc) shall be used wherever possible in lieu of uncured flashings.
 3. Terminate base-of-wall flashings in accordance with manufacturer's approved details.
 4. Pre-flashing at sheet metal parapet copings:
 - a. Extend EPDM membrane and/or flashing over top of parapet prior to capping with sheet metal.
 5. Expansion Joints:
 - a. Install EPDM membrane at expansion joints as recommended by manufacturer.
- H. Hot or Cold Weather Procedures:
1. Comply with manufacturer's instructions.

3.10 INSTALLATION - WALKWAYS

- A. Molded Walkway Pads:
1. Install where indicated.
 2. Clean surfaces to be adhered.
 3. Adhere pads to membrane per manufacturer's instructions.

3.11 PROTECTION

- A. Prevent water from getting under installed membrane by using water cutoffs.
1. Make water cutoffs by extending membrane beyond insulation and setting end of membrane in 4 IN wide strip of water cutoff mastic.
 2. Remove temporary water cutoffs prior to proceeding with next work period; remove portion of membrane in contact with matic.

- B. Remove and replace wet insulation.

3.12 CLEAN UP

- A. All debris must be disposed of in a legally acceptable manner.
- B. A representative of manufacturer shall make an inspection and issue written report to Architect that roofing system has been installed properly.

END OF SECTION

THIS PAGE NOT USED

SECTION 07553

SELF-ADHERING MODIFIED BITUMINOUS MEMBRANE ROOFING

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This Section includes the following:
 - 1. Protected, self-adhering roofing membrane, two ply.
 - 2. Insulation.
 - 3. Aggregate ballast.
 - 4. Roof pavers.

- B. Related Sections include the following:
 - 1. Rough Carpentry: Section 06100.
 - 2. Flashing and Sheet Metal: Section 07600
 - 3. Roof Specialties: Section 07730
 - 4. Piping Systems: Section 15205

1.02 PERFORMANCE REQUIREMENTS

- A. Install self-adhering modified bituminous membrane roofing and flashing system with compatible components that will not permit passage of liquid and will withstand wind loads, flotation loads, thermally induced movement, and exposure to weather without failure.

1.03 SUBMITTALS

- A. Product Data: For each type of roofing material indicated.

- B. Shop Drawings: Show locations and extent of roofing. Include plans, sections, details, and attachments to other Work, for substrate joints and cracks, flashing sheets, roof penetrations, inside and outside corners, vertical intersections, roof slope, expansion joints, and membrane terminations.
 - 1. Show locations, extent, and details of roof pavers.

- C. Samples for Verification: For each of the following products:
 - 1. 12-by-12-inch300-by-300-mm square of flashing sheet.
 - 2. 12-by-12-inch300-by-300-mm square of board insulation.
 - 3. 10 lb4.5 kg of aggregate ballast in gradation indicated.
 - 4. Roof paver, full sized, in each color and texture required.

- D. Installer Certificates: Signed by manufacturers certifying that installers comply with requirements.

- E. Qualification Data: For Installer.

- F. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for current formulation of self-adhering modified bituminous membrane roofing.

- G. Research/Evaluation Reports: For self-adhering modified bituminous membrane roofing.

- H. Maintenance Data: For roofing system to include in maintenance manuals.
- I. Warranties: Draft of special warranty specified in this Section.
- J. Inspection Report for Information: Copy of roofing system manufacturer's inspection report of completed roofing membrane.

1.04 QUALITY ASSURANCE

- A. Installer Qualifications: An employer of workers trained and approved by manufacturer.
- B. Source Limitations: Obtain roofing membrane materials through one source from a single manufacturer.
- C. Fire-Test-Response Characteristics: Provide self-adhering modified bituminous membrane roofing with the fire-test-response characteristics indicated, as determined by testing identical products per test method indicated below by UL or another testing and inspecting agency acceptable to authorities having jurisdiction. Identify materials with appropriate markings of applicable testing and inspecting agency.
 - 1. Exterior Fire-Test Exposure: Class A; complying with ASTM E 108, for application and slopes indicated.
- D. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1 Section "Project Management and Coordination."

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials to Project site in original containers with seals unbroken, labeled with manufacturer's name, product brand name and type, date of manufacture, and directions for storing and mixing with other components.
 - 1. Handle and store roofing materials and place equipment in a manner to avoid significant or permanent damage to deck or structural supporting members.
- B. Protect roofing insulation materials from damage and from deterioration by sunlight, moisture, soiling, and other sources. Store in a dry location.

1.06 PROJECT CONDITIONS

- A. Environmental Limitations: Apply roofing within the range of ambient and substrate temperatures recommended by roofing system manufacturer. Do not apply roofing to a damp or wet substrate.
 - 1. Do not apply roofing in snow, rain, fog, or mist.

1.07 WARRANTY

- A. Special Roofing Membrane Manufacturer's Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace roofing that does not remain watertight and base flashing that does not remain watertight or that splits, tears, or separates at seams or from substrate within specified warranty period.
 - 1. Warranty also includes board insulation and roof pavers.

2. Warranty does not include failure of roofing membrane due to formation of new joints and cracks in roof deck in excess of 1/16 inch 1.6 mm wide.
3. Warranty Period: 15 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:

2.02 ROOFING MEMBRANE

- A. Self-Adhering Modified Bituminous Roofing Membrane: 50-mil-1.3-mm- thick, minimum, sheet consisting of 46 mils 1.2 mm, minimum, of rubberized asphalt laminated to a 4-mil-0.10-mm- thick, cross-laminated, high-density polyethylene film; with release liner on adhesive side.
 1. Physical Properties: As follows, measured per standard test methods referenced:
 - a. Tensile Strength (Membrane): 250 psi 1.7 MPa minimum; ASTM D 412, Die C, modified.
 - b. Ultimate Elongation: 250 percent minimum; ASTM D 412, Die C, modified.
 - c. Pliability: Pass at minus 25 deg F minus 32 deg C; ASTM D 146.
 - d. Crack Cycling: Unaffected after 100 cycles of 1/8-inch 3-mm movement; ASTM C 836.
 - e. Puncture Resistance: 40 lbf 180 N minimum; ASTM E 154.
 - f. Water Absorption: 0.15 percent weight-gain maximum after 48-hour immersion at 70 deg F 21 deg C; ASTM D 570.
 2. Underlayment Membrane: Self-leveling, two-component, elastomeric, cold fluid-applied modified urethane.

2.03 AUXILIARY MATERIALS

- A. General: Furnish auxiliary materials recommended by roofing system manufacturer for intended use and compatible with roofing.
 1. Furnish liquid-type auxiliary materials that meet VOC limits of authorities having jurisdiction.
- B. Concealed Flashing Membrane: Self-adhering, rubberized-asphalt composite sheet of same material, construction, and thickness as roofing membrane.
- C. Metal Counterflashing: Metal counterflashing is specified in Division 7 Section "Sheet Metal Flashing and Trim."
- D. Liquid Membrane: Trowel grade, two-component, elastomeric, cold fluid-applied urethane.
- E. Mastic and Sealant: Liquid mastic and sealant recommended by manufacturer.
- F. Metal Termination Bars: Manufacturer's standard predrilled stainless-steel or aluminum termination bars, approximately 1 by 1/8 inch 25 by 3 mm thick; with anchors.

- G. Fabric Mat: Woven or nonwoven polypropylene, polyolefin, or polyester fabric mat; water permeable and resistant to UV-light degradation; of type and weight recommended by insulation manufacturer for application.

2.04 INSULATION

- A. Board Insulation: ASTM C 578; extruded polystyrene, of type, minimum density, and minimum compressive strength indicated below; fabricated with rabbeted edges and with one side having ribbed drainage channels:
1. Type VI, 1.8 lb/cu. ft. 29 kg/cu. m and 40 psi 276 kPa. Retain paragraph and selected subparagraph below if mortar-faced, extruded-polystyrene roofing insulation is required.
- B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Board Insulation:
 - a. Diversifoam Products.
 - b. Dow Chemical Company (The).
 - c. Owens Corning.
 - d. Tenneco Building Products.

2.05 AGGREGATE BALLAST

- A. Aggregate Ballast: Washed, crushed stone or smooth stone that will withstand weather exposure without significant deterioration and will not contribute to membrane degradation. Provide one of the following sizes in accordance with applicable wind load design:
1. Size: ASTM D 448, Size 5, ranging in size from 1/2 to 1 inch 13 to 25 mm.
 2. Size: ASTM D 448, Size 4, ranging in size from 3/4 to 1-1/2 inches 19 to 38 mm.
 3. Size: ASTM D 448, Size 2, ranging in size from 1-1/2 to 2-1/2 inches 38 to 63 mm.

2.06 ROOF PAVERS

- A. Roof Pavers: Heavyweight, hydraulically pressed, concrete units, with top edges beveled **3/16 inch 5 mm**, factory cast for use as roof pavers; absorption not greater than 5 percent, ASTM C 140; no breakage and maximum 1 percent mass loss when tested for freeze-thaw resistance, ASTM C 67; and as follows:
1. Size: 24 by 24 inches 600 by 600 mm. Manufacture pavers to dimensional tolerances of plus or minus 1/16 inch 1.6 mm in length, height, and thickness
 2. Weight: In accordance with wind load design.
 3. Colors and Textures: As selected by The Engineer from manufacturer's full range.
 4. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 5. Hanover Architectural Products, Inc.
 6. Rapid Building Systems.
 7. Roofblok, Ltd.
 8. Sunny Brook Pressed Concrete Co.
 9. Wausau Tile, Inc.; Terra-Paving Div.
 10. Westile Roofing Products.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates, areas, and conditions under which roofing will be applied, with Installer present, for compliance with requirements and other conditions affecting performance.
 - 1. Proceed with installation only after minimum concrete drying period recommended by roofing system manufacturer has passed.
 - 2. Verify that concrete substrate is visibly dry and free of moisture. Test for capillary moisture by plastic sheet method according to ASTM D 4263.
 - 3. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Clean and prepare substrate according to manufacturer's written recommendations. Provide clean, dust-free, and dry substrate for roofing application.
- B. Mask off adjoining surfaces not receiving roofing to prevent spillage from affecting other construction.
- C. Protect roof drains and other deck penetrations to prevent spillage and migration of roofing fluids.
- D. Remove grease, oil, form-release agents, paints, curing compounds, and other penetrating contaminants or film-forming coatings from concrete.
- E. Remove fins, ridges, mortar, and other projections and fill honeycomb, aggregate pockets, holes, and other voids.
- F. Prepare, fill, and treat joints and cracks in substrate. Remove dust and dirt from joints and cracks according to ASTM D 4258.
 - 1. Install roofing membrane strip and center over treated construction and contraction joints and cracks exceeding a width of 1/16 inch 1.6 mm.
- G. Prepare, treat, and seal vertical and horizontal surfaces at terminations and penetrations through roofing and at drains and protrusions.

3.03 ROOFING MEMBRANE INSTALLATION

- A. Install roofing membrane according to roofing membrane manufacturer's written instructions.
- B. Install fluid-applied underlayment membrane to substrate over area to receive roofing membrane and base flashing. Spread over roof deck to form a uniform, seamless membrane, average 60 mils 1.5 mm thick, but not less than 40 mils 1 mm thick. Allow to cure for at least 24 hours before subjecting to foot traffic.
 - 1. Install fluid-applied underlayment membrane to extend beyond height of concealed flashing membrane.
- C. Install liquid-membrane beads at roof-deck-supported wall junctions. Install transition membrane strips centered over inside and outside corners and at roof terminations.

1. Install bead of liquid membrane on horizontal inside corners.
- D. Install self-adhering modified bituminous membrane roofing.
 - E. Two-Ply Application: Apply and firmly adhere membrane over underlayment membrane. Accurately align sheets and maintain uniform side laps of not less than 50 percent of sheet width to provide minimum coverage of 2 thicknesses of membrane. Maintain uniform 6-inch-150-mm- wide end laps. Overlap and roll seams and stagger end laps. Seal T-joints at end laps of top ply.
 - F. Apply membrane from low point to high point of roof deck to ensure that side laps shed water.
 - G. Repair tears, voids, and lapped seams in roofing not complying with requirements. Slit and flatten fishmouths and blisters. Patch with roofing membrane extending 6 inches150 mm beyond repaired areas in all directions.
 - H. Correct deficiencies in or remove roofing membrane that does not comply with requirements, repair substrates, reapply roofing membrane, and repair flashing sheets.

3.04 FLASHING INSTALLATION

- A. Install concealed flashing membrane at terminations, at roof edges, and at penetrations through roofing membrane, according to roofing membrane manufacturer's written instructions.
- B. Install concealed flashing membrane and extend up walls or parapets a minimum of 8 inches200 mm above insulation.
- C. Install termination bars and mechanically fasten to top of concealed flashing membrane at terminations and perimeter of roofing.
- D. Seal junction of roofing membrane and concealed flashing membrane with mastic or sealant fillets.

3.05 INSULATION INSTALLATION

- A. Loosely lay board insulation units over roofing membrane, with long joints of insulation in continuous straight lines and with end joints staggered between rows. Abut edges and ends between units.
- B. Install one or more layers of insulation to achieve required thickness over roofing membrane. Cut and fit to within 3/4 inch19 mm of projections and penetrations.
- C. Install fabric mat over insulation, overlapping edges and ends at least 12 inches300 mm. Do not lap ends of fabric sheets within 72 inches1800 mm of roof perimeter. Extend fabric 2 to 3 inches50 to 75 mm above ballast at perimeter and penetrations. Apply additional layer of fabric around penetrations to prevent aggregate from getting between penetration and insulation. Do not cover drains or restrict water flow to drains.

3.06 BALLAST INSTALLATION

- A. Apply ballast uniformly over fabric mat at rate required by insulation manufacturer, but not less than the following, carefully spreading aggregate to minimize possibility of damage to membrane. Apply ballast as insulation is installed, leaving roofing membrane insulated and ballasted at end of workday. Provide one of the following in accordance with wind load design:
1. Ballast: 15 lb/sq. ft.75 kg/sq. m, Size 5 aggregate within 48 inches1200 mm of roof perimeter and 24 inches600 mm of roof penetrations; 10 lb/sq. ft.50 kg/sq. m, Size 5 aggregate elsewhere.
 - a. Install one row of roof pavers in lieu of aggregate ballast to roof perimeter and penetrations.
 2. Ballast: 15 lb/sq. ft.75 kg/sq. m, Size 4 aggregate within 48 inches1200 mm of roof perimeter and 24 inches600 mm of roof penetrations; 12 lb/sq. ft.60 kg/sq. m, Size 4 aggregate elsewhere.
 3. Ballast: 12 lb/sq. ft.60 kg/sq. m, Size 4 aggregate to field of roof; lay 2 rows of roof pavers at roof perimeters and penetrations according to insulation manufacturer's written instructions.
 4. Ballast: 15 lb/sq. ft.75 kg/sq. m, Size 2 aggregate within 48 inches1200 mm of roof perimeter and 24 inches600 mm of roof penetrations; 13 lb/sq. ft.65 kg/sq. m, Size 2 aggregate to field of roof; lay 3 rows of roof pavers to corners of roof according to insulation manufacturer's written instructions. Mechanically fasten securement strapping to first row of corner edge roof pavers.
 5. Ballast: 13 lb/sq. ft.65 kg/sq. m, Size 2 aggregate to field of roof; lay 3 rows of concrete pavers at roof perimeter, corners, and penetrations according to insulation manufacturer's written instructions. Mechanically fasten securement strapping to first row of perimeter and corner edge roof pavers.
 6. Ballast: 15 lb/sq. ft.75 kg/sq. m, Size 2 aggregate within 24 inches600 mm of roof penetrations; 13 lb/sq. ft.65 kg/sq. m, Size 2 aggregate to field of roof; lay 4 rows of roof pavers along roof perimeter and at corners according to insulation manufacturer's written instructions. Mechanically fasten securement strapping to first two rows of perimeter and corner edge roof pavers.
 7. Walkway Pavers: Lay roof-paver walkways using roof pavers of size indicated or, if not indicated, of manufacturer's standard size.

3.07 ROOF-PAVER INSTALLATION

- A. Lay roof-paver ballast according to insulation manufacturer's written instructions.
1. Install roof pavers on pedestals set according to pedestal manufacturer's written instructions.

3.08 FIELD QUALITY CONTROL

- A. Engage a qualified testing agency to observe flood tests and to determine and report leaks.
- B. Flood Testing: Flood test each roof deck area for leaks, according to recommendations in ASTM D 5957, after completing roofing and flashing, but before overlying construction is placed. Install temporary containment assemblies, plug or dam drains, and flood with potable water.
1. Flood to an average depth of 2-1/2 inches65 mm with a minimum depth of 1 inch25 mm and not exceeding a depth of 4 inches100 mm. Maintain 2 inches50 mm of

clearance from top of base flashing. Water depth not to exceed load capacity of roof deck.

2. Flood each area for 24 hours.
 3. After flood testing, repair leaks, repeat flood tests, and make further repairs until roofing and flashing installation is watertight.
- C. Final Roof Inspection: Arrange for roofing system manufacturer's technical personnel to inspect roofing installation on completion of roofing membrane and flashing.
1. Notify The Engineer 48 hours in advance of date and time of inspection.
- D. Correct deficiencies in or remove roofing that does not comply with requirements, repair substrates, reapply roofing, and repair flashing.
1. After flood tests, repair leaks and make further repairs until roofing installation is watertight.
- E. Additional testing, at Contractor's expense, will be performed to determine compliance of corrected Work with requirements.

3.08 PROTECTING AND CLEANING

- A. Protect roofing according to manufacturer's written recommendations to prevent damage and wear during application and remainder of construction period.
- B. Protect installed insulation from damage due to UV-light exposure, physical abuse, and other causes. Provide temporary coverings where insulation will be subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.
- C. Clean spillage and soiling from adjacent construction using cleaning agents and procedures recommended by manufacturer of affected construction.

END OF SECTION

SECTION 07600

FLASHING AND SHEET METAL

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing miscellaneous-waterproofing sheet metal including metal flashings, copings, exposed trim, fasciae, gravel stops, reglets, scuppers, gutters and downspouts, conductor heads, splash pans, drip edges, roof and roof-to-wall expansion joint covers, shower pans, overhead piping safety pans, metal accessories, gutter screens, strainers, red-rosin paper, solder, and related nailing strips and miscellaneous wood supports.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Brick Masonry: Section 04215.
- B. Concrete Unit Masonry: Section 04220
- C. Rough Carpentry: Section 06100.
- D. Seals and Sealants: Section 07900.
- E. Roof Accessories: Section 07730.
- F. Built-up Roofing: Section 07515.

1.03 PERFORMANCE REQUIREMENTS:

- A. General: Install sheet metal flashing and trim to withstand wind loads, structural movement, thermally induced movement, and exposure to weather without failing.
- B. Fabricate and install flashings at roof edges to comply with recommendations of FM Loss Prevention Data Sheet 1-49 for the following wind zone:
 - 1. Wind Zone 3: Wind pressures of 46 to 104 psf.

1.04 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Product Data including manufacturer's material and finish data, installation instructions, and general recommendations for each specified flashing material and fabricated product.
- B. Shop Drawings:
 - 1. Show both shop-fabricated and site-fabricated work, indicating where each item is fabricated. Include complete details of joints, supports and fasteners, in accordance with SMACNA Architectural Sheet Metal Manual standard details where applicable.
 - 2. Show dimensions and locations of wood nailing strips, miscellaneous wood supports and details of installation.
 - 3. Fabricated Masonry Flashing: Detail corner units, end-dam units, and other special applications.
- C. Samples: Three of each type of the following materials used in the work:
 - 1. Stainless steel: 12 inches square.
 - 2. Bituminous paint: Pint containers.

3. Aluminum coping: 12-inch by 12-inch corner section.
4. Stainless steel coping: 12-inch by 12-inch corner section.
5. Reglets: 12-inch strips.
6. Expansion-joint cover: 12-inch strips.
7. Downspout and gutter: 12-inch length with anchor strap.
8. Copper-Laminated Flashing: 12 inches square.
9. Coil-coated galvanized steel: 12 inches square.
10. Metal accessories.

D. Certification.

1.05 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
1. Comply with codes and regulations of the jurisdictional authorities.
 2. SMACNA: Architectural Sheet Metal Manual.
 3. FS: QQ-L-201, UU-B-790.
 4. AAMA: 606.1.
 5. NRCA: Roofing and Waterproofing Manual.
 6. ASTM: A167, A755, B32, B101, B209, B221, B370.
 7. UL: 580 for Class 90 wind-uplift resistance.
 8. FM: Loss Prevention Data Sheet 1-49.
 9. Copper Development Association: Copper in Architecture Handbook.
- B. Installer Qualifications: Engage an experienced Installer who has completed sheet metal flashing and trim work similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.
- C. Coordinate Work of this Section with interfacing and adjoining Work for proper sequencing of each installation. Ensure best possible weather resistance, durability of Work, and protection of materials and finishes.

1.06 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to jobsite in original unopened containers clearly marked with manufacturer's name and brand designation, reference specification number, type and class as applicable.
- B. Store products in approved dry area and protect from contact with soil and exposure to the elements. Keep products dry.
- C. Handle products so as to prevent breakage of containers and damage to products.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Stainless Steel:
1. Through-wall flashing (mechanically keyed) sheets: ASTM A167, Type 304, soft annealed, minimum thickness 0.012 inch.
 2. Fascia, exposed trims, reglets, roof drain flashings, base flashings, counterflashings, flashing receivers, valley flashings, drip edges, eave flashings, equipment support flashings, roof penetration flashings, roof expansion joint covers, scuppers:

- ASTM A167, Type 304, hard tempered, minimum thickness 0.0187 inch, unless otherwise shown or indicated.
3. Copings, gravel stops, and roof-to-wall expansion joint covers: ASTM A167, Type 304, hard tempered, minimum thickness 0.025 inch, unless otherwise shown or indicated.
 - a. Backing or stiffeners required to prevent oil-canning and waviness.
 - b. Finish: No. 2D.
- B. Coil-Coated Galvanized Steel Sheet:
1. Zinc-coated, commercial quality steel sheet with thickness as specified below conforming to ASTM A755, G90 coating designation, coil coated with high-performance fluoropolymer coating of not less than 1 mil thick (0.2 mil primer and 0.8 mil fluoropolymer) each side, unless otherwise specified.
 2. Counter flashings and flashings receivers: Minimum thickness of steel sheet 0.0217 inch, unless otherwise shown or indicated.
 3. Fasciae, trims, drip edges, eave flashings, base flashings, valley flashings, and equipment support flashings: Minimum thickness of steel sheet 0.0276 inch, unless otherwise shown or indicated.
 - a. Backing or stiffeners for fasciae and trims required to prevent oil-canning and waviness.
- C. Aluminum:
1. Extruded anodized fasciae, exposed trims, copings and gravel stops: ASTM B221, Alloy 6063-T52, minimum thickness 0.125 inch.
 2. Alloy sheet anodized scuppers, roof expansion joint covers, and roof-to-wall expansion joint covers: ASTM B209, Alloy 5005-H14, minimum thickness 0.050 inch.
 3. Alloy sheet anodized drip edges, eave flashings, base flashings, counterflashings, and flashing receivers: ASTM B209, Alloy 5005-H14, minimum thickness 0.040 inch.
 4. Finish: Class I color anodized finish with anodic layer thicker than 0.7 mil, dark bronze color, per AAMA 606.1, Guide Specifications and Inspection Methods for Integral Color Anodic Finishes for Architectural Aluminum.
- D. Lead:
1. Flashing for plumbing vents:
 - a. Sheet lead, FS QQ-L-201, minimum 2-1/2 pounds per square foot.
- E. Miscellaneous Items:
1. Red-rosin paper:
 - a. FS UU-B-790, Type I, Style 1b, 5 lb/sq., sized building paper.
 2. Vinyl tape: As recommended by the metal product manufacturer as a dissimilar metal separator.
 3. Wood blocking: Section 06100.
 4. Bituminous Paint: As recommended by the manufacturer as a dissimilar metal separator.
 5. Solder: ASTM B32, with flux-core; of the following solder alloys. Use another alloy if it is demonstrated to the Engineer that better results, including visual as applicable, can be achieved on the particular metals being joined.
 - a. For stainless steel: Tin/silver solder, Alloy Grade Sn96, with acid flux of type recommended by stainless steel manufacturer.
 - b. For copper: 50-50 tin/lead solder, Alloy Grade Sn50, with rosin flux. For lead-coated copper: 60-40 tin/lead solder, Alloy Grade Sn60, with rosin flux.
 6. Sealant:

- a. Elastomeric: Section 07900.
 - b. Epoxy Seam Sealer: Two-part, non-corrosive, aluminum seam-cementing compound as recommended by aluminum manufacturer for exterior and interior non-moving joints including riveted joints.
 - c. Mastic Sealant: Polyisobutylene, nonhardening, nonskinning, nondrying, nonmigrating sealant.
- 7. Metal Accessories and Fasteners: Provide sheet metal clips, straps, anchoring devices, and similar accessory units as required for installation of Work, matching, matching finish of exposed heads, or compatible with material being installed as approved; noncorrosive; size and thickness required for performance per approved samples.
 - 8. Gutter Screen: 1/4-inch non-corrosive hardware cloth installed in sheet metal frames.
 - 9. Adhesives: Type recommended by flashing sheetmetal manufacturer for waterproof and weather-resistant seaming and adhesive application of flashing sheetmetal.
 - 10. Roofing Cement: ASTM D4586, Type I, asbestos free, asphalt based.
 - 11. Asphalt Mastic for under flashing receivers and counterflashing and paint on lap seams and base flashing: SSPC-Paint 12, solvent-type mastic, nominally free of sulfur and containing no asbestos fibers, compounded for 15-mil dry-film thickness per coat.

2.02 FABRICATION, GENERAL:

- A. Sheet Metal Fabrication Standard: Fabricate sheet metal flashing and trim to comply with recommendations of SMACNA's "Architectural Sheet Metal Manual" that apply to the design, dimensions, metal, and other characteristics of the item indicated.
- B. Comply with details shown to fabricate sheet metal flashing and trim that fit substrates and result in waterproof and weather-resistant performance once installed. Verify shapes and dimensions of surfaces to be covered before fabricating sheet metal.
- C. Form exposed sheet metal Work that is without excessive oil canning, buckling, and tool marks and that is true to line and levels indicated, with exposed edges folded back to form hems.
- D. Expansion Provisions: Space movement joints at maximum of 10 feet with no joints allowed within 24 inches of corner or intersection. Where lapped or bayonet-type expansion provisions in the Work cannot be used or would not be sufficiently weatherproof and waterproof, form expansion joints or intermeshing hooked flanges, not less than one-inch deep, filled with mastic sealant (concealed within the joints).
- E. Fabricate nonmoving joints with flat-lock seams. For tin edges to be seamed, form seams and solder. For aluminum to be seamed, form seams and seal with epoxy seam sealer and rivet joints for additional strength as approved.
- F. Sealed joints: Form movable joints in metal to accommodate elastomeric sealant to comply with SMACNA standards.
- G. Conceal fasteners and expansion provisions where possible. Exposed fasteners are not allowed on faces of sheet metal exposed to public view.
- H. Fabricate cleats and attachment devices from same material as sheet metal component being anchored or from compatible, noncorrosive metal recommended by sheet metal manufacturer.

1. Size: As recommended by SMACNA manual or sheet metal manufacturer for application but never less than thickness of metal being secured.

2.03 SHEETMETAL FABRICATIONS:

- A. Downspout: Plain, rectangular, lead-coated copper in accordance with SMACNA Architectural Sheet Metal Manual standards, unless otherwise shown.
- B. Gutters: Lead-coated copper in accordance with SMACNA standards.
- C. Gutter Screen: Fabricate screen and frame of approved material
- D. Reglets:
 1. Stainless steel or lead-coated copper, matching flashing material, closed-slot, friction-type.
- E. Roof and Wall-to-Roof Expansion Joint Covers:
 1. Combination of neoprene and lead-coated copper or stainless steel, with the following additional requirements:
 - a. Cover with neoprene bonded to metal edgings by means of neoprene-based adhesive comprising primer and vulcanizing cement to produce high-strength bond.
 - b. For neoprene part of cover, cured neoprene sheet, tensile strength 1,500-psi minimum, elongation 250-percent minimum, bonded to metal with peel-pull value of 25 pounds per inch minimum at right angles; thickness and width as shown.
 - c. Edgings of metal cover, four inches wide, perforated with holes four inches on centers minimum.
- F. Coping and Gravel Stops:
 1. Extruded aluminum or stainless steel, assemblies tested for wind-uplift resistance in accordance with UL 580 for Class 90-uplift resistance, or greater as required by jurisdictional authority, with testing performed by testing agency acceptable to the Engineer.
 - a. Size: 10-foot long sections, with factory-fabricated corners and intersections, formed with no visible fasteners.
 - b. Movement joint design: Incorporate a waterproof seal using an internal weep system and rubber or vinyl seals into the non-welded joints.
 - c. Fasteners and clips: As standard with the manufacturer for required wind-uplift resistance. Where exposed, finish to match the metal finish.
- G. Flashing for Plumbing Vents:
 1. Lead, sized to extend at least four inches horizontally on roof around pipe, over pipe, and one-inch inside pipe.
- H. Strainer:
 1. Stainless-steel, 12-gauge wires spaced not greater than 1/2-inch apart, as shown and as approved.
- I. Miscellaneous-waterproofing sheetmetal flashings, fasciae, trims, drip edges, scuppers, conductor heads, shower pans, splash pans, and overhead piping safety pans:
 1. Fabricated from material as previously specified, sized as shown and as approved.

PART 3 - EXECUTION

3.01 PREPARATION:

- A. Clean dirt, debris, grease, oil and other foreign substances from surfaces that are to receive metalwork. Coordinate with work of other Sections: 04215, 04220, 07411, and 07730.

3.02 INSTALLATION:

- A. Coordinate flashing and sheet metal with the work of other trades. Shop-fabricate the work whenever possible. Provide for expansion and contraction of sheet metal.
- B. Install the work of this Section in accordance with the NRCA Roofing and Waterproofing Manual, performance requirements, manufacturers' instructions and SMACNA's Architectural Sheet Metal Manual. Anchor units securely in place by methods indicated and conceal fasteners where possible. Set units true to line and level with exposed edges folded back to form hems. Install exposed sheetmetal without excessive oil canning, buckling and tool marks. Verify shapes and dimensions of surfaces to be covered prior to fabrication and trim to fit substrates. Install work with laps, joints and seams that will be permanently watertight and weatherproof. Provide for thermal expansion of metal units. Space movement joints at a maximum of 10 feet with no joints allowed within 24 inches of corner or intersection. Where lapped or bayonet-type expansion provisions cannot be used or would not be sufficiently weatherproof and waterproof, form expansion joints of intermeshing hooked flanges not less than one-inch deep and fill with mastic sealant concealed within joints. Form nonexpansion joints in metal to accommodate elastomeric sealant to comply with SMACNA standards. Fill joint with sealant and form metal to completely conceal sealant. Use joint adhesive for non-moving joints specified not to be soldered. Fabricate non-moving seams in sheetmetal with flat-lock seams, except fabricate non-moving seams in aluminum with flat-lock seams. Form seams and seal with epoxy seam sealer. Rivet joints as approved for additional strength.. Tin edges to be seamed, form seams and solder.
- C. Perform cutting, drilling and other operations in connection with sheet metal work to accommodate work of other trades. Provide accessories as recommended by SMACNA Architectural Sheet Metal Manual.
- D. Where sheet metal abuts or interfaces with adjacent materials, join as shown on approved shop drawings. Isolate dissimilar metals by use of compatible coatings or other approved methods. Apply red-rosin paper backing for sheet metal applied to any surface to permit movement caused by expansion or to prevent galvanic action.
- E. Soldering:
 - 1. Clean surfaces to be soldered to remove oils and foreign matter. Brush liberal amount of flux on seams, solder immediately, neutralize acid and clean.
 - 2. Solder slowly, thoroughly heating seam and completely sweating solder through full width of seam. Use ample solder for full width along seams.
 - 3. Do not solder aluminum and coil-coated galvanized steel sheet. Pre-tinning is not required for lead and lead-coated copper. Do not use torches for soldering, heat surfaces to receive solder and flow solder into joint. Fill joint completely. Completely remove flux and spatter from exposed surfaces.
- F. Seams:

1. Flat lock: 3/4-inch wide, minimum.
 2. Solder lap: One-inch wide, minimum
 3. Unsoldered plain lap: Three-inches wide, minimum.
 4. Seams: Corresponding to direction of flow.
- G. Form flashings from material shown or specified made up from sheets eight to 10 feet long with locked and soldered seams into units of not more than 16 feet. Join units together with three-inch wide loose-locked seams filled with sealant before units are joined. Runs of flashing shorter than 16 feet will not require loose-seam joints. Miter corners and join by locked and soldered joints.
- H. Install expansion-joint covers as indicated and in accordance with manufacturer's recommendations. Splice ends of adjoining lengths of covers with neoprene tabs applied to both faces with approved adhesive. Provide prefabricated corners, intersections and crossovers.
- I. Form cap flashing at parapet walls and other vertical surfaces to extend into metal reglets built into structure and prefilled with sealant. Lap built-up roof flashings and form metal to provide spring action against roof flashings. Prior to installation, coat flashing portions to be concealed with bituminous paint.
- J. Where cants do not occur at intersections of roof decks and vertical surfaces of walls and other construction, provide flashings. Extend base flashings up vertical surfaces eight inches unless otherwise shown, behind metal cap flashing and out onto roof or horizontal surface not less than eight inches. Coat back sides of base flashing with bituminous paint and set into angle formed by roof and vertical surfaces after three plies of roofing-felt reinforcement have been laid. Nail flange with nails spaced three inches on centers and 3/4-inch from edge into wooden nailer provided in roof slab. Secure metal flashing at roof edges according to FM Loss Prevention Data Sheet 1-49 for specified wind zone.
- K. Reglets: Form reglets to reproduce detail and design shown. Form sharp, even and true profiles, bends and intersections. Lock or lap joints and solder or reinforce joints as shown on approved shop drawings or specified. Install reglets to receive counterflashings: Furnish reglets for installation under Division 3 concrete and under Division 4 masonry.
- L. Coping: Install coping in accordance with manufacturer's recommendations. Locate fasteners and clips as follows:
1. At joints and at five-foot maximum intervals.
 2. Center butt joints over anchor clips.
 3. Secure in place allowing for thermal expansion and establishing watertight joint.
- M. Counterflashings: Coordinate installation of counterflashings with installation of assemblies to be protected by counterflashing. Install counterflashings in reglets or receivers. Secure in a waterproof manner by means of snap-in installation and sealant, lead wedges and sealant, interlocking folded seam, or blind rivets and sealant. Lap counterflashing joints a minimum of 2 inches and bed with sealant.
- N. Roof-Drainage System: Install drainage items fabricated from sheet metal, with straps, adhesives, and anchors recommended by SMACNA's Manual or the item manufacturer, to drain roof in the most efficient manner. Coordinate roof-drain flashing installation with roof-drainage system installation. Coordinate flashing and sheet metal items for steep-sloped roofs with roofing installation. Install strainer at top of downspout.

- O. Equipment Support Flashing: Coordinate equipment support flashing installation with roofing and equipment installation. Weld or seal flashing to equipment support member.
- P. Roof-Penetration Flashing: Coordinate roof-penetration flashing installation with roofing and installation of items penetrating roof. Install flashing as follows:
 - 1. Turn flashing down inside vent piping, being careful not to block vent piping with flashing.
 - 2. Seal and clamp flashing to pipes penetrating roof, other than lead flashing on vent piping.
- Q. Install continuous gutter screens on gutters with noncorrosive fasteners, arranged as hinged units to swing open for cleaning gutters.
- R. Overhead-Piping Safety Pan: Suspend pans from pipe and install drain line to plumbing waste or drain line.
- S. Splash Pans: Install where downspouts discharge on low-sloped roofs, unless otherwise shown. Set in roof cement or sealant compatible with roofing material.
- T. Install sealant in accordance with Section 07900.
- U. Install wood blocking in accordance with Section 06100.

3.03 CLEAN-UP:

- A. Clean up rubbish and debris caused by this work and remove from site.
- B. Promptly remove drippings and stains of materials from exposed surfaces.
- C. Provide final protection and maintain conditions that ensure sheet metal flashing and trim Work during construction is without damage or deterioration other than natural weathering at the time of Substantial Completion.

END OF SECTION

SECTION 07730

ROOF ACCESSORIES

PART1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing roof hatches, equipment supports, roof vents, snow guards and miscellaneous roof accessories.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Rough Carpentry: Section 06100.
- B. Seals and Sealants: Section 07900.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Product Data: For each type of product indicated. Include construction details, materials, dimensions of individual components and profiles, and finishes.
- B. Shop Drawings: Show fabrication and installation details. Indicate dimensions, weights, loadings, required clearances, method of field assembly, and components. Include plans, elevations, sections, details, and attachments to other Work.
- C. Coordination Drawings: Roof plans drawn to scale and coordinating penetrations and roof-mounted items. Show the following:
 - 1. Size and location of roof accessories specified in this Section.
 - 2. Method of attaching roof accessories to roof or building structure.
 - 3. Other roof-mounted items including mechanical and electrical equipment, ductwork, piping, and conduit.
- D. Samples for Verification: For each type of exposed finish required, prepared on Samples in manufacturer's standard sizes, and of same thickness and material indicated for the Work. If finishes involve normal color or shade variations, include sample sets showing the full range of variations expected. Provide a mock-up of custom-fabricated items
- E. Certification.

1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. NRCA: Roofing and Waterproofing Manual.
 - 3. SMACNA: Architectural Sheet Metal Manual.
 - 4. ASTM: A653, A729, A780, B209, B221, C920, C1036, D256, D4586, E527.
 - 5. UL 793, 972.
 - 6. SSPC - Paint 12
 - 7. NFPA: 204M.
 - 8. NAAMM.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to jobsite in original unopened containers clearly labeled with manufacturer's name and brand designation, type, class and rating as applicable.

- B. Store products in approved dry area and protect from contact with soil and from exposure to the elements.
- C. Handle products to prevent breakage of containers and damage to products.

PART 2 - PRODUCTS

2.01 MATERIALS, GENERAL:

- A. Aluminum Sheet: ASTM B 209 for alclad alloy 3005H25 or alloy and temper required to suit forming operations, with mill finish, unless otherwise indicated
- B. Extruded Aluminum: ASTM B 221 alloy 6063-T52 or alloy and temper required to suit structural and finish requirements, with mill finish, unless otherwise indicated
- C. Galvanized Steel Sheet: ASTM A 653 with G90 coating designation; commercial quality, unless otherwise indicated.
 - 1. Structural Quality: Grade 40, where indicated or as required for strength.
- D. Aluminum-Zinc Alloy-Coated Steel Sheet: ASTM A 792 with Class AZ-50 coating, structural quality, Grade 40, or as required for strength.
- E. Plastic Sheet: Unless additional thickness is required for light transmittances, provide glazing plastic sheet thickness required for 40-lbf/sq. ft. external and 20-lbf/sq. ft. internal loading pressures as recommended by the manufacturer for the size and shape indicated.
 - 1. Polycarbonate: Thermoformable, monolithic polycarbonate sheets manufactured by the extrusion process, burglar-resistance rated per UL 972 with average impact strength of 16 ft-lbf/in. of width when tested according to ASTM D 256, Method A (Izod)
- F. Insulation: Manufacturer's standard rigid or semirigid glass-fiber board of thickness indicated.
- G. Wood Nailers: Not less than 1-1/2 inches thick complying with Section 06100.
- H. Fasteners: Same metal as metals being fastened, or nonmagnetic stainless steel or other noncorrosive metal as recommended by manufacturer. Match finish of exposed fasteners with finish of material being fastened.
 - 1. Where removing exterior exposed fasteners affords access to building, provide nonremovable fastener heads.
- I. Gaskets: Manufacturer's standard tubular or fingered design of neoprene, EPDM, or PVC; or flat design of foam rubber, sponge neoprene, or cork.
- J. Bituminous Coating: SSPC-Paint 12, solvent-type bituminous mastic, nominally free of sulfur and containing no asbestos fibers, compounded for 15-mil dry film thickness per coating.
- K. Mastic Sealant: Polyisobutylene; nonhardening, nonskinning, nondrying, nonmigrating sealant.
- L. Elastomeric Sealant: Generic type recommended by unit manufacturer that is compatible with joint surfaces; ASTM C 920, Type S, Grade NS, Class 25, and Uses NT, G, A, and, as applicable to joint substrates indicated, O and in accordance with Section 07900.
- M. Roofing Cement: ASTM D 4586, nonasbestos, fibrated asphalt cement designed for trowel application or other adhesive compatible with roofing system.

2.02 ROOF CURBS AND EQUIPMENT SUPPORTS:

- A. General: Provide roof curbs capable of supporting superimposed live and dead loads, including equipment loads and other construction to be supported on roof curbs. Coordinate dimensions with rough-in information or Shop Drawings of equipment to be supported.
- B. Fabrication: Unless otherwise indicated or required for strength, fabricate units from minimum 0.0747-inch thick, structural-quality, hot-dip galvanized or aluminum-zinc alloy-coated steel sheet; factory primed and prepared for painting with welded or sealed mechanical corner joints.

2.03 ROOF HATCHES:

- A. General: Fabricate units to withstand 40-lbf/sq. ft. external and 20-lbf/sq. ft. internal loading pressure. Frame with minimum 9-inch- high, integral-curb, double-wall construction with 1-1/2-inch insulation, formed cants and cap flashing (roofing counterflashing), with welded or sealed mechanical corner joints. Provide double-wall cover (lid) construction with 1-inch-thick insulation core. Provide gasketing and equip with corrosion-resistant or hot-dip galvanized hardware including pintle hinges, hold-open devices, interior padlock hasps, and both interior and exterior latch handles.
- B. Type: Single-leaf personnel access.
 - 1. For Ladder Access: 30 by 36 inches.
 - 2. For Ship's Ladder Access: 30 by 54 inches.
 - a. For Stair Access: 30 by 102 inches.
- C. Type: Double leaf for equipment access.
 - 1. Size: 72 by 96 inches.
- D. Material and Finish: Galvanized steel, baked enamel.
- E. Sloping Roofs: Where slope or roof deck exceeds 1/4 inch per foot (1:48), fabricate hatch curbs with height tapered to match slope to level tops of units.

2.04 SMOKE VENTS:

- A. General: Automatically operated roof vents for heat and smoke constructed to operate (open) without power source that could be interrupted during a fire. Custom fabricate units only to extent necessary to comply with indicated dimensions and other special requirements.
- B. Live Load and Uplift: Unless otherwise indicated, fabricate to withstand a minimum 10-lbf/sq. ft. external live load and 30-lbf/sq. ft. uplift.
- C. Regulatory Requirements: Comply with provisions of the following:
 - 1. UL 793, for construction and performance of automatically operated roof vents for heat and smoke
 - 2. NFPA 204M, for heat-and-smoke vent design constraints, operation, size, and location.\
- D. Framing: Fabricate from the following materials, with manufacturer's standard welded or sealed mechanical corner joints, including cap flashing (roofing counterflashing):
 - 1. Material: Formed sheet or extruded aluminum or galvanized steel, at Contractor's option
 - a. Finish: Baked enamel.
 - b. Finish: High-performance organic coating.
 - 2. Unit Support: Double-wall curb construction with 1-inch insulation, of height indicated or, if not indicated, for mounting with height minimum 9 inches above roof membrane.
 - a. Provide formed cants and base profile coordinated with roof type and insulation thickness.

3. Sloping Roofs: Where slope of roof deck exceeds 1/4 inch per foot(1:48), fabricate curbs with height tapered to match slope to level tops of units.
- E. Dome-Type Units: Manufacturer's standard gravity-opened, shrink-back and drop-out, acrylic or PVC sheet, dome unit for 165 deg F activation. Provide glazing system for easy replacement of activated domes and for drainage of condensation to exterior.
1. Inner Double-Dome Color: Bronze.

2.05 SNOWGUARDS:

- A. L-shaped stop-type, metal or plastic.
- B. Provide in accordance with approved mock-up sample.

2.06 FINISHES, GENERAL:

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- C. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.07 ALUMINUM FINISHES:

- A. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
- B. Conversion-Coated and Factory-Primed Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below).
 1. Organic Coating: Air-dried primer of not less than 2.0-mil0.5-mm dry film thickness.
- C. Baked-Enamel Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Apply baked enamel complying with paint manufacturer's specifications for cleaning, conversion coating, and painting. Below references AAMA standard for pigmented organic coating on extrusions. Color as selected by the Authority's representative.
- D. High-Performance Organic Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
 1. Fluoropolymer Two-Coat System: Manufacturer's standard two-coat, thermocured system consisting of specially formulated inhibitive primer and fluoropolymer color topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight. Color as selected by the Authority's representative.

2.08 GALVANIZED STEEL SHEET FINISHES:

- A. Surface Preparation: Clean surfaces with nonpetroleum solvent so surfaces are free of oil and other contaminants. After cleaning, apply a conversion coating suited to the organic coating to be applied over it. Clean welds, mechanical connections, and abraded areas, and apply galvanizing repair paint specified below to comply with ASTM A 780.

1. Galvanizing Repair Paint: High-zinc-dust-content paint for regalvanizing welds in steel, complying with SSPC-Paint 20.
- B. Baked-Enamel Finish: Immediately after cleaning and pretreating, apply manufacturer's standard two-coat, baked-enamel finish consisting of prime coat and thermosetting topcoat, with a minimum dry film thickness of 1 mil for topcoat. Comply with paint manufacturer's written instructions for applying and baking to achieve a minimum dry film thickness of 2 mils.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. General: Comply with manufacturer's written instructions. Coordinate installation of roof accessories with installation of roof deck, roof insulation, flashing, roofing membranes, penetrations, equipment, and other construction involving roof accessories to ensure that each element of the Work performs properly and that combined elements are waterproof and weather tight. Anchor roof accessories securely to supporting structural substrates so they are capable of withstanding lateral and thermal stresses, and inward and outward loading pressures
- B. Install roof accessory items according to construction details of NRCA's "Roofing and Waterproofing Manual," unless otherwise indicated,
- C. Separation: Separate metal from incompatible metal or corrosive substrates, including wood, by coating concealed surfaces, at locations of contact, with bituminous coating or providing other permanent separation.
- D. Flange Seals: Unless otherwise indicated, set flanges of accessory units in a thick bed of roofing cement to form a seal.
- E. Cap Flashing: Where required as component of accessory, install cap flashing to provide waterproof overlap with roofing or roof flashing (as counterflashing). Seal overlap with thick bead of mastic sealant.
- F. Operational Units: Test-operate units with operable components. Clean and lubricate joints and hardware. Adjust for proper operation.
- G. Heat-and-Smoke Vents: Locate, install, and test according to NFPA 204M.
- H. Install wood nailers in accordance with Section 06100.
- I. Install sealants in accordance with Section 07900.
- J. Adhere snow guards to sheetmetal roofing by approved silicone sealant as specified in Section 07900. Locate and space snow guards in accordance with manufacturer's recommendations. Where snow guards are located on standing seams, provide approved mechanical fastenings.

3.02 CLEANING AND PROTECTION:

- A. Clean exposed surfaces according to manufacturer's written instructions. Touch up damaged metal coatings.

END OF SECTION

THIS PAGE NOT USED

SECTION 07811

SPRAYED FIRE-RESISTIVE MATERIALS

PART 1 - GENERAL

1.01 SUMMARY OF WORK

- A. This Section includes concealed SFRM, exposed SFRM, and exposed intumescent mastic fire-resistive coating.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. List below only products, construction, and equipment that the reader might expect to find in this Section but are specified elsewhere.
- B. Division 5 Section "Structural Steel" for surface conditions required for structural steel receiving SFRM.
- C. Division 7 Section "Building Insulation" for fire-safing insulation.
- D. Division 7 Section "Board Fire Protection" for mineral-fiber-board fire protection.
- E. Division 7 Section "Through-Penetration Firestop Systems" for fire-resistance-rated firestopping systems.
- F. Division 7 Section "Fire-Resistive Joint Systems" for fire-resistance-rated joint systems.
- G. Division 9 Section "Intumescent Paints" for intumescent paints that are not fire resistive.

1.03 DEFINITIONS

- A. SFRM: Sprayed fire-resistive material.
- B. Concealed: Fire-resistive materials applied to surfaces that are concealed from view behind other construction when the Work is completed and have not been defined as exposed.
- C. Exposed: Fire-resistive materials applied to surfaces that are exposed to view when the Work is completed, that are accessible through suspended ceilings, that are in elevator shafts and machine rooms, that are in mechanical rooms, that are in air-handling plenums, and that are identified as exposed on Drawings.

1.04 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: Structural framing plans indicating the following:
 - 1. Locations and types of surface preparations required before applying SFRM.
 - 2. Extent of SFRM for each construction and fire-resistance rating, including the following:
 - a. Applicable fire-resistance design designations of a qualified testing and inspecting agency acceptable to authorities having jurisdiction.
 - 1) For steel joist assemblies, include applicable fire-resistance design designations, with each steel joist tested with the same maximum tensile stress as each steel joist indicated on Drawings or in a schedule. Design designations with steel joists tested at lower maximum tensile stress than

- those indicated are not permitted.
- b. Minimum thicknesses needed to achieve required fire-resistance ratings of structural components and assemblies.
 3. Treatment of SFRM after application.
- C. Samples for Initial Selection: For each type of colored, exposed SFRM indicated.
- D. Samples for Verification: For each type of colored, exposed SFRM, two Samples, each 4 inches (102 mm) square, of each color, texture, and material formulation to be applied. Where finishes involve normal color and texture variations, include sample sets showing the full range of variations expected.
- E. Product Certificates: For each type of SFRM, signed by product manufacturer.
- F. Qualification Data: For manufacturer and testing agency.
- G. Compatibility and Adhesion Test Reports: From SFRM manufacturer indicating the following:
1. Materials have been tested for bond with substrates.
 2. Materials have been verified by SFRM manufacturer to be compatible with substrate primers and coatings.
 3. Interpretation of test results and written recommendations for primers and substrate preparation needed for adhesion.
- H. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for proposed SFRM.
- I. Research/Evaluation Reports: For SFRM.
- J. Field quality-control test reports.
- K. Warranties: Special warranties specified in this Section.

1.05 QUALITY ASSURANCE

- A. Installer Qualifications: A firm or individual certified, licensed, or otherwise qualified by SFRM manufacturer as experienced and with sufficient trained staff to install manufacturer's products according to specified requirements. A manufacturer's willingness to sell its SFRM to Contractor or to an installer engaged by Contractor does not in itself confer qualification on the buyer.
- B. Source Limitations: Obtain SFRM through one source from a single manufacturer.
- C. SFRM Testing: By a qualified testing and inspecting agency engaged by Contractor or manufacturer to test for compliance with specified requirements for performance and test methods.
1. SFRMs are randomly selected for testing from bags bearing the applicable classification marking of UL or another testing and inspecting agency acceptable to authorities having jurisdiction.
 2. Testing is performed on specimens of SFRMs that comply with laboratory testing requirements specified in Part 2 and are otherwise identical to installed fire-resistive materials, including application of accelerant, sealers, topcoats, tamping, troweling, rolling, and water overspray, if any of these are used in final application.
 3. Testing is performed on specimens whose application the independent testing and inspecting agency witnessed during preparation and conditioning. Include in test reports a full description of preparation and conditioning of laboratory test specimens.

- D. Compatibility and Adhesion Testing: Engage a qualified testing and inspecting agency to test for compliance with requirements for specified performance and test methods.
1. Test for bond per ASTM E 736 and requirements in UL's "Fire Resistance Directory" for coating materials. Provide bond strength indicated in referenced fire-resistance design, but not less than minimum specified in Part 2.
 2. Verify that manufacturer, through its own laboratory testing or field experience, has not found primers or coatings to be incompatible with SFRM.
- E. Fire-Test-Response Characteristics: Provide SFRM with the fire-test-response characteristics indicated, as determined by testing identical products per test method indicated below by UL or another testing and inspecting agency acceptable to authorities having jurisdiction. Identify bags containing SFRM with appropriate markings of applicable testing and inspecting agency.
1. Fire-Resistance Ratings: Indicated by design designations from UL's "Fire Resistance Directory" or from the listings of another testing and inspecting agency, FM's "Approval Guide, Building Materials," or Omega Point Laboratories Inc. Directory of Listed Building Products, Materials and Assemblies acceptable to authorities having jurisdiction, for SFRM serving as direct-applied protection tested per ASTM E 119.
 2. Surface-Burning Characteristics: ASTM E 84.
- F. Provide products containing no detectable asbestos as determined according to the method specified in 40 CFR 763, Subpart E, Appendix E, Section 1, "Polarized Light Microscopy."
- G. Mockups: Apply mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
1. Extent of Mockups: Approximately 100 sq. ft. (9 sq. m) of surface for each product indicated.
 2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.
- H. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1 Section "Project Management and Coordination." Review methods and procedures related to SFRM including, but not limited to, the following:
1. Review products, exposure conditions, design ratings, restrained and unrestrained conditions, calculations, densities, thicknesses, bond strengths, and other performance requirements.
 2. Review and finalize construction schedule and verify sequencing and coordination requirements.
 3. Review weather predictions, ambient conditions, and proposed temporary protections for SFRM during and after installation.
 4. Review surface conditions and preparations.
 5. Review field quality-control testing procedures.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Deliver products to Project site in original, unopened packages with intact and legible manufacturers' labels identifying product and manufacturer, date of manufacture, shelf life if applicable, and fire-resistance ratings applicable to Project.
- B. Use materials with limited shelf life within period indicated. Remove from Project site and discard materials whose shelf life has expired.
- C. Store materials inside, under cover, and aboveground; keep dry until ready for use. Remove from Project site and discard wet or deteriorated materials.

1.07 PROJECT CONDITIONS

- A. Environmental Limitations: Do not apply SFRM when ambient or substrate temperature is 40 deg F (4 deg C) or lower unless temporary protection and heat are provided to maintain temperature at or above this level for 24 hours before, during, and for 24 hours after product application.
- B. Ventilation: Ventilate building spaces during and after application of SFRM. Use natural means or, if they are inadequate, forced-air circulation until fire-resistive material dries thoroughly.

1.08 COORDINATION

- A. Sequence and coordinate application of SFRM with other related work specified in other Sections to comply with the following requirements:
 - 1. Provide temporary enclosure as required to confine spraying operations and protect the environment.
 - 2. Provide temporary enclosures for applications to prevent deterioration of fire-resistive material due to exposure to weather and to unfavorable ambient conditions for humidity, temperature, and ventilation.
 - 3. Avoid unnecessary exposure of fire-resistive material to abrasion and other damage likely to occur during construction operations subsequent to its application.
 - 4. Do not apply fire-resistive material to metal roof deck substrates until concrete topping, if any, has been completed. For metal roof decks without concrete topping, do not apply fire-resistive material to metal roof deck substrates until roofing has been completed; prohibit roof traffic during application and drying of fire-resistive material.
 - 5. Do not apply fire-resistive material to metal floor deck substrates until concrete topping has been completed.
 - 6. Do not begin applying fire-resistive material until clips, hangers, supports, sleeves, and other items penetrating fire protection are in place.
 - 7. Defer installing ducts, piping, and other items that would interfere with applying fire-resistive material until application of fire protection is completed.
 - 8. Do not install enclosing or concealing construction until after fire-resistive material has been applied, inspected, and tested and corrections have been made to defective applications.

1.09 WARRANTY

- A. Special Warranty: Manufacturer's standard form, signed by Contractor and by Installer, in which manufacturer agrees to repair or replace SFRMs that fail in materials or workmanship within specified warranty period.
 - 1. Failures include, but are not limited to, the following:
 - a. Cracking, flaking, spalling, or eroding in excess of specified requirements; peeling; or delaminating of SFRM from substrates.
 - b. Not covered under the warranty are failures due to damage by occupants and Owner's maintenance personnel, exposure to environmental conditions other than those investigated and approved during fire-response testing, and other causes not reasonably foreseeable under conditions of normal use.
 - 2. Warranty Period: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 CONCEALED SFRM

- A. Available Products: Subject to compliance with requirements, products that may be incorporated

into the Work include, but are not limited to, the following:

- B. Products: Subject to compliance with requirements, provide one of the following:
1. Concealed Cementitious SFRM:
 - a. Carboline Co., Fireproofing Products Div.; Pyrolite 15 High Yield.
 - b. Grace, W. R. & Co. - Conn., Construction Products Div.; Monokote Type MK-6.
 - c. Isolatek International Corp.; Cafco 300.
 - d. Southwest Vermiculite Co., Inc.; Type 5.
 - e. Carboline Co., Fireproofing Products Div.; Pyrolite 15 Blue.
 - f. Grace, W. R. & Co. - Conn., Construction Products Div.; Retro-Gard.
 - g. Isolatek International Corp.; Cafco 300 SB
 2. Concealed Sprayed-Fiber Fire-Resistive Material:
 - a. Isolatek International Corp.; Cafco Blaze-Shield II.
- C. Material Composition: Manufacturer's standard product or either of the following:
1. Concealed Cementitious SFRM: Factory-mixed, dry formulation of gypsum or portland cement binders, additives, and lightweight mineral or synthetic aggregates mixed with water at Project site to form a slurry or mortar for conveyance and application.
 2. Concealed Sprayed-Fiber Fire-Resistive Material: Factory-mixed, dry formulation of inorganic binders, mineral fibers, fillers, and additives conveyed in a dry state by pneumatic equipment and mixed with water at spray nozzle to form a damp, as-applied product.
- D. Physical Properties: Minimum values, unless otherwise indicated, or higher values required to attain designated fire-resistance ratings, measured per standard test methods referenced with each property as follows:
1. Dry Density: 15 lb/cu. ft. (240 kg/cu. m) for average and individual densities, or greater if required to attain fire-resistance ratings indicated, per ASTM E 605 or AWCI Technical Manual 12-A, Section 5.4.5, "Displacement Method."
 2. Thickness: Minimum average thickness required for fire-resistance design indicated according to the following criteria, but not less than 0.375 inch (9 mm), per ASTM E 605:
 - a. Where the referenced fire-resistance design lists a thickness of 1 inch (25 mm) or more, the minimum allowable individual thickness of SFRM is the design thickness minus 0.25 inch (6 mm).
 - b. Where the referenced fire-resistance design lists a thickness of less than 1 inch (25 mm) but more than 0.375 inch (9 mm), the minimum allowable individual thickness of SFRM is the greater of 0.375 inch (9 mm) or 75 percent of the design thickness.
 - c. No reduction in average thickness is permitted for those fire-resistance designs whose fire-resistance ratings were established at densities of less than 15 lb/cu. ft. (240 kg/cu. m).
 3. Bond Strength: 150 lbf/sq. ft. (7.2 kPa) minimum per ASTM E 736 based on laboratory testing of 0.75-inch (19-mm) minimum thickness of SFRM.
 4. Compressive Strength: 5.21 lbf/sq. in. (35.9 kPa) minimum per ASTM E 761. Minimum thickness of SFRM tested shall be 0.75 inch (19 mm) and minimum dry density shall be as specified but not less than 15 lb/cu. ft. (240 kg/cu. m).
 5. Corrosion Resistance: No evidence of corrosion per ASTM E 937.
 6. Deflection: No cracking, spalling, or delamination per ASTM E 759.
 7. Effect of Impact on Bonding: No cracking, spalling, or delamination per ASTM E 760.
 8. Air Erosion: Maximum weight loss of 0.025 g/sq. ft. (0.270 g/sq. m) in 24 hours per ASTM E 859. For laboratory tests, minimum thickness of SFRM is 0.75 inch (19 mm), maximum dry density is 15 lb/cu. ft. (240 kg/cu. m), test specimens are not prepurged by mechanically induced air velocities, and tests are terminated after 24 hours.
 9. Fire-Test-Response Characteristics: Provide SFRM with the following surface-burning

characteristics as determined by testing identical products per ASTM E 84 by UL or another testing and inspecting agency acceptable to authorities having jurisdiction:

- a. Flame-Spread Index: 10 or less.
 - b. Smoke-Developed Index: 0.
10. Fungal Resistance: No observed growth on specimens per ASTM G 21

2.02 EXPOSED SFRM

- A. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
- B. Products: Subject to compliance with requirements, provide one of the following:
1. Exposed Cementitious SFRM:
 - a. Carboline Co., Fireproofing Products Div.; Pyrolite 22.
 - b. Carboline Co., Fireproofing Products Div.; Pyrocrete 239.
 - c. Carboline Co., Fireproofing Products Div.; Pyrocrete 40.
 - d. Carboline Co., Fireproofing Products Div.; Pyrocrete 240 High Yield.
 - e. Carboline Co., Fireproofing Products Div.; Pyrocrete 241.
 - f. Grace, W.R. & Co. - Conn., Construction Products Div.; Monokote Type Z106G.
 - g. Grace, W.R. & Co. - Conn., Construction Products Div.; Monokote Type Z106.
 - h. Grace, W.R. & Co. - Conn., Construction Products Div.; Monokote Type Z106/HY.
 - i. Grace, W.R. & Co. - Conn., Construction Products Div.; Monokote Type Z146.
 - j. Isolatek International Corp.; Cafco 400.
 - k. Isolatek International Corp.; Fendolite M-II.
 - l. Pyrok, Inc.; Pyrok-HD.
 - m. Pyrok, Inc.; Pyrok-MD.
 2. Exposed Sprayed-Fiber Fire-Resistive Material:
 - a. Isolatek International Corp.; Cafco Blaze-Shield HP.
- C. Material Composition: Manufacturer's standard product, as follows:
1. Exposed Cementitious SFRM: Factory-mixed, dry, cement aggregate formulation; or chloride-free formulation of gypsum or portland cement binders, additives, and inorganic aggregates mixed with water at Project site to form a slurry or mortar for conveyance and application.
 2. Exposed Sprayed-Fiber Fire-Resistive Material: Factory-mixed, dry formulation of inorganic binders, mineral fibers, fillers, and additives conveyed in a dry state by pneumatic equipment and mixed with water at spray nozzle to form a damp, as-applied product.
- D. Physical Properties: Minimum values, unless otherwise indicated, or higher values required to attain designated fire-resistance ratings, measured per standard test methods referenced with each property as follows:
1. Dry Density: Values for average and individual densities as required for fire-resistance ratings indicated, per ASTM E 605 or AWCI Technical Manual 12-A, Section 5.4.5, "Displacement Method," but with an average density of not less than 22 lb/cu. ft. (352 kg/cu. m).
 2. Bond Strength: 434 lbf/sq. ft. (21 kPa) minimum per ASTM E 736.
 3. Compressive Strength: 51 lbf/sq. in. (351 kPa) minimum per ASTM E 761.
 4. Dry Density: Values for average and individual densities as required for fire-resistance ratings indicated, per ASTM E 605 or AWCI Technical Manual 12-A, Section 5.4.5, "Displacement Method," but with an average density of not less than 39 lb/cu. ft. (625 kg/cu. m).
 5. Bond Strength: 1000 lbf/sq. ft. (48 kPa) minimum per ASTM E 736.
 6. Compressive Strength: 300 lbf/sq. in. (2067 kPa) minimum per ASTM E 761.

7. Corrosion Resistance: No evidence of corrosion per ASTM E 937.
8. Deflection: No cracking, spalling, or delamination per ASTM E 759.
9. Effect of Impact on Bonding: No cracking, spalling, or delamination per ASTM E 760.
10. Air Erosion: Maximum weight loss of 0.025 g/sq. ft. (0.270 g/sq. m) per ASTM E 859.
11. Combustion Characteristics: Passes ASTM E 136.
12. Fire-Test-Response Characteristics: Provide SFRM with the following surface-burning characteristics as determined by testing identical products per ASTM E 84 by UL or another testing and inspecting agency acceptable to authorities having jurisdiction:
 - a. Flame-Spread Index: 10 or less.
 - b. Smoke-Developed Index: 0
13. Fungal Resistance: No observed growth on specimens per ASTM G 21.
14. For exterior applications of SFRM, provide formulation listed and labeled by testing and inspecting agency acceptable to authorities having jurisdiction for surfaces exposed to exterior.

2.03 AUXILIARY FIRE-RESISTIVE MATERIALS

- A. General: Provide auxiliary fire-resistive materials that are compatible with SFRM and substrates and are approved by UL or another testing and inspecting agency acceptable to authorities having jurisdiction for use in fire-resistance designs indicated.
- B. Substrate Primers: For use on each substrate and with each sprayed fire-resistive product, provide primer that complies with one or more of the following requirements:
 1. Primer's bond strength complies with requirements specified in UL's "Fire Resistance Directory" for coating materials based on a series of bond tests per ASTM E 736.
 2. Primer is identical to those used in assemblies tested for fire-test-response characteristics of SFRM per ASTM E 119 by UL or another testing and inspecting agency acceptable to authorities having jurisdiction.
- C. Adhesive for Bonding Fire-Resistive Material: Product approved by manufacturer of SFRM.
- D. Metal Lath: Expanded metal lath fabricated from material of weight, configuration, and finish required to comply with fire-resistance designs indicated and fire-resistive material manufacturer's written recommendations. Include clips, lathing accessories, corner beads, and other anchorage devices required to attach lath to substrates and to receive SFRM.
- E. Reinforcing Fabric: Glass- or carbon-fiber fabric of type, weight, and form required to comply with fire-resistance designs indicated; approved and provided by manufacturer of SFRM.
- F. Reinforcing Mesh: Metallic mesh reinforcement of type, weight, and form required to comply with fire-resistance designs indicated; approved and provided by manufacturer of intumescent mastic coating fire-resistive material. Include pins and attachment.
- G. Sealer for Sprayed-Fiber Fire-Resistive Material: Transparent-drying, water-dispersible, tinted protective coating recommended in writing by manufacturer of sprayed-fiber fire-resistive material.
 1. Product: Subject to compliance with requirements, provide "Caico Bond-Seal" by Isolatak International Corp.
- H. Topcoat: Type recommended in writing by manufacturer of each SFRM for application over concealed and exposed SFRM.
- I. Cement-Based Topcoat: Factory-mixed, cementitious hardcoat formulation recommended in writing by manufacturer of SFRM for trowel or spray application over concealed and exposed

SFRM.

1. Product: Subject to compliance with requirements, provide "Hardcoat 4500" by Carboline Co.; Fireproofing Products Div. "Cafco 800" by Isolatek International Corp.
- J. Veneer-Plaster Topcoat: Factory-mixed formulation of a latex-modified, portland cement-based veneer plaster recommended in writing by manufacturer of SFRM for trowel or spray application over concealed and exposed SFRM.
1. Product: Subject to compliance with requirements, provide "Topkrete Type TK-610L" by Grace, W. R. & Co.--Conn.; Construction Products Div.
- K. Water-Based Permeable Topcoat: Factory-mixed formulation recommended in writing by manufacturer of SFRM for brush, roller, or spray application over concealed and exposed SFRM. Provide application at a rate of 60 sq. ft./gal. (1.5 sq. m/L).
1. Product: Subject to compliance with requirements, provide "Cafco Topcoat" by Isolatek International Corp.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates, areas, and conditions; with Installer present, for compliance with requirements for substrates and other conditions affecting performance of work. A substrate is in satisfactory condition if it complies with the following:
1. Substrates comply with requirements in the Section where the substrate and related materials and construction are specified.
 2. Substrates are free of dirt, oil, grease, release agents, rolling compounds, mill scale, loose scale, incompatible primers, incompatible paints, incompatible encapsulants, or other foreign substances capable of impairing bond of fire-resistive materials with substrates under conditions of normal use or fire exposure.
 3. Objects penetrating fire-resistive material, including clips, hangers, support sleeves, and similar items, are securely attached to substrates.
 4. Substrates are not obstructed by ducts, piping, equipment, and other suspended construction that will interfere with applying fire-resistive material.
- B. Verify that concrete work on steel deck has been completed.
- C. Verify that roof construction, installation of roof-top HVAC equipment, and other related work are completed.
- D. Conduct tests according to fire-resistive material manufacturer's written recommendations to verify that substrates are free of substances capable of interfering with bond.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Cover other work subject to damage from fallout or overspray of fire-resistive materials during application.
- B. Clean substrates of substances that could impair bond of fire-resistive material, including dirt, oil, grease, release agents, rolling compounds, mill scale, loose scale, and incompatible primers, paints, and encapsulants.

- C. Prime substrates where recommended in writing by SFRM manufacturer unless compatible shop primer has been applied and is in satisfactory condition to receive SFRM.
- D. For exposed applications, repair substrates to remove surface imperfections that could affect uniformity of texture and thickness in finished surface of SFRM. Remove minor projections and fill voids that would telegraph through fire-resistive products after application.

3.03 APPLICATION, GENERAL

- A. Comply with fire-resistive material manufacturer's written instructions for mixing materials, application procedures, and types of equipment used to mix, convey, and spray on fire-resistive material, as applicable to particular conditions of installation and as required to achieve fire-resistance ratings indicated.
- B. Apply SFRM that is identical to products tested as specified in Part 1 "Quality Assurance" Article and substantiated by test reports, with respect to rate of application, accelerator use, sealers, topcoats, tamping, troweling, water overspray, or other materials and procedures affecting test results.
- C. Install metal lath and reinforcing fabric, as required, to comply with fire-resistance ratings and fire-resistive material manufacturer's written recommendations for conditions of exposure and intended use. Securely attach lath and fabric to substrate in position required for support and reinforcement of fire-resistive material. Use anchorage devices of type recommended in writing by SFRM manufacturer. Attach accessories where indicated or required for secure attachment of lath and fabric to substrate.
- D. Coat substrates with bonding adhesive before applying fire-resistive material where required to achieve fire-resistance rating or as recommended in writing by SFRM manufacturer for material and application indicated.
- E. Extend fire-resistive material in full thickness over entire area of each substrate to be protected. Unless otherwise recommended in writing by SFRM manufacturer, install body of fire-resistive covering in a single course.
- F. Spray apply fire-resistive materials to maximum extent possible. Following the spraying operation in each area, complete the coverage by trowel application or other placement method recommended in writing by SFRM manufacturer.
- G. For applications over encapsulant materials, including lockdown (post-removal) encapsulants, apply SFRM that differs in color from that of encapsulant over which it is applied.
- H. Where sealers are used, apply products that are tinted to differentiate them from SFRM over which they are applied.

3.04 APPLICATION, CONCEALED SFRM

- A. Apply concealed SFRM in thicknesses and densities not less than those required to achieve fire-resistance ratings designated for each condition, but apply in greater thicknesses and densities if specified in Part 2 "Concealed SFRM" Article.
- B. Apply water overspray to concealed sprayed-fiber fire-resistive material as required to obtain designated fire-resistance rating.
- C. Cure concealed SFRM according to product manufacturer's written recommendations.

- D. Apply sealer to concealed SFRM.
- E. Apply topcoat to concealed SFRM.

3.05 APPLICATION, EXPOSED SFRM

- A. Apply exposed SFRM in thicknesses and densities not less than those required to achieve fire-resistance ratings designated for each condition, but apply in greater thicknesses and densities if indicated.
 - 1. For steel beams and bracing, provide a thickness of not less than 1 inch (25 mm).
 - 2. For metal floor or roof decks, provide a thickness of not less than 1/2 inch (13 mm).
- B. Provide a uniform finish complying with description indicated for each type of material and matching Architect's sample or, if none, finish approved for field-erected mockup.
- C. Apply exposed cementitious SFRM to produce the following finish:
 - 1. Spray-textured finish with no further treatment.
 - 2. Even, spray-textured finish, produced by rolling flat surfaces of fire-protected members with a damp paint roller to remove drippings and excessive roughness.
 - 3. Skip-troweled finish with leveled surface, smoothed-out texture, and neat edges.
 - 4. Smooth, troweled finish with surface markings eliminated and edges squared.
- D. Apply exposed sprayed-fiber fire-resistive material to produce the following finish:
 - 1. Spray-textured finish.
 - 2. Sealer.
 - 3. Topcoat.
- E. Cure exposed SFRM according to product manufacturer's written recommendations.

3.06 FIELD QUALITY CONTROL

- A. Special Inspections: Owner will engage a qualified special inspector to perform the following special inspection and prepare reports:
 - 1. SFRM.
- B. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections and prepare test reports.
 - 1. Testing and inspecting agency will interpret tests and state in each report whether tested work complies with or deviates from requirements.
- C. Tests and Inspections: Testing and inspecting of completed applications of SFRM shall take place in successive stages, in areas of extent and using methods as follows. Do not proceed with application of SFRM for the next area until test results for previously completed applications of SFRM show compliance with requirements. Tested values must equal or exceed values indicated and required for approved fire-resistance design.
 - 1. Thickness for Floor, Roof, and Wall Assemblies: For each 1000-sq. ft. (93-sq. m) area, or partial area, on each floor, from the average of 4 measurements from a 144-sq. in. (0.093-sq. m) sample area, with sample width of not less than 6 inches (152 mm) per ASTM E 605.
 - 2. Thickness for Structural Frame Members: From a sample of 25 percent of structural members per floor, taking 9 measurements at a single cross section for structural frame beams or girders, 7 measurements of a single cross section for joists and trusses, and 12 measurements of a single cross section for columns per ASTM E 605.

3. Density for Floors, Roofs, Walls, and Structural Frame Members: At frequency and from sample size indicated for determining thickness of each type of construction and structural framing member, per ASTM E 605 or AWC Technical Manual 12-A, Section 5.4.5, "Displacement Method."
 4. Bond Strength for Floors, Roofs, Walls, and Structural Framing Members: For each 10,000-sq. ft. (929 sq. m) area, or partial area, on each floor, cohesion and adhesion from one sample of size indicated for determining thickness of each type of construction and structural framing member, per ASTM E 736.
 - a. Field test SFRM that is applied to flanges of wide-flange, structural-steel members on surfaces matching those that will exist for remainder of steel receiving fire-resistive material.
 - b. If surfaces of structural steel receiving SFRM are primed or otherwise painted for coating materials, perform series of bond tests specified in UL's "Fire Resistance Directory." Provide bond strength indicated in referenced UL fire-resistance criteria, but not less than 150 lbf/sq. ft. (7.2 kPa) minimum per ASTM E 736.
 5. If testing finds applications of SFRM are not in compliance with requirements, testing and inspecting agency will perform additional random testing to determine extent of noncompliance.
- D. Remove and replace applications of SFRM that do not pass tests and inspections for cohesion and adhesion, for density, or for both and retest as specified above.
- E. Apply additional SFRM, per manufacturer's written instructions, where test results indicate that thickness does not comply with specified requirements, and retest as specified above.

3.08 CLEANING, PROTECTING, AND REPAIR

- A. Cleaning: Immediately after completing spraying operations in each containable area of Project, remove material overspray and fallout from surfaces of other construction and clean exposed surfaces to remove evidence of soiling.
- B. Protect SFRM, according to advice of product manufacturer and Installer, from damage resulting from construction operations or other causes so fire protection will be without damage or deterioration at time of Substantial Completion.
- C. Coordinate application of SFRM with other construction to minimize need to cut or remove fire protection. As installation of other construction proceeds, inspect SFRM and patch any damaged or removed areas.
- D. Repair or replace work that has not successfully protected steel.

END OF SECTION

THIS PAGE NOT USED

SECTION 07841

FIRESTOPPING

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This Section perimeter fire containment systems and specifies through-penetration firestop systems for penetrations through the following fire-resistance-rated assemblies:
1. Floors.
 2. Roofs.
 3. Walls and partitions.
 4. Construction enclosing compartmentalized areas.
 5. Smoke barriers

1.02 RELATED WORK SPECIFIED ELSEWHERE:

1. Cast-in-Place Structural Concrete: Section 03300 for construction of openings in concrete slabs and walls.
2. Division 15 Sections specifying duct and piping penetrations.
3. Division 16 Sections specifying cable and conduit penetrations.

1.03 PERFORMANCE REQUIREMENTS:

- A. General: For the following constructions, provide through-penetration firestop systems that are produced and installed to resist spread of fire according to requirements indicated, resist passage of smoke and other gases, and maintain original fire-resistance rating of assembly penetrated.
1. Fire-resistance-rated non-load-bearing walls, including partitions, with fire-protection-rated openings.
 2. Fire-resistance-rated floor assemblies
 3. Fire-resistance-rated roof assemblies.
- B. F-Rated Systems: Provide through-penetration firestop systems with F-ratings indicated, as determined per ASTM E 814, but not less than that equaling or exceeding fire-resistance rating of constructions penetrated.
- C. T-Rated Systems: For the following conditions, provide through-penetration firestop systems with T-ratings indicated, as well as F-ratings, as determined per ASTM E 814, where systems protect penetrating items exposed to potential contact with adjacent materials in occupiable floor areas:
1. Penetrations located outside wall cavities.
 2. Penetrations located outside fire-resistive shaft enclosures.
 3. Penetrations located in construction containing fire-protection-rated openings.
 4. Penetrating items larger than 4-inch diameter nominal pipe or 16 sq. in. in overall cross-sectional area.
- D. For through-penetration firestop systems exposed to view, traffic, moisture, and physical damage, provide products that after curing do not deteriorate when exposed to these conditions both during and after construction.

1. For piping penetrations for plumbing and wet-pipe sprinkler systems, provide moisture-resistant through-penetration firestop systems.
 2. For floor penetrations with annular spaces exceeding 4 inches in width and exposed to possible loading and traffic, provide firestop systems capable of supporting floor loads involved either by installing floor plates or by other means.
 3. For penetrations involving insulated piping, provide through-penetration firestop systems not requiring removal of insulation.
- E. For through-penetration firestop systems exposed to view, provide products with flame-spread ratings of less than 25 and smoke-developed ratings of less than 450, as determined per ASTM E 84.

1.04 SUBMITTALS:

- A. Submit the following for approval in accordance with the Special Conditions and with the additional requirements as specified for each:
- B. Product Data: For each type of through-penetration firestop system product indicated.
- C. Shop Drawings: For each through-penetration firestop system, show each kind of construction condition penetrated, relationships to adjoining construction, and kind of penetrating item. Include firestop design designation of testing and inspecting agency acceptable to authorities having jurisdiction that evidences compliance with requirements for each condition indicated.
1. Submit documentation, including illustrations, from a qualified testing and inspecting agency that is applicable to each through-penetration firestop system configuration for construction and penetrating items.
- D. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.
- E. Certification: Signed by manufacturers of through-penetration firestop system products certifying that products furnished comply with requirements.

1.05 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
1. Comply with codes and regulations of the jurisdictional authorities.
 2. ASTM E 84, E 814.
 3. UL - 1479.
- B. Installer Qualifications: An experienced installer who has completed through-penetration firestop systems similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.
- C. Source Limitations: Obtain through-penetration firestop systems, for each kind of penetration and construction condition indicated, from a single manufacturer.
- D. Fire-Test-Response Characteristics: Provide through-penetration firestop systems that comply with the following requirements and those specified in "Performance Requirements" Article:

1. Through-penetration firestop systems are identical to those tested per ASTM E 814. Provide rated systems complying with the following requirements:
 - a. Through-penetration firestop system products bear classification marking of qualified testing and inspecting agency.
 - b. Through-penetration firestop systems correspond to UL in Fire Resistance Directory reference to through-penetration firestop system designations listed by the following:

1.06 DELIVERY, STORAGE, AND HANDLING:

- A. Deliver through-penetration firestop system products to Project site in original, unopened containers or packages with intact and legible manufacturers' labels identifying product and manufacturer; date of manufacture; lot number; shelf life, if applicable; qualified testing and inspecting agency's classification marking applicable to Project; curing time; and mixing instructions for multicomponent materials.
- B. Store and handle materials for through-penetration firestop systems to prevent their deterioration or damage due to moisture, temperature changes, contaminants, or other causes.

1.07 PROJECT CONDITIONS:

- A. Environmental Limitations: Do not install through-penetration firestop systems when ambient or substrate temperatures are outside limits permitted by through-penetration firestop system manufacturers or when substrates are wet due to rain, frost, condensation, or other causes.
- B. Ventilate through-penetration firestop systems per manufacturer's written instructions by natural means or, where this is inadequate, forced-air circulation.

1.08 COORDINATION:

- A. Coordinate construction of openings and penetrating items to ensure that through-penetration firestop systems are installed according to specified requirements.
- B. Coordinate sizing of sleeves, openings, core-drilled holes, or cut openings to accommodate through-penetration firestop systems.
- C. Do not cover up through-penetration firestop system installations that will become concealed behind other construction until the Engineer has examined each installation.

PART 2 - PRODUCTS

2.01 FIRESTOPPING, GENERAL:

- A. Compatibility: Provide through-penetration firestop systems that are compatible with one another, with the substrates forming openings, and with the items, if any, penetrating through-penetration firestop systems, under conditions of service and application, as demonstrated by through-penetration firestop system manufacturer based on testing and field experience.
- B. Accessories: Provide components for each through-penetration firestop system that are needed to install fill materials and to comply with "Performance Requirements" Article. Use

only components specified by through-penetration firestop system manufacturer and approved by the qualified testing and inspecting agency for firestop systems indicated. Accessories include, but are not limited to, the following items:

1. Permanent forming/damming/backing materials, including the following:
 - a. Slag-/rock-wool-fiber insulation.
 - b. Sealants used in combination with other forming/damming/backing materials to prevent leakage of fill materials in liquid state.
 - c. Fire-rated form board.
 - d. Fillers for sealants.
2. Temporary forming materials.
3. Substrate primers.
4. Collars.
5. Steel sleeves.

2.02 FILL MATERIALS:

- A. General: Provide through-penetration firestop systems containing the types of fill materials indicated in the Through-Penetration Firestop System Schedule at the end of Part 3 by reference to the types of materials described in this Article. Fill materials are those referred to in directories of the referenced testing and inspecting agencies as fill, void, or cavity materials.
- B. Cast-in-Place Firestop Devices: Factory-assembled devices for use in cast-in-place concrete floors and consisting of an outer metallic sleeve lined with an intumescent strip, a radial extended flange attached to one end of the sleeve for fastening to concrete formwork, and a neoprene gasket.
- C. Latex Sealants: Single-component latex formulations that after cure do not re-emulsify during exposure to moisture
- D. Firestop Devices: Factory-assembled collars formed from galvanized steel and lined with intumescent material sized to fit specific diameter of penetrant.
- E. Intumescent Composite Sheets: Rigid panels consisting of aluminum-foil-faced elastomeric sheet bonded to galvanized steel sheet.
- F. Intumescent Putties: Nonhardening dielectric, water-resistant putties containing no solvents, inorganic fibers, or silicone compounds.
- G. Intumescent Wrap Strips: Single-component intumescent elastomeric sheets with aluminum foil on one side.
- H. Mortars: Prepackaged, dry mixes consisting of a blend of inorganic binders, hydraulic cement, fillers, and lightweight aggregate formulated for mixing with water at Project site to form a nonshrinking, homogeneous mortar.
- I. Pillows/Bags: Reusable, heat-expanding pillows/bags consisting of glass-fiber cloth cases filled with a combination of mineral-fiber, water-insoluble expansion agents and fire-retardant additives.
- J. Silicone Foams: Multicomponent, silicone-based liquid elastomers that, when mixed, expand and cure in place to produce a flexible, nonshrinking foam.

- K. **Silicone Sealants:** Moisture-curing, single-component, silicone-based, neutral-curing elastomeric sealants of grade indicated below:
1. **Grade for Horizontal Surfaces:** Pourable (self-leveling) formulation for openings in floors and other horizontal surfaces.
 2. **Grade for Vertical Surfaces:** Nonsag formulation for openings in vertical and other surfaces.

2.03 PERIMETER FIRE-CONTAINMENT SYSTEMS:

- A. Where indicated for gaps between the perimeter edge of fire-resistance-rated floor assemblies and non-fire-resistance-rated exterior curtain walls, provide a perimeter fire-containment system with the fire-test response characteristics indicated, as determined by testing identical systems per UBC Standard 26-9 and UL 2079 by UL or another testing and inspecting agency acceptable to authorities having jurisdiction. Materials shall be identified with appropriate markings of applicable testing and inspecting agency.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine substrates and conditions, with Installer present, for compliance with requirements for opening configurations, penetrating items, substrates, and other conditions affecting performance.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION:

- A. **Surface Cleaning:** Clean out openings immediately before installing through-penetration firestop systems to comply with written recommendations of firestop system manufacturer and the following requirements:
1. Remove from surfaces of opening substrates and from penetrating items foreign materials that could interfere with adhesion of through-penetration firestop systems.
 2. Clean opening substrates and penetrating items to produce clean, sound surfaces capable of developing optimum bond with through-penetration firestop systems. Remove loose particles remaining from cleaning operation.
 3. Remove laitance and form-release agents from concrete.
- B. **Priming:** Prime substrates where recommended in writing by through-penetration firestop system manufacturer using that manufacturer's recommended products and methods. Confine primers to areas of bond; do not allow spillage and migration onto exposed surfaces.
- C. **Masking Tape:** Use masking tape to prevent through-penetration firestop systems from contacting adjoining surfaces that will remain exposed on completion of Work and that would otherwise be permanently stained or damaged by such contact or by cleaning methods used to remove smears from firestop system materials. Remove tape as soon as possible without disturbing firestop system's seal with substrates.

3.03 THROUGH-PENETRATION FIRESTOP SYSTEM INSTALLATION:

- A. General: Install through-penetration firestop systems to comply with "Performance Requirements" Article and firestop system manufacturer's written installation instructions and published drawings for products and applications indicated.
- B. Install forming/damming/backing materials and other accessories of types required to support fill materials during their application and in the position needed to produce cross-sectional shapes and depths required to achieve fire ratings indicated.
- C. Install fill materials for firestop systems by proven techniques to produce the following results:
 - 1. Fill voids and cavities formed by openings, forming materials, accessories, and penetrating items as required to achieve fire-resistance ratings indicated.
 - 2. Apply materials so they contact and adhere to substrates formed by openings and penetrating items.
 - 3. For fill materials that will remain exposed after completing Work, finish to produce smooth, uniform surfaces that are flush with adjoining finishes.

3.04 FIELD QUALITY CONTROL:

- A. Where deficiencies are found, repair or replace through-penetration firestop systems so they comply with requirements.

3.05 IDENTIFICATION:

- A. In areas not exposed to public view, identify through-penetration firestop systems with pressure-sensitive, self-adhesive, preprinted vinyl labels. Attach labels permanently to surfaces of penetrated construction on both sides of each firestop system installation where labels will be visible to anyone seeking to remove penetrating items or firestop systems. Include the following information on labels:
 - 1. The words: "Warning--Through-Penetration Firestop System--Do Not Disturb."

3.06 CLEANING AND PROTECTION:

- A. Clean off excess fill materials adjacent to openings as Work progresses by methods and with cleaning materials that are approved in writing by through-penetration firestop system manufacturers and that do not damage materials in which openings occur.
- B. Provide final protection and maintain conditions during and after installation that ensure through-penetration firestop systems are without damage or deterioration at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated through-penetration firestop systems immediately and install new materials to produce through-penetration firestop systems complying with specified requirements.

3.07 THROUGH-PENETRATION FIRESTOP SYSTEM SCHEDULE:

- A. Where UL-classified systems are indicated, they refer to the alpha-alpha-numeric designations listed in UL's "Fire Resistance Directory" under product Category XHEZ.
- B. Firestop Systems for Metallic and Non-metallic Conduit, Tubing, Sleeves, Cable Trays and Cables:

1. UL-1479: Fire rated for 3 hours.
 2. Type of fill materials: One or more of the following:
 - a. Silicone sealant.
 - b. Intumescent putty.
 - c. Silicone foam.
- C. Firestop Systems for Insulated Pipes: Comply with the following:
1. UL- 1479: CAJ 5087.
 2. Type of Fill Materials: Intumescent putty.
- D. Firestop Systems for Miscellaneous Mechanical Penetrations: Comply with the following:
1. UL- 1479: CAS 8033.
 2. Type of Fill Materials: Mortar.
- E. Firestop Systems for Ductwork: Comply with the following:
1. UL- 1479: WJ7007.
 2. Type of Fill Materials: Intumescent sealant.

END OF SECTION

THIS PAGE NOT USED

SECTION 07900

SEALS AND SEALANTS

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing compression seals and sealants not specified elsewhere.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Expansion joint cover assemblies and systems: Sections 05811.
- B. Sealant for metal thresholds: Section 08710.
- C. Glazing sealant: Section 08800.
- D. Acoustical sealant: Section 09255.
- E. Ceramic tile sealant: Section 09320.
- F. Caulk for painting preparation: Section 09920.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ASTM: C920, C1193, D412, D1752, D2628.
- B. Manufacturer Qualification:
 - 1. General: Provide the products of established manufacturers. Insofar as possible, provide products from a single manufacturer.
 - 2. Sealant color-selection capability: Have color-selection capability resolved early in the submittals process to prevent delay of the work.
 - a. Where sealants are exposed, provide products of a manufacturer who can match the colors of adjacent materials by either having an acceptable range of standard colors or by factory blending custom colors as acceptable to the Engineer and at no additional cost to the Authority.
 - b. Where a manufacturer's colors are insufficient for proper color-match, use acceptable colors from another acceptable manufacturer.
 - 3. On-site representation: Use only a sealant manufacturer who has a local, knowledgeable representative who can visit the project site prior to construction and at least twice during sealant installation to observe conditions and recommend solutions at no additional cost to the Authority.
- C. Design Criteria:
 - 1. Designed width of exterior joints: Joint widths indicated on drawings are shown at their designed width. This is measured when the joint would be at the average air temperature for the year, which is approximately 50F, based on an average minimum air temperature of zero degrees F and an average maximum air temperature of 100F.
 - 2. Designed width of interior joints: Joint widths indicated on the drawings are shown at their designed width at 50F.
 - 3. Joint width at time of seal or sealant application: Make joint widths at time of installation never less than the calculated width, which at 0 degrees F is 25 percent wider than the designed width and at 100F is 25 percent narrower than the designed

width for exterior joints and 1-1/2 percent smaller than the designed width for each degree the ambient temperature exceeds 50F, and 1-1/2 percent larger than the designed width for each degree the ambient temperature is less than 50F.

- a. It is recommended that seals and sealant be installed when the average daily air temperature is 50 degrees F plus or minus five degrees, when joint should be at its designed width.
 - b. If joints are less than the calculated width at the time of proposed installation, take corrective action, which may include saw cutting of joint or other remedial measures approved by the Engineer and by the seal or sealant manufacturer.
 - c. If the joint depth is not sufficient for the designed width of the joint, sealant and backup, cut out the joint to the required depth for the sealant and backup.
 - d. Perform cutting and remedial measures that are acceptable to the Engineer. Cost of cutting and remedial measures are at no additional cost to the Authority.
4. Joint size and sealant size: Except as otherwise indicated, make sealant at least 1/4-inch wide x 1/4-inch deep. In joints 3/8 inches wide, make sealant 1/4-inch deep. In joints wider than 3/8-inch and up to 1-inch wide, make sealant depth 1/2 of the joint width. For joints wider than 1 inch, make sealant depth as recommended by the sealant manufacturer.

1.04 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Samples:
1. Material samples: Four of each type of the following materials used in the work:
 - a. Compression seals: 12 inches long, plus each factory-made corner unit.
 - b. Sealant and lubricant-adhesive: Half-pint containers.
 - c. Sealant colors: Fully cured beads of each color used, each six inches long.
 - d. Backup material: 12 inches long.
 - e. Joint filler: 12 inches long.
 - f. Color chips: 12 inches long, one for each color used in the work.
 2. Demonstration samples: Make demonstration installation of each seal and sealant installation type and color. Use approved materials, installed and cured as required. Remove demonstration samples as directed. Perform testing on sealant demonstration samples as specified under Field Testing.
- B. Shop Drawings:
1. General: Submit manufacturers technical product data for each product proposed to be used, together with standard and custom color-selection samples.
 2. Compression seals: Detail correct size and placement of each type and size of compression seal in its joint.
 3. Test results: Inspection and adhesion test results performed by sealant manufacturer.
- C. Certification by each manufacturer that the products provided will perform as required and will not stain adjacent materials.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to jobsite in original unopened containers clearly marked with manufacturer's name and brand designation, referenced specification number, type and class as applicable.
- B. Store products in approved dry area and protect from contact with soil and from exposure to the elements. Keep products dry.
- C. Handle products to prevent breakage of containers and damage to products.

1.06 JOB CONDITIONS:

- A. Environmental Requirements:
 - 1. Application of seals or sealants, including their related products, when ambient temperature is lower than 40F or when there is ice, frost or dampness visible on surfaces to be sealed is prohibited.
 - 2. Comply with manufacturer's environmental recommendation.

PART 2 - PRODUCTS

2.01 COMPRESSION-SEAL MATERIALS:

- A. Preformed compression seals: ASTM D2628, rectangular design unless otherwise shown.
 - 1. Width: Size compression seals for full amount of joint movement as required, plus the thickness of the compressed seal as recommended by the manufacturer.
 - 2. Corners: Provide factory pre-molded or factory pre-cut and welded corner units for angular changes in direction, vertically as well as horizontally, including 30, 60, 45, 90, 120, 135, and 150 degrees as required by joint location.
- B. Lubricant-adhesive, general: One-part moisture-curing polyurethane as recommended by compression seal manufacturer, with the following additional requirements:

Physical Property	Requirement	ASTM Test Method
Average weight per gallon	8.00 pounds plus-or-minus 10 percent	-
Solids content	65 - 74 percent by weight	-
Adhesive	Fluid from 5F to 120F	-
Film strength	1200 psi, minimum	D412
Elongation	250 percent	D412

- C. Lubricant-adhesive for compression seal in granite: Same as above, but also tested for nonstaining over a three-month period on samples of granite to be used.

2.02 SEALANT AND ACCESSORIES:

- A. General: Provide joint sealant, backup rod, primer, and other related materials that are compatible with one another and with the joint substrates under conditions of service and application, as demonstrated by sealant manufacturer based on field experience and submitted test reports.
- B. Sealant (Polyurethane): Polyurethane-based or epoxidized polyurethane based, multi-part elastomeric sealant, ASTM C920, Type M (multi-component), Class 25 (withstands an increase or decrease of 25 percent of the joint width) as follows:
 - 1. For joints in horizontal surfaces: Grade P (pourable or self-leveling), Uses T (traffic areas), M (on masonry) or O (other than standard substrates).
 - 2. For joints in sloped surfaces: Grade NS (nonsag), Uses T (traffic areas), M (on masonry) or O (other than standard substrates).
 - 3. For joints in overhead and vertical surfaces: Grade NS (nonsag), Uses NT (nontraffic areas), M (on masonry), A (on aluminum), or O (other than standard substrates).
- C. Primer: Colorless, nonstaining liquid material of types suited to each substrate surface, as tested and recommended in writing by the manufacturer of each sealant to be used.
- D. Backup Rod: Preformed, compressible, resilient, non-waxed, non-extruding, nonstaining, closed-cell rod stock of polyethylene or polyethylene-jacketed foam which will maintain a uniform round or oval cross-sectional shape when compressed into the joint.
 - 1. Select backup rods as recommended by the manufacturer of each sealant to be used; compatible with joint substrates, sealants, primers, and other joint fillers; that will not bond with sealants and primers; and are approved for applications indicated based on field experience and laboratory testing.
 - 2. Select backup rod of the sizes and shapes to suit the various conditions and at about 30 percent wider than the joint width.
 - a. Where depth of joint is too shallow for round backup rod use 1/2-round backup rod, factory manufactured with cut surface fused by heat process so that it cannot release gas.
 - b. Where depth is too shallow for 1/2-round rod, use bond breaker tape.
- E. Bond-Breaker Tape: Polyethylene tape, as recommended by the manufacturer of each sealant to be used, for preventing sealant from adhering to joint-filler materials or joint surfaces at back of joint where such adhesion would promote sealant failure, or result in less than optimal performance. Provide tape sized properly for the joint. Provide self-adhesive tape where applicable.
- F. Cleaning Agent: Joint cleaning compound tested and recommended in writing by sealant manufacturer for cleaning joint surfaces before priming. Use only a cleaner which is nonstaining, non-harmful to masonry, does not leave oily residues, and does not have a detrimental effect on adhesion or in-service performance.
- G. Weep Tubes: Vinyl tubing, 3/8-inch diameter.
- H. Masking Tape: Nonstaining, nonabsorbent type, compatible with joint sealants and to surfaces adjacent to joints. Use only a masking tape which will easily come off entirely, including adhesive.
- I. Joint Filler for Sealant Joints : Nonstaining joint filler compatible with backer rod and sealant:

1. Sponge rubber: Preformed strips complying with ASTM D1752 Type I.
- J. Joint Filler for Pavers and Walkways: Nonstaining joint filler compatible with backer rod and sealant; one of the following. Where filler is not shown covered by sealant, see Section 03300:
1. Cork: Preformed strips complying with ASTM D1752 Type II.
 2. Self-expanding cork: Preformed strips complying with ASTM D1752 Type III.
- K. Interior Acrylic Latex Caulk per ASTM C-834. Single component, paintable.
1. For interior junctions of dissimilar materials.
- L. Silicone Caulk. White silicone per ASTM C-920. Single component, mildew resistant.
1. For interior locations, at plumbing fixtures and sinks.

PART 3 - EXECUTION

3.01 INSPECTION AND PREPARATION:

- A. Inspection:
1. With installer present, examine joints for compliance with requirements for joint configuration, installation tolerances, and other conditions affecting the performance of joint seals and sealants.
 2. Have sealant manufacturer's representative visit the site and review the project joint conditions and details for sealant work of this Project and perform adhesion testing. Have sealant manufacturer representative report to the Engineer in writing the results of his inspections and tests.
 3. Do not proceed with work of this section until unsatisfactory conditions have been corrected.
- B. Preparation: Comply with the recommendations of ASTM C1193 and the following:
1. Cleaning:
 - a. Clean joint surfaces receiving seals or sealants. Ensure that they are sound, smooth, clean, dry, and free of foreign substances and contaminants, including curing compounds and release agents.
 - b. Remove factory or field-applied coatings that will be detrimental to adhesion of seals, sealants or primers.
 2. Masking: Use masking where required to prevent contact of sealant and primers with adjoining surfaces that otherwise would be stained or damaged by such contact or by cleaning methods required to remove sealant or primer smears.
- C. Priming: Unless sealant manufacturer specifically recommends in writing against priming, apply primer to prepared surfaces that will receive sealant. Apply primer on clean, dry surfaces, and prior to installation of backup rod. Completely wet both inner faces of the joint with primer.
- D. Backup rod: Install backup rod in joints (after primer is dry) to provide backup and give proper shape for sealant bead. Where there is insufficient joint depth for backup rod, install half-round backup rod or bond breaker tape as approved in lieu of backup rod.
1. Proper cross-sectional shape for sealant bead is a very slight hourglass shape with back and front faces having slight concave curvature, unless indicated otherwise. Use special blunt T-shaped tool or roller to install backup rod to the proper and uniform depth required for the sealant.

2. Install size of backup rod that will provide approximately 30 percent compression.
 3. Do not stretch, twist, braid, puncture, or tear backup rod. A broken surface will emit gas (out-gassing) that blisters the installed sealant, thereby requiring complete removal and reinstallation of primer, backup rod, and sealant.
 4. Tightly butt backup rods at joints and intersections. At outside corners, provide sufficient length of backer rod so that rod can be bent around corner rather than cut at corner, so that out-gassing will not occur.
- E. Bond breaker tape: Where space for a backup rod is inadequate, use bond breaker tape to prevent three-sided adhesion. Install bond breaker tape smoothly over back of joints so that sealant adheres to the sides of joint but not to the back of joint.

3.02 INSTALLATION:

- A. Compression Seals:
1. If adjacent surfaces are to receive waterproofing, install compression seals prior to application of waterproofing.
 2. Prime interfaces, edges and corners of joints as necessary.
 3. Prime and lubricate joints by coating both sides of joint with lubricant-adhesive to wet-film thickness of 20 mils.
 4. While lubricant-adhesive is still wet, install compression seals to depth shown.
 5. Recess exposed edges slightly behind adjoining surfaces, unless otherwise shown, so that compressed units will not protrude from joints.
 6. Bond ends together with materials and methods recommended by manufacturer to ensure continuous watertight and airtight performance. Where factory pre-molded or pre-welded corner units are unavailable, miter-cut and bond ends at corners.
- B. Sealant:
1. Comply with ASTM C1193 and with manufacturer's recommendations, except where more stringent requirements are shown or specified.
 2. Set joint-filler units at depth or position in joint as shown to coordinate with other work, including installation of bond breakers, backer rods and sealants. Do not leave voids or gaps between ends of joint-filler units.
 3. Install back-up material, except where shown to be omitted or recommended to be omitted by sealant manufacturer for application used.
 4. Install bond-breaker tape where shown and where recommended by manufacturer to ensure that sealants will perform as intended.
 5. Employ installation techniques which will ensure that sealants are deposited in uniform, continuous ribbons without gaps or air pockets, with complete wetting of joint bond surfaces equally on opposite sides.
 - a. Except as otherwise shown, fill sealant rabbet to slightly concave surface, slightly below adjoining surfaces. Where horizontal joints are between horizontal surface and vertical surface, fill joint to form slight cove, so that joint will not trap moisture and dirt.
 - b. Fill joints to a depth equal to 50 percent of joint width, but not more than 1/2-inch deep nor less than 1/4-inch deep.
 - c. Ensure that temperature of sealant, as well as of substrates, at time of sealant application, is as recommended by sealant manufacturer and as specified herein. Apply sealant at optimum time after primer application.
 - d. Remove masking immediately after tooling of sealant and before sealant face starts to skin over. Do not cause dislocation of sealant, or migration of sealant to adjacent surfaces when removing masking tape.

6. Spillage: Do not allow sealants or compounds to overflow from confines of joints, to spill onto adjoining work or to migrate into voids of exposed finishes. If spillage occurs, eliminate evidence of spillage to the Engineer's satisfaction.
7. Seal joints in granite work with sealant, except granite-paving joints and pylon-apron joints that are shown to be grouted. Ensure joint depths of at least 3/4 inch before placing backup. If necessary, rake-out joints to a minimum depth of 3/4 inch.
8. Weep Holes: Install weep tubes, sloping to expel water, where required to allow free drainage of hollow spaces. Where so shown, install tubes through sealant and backing to ensure an unobstructed drainage path. Do not seal over weep holes provided by other trades.

3.03 CURING AND PROTECTING:

- A. Cure sealants in compliance with manufacturer's recommendations, to obtain high early bond strength, internal cohesive strength and surface durability.
- B. Cure and protect joint sealers during construction period, so that they will be without deterioration, soiling or damage, other than normal wear and weathering, at time of final acceptance.
- C. Cure and protect sealants so as to minimize increases in modulus of elasticity and other accelerated aging effects.
- D. Replace or restore sealants damaged or deteriorated during construction and from testing as directed. Cut out or remove damaged sealant immediately and properly prepare and reseal joint with new materials to produce sealant installation with repaired areas indistinguishable from other work.

3.04 FIELD TESTING:

- A. Sealant: Field test cured sealant installations in the presence of and where directed by the Engineer. Test each type of joint sealant for adhesion to joint substrates by hand-pull method as follows:
 1. Make knife cuts as follows: A transverse cut from one side of joint to the other, followed by parallel cuts approximately 2 inches long at each side of joint and meeting the transverse cut at the end of the 2-inch cuts. Place a mark 1 inch from the top of 2-inch piece.
 2. Use fingers to grasp the 2-inch piece of sealant just above the 1-inch mark; pull firmly away at a 90-degree angle while holding a ruler along side of sealant; pull sealant out of joint to the distance recommended by sealant manufacturer for testing adhesive capability, but not less than the distance equaling the specified maximum movement capability in extension; hold this position for 10 seconds.
 3. Report whether or not the sealant in joint (connected to pulled-out portion) failed to adhere to joint substrates or failed cohesively or adhesively. Include data on pull distance used to test each type of sealant and joint substrate.
 4. Sealants not evidencing adhesive failure from testing, in absence of other indications of noncompliance with requirements, will be considered acceptable, subject to certification of design and performance criteria by the manufacturer.
 5. Make a minimum of 10 such tests unless otherwise directed by the Engineer. Submit report of testing to the Engineer.

3.05 CLEANING:

- A. Immediately clean off excess primers, drippings, sealants and sealant smears as work progresses, using methods and with cleaning materials approved by manufacturer of each joint primer and sealant and by manufacturers of materials where joints occur.
- B. Use only materials and methods acceptable to the Engineer.

END OF SECTION

SECTION 08110

HOLLOW METAL DOORS AND FRAMES

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing metal doors and frames.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Finish hardware: Section 08710.
- B. Glass and glazing: Section 08800.
- C. Field painting: Section 09920.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings:
 - 1. Details of construction, connections, anchors, schedules, setting diagrams and interface with work of other trades.
 - 2. Schedule of doors and frames using the same reference numbers for details and openings as those on the Contract Documents.
- B. Certification.

1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. NFPA: 80 (Standard for Fire Doors and Fire Windows).
 - 3. UL: Building Materials Directory.
 - 4. NAAMM: Standards HMMA 861 and 862.
 - 5. SDI: 100.
 - 6. FS: TT-F-322.
 - 7. ASTM: A153, A366, A526, A569, A780, C236, C976.
 - 8. DHI (Door and Hardware Institute): A115, Recommended Locations for Builder's Hardware.
 - 9. ADA (Americans With Disabilities Act).
- B. Fire-Rated Assemblies: Where UL-listing, UL-label or UL Building Materials Directory is specified, another testing and inspection agency acceptable to the Engineer and to authorities having jurisdiction may be used.

1.05 PRODUCT, DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to the jobsite in original unopened containers or wrappings clearly labeled with manufacturer's name and brand designation, door schedule number, referenced specification number, type, class and rating as applicable.

- B. Store products in an approved dry area, protect from contact with soil and from exposure to the elements.
- C. Handle products so as to prevent breakage of containers and damage to products.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Hot-Rolled Steel Sheets and Strip: Commercial quality carbon steel, pickled and oiled, complying with ASTM A569, free of scale, pitting or surface defects.
- B. Cold-Rolled Steel Sheets: Commercial quality, level, carbon steel, complying with ASTM A366.
- C. Galvanized Steel Sheets: Zinc-coated carbon steel sheets of commercial quality, complying with ASTM A526, G60 zinc coating, mill phosphatized.
- D. Shop-Applied Primer: Rust-inhibitive baked-on primer, suitable as base for specified finish paint systems.
- E. Finish Paint Systems: Section 09920.
- F. Supports and Anchors: Sheet steel, gauge in accordance with HMMA reference standards, unless specified otherwise. After fabricating, galvanize units to be built into or attached to exterior walls, wet areas such as doors to toilet rooms and janitor's room, or attached to slabs on grade; complying with ASTM A153, Class B.
- G. Inserts, Bolts and Fasteners: Manufacturer's standard units unless specified otherwise. Hot-dip galvanized items to be used in exterior walls, wet areas such as doors to toilet rooms and janitor's rooms, or attached to slabs on grade; complying with ASTM A153, Class C or D as applicable.
- H. Metallic Filler: FS TT-F-322.
- I. Galvanizing Repair Compound: Stick form, melting point 600F to 650F, GALVABAR or equal.

2.02 FABRICATION, GENERAL:

- A. Fabricate hollow metal door and frame units to be rigid, neat in appearance, and free from defects, warp or buckle. Wherever practicable, fit and assemble units in manufacturer's plant. Clearly identify work that cannot be permanently factory-assembled before shipment, to ensure proper assembly at project site.
- B. Galvanize exterior door and frame assemblies, and wet area door and frame assemblies such as at toilet room and janitor's room; including but not limited to face sheets, reinforcements, closures, dust covers, mortar shields, glazing and louver beads, clips, anchor bolts, screws, rivets and welds.
- C. Exposed fasteners are not allowed on door frames and door faces; elsewhere, provide countersunk flat philips heads for exposed screws and bolts.
- D. Door Hardware Preparation:

1. Prepare and reinforce doors and frames to receive mortised and concealed hardware in accordance with final Hardware Schedule and templates provided by hardware supplier. Comply with applicable requirements of DHI A115-series, Steel Door Prep Standards, for door and frame preparation for hardware.
 2. Reinforce doors and frames to receive surface-applied hardware. Drilling and tapping for surface-applied hardware may be done at project site.
 3. Locate hardware as indicated on approved shop drawings or, if not indicated, in accordance with ADA requirements pertaining to operating hardware locations, and the Recommended Locations for Builder's Hardware, published by the DHI.
- E. Shop Painting:
1. Clean, treat and paint exposed surfaces of steel door and frame units, including galvanized surfaces.
 2. Chemically clean steel surfaces of mill scale, rust, oil, grease, dirt and other foreign materials before application of paint.
 3. Apply phosphate conversion pretreatment coating.
 4. Apply shop coat of prime paint of even consistency to provide a uniformly finished surface ready to receive finish paint. Apply primer immediately after surface preparation and pretreatment.
- F. Insulated Metal Assemblies: Where scheduled, provide doors and frames fabricated as thermal-insulating assemblies and tested according to ASTM C236 or ASTM C976.

2.03 FRAMES:

- A. General:
1. Fabricate frames to uniform profile as shown of full-welded unit construction, with corners mitered and reinforced. Continuously weld full depth and width of frame, except for knock-down frames.
 2. Mullions and Transom Bars: Provide closed or tubular mullions and transom bars where indicated.
 - a. Fasten mullions and transom bars at crossings and to jambs by butt welding, except for knock-down frames.
 - b. Reinforce joints between frame members with concealed clip angles or sleeves of the same metal and thickness as frame.
 3. Jamb anchors: Provide in accordance with NAAMM Standards HMMA 861 and 862:
 - a. Provide T-type anchors or strap-and-stirrup type anchors at new masonry.
 - b. Provide Z-type anchors at metal stud partitions.
 - c. Provide bolt-type anchors with pipe spacers at in-place construction.
 4. Floor anchors: Provide floor anchors for each jamb and mullion that extends to floor, formed of galvanized steel sheet, as follows:
 - a. Monolithic concrete slabs: Clip-type anchors, with two holes to receive fasteners, welded to bottom of jambs and mullions.
 - b. Separate topping concrete slabs: Adjustable type with extension clips, allowing not less than two-inch height adjustment. Terminate bottom of frames at finish floor surface.
 5. Head anchors: Provide two anchors at head of frames exceeding 42 inches wide for frames mounted in steel stud walls.
 6. Head strut supports:
 - a. Provide 3/8-inch by two-inch vertical steel struts extending from top of frame at each jamb to supporting construction above, unless frame is anchored to masonry or to other structural support at each jamb.
 - b. Bend top of struts to provide flush contact for securing to supporting construction above.

- c. Provide adjustable bolted anchorage to frame jamb members.
 - 7. Structural reinforcing members: Provide structural reinforcing members as a part of frame assembly, where indicated at mullions, transoms or other locations which are to be built into frame.
 - 8. Spreader bars: Across bottom of welded frames, provide removable spreader bar, tack welded to jambs and mullions.
 - 9. Door silencers:
 - a. Drill stop to receive three silencers on single door frames and two silencers on double door frames.
 - b. Install plastic plugs to keep holes clear during construction.
 - 10. Plaster guards: Provide 18-gauge steel plaster guards or dust-cover boxes (galvanized at exterior locations), welded to frame, at back of hardware cutouts, where mortar or other materials might obstruct hardware installation or operation and to close off interior of openings.
- B. Interior Hollow Metal Frames: NAAMM Standard HMMA 861, Guide Specifications for Commercial Hollow Metal Doors and Frames except as follows:
 - 1. Openings over four feet wide: 12-gauge.
 - 2. Cart-storage rooms and other doors as indicated: Use security hollow metal frames specified below.
 - 3. Knock-down frames may be used in drywall construction as specified below.
- C. Exterior and Security Hollow Metal Frames: NAAMM Standard HMMA 862, Guide Specifications for Security Hollow Metal Doors and Frames, except as follows:
 - 1. Use for exterior doors and for indicated security doors including cart-storage room.
 - 2. Cart-storage-room frame anchors: Hot-dipped galvanized anchor bolts, not less than 1/2-inch by six inches, inaccessible from the safety walk, eight per frame.
- D. Interior Knock-Down Hollow Metal Frames: SDI 100, and as follows:
 - 1. Knock-down frames may be used only in interior drywall construction.
 - 2. Openings four foot wide or less: 16-gauge.
 - 3. Openings over four feet wide: 12-gauge.

2.04 DOORS:

- A. Thermal Insulation: Provide exterior doors and panels with internal thermal insulation of fiberglass batts..
- B. Interior Hollow Metal Doors: NAAMM Standard HMMA 861, Guide Specifications for Commercial Hollow Metal Doors and Frames except for cart-storage room and other doors as indicated.
- C. Exterior and Security Hollow metal Doors: NAAMM Standard HMMA 862, Guide Specifications for Security Hollow Metal Doors and Frames.
 - 1. Use for exterior doors and for indicated security doors including cart-storage room.

2.05 FIRE-DOOR ASSEMBLIES:

- A. Where fire-rated door and frame assemblies are required for code compliance, or are otherwise indicated, provide door, frame and hardware assemblies in compliance with NFPA 80, which are labeled and listed by UL.

- B. Fabrication and assembly requirements necessary to obtain labels will take precedence over requirements shown or specified, except where requirements shown or specified exceed sizes or gauges required for labeling.
- C. Where oversized fire doors are required, furnish manufacturer's certification that assembly has been constructed with materials and methods equivalent to labeled construction.
- D. Louvers: Equip louvers in fire-rated doors with UL-listed self-closing fire dampers with fusible links.
- E. Identify each fire door and frame with permanent UL labels, indicating the applicable fire rating of both the door and the frame. Secure labels to vertical edge of doors and frames where readily visible. Protect labels from painting operations.

2.06 TRANSOM ASSEMBLIES:

- A. Removable Transom Bar: Formed as shown of same material as frame, with manufacturer's standard bolted connection.
- B. Removable Transom Panel: Formed as shown of the same construction as the door or doors below, through-bolted to frame eight inches on-center maximum.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Deliver work, ready to set up and erect in place as rapidly as general construction work permits. Set work in place in accordance with approved shop drawings, plumb and level, strongly secured against displacement and with built-in anchors. In masonry construction, set frames in advance of masonry work. Limit field-cutting, drilling and punching to minimum necessary.
- B. Anchor metal frames in accordance with NAAMM Standards HMMA 861 and 862.
- C. Anchor fire-door assemblies in accordance with NFPA 80.
- D. Install doors after masonry work has been completed; accurately fit and adjust to work properly.
- E. Maintain installation clearances and tolerances in accordance with NAAMM Standards HMMA 861 and 862.
- F. Coat field welds and repair damage to zinc-coated surfaces in accordance with ASTM A780 and as follows:
 - 1. Wire-brush welds and other repair areas to bright metal.
 - 2. Apply galvanizing repair compound at rate of two ounces per square foot.
- G. Touch-up shop applied primer as recommended by manufacturer for compatibility with finish paint system.
- H. Application of finish hardware: Section 08710.
- I. Glazing materials and installation: Section 08800.

3.02 CLEAN UP:

- A. Upon completion of installation, clean surfaces of doors and frames as recommended by door manufacturer.
- B. Remove from the site rubbish and debris caused by this work.
- C. Leave areas surrounding openings in broom-clean condition.

END OF SECTION

SECTION 08305

ACCESS DOORS AND FRAMES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing wall and ceiling access doors and frames, fire-rated wall access doors and frames, access hatches, tile covered access hatches and passenger emergency-egress hatches.
- B. Work Specified Elsewhere:
 - 1. Cast-In-Place Concrete: Section 03300.
 - 2. Mortar, Grout and Masonry Accessories: Section 04050.
 - 3. Brick Masonry: Section 04125.
 - 4. Concrete Unit Masonry: Section 04220.
 - 5. Structural Steel: Section 05120.
 - 6. Roof Hatches: Section 07730.
 - 7. Finish Hardware: Section 08710.
 - 8. Tile: Section 09320.
 - 9. Paver Tile: Section 09340.
 - 10. Acoustical Panel Ceilings: Section 09511.
 - 11. Field Painting: Section 09920.

1.02 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Product Data: For each type of door and frame indicated. Include construction details relative to materials, individual components and profiles, finishes, and fire ratings (if required) for access doors and frames.
- B. Shop Drawings: Show fabrication and installation details. Include plans, elevations, sections, hardware, fittings, fastenings, details, and attachments to other Work. Manufacturer's standard drawings may be submitted in lieu of Contractor prepared shop drawings if manufacturer's standard drawings show required details.
- C. Samples: For each door face material, at least 3 by 5 inches in size, in specified finish.
- D. Schedule: Provide complete door and frame schedule, including types, general locations, sizes, construction details, latching or locking provisions, and other data pertinent to installation.
- E. Coordination Drawings: Reflected ceiling plans drawn to scale and coordinating penetrations and ceiling-mounted items with concealed framing, suspension systems, piping, ductwork, and other construction. Show the following:
 - 1. Method of attaching door frames to surrounding construction.
 - 2. Ceiling-mounted items including access doors and frames, lighting fixtures, diffusers, grilles, speakers, sprinklers, and special trim.

- F. Certification:
1. Certification from manufacturer of steel gratings verifying that gratings are capable of supporting loading as shown.
 2. Certified test reports of successful factory testing performed on passenger emergency-egress hatches. Certification of previous successful testing of hatches of same design furnished under similar Authority contracts acceptable in lieu of specified testing.
 3. Certification that welding personnel are currently qualified in accordance with AWS D1.1.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
1. Comply with codes and regulations of the jurisdictional authorities.
 2. AASHTO: Standard Specifications for Highway Bridges: HS-20-44 Loading.
 3. AGA: The Design and Fabrication of Galvanized Products.
 4. AISC: Specification for Structural Steel for Buildings-Allowable Stress Design
 5. ASTM: A36, A53, A90, A123, A143, A153, A167, A193, A276, A307, A384, A413, A501, A588, A593, A633, A666, A780, A786, B221, B633, D1187, F594.
 6. AWS: D1.1, D1.2, D1.3, D1.4.
 7. FS; FF-B-588, FF-P-395, FF-S-325, RR-G-661, TT-P-664.
 8. MS: MIL-P-21305.
 9. NAAMM: Metal Finishes Manual for Architectural Metal Products
 10. NFPA: 101 (Fire Exit Hardware), 252 (Standard Method of Fire Tests for Door Assemblies)
 11. SSPC: SP 11, Paint 12.
 12. UL: 10B (Fire Tests of Door Assemblies)
- B. Source Limitations: Obtain doors and frames through one source from a single manufacturer.
- C. Fire-Rated Access Doors and Frames: Units complying with NFPA 80 that are identical to access door and frame assemblies tested for fire-test-response characteristics per the following test method and that are labeled and listed by UL, ITS, or another testing and inspecting agency acceptable to authorities having jurisdiction:
1. NFPA 252 or UL 10B for vertical access doors.
- D. Size Variations: Obtain the Engineer's acceptance of manufacturer's standard-size units, which may vary slightly from sizes indicated.
- E. Welding: Qualify procedures and personnel according to the following:
1. AWS D1.1, "Structural Welding Code-Steel."
 2. AWS D1.2, "Structural Welding Code-Aluminum."
 3. AWS D1.3, "Structural Welding Code-Sheet Steel."
 4. AWS D1.4, "Structural Welding Code-Reinforcing Steel."
 5. Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification. Such certification is to remain in force for the duration of the welding operations under this Contract.
- F. Passenger Emergency-Egress Hatches Meeting AASHTO HS-20-44 Loading:
1. Performance Requirements:
 - a. Design exit hardware so that:
 - 1) Force of not more than 15 pounds on pull ring will actuate release

- bar and latches and outward force of not exceeding 30 pounds will open hatch.
 - 2) Force of not more than 50 pounds on pull ring will actuate release bar and latches when latched leaf is subjected to outward force of 250 pounds applied against latching edge adjacent to latch or to flush grip handle in direction in which latch opens.
 - b. Provide one-inch minimum distance between bar and other door parts, when bar has traveled to fully open position.
 - c. Provide sufficient supports on latch bars to prevent damage and misalignment.
 - d. Design and provide sufficient latch bar springs for proper operation.
 - e. Coordinate design with design-specialty applications which interface with hatch design
 - f. Make recommendations for specialty-design actions to be performed by other specialties.
2. Factory testing:
- a. Perform endurance testing in which hatch leaf is attached to frame assembly and, complete with exit hardware, is subjected to 1,000 opening-and-closing cycles. Hatch, including release mechanism, exit hardware and latches, to operate without failure and show no signs of excessive wear.
 - b. Perform opening tests in which hatch leaf is subjected to the 15-pound test before and after endurance test and in which hatch leaf is subjected to 250-pound-outward-force test after endurance test. With spring scales, or by other approved means, test and record force required to open hatch. Opening force not to exceed 30 pounds for normal test and 50 pounds for 250-pound-outward-force test.
 - c. Test data to be recorded and certified by the manufacturer.
 - d. Notify the Authority at least 14 calendar days prior to each test.
3. Covers: Shall be reinforced to support a minimum live load of 300 psf (1464 kg/m²) with a maximum deflection of 1/150th of the span. Operation shall be smooth and easy with controlled operation throughout the entire arc of opening and closing. Operation shall not be affected by temperature.
4. AASHTO-HS-20-44 load or higher load if required by the jurisdictional authority where the hatch is installed: Structural steel plate with load-carrier beams.

1.04 PROJECT CONDITIONS:

- A. Field Measurements: Where doors and hatches are indicated to fit in walls and other construction, verify dimensions by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
 - 1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating metal fabrications without field measurements. Coordinate construction to ensure that actual dimensions correspond to established dimensions. Allow for trimming and fitting.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products undamaged
- B. Store products so as to prevent rust

- C. Handle products so as to prevent damage.
- D. After completion of factory testing, package and ship hatches as directed.

1.06 COORDINATION:

- A. Verification: Determine specific locations and sizes for access doors needed to gain access to concealed equipment, and indicate on a schedule.
- B. Concrete Work: Coordinate with concrete work so that frames are available for placing integrally with floor slabs or concrete walls unless frames are to be installed during related interior floor work.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. General Requirements:
 - 1. Insofar as practicable, furnish similar products of a single manufacturer.
 - 2. Metal Surfaces, General: For metal fabrications exposed to view in the completed Work, provide materials with smooth, flat surfaces without blemishes. Do not use materials with exposed pitting, seam marks, roller marks, rolled trade names, or roughness.

2.02 FERROUS METALS:

- A. Structural Steel: Plates, shapes, bars and angles: ASTM A36.
- B. Rolled-Steel Floor Plate: ASTM A786/A786M, raised pattern floor plates from rolled-steel floor plate, galvanized after fabrication, of thickness and in pattern indicated below:
 - 1. Thickness: Minimum 1/4 inch, unless otherwise shown or calculated.
 - 2. Pattern: No. 2, or as selected from manufacturer's standard patterns; flat back.
- C. Load-carrier beams: ASTM A588.
- D. Structural Tubing: ASTM A501.
- E. Steel Pipe: ASTM A53, standard weight (Schedule 40), unless another weight is indicated or required by structural loads. Galvanized unless otherwise shown or specified.
- F. Pipe Sleeves and Pipe Fittings: ASTM A53. Galvanized unless otherwise shown or specified.
- G. Stainless Steel Sheets, Strips, Plates, Shapes, and Flat Bars: ASTM A666, Type 304. Type 316L for corrosive environments.
- H. Stainless Steel Bars and Shapes: ASTM A276, Type 304. Type 316L for corrosive environment.
- I. Guard Chain: ASTM A413, Class Grade 28, galvanized steel, 9/32-inch thick, complete with stainless steel eyes, spring-loaded catches and mounting components.

- J. Grating: Steel, bar and crossbar type shown, hot-dipped galvanized after fabrication and sizing, FS RR-G-661, Type 1, Class 1 or 2.

2.03 ALUMINUM:

- A. Aluminum Extrusions: ASTM B221, Alloy 6063.
- B. Aluminum-Alloy Rolled Tread Plate: ASTM B 632, alloy 6061.

2.04 FASTENERS:

- A. General: Provide Type 302 or 316 stainless steel fasteners for exterior use and zinc-plated fasteners complying with ASTM B633, Class Fe/Zn 5, where built into exterior walls. Select fasteners for type, grade, and class required.
- B. Screws: Material, type and size to suit purpose; steel, except stainless., cadmium-plated.
1. Stainless steel, ASTM A193, Alloy S30400.
- C. Machine Bolts: Material, type and size best suited to the purpose. Minimum tensile strength 60,000 psi.
1. Carbon steel: ASTM A307, Grade B, galvanized.
 2. Stainless steel: ASTM A193, Class 1A.
- D. Toggle bolt: FS FF-B-588.
- E. Drive stud: FS FF-S-325, Group 6.
- F. Expansion shield: FS FF-S-325 Group I, Type 2, Class 2, Style 1; Group II, Type 3, Class 1; Group IV, Type 1; best suited to the purpose.
- G. Screw anchors: Lead or plastic for wood or metal screws.
- H. Anchor bolt sleeve: Corrugated high-density polyethylene plastic.
- I. Powder actuated: FS FF-P-395.
- J. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E488, conducted by a qualified independent testing agency.
1. Material: Alloy Group 1 or 2 stainless steel bolts complying with ASTM F593 and nuts complying with ASTM F594.

2.05 CONCRETE AND GROUT:

- A. Nonshrink Grout: Section 04050.
- B. Surface hardener: Water-soluble, inorganic fluosilicate compound for curing, hardening and dustproofing fresh concrete.

2.06 COATINGS:

- A. Shop Primer for Ferrous Metals: Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with performance requirements in FS TT-P-664; selected for good resistance to normal atmospheric corrosion, compatibility with finish paint systems indicated, and capability to provide a sound foundation for field-applied topcoats despite prolonged exposure.
- B. Galvanizing (zinc-coating by hot-dipped process): ASTM A90, ASTM A123, or ASTM A143, ASTM A153 or ASTM A384, as applicable.
- C. Zinc-rich paint: MS MIL-P-21305.
- D. Electro deposited zinc coating: ASTM B633.
- E. Galvanizing Repair Compound: Stick form, melting point 600-degree F to 650-degree F, GALVABAR or equal.
- F. Bituminous Coating: Cold-applied asphalt mastic complying with SSPC Paint 12, except containing no asbestos fibers, or cold-applied asphalt emulsion complying with ASTM D1187.

2.07 FABRICATION, GENERAL:

- A. Shop Assembly: Preassemble items in shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.
- B. Provide access door assemblies manufactured as integral units ready for installation.
- C. Fabricate and prepare products required to be galvanized in accordance with recommendations of AGA.
- D. Provide material that is free from mill scale, flake rust and mill pitting.
- E. Cut, reinforce, drill and tap metal fabrications as indicated to receive finish hardware, screws, and similar items. Provide plates welded on for mounting hardware.
- F. Shear and punch metals cleanly and accurately. Remove burrs.
- G. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners whenever possible. Use exposed fasteners of type indicated or, if not indicated, Phillips flat-head (countersunk) screws or bolts. Locate joints where least conspicuous.
- H. Ease exposed edges to a radius of approximately 1/32 inch, unless otherwise indicated. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.
- I. Provide for anchorage of type indicated; coordinate with supporting structure. Fabricate and space anchoring devices to secure metal fabrications rigidly in place and to support indicated loads.
- J. Where miscellaneous access openings, with exception of gratings, occur in finished floor areas, include stainless steel edge rims of depth to accommodate floor finishing materials.

- K. Welding corners and seams continuously to comply with the following:
1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 2. Obtain fusion without undercut or overlap.
 3. Remove welding flux immediately.
 4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.
- L. Fabricate joints that will be exposed to weather in a manner to exclude water, or provide weep holes where water may accumulate.
- M. Form exposed work true to line and level with accurate angles and surfaces and straight sharp edges.
- N. Remove sharp or rough areas on exposed traffic surfaces.
- O. Painting: Shop paint (prime) before shipment. Phosphatize galvanized surfaces before priming.

2.08 WALL AND CEILING ACCESS DOORS AND FRAMES:

- A. Access Doors: Steel, baked-enamel prime coat; 12-inches square, minimum size.
1. Wall-mounted, sheet steel type: Sizes under four square feet.
 - a. Door:
 - 1) Fixed: 1/4-inch steel plate screwed to frame 18 inches on centers maximum, with flathead, countersunk, tap screws.
 - 2) Operable: Equipped with spring hinges and lockset conforming to requirements of Section 08710; locks keyed into group with mechanical rooms.
 - b. Frame: Structural steel shapes and corners mitered and welded. Strap anchors places not more than 18 inches on centers and extending 18 inches minimum into masonry or concrete.
 2. Wall-mounted, hollow metal type: Size over four square feet.
 - a. Door and frame: Conform to the requirements of Section 08110; galvanized in exterior walls.
 - b. Hardware: Equipped with spring hinges and lockset conforming to requirements of Section 08710; locks keyed into group with mechanical rooms.
 - c. Fire rated: UL 1-1/2 hour B-Label, with labeled hardware.
 3. Ceiling mounted: Galvanized steel, door and frame 16-gauge minimum; continuous piano hinge; with sleeve and plastic grommet for screwdriver from the room side; for gypsum board ceiling.
 - a. Door and frame: Flush with ceiling surface; flush metal door fitting neatly into the frame.
 - b. Size and locations: As required to access equipment indicated or as shown.
 - c. Insulation: Provide upper side of doors with one-inch thick mineral fiberboard permanently cemented in place.
 - d. Manufactured by the C. M. Walsh Company of Boston, Massachusetts, or equal.
 4. Wall or ceiling mounted in plaster walls or ceilings: Size 16 inches square.
 - a. Flush door panel mounted to frame on concealed spring hinges opening to 175 degrees.

- b. Fire rated: UL 1-1/2 hour B-Label, with key operated flush lock.
- c. Manufactured by MILCOR, K-access door or equal.

2.09 ACCESS HATCH, TYPE A:

- A. Fabricated by a manufacturer regularly engaged in the production of access hatches; and designed to meet the requirements of AASHTO-HS-20-44 load or higher load if required by the jurisdictional authority where the hatch is installed.
- B. Door:
 - 1. Grating: Steel, ASTM A36.
 - 2. Side Plate: Floor plate, diamond pattern, flat back.
 - 3. Bearing bars: 2-1/2 inches by 1/4 inch at 13/16-inch on centers and cross bars at four inches on centers.
- C. Frame: Structural steel angle framed on three sides, formed steel plate on the hinge side.
- D. Ferrous-metal components: Galvanized after fabrication.
- E. Hardware:
 - 1. Hinges: Forged brass with stainless steel pins.
 - 2. Lifting mechanism: Stainless steel compression-spring mechanism balancing door leaves through entire arc acting as check to downward motion. Force necessary to open the hatch not to exceed 50 pounds.
 - 3. Hold-open devices: Automatic, 90-degree hold-open arms with vinyl-covered release handles.
 - 4. Locking devices: Snap locks with handles on the underside and removable key handles on top side. Include removable plugs for concealing key holes.

2.10 PASSENGER EMERGENCY-EGRESS HATCH:

- A. Fabricated by a manufacturer regularly engaged in the production of access hatches; and designed to meet the following requirements:
- B. Door leaves: Fabricated in accordance with approved shop drawings.
 - 1. 250 pounds per-square-foot loading: Rolled Steel Floor plate, diamond pattern, flat back. Galvanized after fabrication.
- C. Frame: 1/4-inch structural steel with formed gutters with drainage couplings. Frames welded to eight-inch supporting channels on four sides with full flange around perimeter. Galvanized after fabrication.
- D. Drain Coupling: Provide a 1-1/2" drain coupling located in the right front corner of the channel frame (note: can be placed at a different location if directed by the Engineer).
- E. Hardware:
 - 1. Hinges: Forged brass or Type 316 stainless steel. Hinge pins of stainless steel. Each hinge equipped with two pressure-lubrication fittings, Lincoln No. 5012, or equal.
 - 2. Lifting Mechanism: Stainless steel compression-spring mechanism balancing door leaves through entire arc acting as check to downward motion. Force necessary to open the hatch when applied to inner edge of exit release bar not to exceed 30

- pounds. Manufacturer shall provide the required number and size of compression spring operators enclosed in telescopic tubes to provide, smooth, easy, and controlled cover operation throughout the entire arc of opening and to act as a check in retarding downward motion of the cover when closing. The upper tube shall be the outer tube to prevent accumulation of moisture, grit, and debris inside the lower tube assembly. The lower tube shall interlock with a flanged support shoe fastened to a formed 1/4" gusset support plate.
3. Hold-open devices: Covers shall be equipped with a hold open arm which automatically locks the covers in the open position.
 4. Locking devices:
 - a. Interior: Stainless steel panic bar fabricated and installed to meet NFPA 101 requirements.
 - b. Exterior: A removable exterior turn/lift handle with a spring loaded ball detent shall be provided to open the leaf and the latch release shall be protected by a flush, gasketed, removable screw plug.
 - c. Miscellaneous: Flush grip handles, pull rings with removable caps, handrails on leaves and guard chains of type standard with manufacturer.

2.11 TILE-COVERED FLOOR HATCH:

- A. General: Commercially manufactured to support a uniformly distributed live load of 150 psf and a maximum deflection of 1/150 of the span. Custom sized heavy duty aluminum frame and cover with aluminum or brass exposed edges, and complete with reinforcing, support beams (where necessary), and related accessories.
- B. Aluminum Frames and Covers: Extruded aluminum, ASTM B 221, alloy 6063-T6, with mitered and keyed corners and factory coated with zinc chromate primer or manufacturer's standard protective paint where surfaces will be in contact with concrete.
 1. Exposed Edge Finishes: Mill finish, No. 385 alloy bronze.
 2. Cover Reinforcing: ASTM A 185 (mesh) or ASTM A 615 (bars), factory engineered to meet design load requirements for medium and heavy duty applications.
- C. Steel Support Beams: ASTM A 36, factory engineered to meet design load requirements where maximum spans for single cover are exceeded and elsewhere when required. 1. Furnish steel beam pocket and bearing plate for support beams
- D. Hardware:
 1. Lifting/Locking Device: Lifting blocks (one each corner typically) secured to hatch cover and fitted with threaded bolt
 - a. Furnish threaded handle for lifting, with integral hex head drive for removing securing bolt (for covers equipped with double seals) or blanking bolt (for non-sealed covers).
 2. Seals: Continuous EPDM perimeter seal.
 3. Concrete Fill: Section 0330
- E. Fabrication:
 1. Shop fabricate floor access hatches and covers in sizes and configurations shown for single unit pit access, or multiple unit trench access.

2. Sizes (Single Unit Maximum): 48 inches square (clear opening).
 - a. Where size requirements exceed those shown, multiple covers can be joined together to obtain the desired sizes.
 - b. Where very large covers are required, a small inspection cover may be integrated into the large cover for convenience.
3. Sizes (Multiple Units Maximum): 36 inches square (clear opening).
4. Furnish reinforcement assembly loose for field positioning.
5. All aluminum surfaces in contact with concrete shall receive a factory applied primer or protective paint.
6. Dissimilar metals shall be protected against electrolytic action.

2.12 FINISHES:

A. General:

1. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
2. Finish metal fabrications after assembly.
3. Galvanize ferrous metal unless other finish is shown or specified.

B. Galvanizing:

1. Clean ferrous metal thoroughly before applying zinc coating.
2. Apply zinc coating to products after fabrication, by hot-dip method, using coating weighing not less than two ounces per-square-foot.

C. Shop Paint:

1. Ferrous metal thoroughly cleaned as recommended by primer manufacturer and in accordance with SSPC SP11 and, except for items to be encased in concrete, given prime coat of paint.
2. Zinc yellow iron-oxide primer or red-lead based primer applied so as to thoroughly cover surfaces without leaving runs or sags

D. Stainless Steel: Remove tool and die marks and stretch lines or blend into finish. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.

E. Aluminum: AA-M10 (Mechanical Finish: as fabricated, unspecified).

PART 3 - EXECUTION

3.01 PREPARATION:

- A. Advise installers of other work about specific requirements relating to access door and floor door installation, including sizes of openings to receive access door and frame, as well as locations of supports, inserts, and anchoring devices.

- B. Examine the substrates and conditions under which the work is to be performed, and notify the General Contractor in writing of conditions detrimental to the proper and timely completion of the work. Do not proceed with the installation until unsatisfactory conditions have been corrected.
- C. Remove foreign substances from surfaces to receive metal items.
- D. Protect surrounding surfaces from damage while performing the work of this section.

3.02 INSTALLATION, GENERAL:

- A. Coordinate placement of doors with the work of other trades
- B. Comply with manufacturer's written instructions for installing all access doors and hatches.
- C. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing metal fabrications to in-place construction. Include threaded fasteners for concrete and masonry inserts, toggle bolts, through-bolts, lag bolts, wood screws, and other connectors.
- D. Cutting, Fitting and Placement: Perform cutting, drilling, and fitting required for installing doors and hatches. Set frames, doors and hatches accurately in location, alignment, and elevation; with edges and surfaces level, plumb, true, and free of rack; and measured from established lines and levels.
- E. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry or similar construction.
- F. Provide anchors and inserts in sufficient numbers for proper fastening of doors and hatches.
- G. Provide bar anchors with turned ends extending six inches minimum into concrete and 12 inches minimum into masonry. Lay anchors flat in masonry joints.
- H. Embed anchors accurately in concrete to permit aligning door in proper position.
- I. For fabricated items, use fastenings and anchors of size and type shown on approved shop drawings or manufacturer's standard drawings.

3.03 INSTALLING PASSENGER EMERGENCY-EGRESS HATCH:

- A. Lift hatches by means of slings attached at four corners of each hatch frame.

- B. Set hatch in framed opening; shim as necessary to ensure even support of hatch and alignment with adjoining work and in accordance with manufacturer's recommendations. Shim pattern, as shown
- C. After shimming, ensure hatch is not racked and weld in place as shown.
- D. After welding is completed, repair damaged zinc-coating and abraded shop coatings.
- E. Field-weld steel inserts to hatch frame and opening frame at hatch hinge points and coat completely with galvanizing repair compound at rate of two ounces per-square-foot.
- F. Fill space between hatch and frame and framed opening with nonshrink grout.
- G. Install 1-1/2 inch steel, Schedule 40, piping from hatch frame drain to floor drain, or if no drain, to floor. Piping not to encroach on egress pathway or headroom clearance (six-feet, eight-inches, minimum). Drain not to discharge into egress pathway.

3.04 TILE-COVERED ACCESS HATCHES:

- A. Set aluminum frames in recess, level and in proper relationship to adjacent finished flooring. For multiple covers and where maximum span for single covers is exceeded, install beam pockets and set support beams on base plates grouted to required heights. Grout frames solid with Portland cement concrete.
- B. Place cover in frame properly aligned. Clip reinforcement assembly into proper position and fill cover with Portland cement concrete to height necessary to receive scheduled finish flooring material. Hand trowel to smooth dense surface.

3.05 PAINTING AND REPAIRING COATED SURFACES:

- A. Before erection or enclosing construction, paint items that support masonry or will be concealed in finish work, except items encased in concrete.
- B. Where shop coat is abraded or burned by welding, clean and touch-up.
- C. Touch-up primed surfaces with same material as coating.
- D. Where aluminum parts come in contact with concrete or steel, coat contact surfaces of aluminum with bituminous coating.
- E. Coat field welds and repair damage to zinc-coated surfaces in accordance with ASTM A780

and as follows:

1. Wire brush areas to be coated to bright metal.
2. Apply galvanizing repair compound at rate of two ounces per-square-foot.

3.06 FIELD QUALITY CONTROL OF PASSENGER EMERGENCY-EGRESS HATCH:

- A. Field Testing of Passenger Emergency-Egress Hatch:
1. Upon completion of installation of passenger emergency-egress hatch, verify with spring scales that each leaf of each access hatch will open when force of 30 pounds or less is applied at inner end of exit release bar.
 2. Operate leaf no less than three times. Record opening force required each time. If adjustments are necessary to achieve specified results, repeat the test.
 3. Perform field tests in the presence of the Engineer.
 4. At the time of final inspection for substantial completion, repeat field tests as specified.
 5. If hatch fails field tests, make necessary adjustments until it operates as specified.
 6. During the life of the Contract, check operation of hatch leaves at periods not exceeding 90 days. Lubricate moving parts and check for proper operation.

3.07 ADJUSTING AND CLEANING:

- A. Adjust doors and hardware after installation for proper operation.
- B. Remove and replace doors and frames that are warped, bowed, or otherwise damaged.
- C. Tile-Covered Access Hatches: If necessary for alignment after finish flooring is installed, exposed edges of frame and cover may be ground to remove up to 1/8 inch and provide flush surface.

END OF SECTION

THIS PAGE NOT USED

SECTION 08361

SECTIONAL OVERHEAD DOORS

PART 1 - GENERAL

1.01 SUMMARY OF WORK

- A. This Section includes electrically operated sectional overhead doors.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. List below only products, construction, and equipment that the reader might expect to find in this Section but are specified elsewhere.
- B. Division 5 Section "Metal Fabrications" for miscellaneous steel supports.
- C. Division 8 Section "Door Hardware" for lock cylinders and keying.
- D. Division 9 Section "Painting" for field-applied paint finish.
- E. Division 16 Sections for electrical service and connections for powered operators and accessories.

1.03 DEFINITIONS

- A. Operation Cycle: One cycle of a door is complete when it is moved from the closed position to the fully open position and returned to the closed position.

1.04 PERFORMANCE REQUIREMENTS

- A. Structural Performance: Provide sectional overhead doors capable of withstanding the effects of gravity loads and the following loads and stresses without evidencing permanent deformation of door components:
 - 1. Wind Loads: Determine loads based on the following minimum design wind pressures:
 - a. Uniform pressure (velocity pressure) of **20 lbf/sq. ft. (960 Pa)**, acting inward and outward.
 - 2. Air Infiltration: Maximum rate not more than indicated when tested according to ASTM E 283.
 - a. Maximum Rate: 0.08 cfm (0.038 L/s) at 15 mph (24 km/h).
 - 3. Impact Test for Flying Debris: Comply with ASTM E 1996, tested according to ASTM E 1886.
 - a. Level of Protection: Enhanced Protection.
 - b. Wind Zone per local codes: **110 mph (176 km/h)**, pressure test to 3/4 and 1-1/2 x design pressure (positive and negative).
- B. Operation-Cycle Requirements: Provide sectional overhead door components and operators capable of operating for not less than 10,000 cycles.

1.05 SUBMITTALS

- A. Product Data: For each type and size of sectional overhead door and accessory. Include the following:

1. Summary of forces and loads on walls and jambs.
 2. Motors: Show nameplate data and ratings, characteristics, and mounting arrangements.
- B. Shop Drawings: For special components and installations not dimensioned or detailed in manufacturer's product data.
- C. Samples for Initial Selection: For units with factory-applied color finishes.
- D. Samples for Verification: For each type of exposed finish required, prepared on Samples of size indicated below.
1. Frame: 6 inches (150 mm) long.
 2. Panel: 6 inches (150 mm) square.
- E. Qualification Data: For Installer.

1.06 QUALITY ASSURANCE

- A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for both installation and maintenance of units required for this Project
- B. Source Limitations: Obtain sectional overhead doors through one source from a single manufacturer.
1. Obtain operators and controls from sectional overhead door manufacturer.
- C. Product Options: Drawings indicate size, profiles, and dimensional requirements of sectional overhead doors and accessories and are based on the specific system indicated. Other manufacturers' systems with equal performance and dimensional characteristics may be considered. Refer to Division 1 Section "Product Requirements."
- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
- B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Steel Doors with Insulated Steel Panels:
 - a. Amarr Garage Doors.
 - b. Arm-R-Lite.
 - c. Clopay Building Products Company; a Griffon Company.
 - d. Fimbel Door Corporation.
 - e. General American Door Company.
 - f. Haas Door; a Nofziger Company.
 - g. Martin Door Manufacturing.
 - h. Overhead Door Corp.
 - i. Raynor.
 - j. Wayne-Dalton Corp.
 - k. Windsor Door; a MAGNATRAX Corporation.

2.02 STEEL DOOR SECTIONS

- A. Construct door sections including face sheets and frames from zinc-coated (galvanized), cold-rolled, commercial steel (CS) sheet, complying with ASTM A 653/A 653M, G90 (Z275) coating designation.
 - 1. Minimum Base-Metal (Uncoated) Thickness for Section Faces: 0.033 inch (0.85 mm).
 - 2. Exterior-Section Face: Flat.
 - 3. Exterior-Section Face: Manufacturer's standard grooved, ribbed, or fluted.
- B. Fabricate door panels from a single sheet to provide sections not more than 24 inches (600 mm) high and nominally 2 inches (51 mm) deep. Roll horizontal meeting edges to a continuous, interlocking, keyed, rabbeted, shiplap, or tongue-in-groove weathertight seal, with a reinforcing flange return.
 - 1. For insulated doors, provide door sections with continuous thermal-break construction, separating faces of door.
- C. Enclose open sections with channel end stiles formed from not less than 0.064-inch- (1.6-mm-) thick galvanized steel sheet and weld end stiles to door section in place. Provide intermediate stiles formed from not less than 0.064-inch- (1.6-mm-) thick galvanized steel sheet, cut to door section profile, and welded in place.
 - 1. Stile Spacing: Not more than 48 inches (1200 mm) apart.
- D. Reinforce bottom section with a continuous channel or angle complying with bottom-section profile and allowing installation of astragal.
- E. Reinforce sections with continuous horizontal and diagonal reinforcement, as required to stiffen door and for wind loading. Provide galvanized steel bars, struts, trusses, or strip steel, formed to depth and bolted or welded in place.
- F. Provide reinforcement for hardware attachment.
- G. Thermal Insulation: Insulate inner core of steel sections with door manufacturer's standard polyurethane insulation, foamed in place to completely fill inner core of section and pressure bonded to face sheets to prevent delamination under wind load, and with maximum flame-spread and smoke-developed indexes of 75 and 450, respectively, according to ASTM E 84. Enclose insulation completely within steel sections that incorporate the following inside facing material, with no exposed insulation material evident:
 - 1. Inside Facing Material: Zinc-coated (galvanized) steel sheet with a minimum base (uncoated) metal thickness of 0.028 inch (0.70 mm).
- H. Fabricate sections so finished door assembly is rigid and aligned, with tight hairline joints and free of warp, twist, and deformation.
- I. Finish: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
 - 1. Surface Preparation: Clean galvanized surfaces with nonpetroleum solvent so surfaces are free of oil and other contaminants.
 - a. Pretreat zinc-coated steel, after cleaning, with a conversion coating of type suited to organic coating applied over it.
 - 2. Apply manufacturer's standard primer to both door faces after forming, according to coating

- manufacturer's written instructions for application and minimum dry film thickness.
3. Apply manufacturer's standard primer and finish coats to interior- and exterior-door faces after forming, according to coating manufacturer's written instructions for application, thermosetting, and minimum dry film thickness.
 4. Apply manufacturer's standard primer and powder-coat finish to interior- and exterior-door faces after forming, according to coating manufacturer's written instructions for application, thermosetting, and minimum dry film thickness.
 - a. Color and Gloss: As selected by Architect from manufacturer's full range.

2.03 TRACKS, SUPPORTS, AND ACCESSORIES

- A. Tracks: Manufacturer's standard, galvanized steel track system, sized for door size and weight, designed for lift type indicated and clearances shown, and complying with ASTM A 653/A 653M for minimum G60 (Z180) zinc coating. Provide complete track assembly including brackets, bracing, and reinforcement for rigid support of ball-bearing roller guides for required door type and size. Slot vertical sections of track spaced at 2 inches (51 mm) apart for door-drop safety device. Slope tracks at proper angle from vertical or design to ensure tight closure at jambs when door unit is closed. Weld or bolt to track supports.
 1. Provide tracks configured for the following lift types:
 - a. Standard.
 - b. Low headroom.
 - c. High.
- B. Track Reinforcement and Supports: Galvanized steel track reinforcement and support members, complying with ASTM A 36/A 36M and ASTM A 123/A 123M. Secure, reinforce, and support tracks as required for door size and weight to provide strength and rigidity without sag, sway, and vibration during opening and closing of doors.
 1. Support and attach tracks to opening jambs with continuous angle welded to tracks and attached to wall. Support horizontal (ceiling) tracks with continuous angle welded to track and supported by laterally braced attachments to overhead structural members at curve and end of tracks.
 - a. Repair galvanized coating on tracks according to ASTM A 780.
- C. Weatherseals: Replaceable, adjustable, continuous, compressible weather-stripping gaskets of flexible vinyl, rubber, or neoprene fitted to bottom and top of overhead door.
 1. Provide motor-operated doors with combination bottom weatherseal and sensor edge.
 2. Provide continuous flexible seals at door jambs for a weathertight installation.
- D. Full-Vision Panels: Manufacturer's standard, tubular, aluminum-framed section fully glazed with 6-mm-thick, clear polycarbonate glazing set in vinyl, rubber, or neoprene glazing channel and with removable extruded-vinyl or aluminum stops. Finish to match steel sections.

2.04 HARDWARE

- A. General: Provide heavy-duty, corrosion-resistant hardware, with hot-dip galvanized, stainless-steel, or other corrosion-resistant fasteners, to suit door type.
- B. Hinges: Heavy-duty galvanized steel hinges of not less than 0.0747-inch- (1.9-mm-) thick, uncoated steel at each end stile and at each intermediate stile, according to manufacturer's written recommendations for door size. Attach hinges to door sections through stiles and rails with bolts and lock nuts or lock washers and nuts. Use rivets or self-tapping fasteners where access to nuts is not possible. Provide double-end hinges where required, for doors exceeding

16 feet (4.87 m) in width, unless otherwise recommended by door manufacturer.

- C. Rollers: Heavy-duty rollers with steel ball bearings in case-hardened steel races, mounted with varying projections to suit slope of track. Extend roller shaft through both hinges where double hinges are required. Provide 3-inch- (75-mm-) diameter roller tires for 3-inch- (75-mm-) wide track and 2-inch- (51-mm-) diameter roller tires for 2-inch- (51-mm-) wide track.
 - 1. Tire Material: Case-hardened steel.
- D. Push/Pull Handles: For push-up-operated or emergency-operated doors, provide galvanized steel lifting handles on each side of door.
- E. Slide Bolt: Fabricate with side-locking bolts to engage through slots in tracks for locking by padlock, located on single-jamb side, operable from inside only.
- F. Fabricate locking device assembly with lock, spring-loaded dead bolt, operating handle, cam plate, and adjustable locking bar to engage through slots in tracks.
 - 1. Locking Bars: Single-jamb side or Full-disc cremone type, both jamb sides operable from inside and outside.
 - 2. Lock cylinder is specified in Division 8 Section "Door Hardware."
- G. Chain Lock Keeper: Suitable for padlock.
- H. If door unit is power operated, provide safety interlock switch to disengage power supply when door is locked.

2.05 COUNTERBALANCE MECHANISM

- A. Extension Spring: Counterbalance mechanism with aircraft-type steel cable over ball-bearing sheaves. Provide oil-tempered wired springs with internal safety rods. Combine operation with a spring bumper in each horizontal track to cushion door at end of opening operation.
- B. Torsion Spring: Counterbalance mechanism consisting of adjustable-tension torsion springs fabricated from oil-tempered-steel wire complying with ASTM A 229/A 229M, Class II, mounted on a cross-header tube or steel shaft. Connect to door with galvanized aircraft-type lift cables with cable safety factor of at least 5 to 1. Provide springs calibrated for a minimum of 50,000 cycles.
- C. Cable Drums: Cast-aluminum or gray-iron casting cable drums grooved to receive cable. Mount counterbalance mechanism with manufacturer's standard ball-bearing brackets at each end of shaft. Provide one additional midpoint bracket for shafts up to 16 feet (4.87 m) long and two additional brackets at one-third points to support shafts more than 16 feet (4.87 m) long unless closer spacing is recommended by door manufacturer.
- D. Cable Safety Device: Include a spring-loaded, steel or bronze cam mounted to bottom door roller assembly on each side and designed to automatically stop door if either cable breaks.
- E. Bracket: Provide anchor support bracket as required to connect stationary end of spring to the wall and to level shaft and prevent sag.
- F. Provide a spring bumper at each horizontal track to cushion door at end of opening operation.

2.06 ELECTRIC DOOR OPERATORS

- A. General: Provide electric door operator assembly of size and capacity recommended and provided by door manufacturer for door specified, with electric motor and factory-rewired motor

controls, starter, gear-reduction unit, solenoid-operated brake, clutch, remote-control stations, control devices, integral gearing for locking door, and accessories required for proper operation.

- B. Comply with NFPA 70.
- C. Disconnect Device: Hand-operated disconnect device or mechanism for automatically engaging chain-and-sprocket operator and releasing brake for emergency manual operation while disconnecting motor without affecting timing of limit switch. Mount disconnect device and operator so they are accessible from floor level. Include interlock device to automatically prevent motor from operating when emergency operator is engaged.
- D. Design operator so motor may be removed without disturbing limit-switch adjustment and without affecting emergency auxiliary operator.
- E. Provide control equipment complying with NEMA ICS 1, NEMA ICS 2, and NEMA ICS 6, with NFPA 70, Class 2 control circuit, maximum 24-V, ac or dc.
- F. Door-Operator Type: Unit consisting of electric motor and the following:
 - 1. Jackshaft gear-head hoist type, with enclosed worm-gear, running-in-oil, primary drive; chain-and-sprocket secondary drive; auxiliary chain hoist; and floor-level quick release for manual operation.
- G. Electric Motors: High-starting torque, reversible, continuous-duty, Class A insulated, electric motors complying with NEMA MG 1, with overload protection, sized to start, accelerate, and operate door in either direction from any position, at not less than 2/3 fps (0.2 m/s) and not more than 1 fps (0.3 m/s), without exceeding nameplate ratings or service factor.
 - 1. Type: Polyphase, medium-induction type.
 - 2. Service Factor: Comply with NEMA MG 1, unless otherwise indicated.
 - 3. Coordinate wiring requirements and electrical characteristics of motors with building electrical system.
 - 4. Provide open dripproof-type motor, and controller with NEMA ICS 6, Type 1 enclosure.
 - 5. Provide totally enclosed, nonventilated or fan-cooled motor, fitted with plugged drain, and controller with NEMA ICS 6, Type 4 enclosure where indicated.
- H. Remote-Control Station: Momentary-contact, three-button control station with push-button controls labeled "Open," "Close," and "Stop."
 - 1. Provide full-guarded, surface-mounted, heavy-duty-type interior unit with general-purpose, NEMA ICS 6, Type 1 enclosure.
- I. Obstruction Detection Device: Provide each motorized door with indicated external automatic safety sensor capable of protecting full width of door opening. Activation of sensor immediately stops and reverses downward door travel.
 - 1. Photoelectric Sensor: Manufacturer's standard system designed to detect an obstruction in door opening without contact between door and obstruction.
 - a. Self-Monitoring Type: Designed to interface with door operator control circuit to detect damage to or disconnection of sensing device. When self-monitoring feature is activated, door closes only with sustained pressure on close button.
 - 2. Pressure-Sensor Edge: Provide each motorized door with an automatic safety sensor edge, located within astragal or weather stripping mounted to bottom bar. Contact with sensor immediately stops and reverses downward door travel. Connect to control circuit using manufacturer's standard take-up reel or self-coiling cable.
 - a. Provide electrically actuated automatic bottom bar.
 - 1) Self-Monitoring Type: Four-wire configured device.

- J. Limit Switches: Adjustable switches interlocked with motor controls and set to automatically stop door at fully opened and fully closed positions.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. General: Install door, track, and operating equipment complete with necessary hardware, jamb and head molding strips, anchors, inserts, hangers, and equipment supports according to Shop Drawings, manufacturer's written instructions, and as specified.
- B. Fasten vertical track assembly to framing, spaced not less than 24 inches (600 mm) apart. Hang horizontal track from structural overhead framing with angle or channel hangers fastened to framing by welding or bolting or both. Provide sway bracing, diagonal bracing, and reinforcement as required for rigid installation of track and door-operating equipment.

3.02 STARTUP SERVICES

- A. Engage a factory-authorized service representative to perform startup services.
 - 1. Complete installation and startup checks according to manufacturer's written instructions.
 - 2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

3.03 ADJUSTING

- A. Lubricate bearings and sliding parts; adjust doors to operate easily, free from warp, twist, or distortion and with weathertight fit around entire perimeter.
- B. Adjust belt-driven motors as follows:
 - 1. Use adjustable motor-mounting bases for belt-driven motors.
 - 2. Align pulleys and install belts.
 - 3. Tension belt according to manufacturer's written instructions.
- C. Touch-up Painting: Immediately after welding galvanized track to track supports, clean field welds and abraded galvanized surfaces and repair galvanizing to comply with ASTM A 780.

3.04 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain sectional overhead doors. Refer to Division 1.

END OF SECTION

SECTION 08410

ALUMINUM ENTRANCES AND STOREFRONTS

PART 1 -GENERAL

1.01 SUMMARY OF WORK:

- A. This Section specifies provision of exterior aluminum entrances and storefronts including doors, hardware, weatherstripping, and framing members.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Section 08800: Glass and Glazing.
- B. Section 08710: Finish Hardware.

1.03 QUALITY ASSURANCE:

- A. Installer Qualifications: Engage an experienced installer to assume engineering responsibility and perform work of this Section who has specialized in installing entrances similar to those required for this Project and who is acceptable to manufacturer.

1.04 DESCRIPTION:

- A. General: Provide aluminum entrances and storefronts capable of withstanding loads and thermal and structural movement requirements indicated without failure. Failure includes the following:
 - 1. Air infiltration and water penetration exceeding specified limits.
 - 2. Framing members transferring stresses, including those caused by thermal and structural movement, to glazing units.
- B. Glazing: Physically and thermally isolate glazing from framing members.
- C. Thermally Broken Construction: Provide aluminum entrances and storefronts that isolate aluminum exposed to exterior from aluminum exposed to interior with a material of low thermal conductance.
- D. Wind Loads: Provide aluminum entrances and storefronts, including anchorage, capable of withstanding wind-load design pressures calculated according to requirements of authorities having jurisdiction or the American Society of Civil Engineers' ASCE 7, "Minimum Design Loads for Buildings and Other Structures," 6.4.2, "Analytical Procedure," whichever are more stringent.
 - 1. Deflection of framing members in a direction normal to wall plane is limited to 1/175 of clear span or 3/4 inch whichever is smaller, unless otherwise indicated.
 - 2. Static-Pressure Test Performance: Provide aluminum entrances and storefronts that do not evidence material failures, structural distress, failure of operating components to function normally, or permanent deformation of main framing members exceeding 0.2 percent of clear span when tested according to ASTM E 330.
 - a. Pressure: 150 percent of inward and outward wind-load design pressures.
 - b. Duration: As required by design wind velocity; fastest 1 mile of wind for relevant exposure category.

- E. Dead Loads: Provide entrance-members that do not deflect an amount which will reduce glazing bite below 75 percent of design dimension when carrying full dead load.
 - 1. Provide a minimum 1/8-inch clearance between members and top of glazing or other fixed part immediately below.

- F. Air Infiltration: Provide aluminum entrances and storefronts with permanent resistance to air leakage through fixed glazing and frame areas of not more than 0.06 cfm/sq. ft. of fixed wall area when tested according to ASTM E 283 at a static-air-pressure difference of 1.57 lbf/sq. ft.

- G. Water Penetration: Provide aluminum entrances and storefronts that do not evidence water leakage through fixed glazing and frame areas when tested according to ASTM E331 at minimum differential pressure of 20 percent of inward-acting wind-load design pressure as defined by ASCE 7, "Minimum Design Loads for Buildings and Other Structures," but not less than 6.24 lbf/sq. ft. Water leakage is defined as follows:
 - 1. Uncontrolled water infiltrating aluminum entrances and storefronts or appearing on normally exposed interior surfaces from sources other than condensation. Water controlled by flashing and gutters that is drained back to the exterior and cannot damage adjacent materials or finishes is not water leakage.

- H. Thermal Movements: Provide aluminum entrances and storefronts, including anchorage, that accommodate thermal movements of aluminum entrances and storefronts and supporting elements resulting from the following maximum change (range) in ambient and surface temperatures without buckling, damaging stresses on glazing, failure of joint sealants, damaging loads on fasteners, failure of doors or other operating units to function properly, and other detrimental effects.
 - 1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

- I. Structural-Support Movement: Provide aluminum entrances and storefronts that accommodate structural movements including, but not limited to, sway and deflection.

- J. Condensation Resistance: Provide aluminum entrances and storefronts with condensation resistance factor (CRF) of not less than 45 when tested according to AAMA 1503.1.

- K. Dimensional Tolerances: Provide aluminum entrances and storefronts that accommodate dimensional tolerances of building frame and other adjacent construction.

1.05 SUBMITTALS:

Submit the following in accordance with requirements elsewhere in this Contract and with the additional requirements as specified for each:

- A. Product Data: For each product specified. Include details of construction relative to materials, dimensions of individual components, profiles, and finishes.

- B. Shop Drawings: For aluminum entrances and storefronts show details of fabrication and installation, including plans, elevations, sections, details of components, glazing provisions for expansion and contraction, and attachments to other work.
 - 1. For aluminum entrances and storefronts, include hardware schedule and indicate operating hardware types, quantities, and location

- C. Samples for Initial Selection: Manufacturer's color charts showing the full range of colors available for factory-applied color finishes.
- D. Samples for Verification: Of each type of exposed finish required. Where finishes involve normal color and texture variations, include Sample sets showing the full range of variations expected.
- E. Cutaway Sample: Of vertical-to-horizontal framing intersection, made from minimum 6-inch lengths of full-size components and showing details of the following:
 - 1. Joinery.
 - 2. Anchorage.
 - 3. Expansion provisions.
 - 4. Glazing.
 - 5. Flashing and drainage.

1.06 WARRANTY:

- A. Warranty Period: 1 year in addition to the warranty requirements specified elsewhere in this Contract, for a total of 2 years from date of Substantial Completion.
 - 1. Failures include, but are not limited to, the following:
 - 2. Failure of aluminum entrances and storefronts to meet performance requirements.
 - 3. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
 - 4. Failure of operating components to function normally.
 - 5. Water leakage through fixed glazing and frame areas.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated, complying with the requirements of standards indicated below.
 - 1. Sheet and Plate: ASTM B 209.
 - 2. Extruded Bars, Rods, Shapes, and Tubes: ASTM B 221.
 - 3. Extruded Structural Pipe and Tubes: ASTM B 429.
 - 4. Bars, Rods, and Wire: ASTM B 211.
 - 5. Aluminum Finish: Dark bronze integral color anodized Class 1 finish, NAAMM AA-M12C22A44.
 - a. Provide all material, free of scratches and surfaces blemishes.
 - b. Match existing adjacent installations.
- B. Glazing as specified in Section 08800.
- C. Glazing Gaskets: Manufacturer's standard pressure-glazing system of black, resilient glazing gaskets, setting blocks, and shims or spacers, fabricated from an elastomer of type and in hardness recommended by system and gasket manufacturer to comply with system performance requirements. Provide gasket assemblies that have corners sealed with sealant recommended by gasket manufacturer. Insert specific gasket-material requirements, if any.
- D. Bituminous Paint: Cold-applied asphalt-mastic paint complying with SSPC-Paint 12 requirements, except containing no asbestos, formulated for 30-mil thickness per coat.

- E. Sill Mastic: Butyl: Polymerized butyl rubber and inert fillers (pigments), solvent-based with minimum 75-percent solids, non-sag consistency, tack-free time of 24 hours or less, paintable, non-staining, and complying with FS TT-S-001657.

2.02 COMPONENTS:

- A. Doors: Provide manufacturer's standard 1-3/4-inch thick glazed doors with minimum 0.125-inch-thick, extruded tubular rail and stile members as approved. Mechanically fasten corners with reinforcing brackets that are deep penetration and fillet welded or that incorporate concealed tie-rods.
1. Glazing Stops and Gaskets: Provide manufacturer's standard snap-on extruded-aluminum glazing stops and preformed gaskets, as approved.
 2. Stile Design: Match existing.
- B. Brackets and Reinforcements: Provide manufacturer's standard brackets and reinforcements that are compatible with adjacent materials, as approved. Provide nonstaining, nonferrous shims for aligning components as approved.
- C. Fasteners and Accessories: Manufacturer's standard corrosion-resistant, nonstaining, nonbleeding fasteners and accessories compatible with adjacent materials, as approved.
1. Reinforce members as required to retain fastener threads.
 2. Do not use exposed fasteners, except for hardware application. For hardware application, use countersunk Phillips flat-head machine screws finished to match framing members or hardware being fastened, unless otherwise indicated.
- D. Concealed Flashing: Manufacturer's standard corrosion-resistant, nonstaining, nonbleeding flashing, compatible with adjacent materials, and of type approved.
- E. Weather Stripping: ANSI/BHMA A156.22, Finish 628 (satin aluminum clear anodized) with stainless steel sheet-metal screws and as follows:
1. Head and jamb: Head and jamb type, stop-applied; National Guard A626 or equal. Provide nylon brush gasketing or equal.
 2. Sill: Drip strip at sill; National Guard 15 or equal.
 3. Sweep: Door sweep type, surface mounted at bottom of door; National Guard D608 nylon brush gasketing or equal. Provide sweep on side opposite to drip strip where scheduled.

2.03 FINISH HARDWARE:

- A. General: Provide heavy-duty hardware units indicated in sizes, number, and type recommended by manufacturer for entrances indicated as specified in Section 08710, and as approved. Finish exposed parts to match door finish, unless otherwise indicated.
- B. Offset Pivots where approved: ANSI/BHMA A156.4, Grade 1 with exposed parts of cast-aluminum alloy. Provide top, bottom, and intermediate pivots at each door leaf.
- C. Ball-Bearing Butts: ANSI/BHMA A156.1, Grade 1, 5-knuckle, ball-bearing butts. Provide nonremovable pins at hinges exposed to door outside and provide full-mortise Type 1 slip-in nonferrous hinges for applications exposed to weather. Provide 3 hinges at each leaf for doors up to 36 inches wide and 80 inches tall; provide 4 hinges at each leaf for taller doors.

- D. Closers, General: Comply with manufacturer's recommendations for closer size, depending on door size, exposure to weather, and anticipated frequency of use.
1. Closing Cycle: Comply with requirements of authorities having jurisdiction or the Americans with Disabilities Act (ADA), "Accessibility Guidelines for Buildings and Facilities (ADAAG)," whichever are more stringent.
 2. Opening Force: Comply with the following maximum opening-force requirements for locations indicated:
 - a. Exterior Doors: 15 lbf.
 3. Surface Mounted Overhead Closers: ANSI/BHMA 156.4, Grade 1, provide cover and the following:
 - a. Mounting: parallel arm, interior locations (room side of door unless otherwise specified).
 - b. Cushion stop: Adjustable at angle directed by the Engineer from manufacturer's standard options.
 4. Door Stops: ANSI/BHMA A156.16, Grade 1, floor- or wall-mounted door stop, as appropriate for door location indicated, with integral rubber bumper. Retain appropriate cylinder requirements below.
- E. Cylinders and Keying for Yard Buildings: Match the Authority's existing keying and interchangeable core system as follows and at no additional cost to the Authority.
1. Cylinders: Finish 630.
 - a. For locksets: ANSI/BHMA A156.5, interchangeable-core type, designed to accept the Authority's existing Russwin Recore System. One core furnished for each lock, stamped with visual key control.
 - b. High security: Interlocking-pin type, Emhart High-Security Locking System or equal
 2. Construction cores: Provide construction cylinders until final cylinders and keying is approved and installed.
 3. Keys and keying:
 - a. Keys: Stamped with the inscription TRANSIT AUTHORITY - DO NOT DUPLICATE and with visual key-control data.
 - b. Quantity: Three keys for each core plus blanks equal to 10-percent of total keys furnished.
 4. Key tags and holders: ANSI/BHMA A156.5, inscribed with key-change number and key-control symbol.
 5. Cylinder Guard: Manufacturer's standard hardened-steel security ring with retainer plate for inside stile wall that protects lock cylinder from removal by wrenches, prying, or sawing.
- F. Deadlatch Locks: Manufacturer's standard mortise deadlatch with minimum 1/2-inch-12.7-mm- long latch bolt and auxiliary bolt located below latch bolt and complying with ANSI/BHMA A156.5, Grade 1 requirements.
1. Lever Handles: Manufacturer's standard cast-aluminum-alloy, inside-lever, deadlatch operating unit.
 2. Latch Paddle Devices: Manufacturer's standard extruded-aluminum deadlatch operating paddle.
 - a. Provide units for push applications.
 - b. Provide units for push and pull applications. Hook-bolt locks are recommended for pairs of doors, since they provide additional resistance to prying.
 3. Lockset Faceplates: Manufacturer's standard extruded-aluminum faceplate for lock type indicated that lays flush with door stile.

- a. Provide radiused faceplate with weather sweep extending full length of lock at meeting stiles of pairs of doors.
- 4. Flat Face Strikes: Manufacturer's standard stainless-steel, flat face strike with steel mounting plate and black-plastic dustbox.
- 5. Retain one flush-bolt requirement below if required for inactive leaf of pairs of doors. Model codes prohibit manual flush bolts on means of egress doorways. If exit devices are not required, consider specifying 2- or 3-point locking systems listed above or inserting requirements for automatic flush bolts that comply with requirements of authorities having jurisdiction.
- 6. Manual Flush Bolts: ANSI/BHMA A156.16, edge-mortised, lever-extension-type flush bolts.
 - a. Locate flush bolts at bottom of inactive leaf of pairs of doors.
 - b. Locate flush bolts at top and bottom of inactive leaf of pairs of doors.
- G. Pull Handles: Aluminum pull handles as indicated on Drawings.
- H. Push Bars: Aluminum push bars as indicated on Drawings.
- I. Thresholds: At exterior doors, provide manufacturer's standard threshold with cutouts coordinated for operating hardware, with anchors and jamb clips, and not more than 5/16-inch, with beveled edges providing a floor level change with a slope of not more than 1:2, and in the following material:
 - 1. Material: Aluminum, mill finish.
- J. Weatherstripping: ANSI/BHMA A156.22, Finish 628 (satin aluminum clear anodized) with stainless steel sheet-metal screws and as follows:
 - 1. Head and jamb: Head and jamb type, stop-applied; National Guard A626 or equal or compression type gasketing as approved.
 - 2. Sill: Drip strip at sill; National Guard 15 or equal.
 - 3. Sweep: Door sweep type, surface mounted at bottom of door; National Guard D608 nylon brush gasketing or equal. Provide sweep on side opposite to drip strip where scheduled.
- K. Special Security Alarmed Exit Device for Parking Structures: To sound alarm at unauthorized entry or exit at locations indicated and as required and approved.

2.04 FABRICATION:

- A. General: Fabricate components that, when assembled, will have accurately fitted joints with ends coped or mitered to produce hairline joints free of burrs and distortion. After fabrication, clearly mark components to identify their locations in Project according to Shop Drawings.
- B. Forming: Form shapes with sharp profiles, straight and free of defects or deformations, before finishing.
- C. Prepare components to receive concealed fasteners and anchor and connection devices.
- D. Fabricate components to drain water passing joints and condensation and moisture occurring or migrating within the aluminum entrances and storefronts to the exterior.
- E. Welding: Weld components to comply with referenced AWS standard. Weld before finishing components to greatest extent possible. Weld in concealed locations to greatest extent

possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.

- F. Glazing Channels: Provide minimum clearances for thickness and type of glass indicated according to FGMA's "Glazing Manual."
- G. Metal Protection: Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer or by applying sealant or tape recommended by manufacturer for this purpose.
- H. Entrances: Fabricate door framing in profiles indicated. Reinforce as required to support imposed loads. Factory assemble door and frame units and factory install hardware to greatest extent possible. Reinforce door and frame units as required for installing hardware indicated. Cut, drill, and tap for factory-installed hardware before finishing components.
 - 1. Exterior Doors: Provide nylon brush gasketing or compression weather stripping where indicated as approved.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of aluminum entrances and storefronts. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.02 INSTALLATION:

- A. General: Protect and handle aluminum entrances and storefronts components to prevent damage; do not install damaged components. Fit frame joints to produce hairline joints free of burrs and distortion. Rigidly secure nonmovement joints. Seal joints watertight.
- B. Metal Protection: Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer or by applying sealant or tape recommended by manufacturer for this purpose.
- C. Install components to drain water passing joints and condensation and moisture occurring or migrating within the aluminum entrances and storefronts to the exterior.
- D. Set continuous sill members and flashing in a full sealant bed to provide weathertight construction, unless otherwise indicated. Comply with requirements as specified in Section 07900.
- E. Install framing components plumb and true in alignment with established lines and grades without warp or rack of framing members.
- F. Install entrances plumb and true in alignment with established lines and grades without warp or rack. Lubricate operating hardware and other moving parts according to hardware manufacturers' written instructions.
 - 1. Install surface-mounted hardware in accordance with Section 08710 and according to manufacturer's written instructions using concealed fasteners to greatest extent possible.

- G. Install glazing to comply with requirements of Section 08800, unless otherwise indicated. Delete subparagraphs below if no structural-sealant-glazed systems.
- H. Install perimeter sealant to comply with manufacturer's requirements and Section 08800, unless otherwise indicated.
- I. Erection Tolerances: Install entrance and storefront aluminum entrances and storefronts to comply with the following maximum tolerances:
 - 1. Variation from Plane: Limit variation from plane or location shown to 1/8 inch in 12 feet 1/4 inch over total length.
 - 2. Alignment: Where surfaces abut in line, limit offset from true alignment to 1/16 inch. Where surfaces meet at corners, limit offset from true alignment to 1/32 inch.
 - 3. Diagonal Measurements: Limit difference between diagonal measurements to 1/8 inch.

3.03 FIELD QUALITY CONTROL:

- A. Water Spray Test: After completing the installation of test areas indicated, test aluminum entrances and storefronts for water penetration according to AAMA 501.2 requirements.
- B. Repair or remove and replace Work as directed by the Engineer that does not meet requirements or that is damaged by testing; replace to conform to specified requirements.

3.04 ADJUSTING:

- A. Adjust doors and hardware to provide tight fit at contact points and weather stripping, smooth operation, and weathertight closure.

3.05 PROTECTION:

- A. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure aluminum entrances and storefronts are without damage or deterioration at the time of Substantial Completion.

END OF SECTION

SECTION 08630

METAL-FRAMED SKYLIGHTS

PART 1 - GENERAL

1.01 SUMMARY OF WORK

- A. This Section includes aluminum-framed skylights with the following characteristics:
 - 1. Glazing is glass.
 - 2. Glazing is retained by field-installed pressure caps on four sides.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Division 5 Section "Structural Steel" for steel framing that supports skin-system assemblies.
- B. Division 7 Section "Building Insulation" for insulation materials field installed with metal-framed skylights.
- C. Division 7 Section "Sheet Metal Flashing and Trim" for metal flashings installed at perimeters of assemblies.
- D. Division 7 Section "Joint Sealants" for sealants installed at perimeters of metal-framed skylights.

1.03 PERFORMANCE REQUIREMENTS

- A. Provide metal-framed skylights, including anchorage, capable of withstanding, without failure, the effects of the following:
 - 1. Structural loads.
 - 2. Thermal movements.
 - 3. Movements of supporting structure.
 - 4. Dimensional tolerances of building frame and other adjacent construction.
- B. Failure includes the following:
 - 1. Deflection exceeding specified limits.
 - 2. Water leakage.
 - 3. Thermal stresses transferred to building structure.
 - 4. Noise or vibration created by wind and thermal and structural movements.
 - 5. Framing members transferring stresses, including those caused by thermal and structural movements, to glazing.
 - 6. Loosening or weakening of fasteners, attachments, and other components.
 - 7. Sealant failure.
- C. Structural Loads:
 - 1. Wind Loads: Per local codes.
 - 2. Snow Loads: Per local codes.
 - 3. Concentrated Live Loads: 250 lbf (1112 N) applied to framing members at locations that will produce greatest stress or deflection.
 - 4. Seismic Loads: Per local codes.
 - 5. Load Combinations: Calculate according to requirements of applicable codes.
- D. Deflection of Framing Members:
 - 1. Deflection Normal to Glazing Plane:
 - a. Spans Up to 20 Feet (6 m): Limited to 1/175 or 1/180 of clear span or 1 inch (25.4 mm), whichever is smaller.

- b. Spans Exceeding 20 Feet (6 m): Limited to 1/240 of clear span.
 - c. Glass Edge Deflection: Limit edge deflection of individual glass lites to 3/4 inch (19 mm).
- 2. Deflection Parallel to Glazing Plane: Limited to 1/360 of clear span or 1/8 inch (3.2 mm), whichever is smaller.

- E. Lateral Bracing of Framing Members: Compression flanges of flexural members are laterally braced by cross members with minimum depth equal to 50 percent of flexural member that is braced. Glazing does not provide lateral support.

- F. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
 - 1. Temperature Change (Range): 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

- G. Structural-Sealant Glazing:
 - 1. Structural Sealant: Capable of withstanding tensile and shear stresses imposed by metal-framed skylight assemblies without failing adhesively or cohesively. Sealant fails cohesively before sealant releases from substrate when tested for adhesive compatibility with each substrate and joint condition required.
 - a. Adhesive failure occurs when sealant pulls away from substrate cleanly, leaving no sealant material behind.
 - b. Cohesive failure occurs when sealant breaks or tears within itself but does not separate from each substrate because sealant-to-substrate bond strength exceeds sealant's internal strength.
 - 2. Structural-Sealant Joints: Designed to produce tensile or shear stress in structural-sealant joints of less than 20 psi (138 kPa).
 - a. Structural-sealant joints do not carry gravity loads of glazing.

1.04 PERFORMANCE TESTING

- A. Provide metal-framed skylights that comply with test-performance requirements indicated, as evidenced by reports of tests performed on manufacturer's standard assemblies by a qualified independent testing agency.

- B. Structural-Performance Test: ASTM E 330.
 - 1. Performance at Design Load: When tested at positive and negative wind-load design pressures, assemblies do not evidence deflection exceeding specified limits.
 - 2. Performance at Maximum Test Load: When tested at 150 percent of positive and negative wind-load design pressures, assemblies, including anchorage, do not evidence material failures, structural distress, and permanent deformation of main supporting members exceeding 0.2 percent of span.
 - 3. Test Durations: As required by design wind velocity but not less than 10 seconds.

- C. Air-Infiltration Test: ASTM E 283.
 - 1. Minimum Static-Air-Pressure Difference: 6.24 lbf/sq. ft. (300 Pa).
 - 2. Maximum Air Leakage: 0.06 cfm/sq. ft. (0.30 L/s per sq. m)

- D. Test for Water Penetration under Static Pressure: ASTM E 331.
 - 1. Minimum Static-Air-Pressure Difference: 20 percent of positive wind-load design pressure, but not less than 12 lbf/sq. ft. (574 Pa).
 - 2. Water Leakage: None.

- E. Test for Water Penetration under Dynamic Pressure: AAMA 501.1.

- 
1. Dynamic Pressure: 20 percent of positive wind-load design pressure, but not less than 12 lbf/sq. ft. (574 Pa).
 2. Water Leakage: No uncontrolled water penetrating systems or appearing on systems' normally exposed interior surfaces from sources other than condensation. Water controlled by flashing and gutters that is drained to exterior and cannot damage adjacent materials or finishes is not considered water leakage.

1.5 SUBMITTALS

- A. Product Data: Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for metal-framed skylights.
- B. Shop Drawings: For metal-framed skylights. Include plans, elevations, sections, details, and attachments to other work.
 1. Include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- C. Samples for Initial Selection: For units with factory-applied color finishes.
- D. Samples for Verification: For each type of exposed finish required, in manufacturer's standard sizes.
- E. Fabrication Sample: Of each framing intersection of assemblies, made from 12-inch (300-mm) lengths of full-size components and showing details of the following:
 1. Joinery.
 2. Anchorage.
 3. Expansion provisions.
 4. Glazing.
 5. Flashing and drainage.
- F. Field quality-control test and inspection reports.
- G. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for metal-framed skylights.
- H. Maintenance Data: For metal-framed skylights to include in maintenance manuals.
- I. Warranties: Special warranties specified in this Section.

1.6 QUALITY ASSURANCE

- A. Installer Qualifications: Entity capable of assuming engineering responsibility and performing work of this Section and who is acceptable to manufacturer.
- B. Testing Agency Qualifications: An independent agency qualified according to ASTM E 699 for testing indicated.
- C. Welding: Qualify procedures and personnel according to AWS D1.2, "Structural Welding Code - Aluminum."
- D. Mockups: Build mockups to demonstrate aesthetic effects and set quality standards for fabrication and installation.
 1. Build mockup of typical skylight area as shown on Drawings.
 2. Approved mockups may become part of the completed Work if undisturbed at time of

Substantial Completion.

- E. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1 Section "Project Management and Coordination."

1.7 PROJECT CONDITIONS

- A. Field Measurements: Indicate measurements on Shop Drawings.

1.8 WARRANTY

- A. Special Assembly Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of metal-framed skylights that fail in materials or workmanship within specified warranty period.
 - 1. Failures include, but are not limited to, the following:
 - a. Structural failures including, but not limited to, excessive deflection.
 - b. Noise or vibration caused by thermal movements.
 - c. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
 - d. Adhesive or cohesive sealant failures.
 - e. Water leakage.
 - 2. Warranty Period: Five years from date of Substantial Completion.
- B. Special Finish Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components on which finishes fail within specified warranty period. Warranty does not include normal weathering.
 - 1. Failures include, but are not limited to, checking, crazing, peeling, chalking, and fading of finishes.
 - 2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Basis-of-Design Product: The design for metal-framed skylights is based on Naturalite BSM-3000 glass insulated panel skylight.. Subject to compliance with requirements, provide the named product or a comparable product by one of the following:
 - 1. Acralight.
 - 2. Architectural Skylight Co., Inc.
 - 3. Bristolite Skylights.
 - 4. CPI International.
 - 5. Exarc Skylights, Inc.
 - 6. Fisher Skylights.
 - 7. Gammans Architectural Products Inc.
 - 8. Lane-Aire Manufacturing Corp.
 - 9. LinEI Signature.
 - 10. Kawneer.
 - 11. Major Industries, Inc.; Auburn Skylights Division.
 - 12. Naturalite Skylight Systems; Vistawall Group (The). Basis of Design.
 - 13. O'Keeffe's Inc.
 - 14. Regal Manufacturing Co.
 - 15. Skyline Products, Inc.
 - 16. Super Sky Products Inc.
 - 17. TRACO.
 - 18. View Thru Glass & Metal Products.
 - 19. Wasco Products, Inc.

2.2 FRAMING SYSTEMS

- A. Aluminum: Alloy and temper recommended in writing by manufacturer for type of use and finish indicated.
 - 1. Sheet and Plate: ASTM B 209 (ASTM B 209M).
 - 2. Extruded Bars, Rods, Profiles, and Tubes: ASTM B 221 (ASTM B 221M).
 - 3. Extruded Structural Pipe and Tubes: ASTM B 429.
- B. Pressure Caps: Manufacturer's standard aluminum components that mechanically retain glazing.
 - 1. Include snap-on aluminum trim that conceals fasteners.
- C. Brackets and Reinforcements: Manufacturer's standard high-strength aluminum with nonstaining, nonferrous shims for aligning skylight components.
- D. Anchors, Fasteners, and Accessories: Manufacturer's standard, corrosion-resistant, nonstaining, and nonbleeding; compatible with adjacent materials.
 - 1. At pressure caps, use ASTM A 193/A 193M, 300 series stainless-steel screws.
 - 2. Where fasteners are subject to loosening or turning out from thermal and structural movements, wind loads, or vibration, use self-locking devices.
 - 3. Exposed Fasteners:
 - a. Use exposed fasteners with countersunk Phillips screw heads.
 - b. Finish exposed portions to match framing system.
 - 4. At movement joints, use slip-joint linings, spacers, and sleeves of material and type recommended in writing by manufacturer.
- E. Concrete and Masonry Inserts: Hot-dip galvanized cast-iron, malleable-iron, or steel inserts complying with ASTM A 123/A 123M or ASTM A 153/A 153M requirements.
- F. Anchor Bolts: ASTM A 307, Grade A (ASTM F 568M, Property Class 4.6), hot-dip zinc coating, ASTM A 153/A 153M, Class C.
- G. Concealed Flashing: [Manufacturer's standard, corrosion-resistant, nonstaining, nonbleeding flashing compatible with adjacent materials.
- H. Exposed Flashing and Closures: Manufacturer's standard aluminum components not less than 0.040 inch (1.016 mm) thick.
- I. Framing Gaskets: Manufacturer's standard.
- J. Framing Sealants: As recommended in writing by manufacturer.

2.3 GLAZING SYSTEMS

- A. Glazing: 1 inch insulating glass unit, maximum U-value 0.50, maximum shading coefficient 0.55. Minimum visible light transmittance 55%..
 - 1. Exterior lite: 1/4 inch clear heat strengthened glass.
 - 2. Air space: 1/2 inch
 - 3. Interior lite: Laminated glass, 2 1/8 glass plies; 0.060 inch polyvinyl butyl interlayer.
- B. Spacers, Setting Blocks, and Gaskets: Manufacturer's standard elastomeric types.
- C. Bond-Breaker Tape: Manufacturer's standard tetrafluoroethylene-fluorocarbon or polyethylene material to which sealants will not develop adhesion.
- D. Glazing Sealants: As recommended in writing by manufacturer.

1. Weatherseal Sealant: ASTM C 920 for Type S, Grade NS, Class 25, Uses NT, G, A, and O; neutral-curing silicone formulation compatible with structural sealant and other components with which it comes in contact; and recommended in writing by structural- and weatherseal-sealant and metal-framed skylight manufacturers for this use.
 - a. Color: Matching structural sealant.

2.4 ACCESSORY MATERIALS

- A. Insulating Materials: Specified in Division 7 Section "Building Insulation."
- B. Bituminous Paint: Cold-applied asphalt-mastic paint complying with SSPC-Paint 12 requirements except containing no asbestos, formulated for 30-mil (0.762-mm) thickness per coat.

2.5 FABRICATION

- A. Fabricate aluminum components before finishing.
- B. Fabricate aluminum components that, when assembled, have the following characteristics:
 1. Profiles that are sharp, straight, and free of defects or deformations.
 2. Accurately fitted joints with ends coped or mitered.
 3. Internal guttering systems or other means to drain water passing joints, condensation occurring within framing members, and moisture migrating within skylight to exterior.
 4. Physical and thermal isolation of glazing from framing members.
 5. Accommodations for thermal and mechanical movements of glazing and framing to maintain required glazing edge clearances.
- C. Fabricate aluminum sill closures with weep holes and for installation as continuous component.
- D. Reinforce aluminum components as required to receive fastener threads.
- E. Weld aluminum components in concealed locations to greatest extent possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.
- F. Factory-Glazed Units:
 1. Factory install glazing to comply with requirements in Division 8 Section "Glass and Glazing".
 2. Prepare surfaces that will contact structural sealant according to structural-sealant manufacturer's written instructions to ensure compatibility and adhesion. Preparation includes, but is not limited to, cleaning and priming surfaces.
- G. After fabrication, clearly mark components to identify their locations in Project according to Shop Drawings.

2.6 ALUMINUM FINISHES

- A. General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
- C. High-Performance Organic Finish (3-Coat Fluoropolymer): AA-C12C40R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: conversion coating; Organic Coating:

manufacturer's standard 3-coat, thermocured system consisting of specially formulated inhibitive primer, fluoropolymer color coat, and clear fluoropolymer topcoat, with both color coat and clear topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with AAMA 2605 and with coating and resin manufacturers' written instructions.

1. Color and Gloss: [As selected by Architect from manufacturer's full range.

2.7 SOURCE QUALITY CONTROL

- A. Structural-Sealant Glazing: Perform quality-control procedures complying with ASTM C 1401 recommendations including, but not limited to, material qualification procedures, sealant testing, and fabrication reviews and checks.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of work.
 1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. General:
 1. Comply with manufacturer's written instructions.
 2. Do not install damaged components.
 3. Fit joints between aluminum components to produce hairline joints free of burrs and distortion.
 4. Rigidly secure nonmovement joints.
 5. Install anchors with separators and isolators to prevent metal corrosion and electrolytic deterioration and to prevent impeding movement of moving joints.
 6. Weld components in concealed locations to minimize distortion or discoloration of finish. Protect glazing surfaces from welding.
 7. Seal joints watertight, unless otherwise indicated.
- B. Metal Protection: Where aluminum will contact dissimilar materials, protect against galvanic action by painting contact surfaces with bituminous paint or by installing nonconductive spacers as recommended in writing by manufacturer for this purpose.
- C. Install continuous aluminum sill closure with weatherproof expansion joints and locked and sealed or welded corners. Locate weep holes at rafters.
- D. Install components to drain water passing joints, condensation occurring within framing members, and moisture migrating within skylight to exterior.
- E. Install components plumb and true in alignment with established lines and elevations.
- F. Install glazing as specified in Division 8 Section "Glass and Glazing."
 1. Structural-Sealant Glazing:
 - a. Prepare surfaces that will contact structural sealant according to structural-sealant manufacturer's written instructions to ensure compatibility and adhesion. Preparation includes, but is not limited to, cleaning and priming surfaces.
 - b. Install weatherseal sealant according to Division 7 Section "Joint Sealants" and according to weatherseal-sealant manufacturer's written instructions to produce weatherproof joints. Install joint filler behind weatherseal sealant as recommended in writing by weatherseal-sealant manufacturer.

- G. Install insulation materials as specified in Division 7 Section "Building Insulation."
- H. Erection Tolerances: Install metal-framed skylights to comply with the following maximum tolerances:
 - 1. Alignment: Limit offset from true alignment to 1/32 inch (0.8 mm) where surfaces abut in line, edge to edge, at corners, or where a reveal or protruding element separates aligned surfaces by less than 3 inches (76 mm); otherwise, limit offset to 1/8 inch (3.2 mm).
 - 2. Location and Plane: Limit variation from true location and plane to 1/8 inch in 12 feet (3.2 mm in 3.7 m) but no greater than 1/2 inch (13 mm) over total length.

3.3 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified independent testing and inspecting agency to perform field tests and inspections and prepare test and inspection reports.
- B. Testing Services: Testing and inspecting of representative areas to determine compliance of installed skylights with specified requirements shall take place as follows. Do not proceed with installation of the next area until test results for previously completed areas show compliance with requirements.
 - 1. Water-Spray Test: Before installation of interior finishes has begun, skylights shall be tested according to AAMA 501.2 and shall not evidence water penetration.
- C. Repair or remove work where test results and inspections indicate that it does not comply with specified requirements.
- D. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

END OF SECTION

SECTION 08710

FINISH HARDWARE

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing finish hardware.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Access Doors and Frames including locks and cylinders: Section 08305.
- B. NOT USED
- C. Hollow Metal Doors and Frames: Section 08110.
- D. Aluminum Entrances and Storefronts: Section 08410.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulation of the jurisdictional authorities.
 - 2. ANSI/BHMA: A156-Series Standards for Builders Hardware.
 - 3. ASTM: A413
 - 4. FS: TT-S-001657.
 - 5. ADA: ADAAG.
 - 6. NFPA: 80, 101, 130.
 - 7. DHI: Recommended Locations for Builders Hardware for Standard Steel Doors and Frames, Recommended Locations for Builders Hardware for Custom Steel Doors and Frames.
- B. Hardware Supplier Qualifications: A recognized architectural finish hardware supplier, with warehousing facilities in the Project's vicinity, that has a record of successful in-service performance for supplying finish hardware similar in quantity, type, and quality to that indicated for this Project and that employs an experienced architectural hardware consultant (AHC) who is available to the Engineer and Contractor, at reasonable times during the course of the Work for consultation.
 - 1. Require supplier to have his AHC develop the hardware schedule.
 - 2. Require supplier's AHC to meet with the Engineer to discuss and finalize lock-functions and keying requirements.
- C. Fire-Rated Openings: Provide hardware for fire-rated openings that complies with NFPA 80 and requirements of authorities having jurisdiction. Provide only items of hardware that are listed and are identical to products tested by UL, Warnock Hersey, FM, or other testing and inspecting organization acceptable to authorities having jurisdiction for use on types and sizes of doors indicated in compliance with requirements of fire-rated door and door frame labels.
 - 1. Equip labeled doors with hinges of steel or stainless steel base metal, closers, and automatic latching devices in addition to the hardware requirements in the specified hardware sets.
 - 2. If a conflict appears between this paragraph and the hardware sets scheduled, the requirements of this paragraph govern.
- D. Americans With Disabilities Act (ADA): Comply with the ADA Accessibility Guidelines (ADAAG).

1.04 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings:
1. Product Data: Manufacturers' technical literature and catalog cuts, edited as necessary to indicate each item of hardware, model, selected options, finish, installation instructions, maintenance of operating parts and finish, and other information necessary to show compliance with requirements. Make coordinated submittals packages complete with all supporting data.
 2. Hardware Schedule: Hardware schedule coordinated with doors, frames, gates and related work to ensure proper size, thickness, hand, function, design and finish of hardware. Base Hardware Schedule on hardware sets indicated in PART 3 of this section. Indicate complete designations of each item required for each door or opening, including the following information:
 - a. Explanation of each abbreviation, symbol, and code contained in hardware schedule. Schedules with unidentified notations will be rejected without review.
 - b. Door and frame number, size, and materials.
 - c. Type, style, function, size, and finish of each hardware item. Include lockset functions, angle of closer operation, lever and handle designs, lengths of flush bolts, types of stops, sizes of armor and kick plates, and other such data.
 - d. Name and manufacturer of each item.
 - e. Fastenings and other pertinent information.
 - f. Location of each hardware set cross-referenced to indications on Drawings, both on floor plans and in door schedule.
 - g. Mounting locations for hardware.
 - h. Keying information.
 3. Submittal sequence: Submit hardware schedule at earliest possible date particularly where acceptance of hardware schedule must precede fabrication of other work that is critical in the Project construction schedule. Include with hardware schedule the product data, samples, shop drawings of work affected by finish hardware, and other information essential to a coordinated review of hardware schedule.
 4. Templates: Transmit hardware templates directly to trades fabricating related work specified to be prepared for the installation of finish hardware under this section. Submit record copy of these transmittals to the Engineer.
 5. Coordinating hardware preparation by other trades: Check shop drawings of other trades to ensure that correct provisions from transmitted templates are made for locating and installing finish hardware to comply with indicated requirements.
- B. Samples:
1. Finishes: Two, minimum four-inch squares of each finish to be furnished. Submit with shop drawings.
 2. Hardware units: Each type of exposed hardware unit in approved finish and tagged with full description for coordination with hardware schedule. Submit unit samples prior to submission of final hardware schedule.
 - a. When requested, samples will be returned to the supplier. Accepted units that remain undamaged through the submittal, review, and field-comparison process may, after final check of operation, be used in the Work, within limitations of keying coordination requirements.
 - b. Submit the following:
 - 1) One sample of a lockset including, trim, escutcheon, strike box, lever, cylinder, and key.

- 2) One sample of hinge.
 - 3) One sample of each miscellaneous item of finish hardware.
 - 4) Provide finishes so that color and surface finish or polish of various items of the same designated finish match throughout the work. Hardware with non-matching finishes will be rejected.
- c. The Authority reserves the right to require samples of each specific item to be furnished

C. Certification.

D. Documentation:

1. Construction keying schedule.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to jobsite in original unopened packages, clearly labeled with manufacturer's name, brand, specification identification data and identification as shown on approved hardware schedule.
- B. Store products in an approved dry area, protect from contact with soil and from exposure to the elements. Keep products dry.
- C. Handle products so as to prevent breakage of containers and damage to products.

1.06 MAINTENANCE TOOLS AND INSTRUCTIONS:

- A. Furnish a complete set of specialized tools and maintenance instructions as needed for the Authority's continued adjustment, maintenance, removal and replacement of hardware.

PART 2 - PRODUCTS

2.01 HARDWARE TYPES:

- A. General:
 1. Hardware grade: Provide only Grade 1 hardware in accordance with ANSI/BHMA A156-Series Standards and with the additional requirements specified in this section, except where otherwise specified or approved in writing by the Engineer for each specific door number.
 2. Fire-rated hardware: Where applied to fire-rated labeled doors and frames, provide fire-rated listed hardware, tested by a fire-rating testing agency acceptable to authorities having jurisdiction.
 3. Finishes: Finish designations are ANSI/BHMA A156.18 standards and are subject to approval for color, texture and appearance.
 - a. Finish 630 (Formerly US 32D): Except where otherwise indicated, provide finish 630, satin-polish stainless steel on stainless steel base metal, matching sample on file with the Engineer.
 - b. Finish 630 may be substituted for Finish 626 or Finish 652 at no additional cost to the Authority.
 4. Single Source: Obtain each type of hardware from a single manufacturer.
- B. Hinges: ANSI/BHMA A156.1, full mortise butt hinges, anti-friction bearings, button tips (not flush), unless otherwise specified for each specific door number. Extruded butts may be used in lieu of wrought butts.

1. Quantity required per door leaf:
 - a. Doors 61 inches to 90 inches in height: 1-1/2 pairs.
 - b. Doors 91 inches to 120 inches in height: Two pairs.
2. Types:
 - a. Exterior doors, doors from public passageways, and doors to wet areas such as showers: Stainless steel butts, Type A5111, finish 630.
 - b. Interior, non-public doors: Steel butts, Type A8111 (Grade 1), Finish 652.
 - c. Doors with reverse-bevel swing (out-swinging) having locks: Fit butts with non-removable pins effective when door is in closed position.

C. Locksets:

D. Hollow metal doors: ANSI/BHMA A156.13, full mortise, adjustable armored front, 3/4-inch-throw anti-friction latchbolt, one-inch-throw stainless steel deadbolt, Finish 630, Function as scheduled.

1. Trim design:
 - a. Cast lever handles, recurving to within 1/2-inch of door face, equal in appearance and dimensions to one of the following unless otherwise scheduled:

Series	Design	Producer
ML2200 Series	Newport NSA	Corbin/Ruswin
8200 Series	KD rose, L lever	Sargent
8700 Series	PB lever, YK rose	Yale

- b. Finish: 630 unless otherwise scheduled.
 - c. Roses: Concealed screw or screwless, 2-1/4 inch diameter.
 - d. Cylinder trim: Equip with flush or security-beveled solid cylinder collar as appropriate for flush or projecting cylinder.
2. Aluminum doors in Yard Buildings:
 - a. Finish: 630 unless otherwise scheduled.

E. Cylinders and Keying for all doors except aluminum doors in Parking Structures: Match the Authority's existing keying and interchangeable core system as follows and at no additional cost to the Authority.

1. Cylinders: Finish 630.
 - a. For locksets: ANSI/BHMA A156.5, interchangeable-core type, designed to accept the Authority's existing Ruswin Recore System. One core furnished for each lock, stamped with visual key control.
 - b. High security: Interlocking-pin type, Emhart High-Security Locking System or equal.
 - c. Construction cores: Provide construction cylinders until final cylinders and keying is approved and installed.
2. Keys and keying:
 - a. Keys: Stamped with the inscription TRANSIT AUTHORITY - DO NOT DUPLICATE and with visual key-control data.
 - b. Quantity: Three keys for each core plus blanks equal to 10-percent of total keys furnished.
3. Key tags and holders: ANSI/BHMA A156.5, inscribed with key-change number and key-control symbol.

- F. Push Plates and Door Pulls: ANSI/BHMA A156.6, Finish 630, with the following additional requirements:
1. Push plate: 3/16 inch by 10 inches by 20 inches unless otherwise shown, with edges beveled.
 2. Door pull: 3/4-inch round bar, eight inches center-to-center, concealed fasteners; escutcheon plate same as push plate.
- G. Door Closers: ANSI/BHMA A156.4, Type C02xx1 (xx - indicates top-of-door-mounted, on interior side), Finish 630.
1. Surface-mounted.
 2. Sweep period: Adjusted so that from an open position of 70 degrees, the door will take at least three seconds to move to a point 3 inches from the latch, measured to the leading edge of the door.
 3. Cover plate: Full metal cover, Finish 630.
 4. Parallel arms and drop brackets: Provide as necessary for mounting on interior side unless otherwise noted. Where hold-open feature is specified for closers, use type that permits doors to open 140 degrees, other conditions permitting.
 5. Maximum force for pushing or pulling open a door with closer (measured with a push-pull scale applied perpendicular to the door at the door opener or 30 inches from the hinged side, whichever is farther from the hinge):
 - a. Fire doors: Minimum opening force allowable by the jurisdictional authorities.
 - b. Interior hinged doors: 5 lbf.
- H. Stops:
1. Overhead-type: ANSI/BHMA A156.8, Type C54511 holder/stop; holder deactivated on labeled doors, Finish 630.
 2. Wall-type: ANSI/BHMA A156.16, Type L02101, with vandal-resistant concealed fasteners, Finish 630. Use floor-type where wall-type is not practicable.
 3. Floor-type: ANSI/BHMA A156.16, Type L02141 or L02161 as necessary, with matching extender if necessary to properly engage door bottom, Finish 630.
- I. Flush Extension Bolts: ANSI/BHMA A156.8, Type L04081, Finish 630.
1. Dustproof strikes, Type L04021, provided for bolts located at bottom of door leaf, except where metal thresholds are specified. Cut opening to suit bolt.
 2. Operating mechanism located approximately six feet from floor for top bolts and approximately 12 inches from floor for bottom bolts.
 3. Bolts located in edge of inactive leaf of pair of doors.
 4. Automatic Flush Bolts: Listed for 1-1/2 hour, B-labeled, Finish 630; Ives No. 559 or equal with strikes; with coordinator where recommended by manufacturer.
- J. Silencers: ANSI/BHMA A156.16, Type L03011. Provide silencers for each door:
1. Three for each single door.
 2. Two for each pair of doors.
- K. Exit Devices: ANSI/BHMA A156.3; complying with NFPA 80, listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction; lever trim as required for locksets; Finish 630.
1. Single door: Function F03 (mortise); latch bolt by push on crossbar inside and by key from outside; operation from outside is by lever.
 2. Double door: Active leaf Function F03 as above, inactive leaf (manual flush bolts) without outside trim.
 3. Maximum pushing force to operate exit device:
 - a. Fire doors: Minimum opening force allowable by the jurisdictional authorities.
 - b. Interior hinged doors: 5 lbf.

4. Coordinators: ANSI/BHMA A156.3.
- L. Metal Thresholds: ANSI/BHMA A156.21; profiles as shown for each location; ADA compliant; metal thickness 0.125 inch; maximum height 5/16"; with countersunk matching screws.
1. Public passageways and mezzanines: Finish 630, stainless steel with abrasive finish or Finish 613, satin-finish statuary bronze.
 2. Other locations: Finish 719, mill finish aluminum with grooves.
- M. Weather Stripping /Smoke Seals: ANSI/BHMA A156.22, Finish 628 (satin aluminum clear anodized) with stainless steel sheet-metal screws and as follows:
1. Head and jamb: Head and jamb type, stop-applied; National Guard A626 or equal. Provide nylon brush gasketing or equal.
 2. Sill: Drip strip at sill; National Guard 15 or equal.
 3. Sweep: Door sweep type, surface mounted at bottom of door; National Guard D608 nylon brush gasketing or equal. Provide sweep in addition to drip strip where scheduled.
 4. Astragals: Provide nylon brush overlapping type: National Guard 600 or equal.
- N. Chain: ASTM A413, Class PT, case-hardened, carbon-steel security chain, 3/8-inch diameter.
- O. Padlock: Interchangeable-core type padlock, designed to accept the Authority's existing Russwin Recore System.
1. One core furnished for each lock, stamped with visual key control; with two keys, keyed and master-keyed as directed.
 2. Body: Solid extruded brass.
 3. Five-pin tumblers.
 4. Shackle: Hardened steel, zinc-plated, 1-3/4 inch opening height, self-locking spring-type.
- P. Deadlock: ANSI/BHMA A156.5 mortise dead lock, Grade 2 (1/2-inch minimum throw) with interchangeable-core cylinder; operation as scheduled.
- Q. Authority-Furnished Property:
1. Cross-bar lock: High-security locking bar with surface-mounted keepers, inside knob and high-security cylinder.

2.02 FASTENINGS:

- A. Provide hardware complete with screws, through-bolts and other fasteners of suitable type for secure anchorage to construction materials.
- B. Screws, through-bolts and other fasteners having spanner-type heads: As approved.
- C. Provide fasteners that harmonize in material, color and texture with finished appearance of hardware items.
- D. Provide concealed fastenings with door pull, flush pulls, wall door stops and other such items.
- E. Provide phillips-head or Torx head through-bolts and hex bolts as applicable for surface-mounted hardware.
- F. Sheet-metal screws and self-tapping screws are prohibited except where specified.

2.03 TEMPLATES:

- A. Furnish templates of hardware to other trades, so that doors, frames and gates can be cut, reinforced and otherwise prepared in the shop for installation of finish hardware.

2.04 THRESHOLD SEALANT:

- A. Butyl: Polymerized butyl rubber and inert fillers (pigments), solvent-based with minimum 75 percent solids, non-sag consistency, tack-free time of 24 hours or less, paintable, non-staining, and complying with FS TT-S-001657.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. General:
 - 1. Coordinate work of this section with work of other trades.
 - 2. Install each hardware item in compliance with the manufacturer's instructions and recommendations.
 - 3. Apply finish hardware in a neat and workmanlike manner. Set units level, plumb, and true to line and location. Adjust and reinforce the attachment substrate as necessary for proper installation and operation.
 - 4. Cut mortises neat, clean and of proper net size. Drill and countersink units that are not factory prepared for anchorage fasteners. Space fasteners and anchors in accordance with industry standards.
 - 5. Where cutting and fitting is required to install hardware onto or into surfaces that are later to be painted or finished in another way, coordinate removal, storage, and reinstallation or application of surface protection with finishing work specified in other sections. Do not install surface-mounted items until finishes have been completed on the substrates involved.
 - 6. Provide keying in accordance with keying schedule prepared by and for the Contractor in accordance with the Authority's keying system. Deliver keying schedule and keys to the Engineer prior to final acceptance.
- B. Mounting Heights: Mount hardware units at heights indicated in the following publications, except as specifically indicated or required to comply with governing regulations and except as otherwise directed by the Engineer:
 - 1. Recommended Locations for Builders Hardware for Standard Steel Doors and Frames by DHI.
 - 2. Recommended Locations for Builders Hardware for Custom Steel Doors and Frames by DHI.
 - 3. ADA Accessibility Guidelines (ADAAG).
- C. Exterior Thresholds: Set thresholds for exterior doors in full bed of specified butyl sealant.
- D. Weatherstripping /Smoke Seals: Install weatherstripping around entire perimeter of door frame to form a complete seal and in accordance with manufacturers instructions.
 - 1. Position and install head and jamb weatherstripping so that door closes snugly against seal but does not inhibit latching of lockset.
 - 2. Position and install sill weatherstripping to seal snugly against threshold without inhibiting latching of lockset.
 - 3. Note that at fire-rated doors, lockset is to latch by closer operation only, without manual assistance.
- E. Adjustment: Adjust hardware to operate as designed and replace hardware that is missing, scratched, marred or otherwise damaged.

1. Adjust and check each operating item of hardware and each door to ensure proper operation or function of every unit. Replace units that cannot be adjusted to operate freely and smoothly or as intended for the application made.
2. Where door hardware is installed more than one month prior to acceptance or occupancy of a space or area, return to the installation during the week prior to acceptance or occupancy and make final check and adjustment of hardware items in such space or area. Clean operating items as necessary to restore proper function and finish of hardware and doors. Adjust door control devices to compensate for final operation of heating and ventilating equipment.
3. Clean adjacent surfaces soiled by hardware installation.

F. Instruction: At a time prescribed by the Engineer, have the hardware installer or knowledgeable operating-hardware-manufacturers' representatives instruct the Authority's personnel in the proper adjustment and maintenance of hardware and hardware finishes.

3.02 CLEAN-UP:

- A. Remove from the site rubbish and debris caused by this work.
- B. Leave areas surrounding doors in broom-clean condition.

3.03 HARDWARE SETS:

- A. Hardware Sets:
 1. Provide hardware sets in accordance with door schedule and the following set schedule.
 2. Provide the number of pairs of butt hinges in accordance with previously specified requirements.
 3. Designations used to describe hardware items by using a manufacturer's product name and number are for the purpose of describing a general level of quality and function. Products that are equal, complying with the requirements specified in this section may be used.

SET NO. 1	
Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Lockset, Function F09
1 Each	Door Closer
1 Each	Wall-Type Stop
1 Each	Metal Threshold

SET NO. 2

Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Lockset, Function F07
1 Each	Door Closer
1 Each	Wall-Type Stop

SET NO. 3	
Quantity	Hardware
As Necessary	Lock Cylinders (Provide proper cam to engage lock mechanism by other trade.)

SET NO. 4 (NOT USED)	
Quantity	Hardware
1 Each	Deadlock, E06082

SET NO. 5	
Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Latchset, Function F01
1 Each	Door Closer
1 Each	Wall-Type Stop

SET NO. 6 (NOT USED)	
Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Exit Device, Function F03
1 Each	Door Closer
1 Each	Wall-Type Stop

SET NO.7 (NOT USED)	
Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Lockset, Function F13
1 Each	Door Closer with Hold-Open
1 Each	Wall-Type Stop
1 Each	Cross-Bar Lock

SET NO. 8	
Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Lockset, Function F07
2 Each	Door Closer
2 Each	Wall-Type or Floor-Type Stop
2 Each	Automatic Flush Bolt
1 Each	Coordinator

SET NO. 9 (NOT USED)	
Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Lockset, Function F07
2 Each	Door Closer
2 Each	Overhead-Type Stop
1 Each	Metal Threshold
2 Each	Automatic Flush Bolt
1 Each	Coordinator
1 Set	Weatherstripping

SET NO. 10	
Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
2 Each	Door Pulls
2 Each	Door Closer with Hold-Open
2 Each	Wall-Type or Floor-Type Stop, As Necessary

SET NO. 11(NOT USED)	
Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Lockset, Function F09
2 Each	Door Closer
1 Each	Wall-Type Stop
1 Each	Metal Threshold
2 Each	Automatic Flush Bolt
1 Each	Coordinator

SET NO. 12	
Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Lockset, Function F07
1 Each	Door Closer
1 Each	Overhead-Type Stop
1 Each	Metal Threshold
1 Set	Weatherstripping

SET NO. 13	
Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Lockset, Function F14
1 Each	Door Closer
1 Each	Overhead-Type Stop
1 Each	Metal Threshold
1 Set	Weatherstripping

END OF SECTION

SECTION 08800

GLASS AND GLAZING

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing glass and glazing (sealing) of glass areas.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
1. Comply with codes and regulations of the jurisdictional authorities.
 2. ANSI: Z97.1.
 3. ASTM: C509, C542, C864, C920, C1036, C1048, C1172, C1281, D635, D1044, D1925, E774, E1300.
 4. CPSC: 16 CFR 1201, Category II.
 5. UL: 9, 10B.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Samples:
1. Three each of the following:
 - a. Glass and safety plastic: 12 inches square, each material and type.
 - b. Glazing compound: Pint containers.
 - c. Setting blocks and edge blocks.
 - d. Sealant: Cured color samples.
 - 1) Sealant for sealing platform granite edge glass lenses: Clear silicone sealant,, one six-inch long bead.
 - e. Gasket material: 12 inches long.
- B. Certification:
1. When glass is not cut to size by manufacturer and is furnished unlabeled from local stock, submit certification stating location to be installed, quality, thickness, type and manufacturer of each unit of glass furnished.
 2. All tempered safety and laminated tempered safety glass to be permanently marked with the name or trademark of the manufacturer and designation of the applicable safety glazing standard.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to the jobsite in original unopened containers clearly labeled with manufacturer's name and brand designation, referenced specification number, type, class and rating as applicable. Deliver glass with each light bearing manufacturer's label showing strength, grade, thickness, type, quality and safety marking. Do not remove labels from glass

until it has been set and inspected.

- B. Store products in approved dry area; protect from contact with soil and from exposure to the elements.
- C. Handle products to prevent breakage of containers and damage to products.

1.05 JOB CONDITIONS:

- A. Environmental Requirements:
 - 1. Do not install glass when the ambient temperature is below 40F or expected to fall below 40F, unless otherwise approved.
 - 2. Do not apply glazing materials to unprotected surfaces in wet weather or to surfaces on which ice, frost, water or dampness is visible.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Glass:
 - 1. Plate glass: ASTM C1036, Type I (transparent glass, flat), Class 1 (clear), Quality q3.
 - 2. Safety glass: CPSC 16 CFR 1201, Category II and ANSI Z97.1 and as follows:
 - a. Tempered: ASTM C1048, Kind FT (fully tempered), Condition A (uncoated surfaces), Type I (transparent glass, flat), Class 1 (clear), Quality q3; 1/4-inch thick unless otherwise shown.
 - b. Laminated: ASTM C1172, Kind LT (fully tempered), 0.060-inch thick polyvinyl-butylal (PVB) interlayer factory-laminated between two pieces of tempered safety glass with protective edgecoat on the assembly to prevent contact of interlayer with water or joint materials; edgecoat such as Edgeseal by PPG, special polyurethane seal on Solaflex glazing by Monsanto, Sommer Macca Urethane E#2 by SX Chemical Company, or equal.
 - 3. Wired: ASTM C1036, Type II (wired), Class 1 (translucent), Form 1 (wired, polished both sides), Quality q8; Mesh m1 (diamond), unless otherwise shown.
 - 4. Spandrel glass: Laminate opacifier film to second surface of insulated unit. Appearance to match insulating vision glazing.
- B. Insulating Glass: ASTM E774, Class CBA; factory preassembled, sealed insulating glass units with 1/2-inch air space; aluminum spacer tube with desiccant held captive within, and dual seal construction.
 - 1. Outer lite: 1/4-inch clear plate glass or tempered safety glass as shown or specified, with low-emissivity (low-E) coating equal to Viracon's Solarscreen 80 on the number-two (inside) surface.
 - 2. Inner lite: 1/4-inch clear plate glass or tempered safety glass as shown or specified.
- C. Safety Plastic: Clear, monolithic polycarbonate sheet complying with the following:
 - 1. Abrasion resistance: Maximum 3.1 percent change in haze when tested in accordance with ASTM D1044 for both surfaces.

2. UV-resistance: Maximum 2.0 yellowing index after three years exposure per ASTM D1925.
3. Flammability: Meet BOCA combustibility classification C1: Horizontal burn rate of one inch per minute or less when tested at a nominal thickness of 0.060 inch, or in the thickness intended for use, in accordance with ASTM D635.

D. Glazing Accessories:

1. Sealant: Multi-component polyurethane; ASTM C920, Type M, Grade NS, Class 25, Use G; colored as required to match framing system in which installed.
2. Glazing compound: Single-component polyurethane; ASTM C920, Type S, Grade NS, Class 25, Use G; colored as required to match framing system in which installed.
3. Glazing tape: Preformed butyl tape, ASTM C1281; 100 percent solids, nonstaining and nonmigrating in contact with nonporous surfaces; with or without spacer rod (pre-shimming) as recommended in writing by tape and glass manufacturers for application indicated; packaged on rolls with a release paper backing; by 3M Company, Tremco Manufacturing Co., or equal.
4. Pressure-sensitive tape: Vinyl electrical tape, 3M Company or equal.
5. Lock-Strip Gaskets: ASTM C542 dense neoprene extrusions; profile shown or required.
6. Compression Seal Gaskets: ASTM C864 neoprene extrusions; profile and hardness as shown or as required to maintain watertight seal.
7. Setting blocks: ASTM C864 neoprene extrusions, 70-90 durometer Shore A hardness; approximately full channel width, four inches long and high enough to afford correct cover and 3/8-inch edge clearance for the glass.
8. Edge blocks (spacers): ASTM C864 neoprene extrusions, 40-50 durometer Shore A hardness; approximately full channel width, three inches long and providing 3/8-inch edge clearance for the glass.
9. Glazing clips and points: Type, material and quantities as required and recommended by the manufacturers of the glazing media.
10. Glazing (face) gasket: Neoprene, formulated of compound meeting or exceeding physical property requirements of ASTM C509, continuous, 50 durometer hardness, providing 3/16-inch face clearance inside and outside.
11. Dielectric screw shield: Nylon expansion anchor, round head, sized to ensure snug fit in predrilled hole and to accommodate size of screw used.

PART 3 - EXECUTION

3.01 PREPARATION:

- A. Verify dimensions before proceeding; obtain measurements at structure for work to be fitted to other construction, including wall-to-wall dimensions, floor-to-ceiling dimensions and those controlled by other trades.
- B. Remove dirt, dust, oil, moisture and other foreign substances from surfaces to receive glass and glazing accessories.
- C. Clean glass surfaces and wipe dry.

3.02 INSTALLATION:

- A. Coordinate work of this section with work of other trades.
- B. Use only tempered safety glass in doors, sidelights and transoms.
- C. Use only fire-rated glass in doors and windows located in fire-rated wall construction, except where wire glass is shown.
- D. Size glass by measuring actual frames or sash. Sizes shown are approximate and are intended for estimating purposes only. Cut glass to form 3/8-inch bite on all sides, except as otherwise required by manufacturer's product data as submitted and approved.
- E. Install glass or plastic using glazing gaskets or other glazing accessories as shown.
- F. Set glass on setting blocks at each quarter point of sill with equal bearing for entire width of each panel. Accurately cut glass to fit frames and provide smooth edges with no sharp or ragged surfaces. Provide edge blocks to prevent glass from contact with side frames.
- G. Unless otherwise shown, set glass in metal interior frames and doors or by back-face glazing with glazing compound; tape to prevent rattling. Reset glazing beads, if necessary, without marring or injuring finish.
- H. Tape Glazing:
 - 1. Position tape on fixed stops so that, when compressed by glass, exposed edges of tape are flush with or protrude slightly above sightline of stops.
 - 2. Install tape continuously, but not necessarily in one continuous length. Do not stretch tape to make it fit opening. Do not overlap butt ends. Cut tape with sharp shears. Place joints in tape at corners of opening with adjoining lengths butted together, not lapped.
 - 3. Seal joints in tape with compatible sealant approved by tape manufacturer.
 - 4. Where framing joints are vertical, cover these joints by applying tape to head and sill first and then to jambs. Where framing joints are horizontal, cover these joints by applying tape to jambs and then to head and sill.
 - 5. Place spacer or centering shims, three inches in length, 3/16 inch in height and 3/32 inch in thickness, every 18 inches under tape. Hold spacers in position by gently placing them in contact with underedge of tape.
 - 6. Position setting blocks for installation of glass. Use setting blocks 1/4 inch in height.
 - 7. Do not remove release paper from tape until just before each glazing unit is installed.
 - 8. Align glass carefully to opening and press glass firmly in place. Apply removable stops and repeat application of spacers or centering shims. Ensure that they are seated as deeply as possible in channel. Fill interior opening in conventional manner with glazing compound.
 - 9. Apply cap bead of sealant over exterior exposed edge of tape.
- I. Set glass in exterior metal windows and doors with neoprene setting blocks at quarter points and neoprene spacers two inches long placed 18 inches on center, and glaze with sealants.
- J. Install glass and glazing accessories in accordance with manufacturer's recommendations. Neatly apply sealants, compounds and tapes in straight lines parallel with glazing rebates and as shown.
- K. Perform direct glazing in dry weather, 40F or warmer.

- L. Tape edges of laminated glass and insulating glass with pressure-sensitive tape if sealant or glazing tape is incompatible with interlayer or seals of insulating glass. Do not expose edges of laminated glass to solvents, cleaners or prolonged contact with water.
- M. Set lead-shim rings on lips at bottom of openings and glass lenses. Set glass lenses to bring flat face level with the top of granite, centered in openings. Use spacers to maintain lenses in position while filling the annular space with backer rod and sealant as shown.

3.03 FIELD QUALITY CONTROL:

- A. Hose Tests:
 - 1. Upon completion of glazing and sealing, perform hose test against exterior glazing and framing members in the presence of the Engineer.
 - 2. Use 5/8-inch minimum diameter hose operated at 40-psi pressure for a minimum of 10 minutes. Repair leaks as soon as surfaces are dry; retest until approved.
- B. Breakage: Prior to final acceptance, replace damaged glass.
- C. Dielectric Testing:
 - 1. After installation at elevator hoistways, test for electrical isolation between screws and hoistway metal, using ohmmeter.
 - 2. Resistance requirement: 10,000 ohms.
 - 3. Replace screws and shields that do not meet resistance requirements and retest as for initial installation. Repeat as necessary until all screws meet resistance requirement.

3.04 CLEAN-UP:

- D. At completion of work, remove labels, except fire labels, clean glass and remove excess glazing compound and sealant from frames and surrounding finish work.
- E. Remove from site rubbish and debris resulting from work of this section.
- F. Leave areas surrounding work in broom-clean condition.

END OF SECTION

SECTION 09255

DRYWALL SYSTEMS

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing non-loadbearing drywall systems, including metal studs, metal furring and acoustical insulation.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Seals and Sealants: Section 07900.
- B. Building Insulation: Section 07210.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements for approval and with the additional requirements as specified for each.

- A. Product Data: For each type of the product indicated.
- B. Samples:
 - 1. Trim Accessories: Full-size sample in 12-inch long length for each trim accessory indicated.
 - 2. Textured Finishes: Manufacturer's standard size for each textured finish indicated and on same backing indicated for Work.
- C. Certification.
 - 1. Certificates from the gypsum-wallboard manufacturer verifying that materials furnished meet specified requirements.

1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ASTM: C36, C423, C475, C641, C645, C665, C754, C834, C840, C931, C954, C919, C1002, C1177, C1047, D226, E84, E90, E119, E413, E497.
 - 3. ASTM A 118.9, C 919.
- B. Fire-Test-Response Characteristics: For gypsum board assemblies with fire-resistance ratings, provide materials and construction identical to those tested in assembly indicated according to ASTM E 119 by an independent testing and inspecting agency acceptable to authorities having jurisdiction.
- C. Sound Transmission Characteristics: For gypsum board assemblies with STC ratings, provide materials and construction identical to those tested in assembly indicated according to ASTM E 90 and classified according to ASTM E 413 by a qualified independent testing agency.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver materials in original packages, containers, or bundles bearing brand name and identification of manufacturer or supplier.
- B. Store materials inside under cover and keep them dry and protected against damage from weather, direct sunlight, surface contamination, corrosion, construction traffic, and other causes. Stack gypsum panels flat to prevent sagging.

1.06 JOB CONDITIONS:

- A. Environmental Limitations: Comply with ASTM C 840 requirements or gypsum board manufacturer's written recommendations, whichever are more stringent.

PART 2 - PRODUCTS

2.01 STEEL PARTITION AND SOFFIT FRAMING:

- A. Components, General: As follows:
 - 1. Comply with ASTM C 754 for conditions indicated.
 - 2. Steel Sheet Components: Complying with ASTM C 645 requirements for metal and with manufacturer's standard corrosion-resistant zinc coating.
- B. Steel Studs and Runners: ASTM C 645, non-loadbearing
 - 1. Minimum Base Metal Thickness: 20 ga.
 - 2. Depth: As shown.
- C. Deep-Leg Deflection Track: ASTM C 645 top runner with 2-inch- deep flanges.
- D. Proprietary Deflection Track: Steel sheet top runner manufactured to prevent cracking of gypsum board applied to interior partitions resulting from deflection of structure above; in thickness indicated for studs and in width to accommodate depth of studs.
- E. Proprietary Firestop Track: Top runner manufactured to allow partition heads to expand and contract with movement of the structure while maintaining continuity of fire-resistance-rated assembly indicated; in thickness not less than indicated for studs and in width to accommodate depth of studs.
- F. Flat Strap and Backing Plate: Steel sheet for blocking and bracing in length and width indicated.
- G. Cold-Rolled Channel Bridging: 0.0538-inch bare steel thickness, with minimum 1/2-inch- wide flange.
 - 1. Depth: As shown.
 - 2. Clip Angle: 1-1/2 by 1-1/2 inch, 0.068-inch-thick, galvanized steel.
- H. Hat-Shaped, Rigid Furring Channels: ASTM C 645.
- I. Resilient Furring Channels: 1/2-inch deep, steel sheet members designed to reduce sound transmission.
- J. Cold-Rolled Furring Channels: 0.0538-inch bare steel thickness, with minimum 1/2-inch- wide flange.

1. Depth: As indicated.
2. Furring Brackets: Adjustable, corrugated-edge type of steel sheet with minimum bare steel thickness of 0.0312 inch.
3. Tie Wire: ASTM A 641/A 641M, Class 1 zinc coating, soft temper, 0.0625-inch diameter wire, or double strand of 0.0475-inch diameter wire.

K. Z-Shaped Furring: With slotted or nonslotted web, face flange of 1-1/4 inches, wall attachment flange of 7/8 inch, minimum bare metal thickness of 0.0179 inch, and depth required to fit insulation thickness indicated.

L. Fasteners for Metal Framing: Of type, material, size, corrosion resistance, holding power, and other properties required to fasten steel members to substrates.

2.02 INTERIOR GYPSUM WALLBOARD

A. Panel Size: Provide in maximum lengths and widths available that will minimize joints in each area and correspond with support system indicated.

B. Gypsum Wallboard: ASTM C 36.

1. Regular Type: Regular-type gypsum panels are also available in 1/4- and 3/8-inch (6.4- and 9.5-mm) thicknesses for limited applications.
 - a. Thickness: 1/2 inch, unless otherwise indicated.
 - b. Long Edges: Tapered and featured (rounded or beveled) for prefilling.
 - c. Location: As indicated.
2. Type X:
 - a. Thickness: 5/8 inch.
 - b. Long Edges: Tapered and featured (rounded or beveled) for prefilling.
 - c. Location: Where required for fire-resistance-rated assembly or as indicated

C. Flexible Gypsum Wallboard: ASTM C 36, manufactured to bend to fit tight radii and to be more flexible than standard regular-type panels of the same thickness.

1. Thickness: 1/4 inch.
2. Long Edges: Tapered.
3. Location: As indicated

D. Sag-Resistant Gypsum Wallboard: ASTM C 36, manufactured to have more sag resistance than regular-type gypsum board.

1. Thickness: 1/2 inch.
2. Long Edges: Tapered.
3. Location: Ceiling surfaces

E. Proprietary, Special Fire-Resistive Type: ASTM C 36, having improved fire resistance over standard Type X.

F. Foil-Backed Gypsum Wallboard: ASTM C 36.

G. Proprietary Abuse-Resistant Gypsum Wallboard: ASTM C 36, manufactured to produce greater resistance to surface indentation and through-penetration than standard gypsum panels.

2.03 EXTERIOR GYPSUM PANELS FOR CEILINGS AND SOFFITS

- A. Panel Size: Provide in maximum lengths and widths available that will minimize joints in each area and correspond with support system indicated.
- B. Exterior Gypsum Soffit Board: ASTM C 931/C 931M, with manufacturer's standard edges.
 - 1. Core: ½ inch, regular type or 5/8 inch Type X.
- C. Glass-Mat Gypsum Sheathing Board: ASTM C 1177/C 1177M.

2.04 TILE BACKING PANELS

- A. Panel Size: Provide in maximum lengths and widths available that will minimize joints in each area and correspond with support system indicated.
- B. Cementitious Backer Units: ASTM A 118.9

2.05 TRIM ACCESSORIES:

- A. Interior Trim: ASTM C 1047
 - 1. Material: , manufacturer's standard metal trim, formed from galvanized or aluminum-coated steel, or rolled zinc.
 - 2. Shapes:
 - a. Cornerbead: Use at outside corners.
 - b. Bullnose Bead: Use where indicated.
 - c. LC-Bead (J Bead): Use at exposed panel edges.
 - d. L-Bead: Use where indicated.
 - e. U-Bead: Use where indicated.
 - f. Expansion Joint Use where indicated.
 - g. Curved-Edge Cornerbead: With notched or flexible flanges; use at curved openings.
- B. Exterior Trim: ASTM C 1047.
 - 1. Material: Hot-dip galvanized steel sheet or rolled zinc.
 - 2. Shapes:
 - a. Cornerbead: Use at outside corners.
 - b. LC-Bead (J-Bead): Use at exposed panel edges.
 - c. Expansion (Control) Joint.

2.06 JOINT TREATMENT MATERIALS:

- A. General: Comply with ASTM C 475.
- B. Joint Tape:
 - 1. Interior Gypsum Wallboard: Paper.
 - 2. Exterior Gypsum Soffit Board: Paper.
 - 3. Glass-Mat Gypsum Sheathing Board: 10-by-10 glass mesh.
- C. Joint Compound for Interior Gypsum Wallboard: For each coat use formulation that is compatible with other compounds applied on previous or for successive coats.
- D. Joint Compound for Exterior Applications:
 - 1. Exterior Gypsum Soffit Board: Use setting-type taping and setting-type, sandable topping compounds.

2. Glass-Mat Gypsum Sheathing Board: As recommended by manufacturer.
- E. Joint Compound for Tile Backing Panel:
1. Cementitious Backer Units: As recommended by manufacturer

2.07 ACOUSTICAL SEALANT:

- A. Acoustical Sealant for Exposed and Concealed Joints: Nonsag, paintable, nonstaining, latex sealant complying with ASTM C 834 that effectively reduces airborne sound transmission through perimeter joints and openings in building construction.

2.08 AUXILIARY MATERIALS

- A. General : Provide auxiliary materials that comply with referenced installation standards and manufacturer's written recommendations.
- B. Laminating Adhesive: Adhesive or joint compound recommended for directly adhering gypsum panels to continuous substrate.
- C. Steel Drill Screws: ASTM C 1002, unless otherwise indicated
1. Use screws complying with ASTM C 954 for fastening panels to steel members from 0.033 to 0.112 inch thick.
 2. For fastening cementitious backer units, use screws of type and size recommended by panel manufacturer.
- D. Isolation Strip at Exterior Walls:
1. Asphalt-Saturated Organic Felt: ASTM D 226, Type I (No. 15 asphalt felt), nonperforated.
 2. Foam Gasket: Adhesive-backed, closed-cell vinyl foam strips that allow fastener penetration without foam displacement, 1/8 inch thick, in width to suit steel stud size.
- E. Sound Attenuation Blankets: ASTM C 665, Type I (blankets without membrane facing) produced by combining thermosetting resins with mineral fibers manufactured from glass, slag wool, or rock wool.
1. Fire-Resistance-Rated Assemblies: Comply with mineral-fiber requirements of assembly.
- F. Thermal Insulation: As specified in Section 07210.
- G. Vapor Barrier: As specified in Section 07210.

2.09 TEXTURE FINISHES

- A. Primer: As recommended by textured finish manufacturer.
- B. Polystyrene Aggregate Ceiling Finish: Water-based, job-mixed, polystyrene aggregate finish with flame-spread and smoke-developed indices of not more than 25 when tested according to ASTM E 84.
- C. Aggregate Finish: Water-based, job-mixed, aggregated, drying-type texture finish for spray application.

- D. Acoustical Finish: Water-based, chemical-setting or drying-type, job-mixed texture finish for spray application:
 - 1. Application Thickness: 1/2 inch.
 - 2. Fire-Test-Response Characteristics: Indices when tested according to ASTM E 84 as follows:
 - a. Flame Spread: Less than 25.
 - b. Smoke Developed: Less than 450.
 - 3. NRC: 0.55 according to ASTM C 423.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine areas and substrates, with Installer present, and including welded hollow-metal frames, cast-in anchors, and structural framing, for compliance with requirements and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLING STEEL PARTITION AND SOFFIT FRAMING:

- A. Install tracks (runners) at floors, ceilings, and structural walls and columns where gypsum board assemblies abut other construction.
 - 1. Where studs are installed directly against exterior walls, install asphalt-felt or foam-gasket isolation strip between studs and wall.
- B. Installation Tolerance: Install each steel framing and furring member so fastening surfaces vary not more than 1/8 inch3 mm from the plane formed by the faces of adjacent framing.
- C. Extend partition framing full height to structural supports or substrates above suspended ceilings, except where partitions are indicated to terminate at suspended ceilings. Continue framing over frames for doors and openings and frame around ducts penetrating partitions above ceiling to provide support for gypsum board.
 - 1. Cut studs 1/2 inch13 mm short of full height to provide perimeter relief.
 - 2. For fire-resistance-rated and STC-rated partitions that extend to the underside of floor/roof slabs and decks or other continuous solid-structure surfaces to obtain ratings, install framing around structural and other members extending below floor/roof slabs and decks, as needed to support gypsum board closures and to make partitions continuous from floor to underside of solid structure.
 - a. Terminate partition framing at suspended ceilings where indicated
- D. Install steel studs so flanges point in the same direction and leading edge or end of each panel can be attached to open (unsupported) edges of stud flanges first.
- E. Frame door openings to comply with GA-600 and with gypsum board manufacturer's applicable written recommendations, unless otherwise indicated. Screw vertical studs at jambs to jamb anchor clips on door frames; install runner track section (for cripple studs) at head and secure to jamb studs.
 - 1. Install two studs at each jamb, unless otherwise indicated.
 - 2. Install cripple studs at head adjacent to each jamb stud, with a minimum 1/2-inch clearance from jamb stud to allow for installation of control joint.
 - 3. Extend jamb studs through suspended ceilings and attach to underside of floor or roof structure above.

4. Frame openings other than door openings the same as required for door openings, unless otherwise indicated. Install framing below sills of openings to match framing required above door heads.
- F. Z-Furring Members:
1. Erect insulation vertically and hold in place with Z-furring members spaced 24 inches o.c.
 2. Except at exterior corners, securely attach narrow flanges of furring members to wall with concrete stub nails, screws designed for masonry attachment, or powder-driven fasteners spaced 24 inches o.c.
 3. At exterior corners, attach wide flange of furring members to wall with short flange extending beyond corner; on adjacent wall surface, screw-attach short flange of furring channel to web of attached channel. At interior corners, space second member no more than 12 inches from corner and cut insulation to fit.
 4. Until gypsum board is installed, hold insulation in place with 10-inch staples fabricated from 0.0625-inch- diameter, tie wire and inserted through slot in web of member.
- G. Vapor Barrier: Install to comply with requirements specified in Section 07210.

3.03 APPLYING AND FINISHING PANELS, GENERAL:

- A. Gypsum Board Application and Finishing Standards: ASTM C 840 and GA-216.
- B. Install sound attenuation blankets before installing gypsum panels, unless blankets are readily installed after panels have been installed on one side.
- C. Install ceiling board panels across framing to minimize the number of abutting end joints and to avoid abutting end joints in the central area of each ceiling. Stagger abutting end joints of adjacent panels not less than one framing member.
- D. Install gypsum panels with face side out. Butt panels together for a light contact at edges and ends with not more than 1/16 inch of open space between panels. Do not force into place.
- E. Locate edge and end joints over supports, except in ceiling applications where intermediate supports or gypsum board back-blocking is provided behind end joints. Do not place tapered edges against cut edges or ends. Stagger vertical joints on opposite sides of partitions. Do not make joints other than control joints at corners of framed openings.
- F. Attach gypsum panels to steel studs so leading edge or end of each panel is attached to open (unsupported) edges of stud flanges first.
- G. Attach gypsum panels to framing provided at openings and cutouts.
- H. Do not attach gypsum panels across the flat grain of wide-dimension lumber, including floor joists and headers. Float gypsum panels over these members using resilient channels, or provide control joints to counteract wood shrinkage.
- I. Form control and expansion joints with space between edges of adjoining gypsum panels.
- J. Cover both faces of steel stud partition framing with gypsum panels in concealed spaces (above ceilings, etc.), except in chases braced internally.

- K. Unless concealed application is indicated or required for sound, fire, air, or smoke ratings, coverage may be accomplished with scraps of not less than 8 sq. ft. 0.7 sq. m in area.
- L. Fit gypsum panels around ducts, pipes, and conduits.
- M. Where partitions intersect open concrete coffers, concrete joists, and other structural members projecting below underside of floor/roof slabs and decks, cut gypsum panels to fit profile formed by coffers, joists, and other structural members; allow 1/4- to 3/8-inch- wide joints to install sealant.
- N. Isolate perimeter of non-load-bearing gypsum board partitions at structural abutments, except floors. Provide 1/4- to 1/2-inch- wide spaces at these locations, and trim edges with U-bead edge trim where edges of gypsum panels are exposed. Seal joints between edges and abutting structural surfaces with acoustical sealant.
- O. Floating Construction: Where feasible, including where recommended in writing by manufacturer, install gypsum panels over wood framing, with floating internal corner construction.
- P. STC-Rated Assemblies: Seal construction at perimeters, behind control and expansion joints, and at openings and penetrations with a continuous bead of acoustical sealant. Install acoustical sealant at both faces of partitions at perimeters and through penetrations. Comply with ASTM C 919 and manufacturer's written recommendations for locating edge trim and closing off sound-flanking paths around or through gypsum board assemblies, including sealing partitions above acoustical ceilings.
- Q. Space fasteners in gypsum panels according to referenced gypsum board application and finishing standard and manufacturer's written recommendations.
 - 1. Space screws a maximum of 12 inches o.c. for vertical applications.
- R. Space fasteners in panels that are tile substrates a maximum of 8 inches o.c.

3.04 PANEL APPLICATION METHODS:

- A. Single-Layer Application:
 - 1. On ceilings, apply gypsum panels before wall/partition board application to the greatest extent possible and at right angles to framing, unless otherwise indicated.
 - 2. On partitions/walls, apply gypsum panels vertically (parallel to framing), unless otherwise indicated or required by fire-resistance-rated assembly, and minimize end joints.
 - a. Stagger abutting end joints not less than one framing member in alternate courses of board.
 - b. At stairwells and other high walls, install panels horizontally, unless otherwise indicated or required by fire-resistance-rated assembly.
 - 3. On Z-furring members, apply gypsum panels vertically (parallel to framing) with no end joints. Locate edge joints over furring members.
- B. Multilayer Application on Ceilings: Apply gypsum board indicated for base layers before applying base layers on walls/partitions; apply face layers in same sequence. Apply base layers at right angles to framing members and offset face-layer joints 1 framing member, 16

inches minimum, from parallel base-layer joints, unless otherwise indicated or required by fire-resistance-rated assembly.

- C. **Multilayer Application on Partitions/Walls:** Apply gypsum board indicated for base layers and face layers vertically (parallel to framing) with joints of base layers located over stud or furring member and face-layer joints offset at least one stud or furring member with base-layer joints, unless otherwise indicated or required by fire-resistance-rated assembly. Stagger joints on opposite sides of partitions.
 - 1. **Z-Furring Members:** Apply base layer vertically (parallel to framing) and face layer either vertically (parallel to framing) or horizontally (perpendicular to framing) with vertical joints offset at least one furring member. Locate edge joints of base layer over furring members.
- D. **Single-Layer Fastening Methods:** Apply gypsum panels to supports with steel drill screws.
- E. **Multilayer Fastening Methods:** Fasten base layers and face layers separately to supports with screws.
- F. **Laminating to Substrate:** Where gypsum panels are indicated as directly adhered to a substrate (other than studs, joists, furring members, or base layer of gypsum board), comply with gypsum board manufacturer's written recommendations and temporarily brace or fasten gypsum panels until fastening adhesive has set.
- G. **Curved Partitions:**
 - 1. Install panels horizontally and unbroken, to the extent possible, across curved surface plus 12-inch/300-mm-long straight sections at ends of curves and tangent to them.
 - 2. On convex sides of partitions, begin installation at one end of curved surface and fasten gypsum panels to studs as they are wrapped around curve. On concave side, start fastening panels to stud at center of curve and work outward to panel ends. Fasten panels to framing with screws spaced 12 inches o.c.
 - 3. For double-layer construction, fasten base layer to studs with screws 16 inches o.c. Center gypsum board face layer over joints in base layer, and fasten to studs with screws spaced 12 inches o.c.
- H. **Exterior Soffits and Ceilings:** Apply exterior gypsum soffit board panels perpendicular to supports, with end joints staggered and located over supports.
 - 1. Install with 1/4-inch open space where panels abut other construction or structural penetrations.
 - 2. Fasten with corrosion-resistant screws.
- I. **Tile Backing Panels:**
 - 1. **Cementitious Backer Units:** ANSI A108.11, at locations indicated to receive tile.
 - 2. **Areas Not Subject to Wetting:** Install standard gypsum wallboard panels to produce a flat surface except at showers, tubs, and other locations indicated to receive water-resistant panels.
 - 3. Where tile backing panels abut other types of panels in the same plane, shim surfaces to produce a uniform plane across panel surfaces.

3.05 INSTALLING TRIM ACCESSORIES:

- A. General: For trim with back flanges intended for fasteners, attach to framing with same fasteners used for panels. Otherwise, attach trim according to manufacturer's written instructions.
- B. Control Joints: Install control joints at locations shown or indicated. Install control joints according to ASTM C 840 and in specific locations approved by the Engineer for visual effect.

3.06 FINISHING GYPSUM BOARD ASSEMBLIES:

- A. General: Treat gypsum board joints, interior angles, edge trim, control joints, penetrations, fastener heads, surface defects, and elsewhere as required to prepare gypsum board surfaces for decoration. Promptly remove residual joint compound from adjacent surfaces.
- B. Prefill open joints, beveled edges, and damaged surface areas.
- C. Apply joint tape over gypsum board joints, except those with trim having flanges not intended for tape.
- D. Gypsum Board Finish Levels: Finish panels to levels indicated below, according to ASTM C 840, for locations indicated:
 - 1. Level 1: At joints and angles, embed tape in joint compound. Panel surfaces must be free of excess joint compound.
 - 2. Level 2: Embed tape and apply separate first coat of joint compound to tape, fasteners, and trim flanges in concealed spaces such as ceiling plenums..
 - 3. Level 3: Embed tape and apply separate first and fill coats of joint compound to tape, fasteners, and trim flanges at surfaces receiving textured finish.
 - 4. Level 4: At joints and angles, embed tape in joint compound and apply three separate coats of joint compound over joints, angles, fastener heads, and flanges of trim accessories at surfaces receiving a smooth painted finish. Panel surfaces must and joint compound must be smooth and free of tool marks and ridges.
- E. Glass-Mat Gypsum Sheathing Board: Finish according to manufacturer's written instructions for use as exposed soffit board.
- F. Cementitious Backer Units: Finish according to manufacturer's written instructions.

3.07 APPLYING TEXTURE FINISHES:

- A. Surface Preparation and Primer: Prepare and apply primer to gypsum panels and other surfaces receiving texture finishes. Apply primer to surfaces that are clean, dry, and smooth.
- B. Texture Finish Application: Mix and apply finish using powered spray equipment, to produce a uniform texture matching approved mockup and free of starved spots or other evidence of thin application or of application patterns.
- C. Prevent texture finishes from coming into contact with surfaces not indicated to receive texture finish by covering them with masking agents, polyethylene film, or other means. If, despite these precautions, texture finishes contact these surfaces, immediately remove droppings and overspray to prevent damage according to texture finish manufacturer's written recommendations.

3.08 FIELD QUALITY CONTROL:

- A. Above-Ceiling Observation: Before Contractor installs gypsum board ceilings, Architect will conduct an above-ceiling observation and report deficiencies in the Work observed. Do not proceed with installation of gypsum board to ceiling support framing until deficiencies have been corrected.
1. Notify the Engineer in advance of date and time when Project, or part of Project, will be ready for above-ceiling observation.
 2. Before notifying the Engineer, complete the following in areas to receive gypsum board ceilings:
 - a. Installation of 80 percent of lighting fixtures, powered for operation.
 - b. Installation, insulation, and leak and pressure testing of water piping systems.
 - c. Installation of air-duct systems.
 - d. Installation of air devices.
 - e. Installation of mechanical system control-air tubing.
 - f. Installation of ceiling support framing.

END OF SECTION

THIS PAGE NOT USED

SECTION 09265

GYPSUM BOARD SHAFT-WALL ASSEMBLIES

PART 1 - GENERAL

1.01 SUMMARY OF WORK

- A. This Section includes shaft enclosures.

1.02 DEFINITIONS

- A. Gypsum Board Construction Terminology: Refer to ASTM C 11 for definitions of terms for gypsum board construction not defined in this Section or in other referenced standards.

1.03 PERFORMANCE REQUIREMENTS

- A. Structural Performance:
 1. Provide gypsum board shaft-wall assemblies capable of withstanding the full air-pressure loads indicated for maximum heights of partitions without failing and while maintaining an airtight and smoke-tight seal. Evidence of failure includes deflections exceeding limits indicated, bending stresses causing studs to break or to distort, and end-reaction shear causing track (runners) to bend or to shear and studs to become crippled.
 2. Provide gypsum board shaft-wall assemblies for horizontal duct enclosures capable of spanning distances indicated within deflection limits indicated.
 3. Air-pressure loads and deflection limits are specified in "Gypsum Board Shaft Wall" Article in Part 2.

1.04 SUBMITTALS

- A. Product Data: For each gypsum board shaft-wall assembly indicated.
- B. Fire-Test-Response Reports: From a qualified independent testing and inspecting agency substantiating each gypsum board shaft-wall assembly's required fire-resistance rating.
 1. Include data substantiating that elevator entrances and other items that penetrate each gypsum board shaft-wall assembly do not negate fire-resistance rating.
- C. Research/Evaluation Reports: Evidence of compliance with building code in effect for Project, from a model code organization acceptable to authorities having jurisdiction that substantiate required fire-resistance rating for each gypsum board shaft-wall assembly.
- B. Acoustical-Test-Response Reports: From a qualified independent testing agency substantiating required STC rating for each gypsum board shaft-wall assembly.

1.05 QUALITY ASSURANCE

- A. Fire-Resistance-Rated Assemblies: Provide materials and construction identical to those tested in assembly indicated according to ASTM E 119 by an independent testing and inspecting agency acceptable to authorities having jurisdiction.
 1. Fire-Resistance-Rated Assemblies: Indicated by design designations from UL's "Fire Resistance Directory," or GA-600, "Fire Resistance Design Manual."
- B. STC-Rated Assemblies: For gypsum board shaft-wall assemblies indicated to have STC ratings, provide assembly materials and construction complying with requirements of assemblies whose STC ratings were determined according to ASTM E 90 and classified according to ASTM E 413

by a qualified independent testing agency.

- C. Preinstallation Conference: Conduct conference at Project site to comply with requirements of Division 1 Section "Project Management and Coordination." Review methods and procedures for installing work related to gypsum board shaft-wall assemblies including, but not limited to, the following:
1. Fasteners proposed for anchoring steel framing to building structure.
 2. Sprayed fire-resistive materials applied to structural framing.
 3. Elevator equipment, including hoistway doors, elevator call buttons, and elevator floor indicators.
 4. Wiring devices in shaft-wall assemblies.
 5. Doors and other items penetrating shaft-wall assemblies.
 6. Items supported by shaft-wall-assembly framing.
 7. Mechanical work enclosed within shaft-wall assemblies.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials in original packages, containers, and bundles bearing brand name and identification of manufacturer or supplier.
- B. Store materials inside under cover and keep them dry and protected against damage from weather, direct sunlight, surface contamination, corrosion, construction traffic, and other causes. Stack gypsum panels flat on leveled supports off the ground to prevent sagging.

1.07 PROJECT CONDITIONS

- A. Comply with requirements for environmental conditions, room temperatures, and ventilation specified in Division 9 Section "Drywall Systems."

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. American Gypsum Co.
 2. G-P Gypsum Corp.
 3. National Gypsum Company.
 4. United States Gypsum Co.

2.02 ASSEMBLY MATERIALS

- A. General: Provide materials and components complying with requirements of fire-resistance-rated assemblies indicated.
1. Provide panels in maximum lengths available to eliminate or minimize end-to-end butt joints.
 2. Provide auxiliary materials complying with gypsum board shaft-wall assembly manufacturer's written recommendations.
- B. Steel Framing: ASTM C 645.
1. Protective Coating: Manufacturer's standard corrosion-resistant zinc coating.
- C. Gypsum Liner Panels: Manufacturer's proprietary liner panels in 1-inch (25.4-mm) thickness and with moisture-resistant paper faces.
- D. Gypsum Wallboard: ASTM C 36, core type as required by fire-resistance-rated assembly

indicated.

1. Edges: Tapered.
- E. Gypsum Base for Gypsum Veneer Plaster: ASTM C 588, core type as required by fire-resistance-rated assembly indicated, with edges as standard with manufacturer.
- F. Water-Resistant, Gypsum Backing Board: ASTM C 630/C 630M, core type as required by fire-resistance-rated assembly indicated.
- H. Accessories: Cornerbead, edge trim, and control joints of material and shapes specified in Division 9 Section "Drywall Systems" that comply with gypsum board shaft-wall assembly manufacturer's written recommendations for application indicated.
- I. Gypsum Wallboard Joint-Treatment Materials: ASTM C 475 and as specified in Division 9 Section "Drywall Systems."
- L. Steel Drill Screws: ASTM C 1002, unless otherwise indicated.
1. Use screws complying with ASTM C 954 for fastening panels to steel members from 0.033 to 0.112 inch (0.84 to 2.84 mm) thick.
 2. For fastening cementitious backer units, use screws of type and size recommended by panel manufacturer.
- M. Track (Runner) Fasteners: Power-driven fasteners of size and material required to withstand loading conditions imposed on shaft-wall assemblies without exceeding allowable design stress of track, fasteners, or structural substrates in which anchors are embedded.
1. Powder-Actuated Fasteners: Provide powder-actuated fasteners with capability to sustain, without failure, a load equal to 10 times that imposed by shaft-wall assemblies, as determined by testing conducted by a qualified independent testing agency according to ASTM E 1190.
 2. Postinstalled Expansion Anchors: Where indicated, provide expansion anchors with capability to sustain, without failure, a load equal to 5 times that imposed by shaft-wall assemblies, as determined by testing conducted by a qualified independent testing agency according to ASTM E 488.
- N. Acoustical Sealant: As specified in Division 9 Section "Drywall Systems."
- O. Sound Attenuation Blankets: ASTM C 665 for Type I, unfaced mineral-fiber-blanket insulation produced by combining thermosetting resins with mineral fibers manufactured from slag or rock wool.

2.03 GYPSUM BOARD SHAFT WALL

- A. Basis-of-Design Product: As indicated on Drawings by design designation of a qualified testing and inspecting agency.
- B. Sustained Air-Pressure Loads: 7.5 lbf/sq. ft. (0.36 kPa).
- C. Deflection Limit: $L/360$.
- D. Studs: Manufacturer's standard profile for repetitive members and corner and end members and for fire-resistance-rated assembly indicated.
1. Depth: 2-1/2 inches (63.5 mm).
 2. Minimum Base Metal Thickness: Manufacturer's standard thicknesses that comply with structural performance requirements for stud depth indicated.

- E. Track (Runner): Manufacturer's standard J-profile track with long-leg length as standard with manufacturer, but at least 2 inches (51 mm), in depth matching studs.
 - 1. Minimum Base Metal Thickness: Manufacturer's standard thicknesses that comply with structural performance requirements for stud depth indicated.
- F. Jamb Struts: Manufacturer's standard J-profile strut with long-leg length of 3 inches (76.2 mm), in depth matching studs, and not less than 0.0341 inch (0.87 mm) thick.
- G. Room-Side Finish: Gypsum board.
- H. Shaft-Side Finish: As indicated by fire-resistance-rated assembly design designation.
- I. Cavity Insulation: Sound attenuation blankets.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates to which gypsum board shaft-wall assemblies attach or abut, with Installer present, including hollow-metal frames, elevator hoistway door frames, cast-in anchors, and structural framing. Examine for compliance with requirements for installation tolerances and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Sprayed Fire-Resistive Materials: Coordinate with gypsum shaft-wall assemblies so both elements of Work remain complete and undamaged. Patch or replace sprayed fire-resistive materials removed or damaged during installation of shaft-wall assemblies to comply with requirements specified in Division 7 Section "Sprayed Fire-Resistive Materials."
 - 1. Before sprayed fire-resistive materials are applied, attach offset anchor plates or ceiling runners (tracks) to surfaces indicated to receive sprayed fire-resistive materials. Where offset anchor plates are required, provide continuous plates fastened to building structure not more than 24 inches (600 mm) o.c.
 - 2. After sprayed fire-resistive materials are applied, remove them only to extent necessary for installation of gypsum board assemblies and without reducing the fire-resistive material thickness below that which is required to obtain fire-resistance rating indicated. Protect remaining fire-resistive materials from damage.

3.03 INSTALLATION

- A. General: Install gypsum board shaft-wall assemblies to comply with requirements of fire-resistance-rated assemblies indicated, manufacturer's written installation instructions, and the following:
 - 1. ASTM C 754 for installing steel framing.
 - 2. Division 9 Section "Drywall Systems" for applying and finishing panels.
- B. Do not bridge building expansion joints with shaft-wall assemblies; frame both sides of joints with furring and other support.
- C. Install supplementary framing in gypsum board shaft-wall assemblies around openings and as required for blocking, bracing, and support of gravity and pullout loads of fixtures, equipment, services, heavy trim, furnishings, and similar items that cannot be supported directly by shaft-wall assembly framing.
 - 1. At elevator hoistway door frames, provide jamb struts on each side of door frame.
 - 2. Where handrails directly attach to gypsum board shaft-wall assemblies, provide galvanized

steel reinforcing strip with 0.0312-inch (0.79-mm) minimum thickness of base (uncoated) metal, accurately positioned and secured behind at least 1 face-layer panel.

- D. Integrate stair hanger rods with gypsum board shaft-wall assemblies by locating cavity of assemblies where required to enclose rods.
- E. At penetrations in shaft wall, maintain fire-resistance rating of shaft-wall assembly by installing supplementary steel framing around perimeter of penetration and fire protection behind boxes containing wiring devices, elevator call buttons, elevator floor indicators, and similar items.
- F. Isolate gypsum finish panels from building structure to prevent cracking of finish panels while maintaining continuity of fire-rated construction.
- G. Install control joints to maintain fire-resistance rating of assemblies.
- H. Seal gypsum board shaft walls with acoustical sealant at perimeter of each assembly where it abuts other work and at joints and penetrations within each assembly. Install acoustical sealant to withstand dislocation by air-pressure differential between shaft and external spaces; maintain an airtight and smoke-tight seal; and comply with manufacturer's written instructions or ASTM C 919, whichever is more stringent.
- I. In elevator shafts where gypsum board shaft-wall assemblies cannot be positioned within 2 inches (51 mm) of the shaft face of structural beams, floor edges, and similar projections into shaft, install 1/2- or 5/8-inch- (12.7- or 15.9-mm-) thick, gypsum board cants covering tops of projections.
 - 1. Slope cant panels at least 75 degrees from horizontal. Set base edge of panels in adhesive and secure top edges to shaft walls at 24 inches (610 mm) o.c. with screws fastened to shaft-wall framing.
 - 2. Where steel framing is required to support gypsum board cants, install framing at 24 inches (610 mm) o.c. and extend studs from the projection to the shaft-wall framing.

END OF SECTION

THIS PAGE NOT USED

SECTION 09320

TILE

PART 1 - GENERAL

1.01 SCOPE OF WORK:

- A. This section specifies providing ceramic tile, ceramic mosaic tile, quarry tile and marble thresholds, typically in restricted areas as shown.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Cast-in-Place Structural Concrete: Section 03300.
- B. Seals and Sealants: Section 07900.

1.03 PERFORMANCE REQUIREMENTS:

- A. Static Coefficient of Friction: For tile installed on walkway surfaces, provide products with the following values as determined by testing identical products per ASTM C1028:
 - 1. Level Surfaces: Minimum 0.6.
 - 2. Ramp Surfaces (slope greater than 1:20): Minimum 0.8.

1.04 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Product Data: For each type of tile, mortar, grout, and other products specified. Include recommendations for product application and use.
- B. Shop Drawings: For the following:
 - 1. Tile patterns and locations.
 - 2. Widths, details, and locations of expansion, contraction, control, and isolation joints in tile substrates and finished tile surfaces.
- C. Tile Samples for Initial Selection: Manufacturer's color charts consisting of actual tiles or sections of tiles showing the full range of colors, textures, and patterns available for each type and composition of tile indicated. Include Samples of accessories involving color selection.
- D. Grout Samples for Initial Selection: Manufacturer's color charts consisting of actual sections of grout showing the full range of colors available for each type of grout indicated.
- E. Samples for Verification: Of each item listed below, prepared on Samples of size and construction indicated. Where products involve normal color and texture variations, include Sample sets showing the full range of variations expected.
 - 1. Ceramic and Ceramic Mosaic Tile: Three panels of each type and composition of tile and for each color and texture required, 12 inches square, mounted on 16 inches square by 1/4-inch thick hardboard with grouted joints using product complying with specified requirements and approved for completed work in color or colors selected by the Engineer.
 - 2. Full-size units of each type of trim and accessory for each color required.

3. Quarry Tile: Four standard size units mounted on 16 inches square by 1/4-inch thick hardboard with grouted joints using product complying with specified requirements and approved for completed work in color or colors selected by the Engineer.
 4. Marble Threshold: Three 12-inch lengths showing range of color, veining and finish.
- F. Master Grade Certificates: For each shipment, type, and composition of tile, per ANSI A137.1, bearing TCA-Certification Mark, signed by tile manufacturer and Installer stating type and quality of material. Submit at time of shipment..
- G. Product Certificates: Signed by manufacturers certifying that the products furnished comply with requirements.
- H. Tile Test Reports: Certified test reports in accordance with ANSI A118.1 through A118.4.

1.05 QUALITY ASSURANCE:

- A. Codes Regulations, Reference Standards and Specifications:
1. Comply with the codes and regulations of the jurisdictional authorities.
 2. ADA: Americans with Disabilities Act.
 3. ANSI: A108.1C, A108.5, A108.6, A108.10, A118.1, A118.2, A118.3, A118.4, A118.6, A137.1.
 4. ASTM: A82, A185, C144, C150, C206, C207, C241, C503, C920, C1028, D4397.
 5. FS: UU-B-790.
 6. TCA: Handbook for Ceramic Tile Installation.
- B. Installer Qualifications: Engage an experienced installer who has completed tile installations similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.
- C. Source Limitations for Tile: Obtain each color, grade, finish, type, composition, and variety of tile from one source with resources to provide products from the same production run for each contiguous area of consistent quality in appearance and physical properties without delaying the Work.
- D. Source Limitations for Setting and Grouting Materials: Obtain ingredients of a uniform quality for each mortar, adhesive, and grout component from a single manufacturer and each aggregate from one source or producer.
- E. Mockups: Before installing floor and wall tile, construct mockups for each form of construction and finish required to verify selections made under Sample submittals and to demonstrate aesthetic effects and qualities of materials and execution. Build mockups to comply with the following requirements, using materials indicated for completed Work.
1. Mockups shall be minimum four feet square and in the location as directed by the Engineer.
 2. Notify the Engineer seven days in advance of the dates and times when mockups will be constructed.
 3. Demonstrate the proposed range of aesthetic effects and workmanship.
 4. Obtain the Engineer's approval of mockups before proceeding with final unit of Work.
 5. Approved mockups may become part of the completed Work.

1.06 DELIVERY, STORAGE, AND HANDLING:

- A. Deliver materials to the site in original unopened containers, clearly labeled with the manufacturer's name, brand designation, type, grade and color. Comply with requirement of ANSI A137.1 for labeling sealed tile packages.
- B. Store materials so as to prevent damage or contamination to materials by water, freezing, foreign matter, and other causes.
- C. Handle materials so as to prevent breakage of containers and damage to materials.

1.07 PROJECT CONDITIONS:

- A. Environmental Limitations: Do not start tile work unless ambient temperature of area in which work occurs is at least 50 deg. F and rising and is maintained at not less than 50 deg. F without interruption while work is being done and for at least 72 hours after completion.
- B. Substrate Conditions: Do not start tile work unless surfaces to receive tile are in satisfactory condition. Commencement of tile work constitutes Contractor's acceptance of the subfloor condition in accordance with ANSI A108-AN-2, General Requirements for Subsurfaces.

1.08 EXTRA MATERIALS:

- A. Deliver extra materials to Owner. Furnish and store extra materials in locations as directed on pallets and in original containers with protective covering for storage, and are clearly identified with labels describing contents and area of placement.
 - 1. Tile and Trim Units: Furnish quantity of full-size units equal to 5 percent of amount installed, for each type, composition, color, pattern, and size indicated.

PART 2 - PRODUCTS

2.01 PRODUCTS, GENERAL:

- A. ANSI Ceramic Tile Standard: Provide tile that complies with ANSI A137.1, "Specifications for Ceramic Tile," for types, compositions, and other characteristics indicated.
 - 1. Provide tile complying with Standard Grade requirements, unless otherwise indicated.
- B. ANSI Standards for Tile Installation Materials: Provide materials complying with ANSI standards referenced in "Setting and Grouting Materials" article.
- C. Colors, Textures, and Patterns: Where manufacturer's standard products are indicated for tile, grout, and other products requiring selection of colors, surface textures, patterns, and other appearance characteristics, provide specific products or materials complying with the following requirements:
 - 1. Provide Engineer's selections from manufacturer's full range of colors, textures, and patterns for products of type indicated.
 - 2. Provide tile trim and accessories that match color and finish of adjoining flat tile.
- D. Factory Blending: For tile exhibiting color variations within the ranges selected during Sample submittals, blend tile in the factory and package so tile units taken from one package show the same range in colors as those taken from other packages and match approved Samples.

2.02 TILE PRODUCTS:

- A. Unglazed Ceramic Mosaic Floor Tile: Provide factory-mounted flat tile complying with the following requirements:
1. Composition: Porcelain or porcelain with abrasive admixture, as indicated.
 2. Module Size: 2 by 2 inches (nominal).
 3. Nominal Thickness: 1/4 inch.
 4. Face: Plain with cushion edges.
- B. Unglazed Quarry Tile: Provide square-edged flat tile complying with the following requirements:
1. Wearing Surface: Nonabrasive or abrasive aggregate embedded in surface, as indicated.
 2. Facial Dimensions: 6 by 6 inches (nominal).
 3. Thickness: 1/2 inch.
 4. Face: Plain.
- C. Glazed Wall Tile: Provide flat tile complying with the following requirements:
1. Module Size: 4-1/4 by 4-1/4 inches.
 2. Thickness: 5/16 inch.
 3. Face: Plain with cushion edges.
 4. Color: White.
- D. Trim Units: Provide tile trim units to match characteristics of adjoining flat tile and to comply with the following requirements:
1. Size: As indicated, coordinated with sizes and coursing of adjoining flat tile where applicable.
 2. Shapes: As follows, selected from manufacturer's standard shapes:
 - a. Base for Thin-Set Mortar Installations: Straight.
 - b. External Corners for Thin-Set Mortar Installations: Surface bullnose.
 - c. Internal Corners: Field-buttet square corners, except with coved base and cap angle pieces designed to member with stretcher shapes.

2.03 STONE THRESHOLDS:

- A. General: Provide stone thresholds that are uniform in color and finish, fabricated to sizes and profiles indicated to provide transition between tile surfaces and adjoining finished floor surfaces.
1. Fabricate thresholds to heights indicated, but not more than 1/2-inch above adjoining finished floor surfaces, with transition edges beveled on a slope of no greater than 1:2.
- B. Marble Thresholds: Provide marble thresholds complying with ASTM C503 requirements for exterior use and with a minimum abrasive-hardness value (Ha) of 10 per ASTM C241.
1. Provide white, honed marble complying with the Marble Institute of America's Group A requirements for soundness.

2.04 SETTING AND GROUTING MATERIALS:

- A. Portland Cement: ASTM C150, Type I.
- B. Sand: ASTM C144.
- C. Hydrated Lime: ASTM C206 or ASTM C207, Type S.

- D. Water: Potable.
- E. Portland Cement Mortar Installation Materials: Provide materials complying with ANSI A108.1A and as specified below:
 - 1. Cleavage Membrane: Polyethylene sheeting ASTM D4397, 4.0 mils thick.
 - 2. Reinforcing Wire Fabric: Galvanized, welded wire fabric, 2 by 2 inches by 0.062-inch diameter; comply with ASTM A185 and ASTM A82, except for minimum wire size.
- F. Dry-Set Portland Cement Mortar: ANSI A118.1.
- G. Chemical-Resistant, Water-Cleanable, Ceramic Tile-Setting and -Grouting Epoxy: ANSI A118.3.
 - 1. Provide product capable of resisting continuous and intermittent exposure to temperatures of up to 140 deg F and 212 deg F, respectively, as certified by mortar manufacturer for intended use.
- H. Sand-Portland Cement Grout: ANSI A108.10, composed of white or gray cement and white or colored aggregate as required to produce color indicated.
- I. Dry-Set Grout: ANSI A118.6, color as indicated.
- J. Chemical-Resistant Epoxy Grout: ANSI A118.3, color as indicated.
 - 1. Provide product capable of resisting continuous and intermittent exposure to temperatures of up to 140 deg F and 212 deg F, respectively, as certified by mortar manufacturer for intended use.

2.05 ELASTOMERIC SEALANTS AND BACKUP JOINT FILLER:

- A. General: Provide manufacturer's standard chemically curing, elastomeric sealants of base polymer and characteristics indicated that comply with applicable requirements of Section 07900.
- B. Colors: Provide colors of exposed sealants to match colors of grout in tile adjoining sealed joints, unless otherwise indicated.
- C. One-Part, Mildew-Resistant Silicone Sealant: ASTM C920; Type S; Grade NS; Class 25; Uses NT, G, A, and, as applicable to nonporous joint substrates indicated, O; formulated with fungicide, intended for sealing interior ceramic tile joints and other nonporous substrates that are subject to in-service exposures of high humidity and temperature extremes.
- D. Multipart, Pourable Urethane Sealant for Use T: ASTM C920; Type M; Grade P; Class 25; Uses T, M, A, and, as applicable to joint substrates indicated, O.
- E. Backup Material: As recommended by sealant manufacturer and as required in Section 07900.
- F. Prime and Joint Cleaner: Use products as recommended by sealant manufacturer.

2.06 MISCELLANEOUS MATERIALS:

- A. Trowelable Underlayments and Patching Compounds: Latex-modified, portland-cement-based formulation provided or approved by manufacturer of tile-setting materials for installations indicated.

- B. Concrete Leveling Bed: In accordance with Section 03300, Class 3500 concrete, pea gravel course aggregate 1/4-inch minimum to 3/8-inch maximum. Adjust slump with plasticizers to maintain proper water-cement ratio.
- C. Building Paper: FS UU-B-790, red-rosin-sized building, Type I, Style 1B.
- D. Tile Cleaner: A neutral cleaner capable of removing soil and residue without harming tile and grout surfaces, specifically approved for materials and installations indicated by tile and grout manufacturers.

2.07 MIXING MORTARS AND GROUT:

- A. Mix mortars and grouts to comply with referenced standards and mortar and grout manufacturers' written instructions.
- B. Add materials, water, and additives in accurate proportions.
- C. Obtain and use type of mixing equipment, mixer speeds, mixing containers, mixing time, and other procedures to produce mortars and grouts of uniform quality with optimum performance characteristics for installations indicated.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine substrates, areas, and conditions where tile will be installed, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of installed tile.
 - 1. Verify that substrates for setting tile are firm; dry; clean; free from oil, waxy films, and curing compounds; and within flatness tolerances required by referenced ANSI A108 series of tile installation standards for installations indicated.
 - 2. Verify that installation of grounds, anchors, recessed frames, electrical and mechanical units of work, and similar items located in or behind tile has been completed before installing tile.
 - 3. Verify that joints and cracks in tile substrates are coordinated with tile joint locations; if not coordinated, adjust latter in consultation with the Engineer.
- B. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.02 PREPARATION:

- A. Remove coatings, including curing compounds, and other substances that contain soap, wax, oil, or silicone and are incompatible with tile-setting materials by using a terrazzo or concrete grinder, a drum sander, or a polishing machine equipped with a heavy-duty wire brush.
- B. Provide concrete substrates for tile floors installed with dry-set or latex-portland cement mortars that comply with flatness tolerances specified in referenced ANSI A108 series of tile installation standards for installations indicated.
 - 1. Use trowelable leveling and patching compounds per tile-setting material manufacturer's written instructions to fill cracks, holes, and depressions.
 - 2. Remove protrusions, bumps, and ridges by sanding or grinding.

- C. Provide leveling course for masonry or concrete-wall when variation exceeds 1/4-inch in eight feet. Leveling course shall consist of dry-set mortar to which an equal volume of a mixture of one-part portland cement and 1-1/2 parts sand has been added. Apply leveling course to maximum thickness of 1/4-inch.
- D. Blending: For tile exhibiting color variations within the ranges selected during Sample submittals, verify that tile has been blended in the factory and packaged so tile units taken from one package show the same range in colors as those taken from other packages and match approved Samples. If not factory blended, either return to manufacturer or blend tiles at Project site before installing.

3.03 INSTALLATION, GENERAL:

- A. ANSI Tile Installation Standards: Comply with parts of ANSI A108 series of tile installation standards in "Specifications for Installation of Ceramic Tile" that apply to types of setting and grouting materials and to methods indicated in ceramic tile installation schedules.
- B. TCA Installation Guidelines: TCA's "Handbook for Ceramic Tile Installation." Comply with TCA installation methods indicated in ceramic tile installation schedules.
- C. Coordinate tile work with work of other trades.
- D. Extend tile work into recesses and under or behind equipment and fixtures to form a complete covering without interruptions, unless otherwise indicated. Terminate work neatly at obstructions, edges, and corners without disrupting pattern or joint alignments.
- E. Accurately form intersections and returns. Perform cutting and drilling of tile without marring visible surfaces. Carefully grind cut edges of tile abutting trim, finish, or built-in items for straight aligned joints. Fit tile closely to electrical outlets, piping, fixtures, and other penetrations so plates, collars, or covers overlap tile.
- F. Jointing Pattern: Lay tile in grid pattern, unless otherwise indicated. Align joints when adjoining tiles on floor, base, walls, and trim are the same size. Lay out tile work and center tile fields in both directions in each space or on each wall area. Adjust to minimize tile cutting. Provide uniform joint widths, unless otherwise indicated.
 - 1. For tile mounted in sheets, use plastic spacers to make joints between tile sheets the same width as joints within tile sheets so joints between sheets are not apparent in finished work.

3.04 FLOOR TILE INSTALLATION:

- A. General: Install floor tile by the portland cement mortar method in accordance with ANSI A108.1C.
- B. Tile Type: Unglazed ceramic mosaic tile and quarry tile.
- C. Setting Bed and Grout: ANSI A108.1C with the following mortar and grout:
 - 1. Dry-set portland cement mortar.
 - 2. Dry-set grout.
- D. Joint Widths: Install tile on floors joint widths as recommended by the tile manufacturer.

- E. Grout: Dry-set grout in accordance with ANSI A108.10.
- F. Where depression is not provided for mortar setting bed, install floor tile by the epoxy method in accordance with ANSI A108.6.

3.05 WALL TILE INSTALLATION:

- A. General: Install wall tile by the dry-set mortar method in accordance with ANSI A108.5.
- B. Tile Type: Glazed wall tile.
- C. Setting Bed and Grout: ANSI A108.5 with the following mortar and grout:
 - 1. Dry-set portland cement mortar.
 - 2. Dry-set grout.
- D. Joint Widths: Install tile on floors joint widths as recommended by the tile manufacturer.
- E. Grout: Dry-set grout in accordance with ANSI A108.10.
- F. Where inside corners are shown as flat tiles, make corner joint a sealant joint as specified for expansion joints below.

3.06 STONE THRESHOLD INSTALLATION:

- A. Stone Thresholds: Install stone thresholds at locations indicated; set in same type of setting bed as abutting field tile, unless otherwise indicated.
 - 1. Set thresholds in latex-portland cement mortar for locations where mortar bed would otherwise be exposed above adjacent nontile floor finish.

3.07 EXPANSION AND CONTROL JOINT INSTALLATION:

- A. Provide expansion and control joints around floor perimeters, at interior corners of tiled walls, in tile surfaces directly above joints in concrete substrates and where recommended by the TCA Handbook for Ceramic Tile Installation.
- B. Do not saw-cut joints after installing tiles.
- C. Install removable divider strips of the same depth as the finished tile system, including setting bed, to keep sealant joints free of setting bed, mortar and grout. Remove strips after grouting and curing operations in order to install sealant.
- D. Install and cure sealant in accordance with manufacturer's instructions. Use primer unless sealant manufacturer recommends against priming.

3.08 CLEANING AND PROTECTING:

- A. Cleaning: On completion of placement and grouting, clean tile surfaces with warm water and washing compound in accordance with recommendations of tile manufacturer. Sponge and wash tile thoroughly and polish with clean dry cloths.
 - 1. The use of acid or acid cleaners on tile is prohibited.

- B. Finished Tile Work: Leave finished installation clean and free of cracked, chipped, broken, unbonded, and otherwise defective tile work.
- C. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure tile is without damage or deterioration at the time of Substantial Completion.
 - 1. When recommended by tile manufacturer, apply a protective coat of neutral protective cleaner to completed tile walls and floors. Protect installed tile work with building paper taped to tile to prevent staining, damage, and wear. Lay board walkways on floors to be used as passageways.
 - 2. Prohibit foot and wheel traffic from tiled floors for at least seven days after grouting is completed.
- D. Before final inspection, remove protective coverings and rinse neutral cleaner from tile surfaces.

END OF SECTION

THIS PAGE NOT USED

SECTION 09511

ACOUSTICAL PANEL CEILINGS

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing lay-in acoustical panels and exposed suspension systems.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. NOT USED

1.03 DEFINITIONS:

- A. CAC: Ceiling Attenuation Class.
- B. LR: Light Reflectance coefficient.
- C. NRC: Noise Reduction Coefficient.

1.04 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Product Data: For each type of product specified provide manufacturer's printed product information including maintenance information.
- B. Coordination Drawings: Reflected ceiling plans drawn to scale and coordinating penetrations and ceiling-mounted items. Show the following:
 - 1. Ceiling suspension system members.
 - 2. Method of attaching suspension system hangers to building structure.
 - 3. Ceiling-mounted items including light fixtures; air outlets and inlets; speakers; sprinklers; and special moldings at walls, column penetrations, and other junctures of acoustical ceilings with adjoining construction.
 - 4. Minimum Drawing Scale: 1/8 inch = 1 foot.
- C. Samples for Initial Selection: Manufacturer's color charts consisting of actual acoustical panels or sections of acoustical panels, suspension systems, and moldings showing the full range of colors, textures, and patterns available for each type of ceiling assembly indicated.
- D. Samples for Verification: Full-size units of each type of ceiling assembly indicated; in sets for each color, texture, and pattern specified, showing the full range of variations expected in these characteristics. Provide three of each type.
 - 1. Full-size samples of each acoustical panel type, pattern, and color.
 - 2. Set of 12-inch-long samples of exposed suspension system members, including moldings, for each color and system type required.

3. Fasteners: Each type.
 4. Accessories.
- E. Product Test Reports: Indicate compliance of acoustical panel ceilings and components with requirements based on comprehensive testing of current products.

1.05 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
1. Codes and regulations of the jurisdictional authorities.
 2. ASTM: A635, A641, B633, C635, CC636, 834, E84, E90, E488, E795, E1190, E1264.
 3. Cisca: Ceiling Systems Handbook.
 4. NAAMM: Metal Finishes Manual for Architectural and Metal Products.
- B. Installer Qualifications: Engage an experienced installer who has completed acoustical panel ceilings similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.
- C. Source Limitations for Ceiling Units: Obtain each acoustical ceiling panel from one source with resources to provide products of consistent quality in appearance and physical properties without delaying the Work.
- D. Source Limitations for Suspension System: Obtain each suspension system from one source with resources to provide products of consistent quality in appearance and physical properties without delaying the Work.
- E. Fire-Test-Response Characteristics: Provide acoustical panel ceilings that comply with the following requirements:
1. Fire-response tests were performed by UL, ITS/Warnock Hersey, or another independent testing and inspecting agency that is acceptable to authorities having jurisdiction and that performs testing and follow-up services.
 2. Surface-burning characteristics of acoustical panels comply with ASTM E1264 for Class A materials as determined by testing identical products per ASTM E84.
 3. Products are identified with appropriate markings of applicable testing and inspecting agency.

1.06 DELIVERY, STORAGE, AND HANDLING:

- A. Deliver acoustical panels and suspension system components to Project site in original, unopened packages, clearly labeled with the manufacturer's name, brand designation, specification number, type, class and ratings as applicable.
- B. Store acoustical panels and suspensions system components in a fully enclosed space where they will be protected against damage from moisture, direct sunlight, surface contamination, and other causes.
- C. Before installing acoustical panels, permit them to reach room temperature and a stabilized moisture content.
- D. Handle acoustical panels carefully to avoid chipping edges or damaging units in any way.

1.07 PROJECT CONDITIONS:

- A. Environmental Limitations: Do not install acoustical panel ceilings until spaces are enclosed and weatherproof, wet-work in spaces is complete and dry, and work above ceilings is complete. Maintain temperature of 70 deg F minimum and relative humidity of 55-percent maximum in spaces in which acoustical panel work is being done.

1.08 COORDINATION:

- A. Coordinate layout and installation of acoustical panels and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies.

1.09 EXTRA MATERIALS:

- A. Furnish extra materials described below that match products installed, are packaged with protective covering for storage, and are identified with labels describing contents.
 - 1. Acoustical Ceiling Units: Full-size units equal to 5.0 percent of amount installed.
 - 2. Suspension System Components: Quantity of each exposed component equal to 2.0 percent of amount installed.

PART 2 - PRODUCTS:

2.01 ACOUSTICAL PANELS, GENERAL:

- A. Acoustical Panel Standard: Provide manufacturer's standard panels of configuration indicated that comply with ASTM E1264 classifications as designated by types, patterns, acoustical ratings, and light reflectances, unless otherwise indicated.
 - 1. Mounting Method for Measuring Noise Reduction Coefficient: Type E-400; plenum mounting in which face of test specimen is 15-3/4 inches away from test surface per ASTM E795.

2.02 METAL SUSPENSION SYSTEMS, GENERAL:

- A. Metal Suspension System Standard: Provide manufacturer's standard direct-hung metal suspension systems of types, structural classifications, and finishes indicated that comply with applicable ASTM C635 requirements.
- B. Finishes and Colors, General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes. Provide manufacturer's standard factory-applied finish for type of system indicated.
- C. Attachment Devices: Size for five times design load indicated in ASTM C635, Table 1, Direct Hung, unless otherwise indicated.
 - 1. Cast-in-Place and Post-installed Anchors in Concrete: Anchors of type and material indicated below, with holes or loops for attaching hangers of type indicated and with capability to sustain, without failure, a load equal to five times that imposed by ceiling

construction, as determined by testing per ASTM E488, conducted by a qualified testing and inspecting agency.

- a. Type: Cast-in-place anchors.
 - b. Type: Post-installed expansion anchors.
 - c. Corrosion Protection: Carbon-steel components zinc plated to comply with ASTM B633, Class Fe/Zn 5 (0.005 mm) for Class SC service condition (mild).
2. Post-installed Powder-Actuated Fasteners in Concrete: Fastener system of type suitable for application indicated, fabricated from corrosion-resistant materials, with clips or other accessory devices for attaching hangers of type indicated, and with capability to sustain, without failure, a load equal to 10 times that imposed by ceiling construction, as determined by testing per ASTM E1190, conducted by a qualified testing and inspecting agency.
- D. Wire Hangers, Braces, and Ties: Provide wires complying with the following requirements:
1. Zinc-Coated Carbon-Steel Wire: ASTM A641/A641M, Class 1 zinc coating, soft temper.
 2. Size: Select wire diameter so its stress at five times hanger design load (ASTM C635, Table 1, Direct Hung) will be less than yield stress of wire, but provide not less than 12 gauge.
- E. Sheet-Metal Edge Moldings and Trim: Type and profile indicated or, if not indicated, manufacturer's standard moldings for edges and penetrations that fit acoustical panel edge details and suspension systems indicated; formed from sheet metal of same material and finish as that used for exposed flanges of suspension system runners. Provide moldings with exposed flange of the same width as exposed runner.
- F. Metal Finish: Baked-Enamel Finish. Immediately after cleaning and pretreating, apply manufacturer's standard two-coat, baked-enamel finish consisting of prime coat and thermosetting topcoat, with not less than 1.0-mil dry film thickness for topcoat. Comply with paint manufacturer's written instructions for applying and baking to achieve a minimum dry film thickness of 2.0 mils.
1. Color and Gloss: Matte white or as selected by the Engineer from manufacturer's full range of colors and glosses.

2.03 ACOUSTICAL SEALANT:

- A. Acoustical Sealant for Exposed and Concealed Joints: Manufacturer's standard nonsag, paintable, nonstaining latex sealant complying with ASTM C834 and the following requirements:
1. Product is effective in reducing airborne sound transmission through perimeter joints and openings in building construction as demonstrated by testing representative assemblies according to ASTM E90.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine substrates and structural framing to which acoustical panel ceilings attach or abut, with Installer present, for compliance with requirements specified in this and other Sections that affect ceiling installation and anchorage, and other conditions affecting performance of acoustical panel ceilings.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION:

- A. Coordination: Furnish layouts for cast-in-place anchors, clips, and other ceiling anchors whose installation is specified in other Sections.
 1. If indicated, furnish cast-in-place anchors and similar devices to other trades for installation well in advance of time needed for coordinating other work.
- B. Measure each ceiling area and establish layout of acoustical panels to balance border widths at opposite edges of each ceiling. Avoid using less-than-half-width panels at borders, and comply with layout shown on reflected ceiling plans.

3.03 INSTALLATION:

- A. General: Install acoustical panel ceilings to comply with publications referenced below per manufacturer's written instructions and CISCA's "Ceiling Systems Handbook."
 1. Standard for Ceiling Suspension System Installations: Comply with ASTM C636.
- B. Suspend ceiling hangers from building's structural members and as follows:
 1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structure or of ceiling suspension system.
 2. Splay hangers only where required to miss obstructions; offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.
 3. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with location of hangers at spacings required to support standard suspension system members, install supplemental suspension members and hangers in form of trapezes or equivalent devices. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced standards and publications.
 4. Secure wire hangers to ceiling suspension members and to supports above with a minimum of three tight turns. Connect hangers directly either to structures or to inserts, eye screws, or other devices that are secure; that are appropriate for substrate; and that will not deteriorate or otherwise fail due to age, corrosion, or elevated temperatures.
 5. Do not support ceilings directly from permanent metal forms or floor deck. Fasten hangers to cast-in-place hanger inserts, powder-actuated fasteners, or drilled-in anchors that extend through forms into concrete.
 6. Do not attach hangers to steel deck tabs.
 7. Do not attach hangers to steel roof deck. Attach hangers to structural members.
 8. Space hangers not more than 48 inches o.c. along each member supported directly from hangers, unless otherwise indicated; and provide hangers not more than 6 inches from ends of each member.
- C. Install edge moldings and trim of type indicated at perimeter of acoustical ceiling area and where necessary to conceal edges of acoustical panels.
 1. Apply acoustical sealant in a continuous ribbon concealed on back of vertical legs of moldings before they are installed.

2. Screw attach moldings to substrate at intervals not more than 16 inches o.c. and not more than 3 inches from ends, leveling with ceiling suspension system to a tolerance of 1/8 inch in 12 feet. Miter inside and outside corners accurately and connect securely.
 3. Do not use exposed fasteners, including pop rivets, on moldings and trim.
- D. Install suspension system runners so they are square and securely interlocked with one another. Remove and replace dented, bent, or kinked members.
- E. Install acoustical panels with undamaged edges and fitted accurately into suspension system runners and edge moldings. Scribe and cut panels at borders and penetrations to provide a neat, precise fit.
1. For square-edged panels, install panels with edges fully hidden from view by flanges of suspension system runners and moldings.
 2. Install hold-down clips in areas indicated, in areas required by authorities having jurisdiction, and for fire-resistance ratings; space as recommended by panel manufacturer's written instructions, unless otherwise indicated or required.

3.04 FIELD QUALITY CONTROL OF POWER-ACTUATED FASTENERS AND POST-INSTALLED ANCHORS:

- A. Testing Agency: Contractor will engage a qualified independent testing agency to perform field quality-control testing.
- B. Extent and Testing Frequency: Testing will take place in successive stages in areas described below. Proceed with installation of acoustical panel ceilings only after test results for previously installed hangers comply with requirements.
1. Extent of Each Test Area: When installation of ceiling suspension systems on each floor has reached 20 percent completion but no panels have been installed.
 2. Within each test area, testing agency will select one of every 10 powder-actuated fasteners and postinstalled anchors used to attach hangers to concrete and will test them for 200 lbf of tension; it will also select one of every two postinstalled anchors used to attach bracing wires to concrete and will test them for 440 lbf of tension.
 3. When testing discovers fasteners and anchors that do not comply with requirements, testing agency will test those anchors not previously tested until 20 consecutively pass and then will resume initial testing frequency.
- C. Testing agency will report test results promptly and in writing to Contractor and Engineer.
- D. Remove and replace those fasteners and anchors that test results indicate do not comply with specified requirements
- E. Additional Testing: Where fasteners and anchors are removed and replaced, additional testing will be performed to determine compliance with specified requirements.

3.05 CLEANING:

- A. Replace damaged and broken acoustical panels.

- B. Clean exposed surfaces of acoustical panel ceilings, including trim, edge moldings, and suspension system members. Comply with manufacturer's written instructions for cleaning and touchup of minor finish damage. Remove and replace ceiling components that cannot be successfully cleaned and repaired to permanently eliminate evidence of damage.
- C. Clean up rubbish and debris and remove from site.
- D. Leave work areas in a broom clean condition.

END OF SECTION

THIS PAGE NOT USED

SECTION 09650

RESILIENT FLOORING

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing rubber floor covering, vinyl composition floor tile, vinyl wall base, rubber stair treads and accessories.

1.02 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Product Data: For each type of product specified provide manufacturer's printed product information.
- B. Samples for Initial Selection: Manufacturer's color charts consisting of units or sections of units showing the full range of colors and patterns available for each type of product indicated.
- C. Samples for Verification: Four of each type, color and pattern of the following materials used in the Work, showing the full range of variations expected:
 - 1. Floor Tile: 12 inches square.
 - 2. Wall Base: 12 inches long.
 - 3. Edge Strips: 12 inches long.
 - 4. Adhesive: Pint container.
- D. Product Certificates: Signed by manufacturers of resilient products certifying that each product furnished complies with requirements.
- E. Maintenance Data: For each type of product specified.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ASTM: D2240, E648, E662, F710, F1066, F1344.
 - 3. FS: RR-T-650, SS-T-312, SS-W-40, UU-B-790.
- B. Installer Qualifications: Engage an experienced installer to perform work of this Section who has specialized in installing resilient products similar to those required for this Project and with a record of successful in-service performance.
- C. Source Limitations: Obtain each type, color, and pattern of product specified from one source with resources to provide products of consistent quality in appearance and physical properties without delaying the Work.

- D. Fire-Test-Response Characteristics: Provide products with the following fire-test-response characteristics as determined by testing identical products per test method indicated below by a testing and inspecting agency acceptable to authorities having jurisdiction.
1. Critical Radiant Flux: 0.45 W/sq. cm or greater when tested per ASTM E648.
 2. Smoke Density: Maximum specific optical density of 450 or less when tested per ASTM E662.

1.04 DELIVERY, STORAGE, AND HANDLING:

- A. Deliver products to Project site in manufacturer's original, unopened cartons and containers, clearly labeled with manufacturer's name and brand designation, referenced specification number, type and color, and shipping and handling instructions.
- B. Store products in dry spaces protected from the weather, with ambient temperatures maintained between 50 and 90 deg F.
- C. Store tiles on flat surfaces.
- D. Handle products to prevent breakage of containers and damage to products.
- E. Move products into spaces where they will be installed at least 48 hours before installation, unless longer conditioning period is recommended in writing by manufacturer.

1.05 PROJECT CONDITIONS:

- A. Maintain a temperature of not less than 70 deg F or more than 90 deg F in spaces to receive products for at least 48 hours before installation, during installation, and for at least 48 hours after installation, unless manufacturer's written recommendations specify longer time periods. After post-installation period, maintain a temperature of not less than 55 deg F or more than 95 deg F.
- B. Do not install products until they are at the same temperature as
- C. Do not install base until plaster or other backing material has thoroughly dried.
- D. Close spaces to traffic during flooring installation and for time period after installation recommended in writing by manufacturer.
- E. Install tiles and accessories after other finishing operations, including painting, have been completed. Where demountable partitions and other items are indicated for installation on top of resilient tile flooring, install tile before these items are installed.
- F. Do not install flooring over concrete slabs until slabs have cured and are sufficiently dry to bond with adhesive, as determined by flooring manufacturer's recommended bond and moisture test.

1.06 EXTRA MATERIALS:

- A. Furnish and store where directed extra materials described below that match products installed, are packaged with protective covering for storage, and are identified with labels describing contents.
 - 1. Furnish not less than one percent of the total quantity of each type, color, pattern, class, wearing surface, and size of resilient tile flooring installed, but not less than one full unopened container.
 - 2. Furnish not less than one percent of the total quantity of each type, color, and size of base material installed, but not less than one full unopened container.

PART 2 - PRODUCTS

2.01 RESILIENT FLOORING:

- A. Rubber Floor Covering: Products complying with ASTM F1344 and with requirements specified.
 - 1. Manufacturers: including but not limited to:
 - a. R.C.A. Rubber Company.
 - b. Or equal.
 - 2. Color and Pattern: Terra Cotta.
 - 3. Class: I-A.
 - 4. Hardness: Durometer hardness not less than 85 Shore, Type A per ASTM D2240 as required according to ASTM F1344.
 - 5. Wearing Surface: Textured.
 - 6. Thickness: 3/16 inch.
 - 7. Fabrication: Fabricate heavy duty rubber mat with interlocking joints in five pieces to fit area shown, with edges square and true, without overlap.
- B. Vinyl Composition Floor Tile: Products complying with ASTM F1066 and with requirements specified:
 - 1. Manufacturers: including but not limited to
 - a. Armstrong.
 - b. Azrock.
 - c. GAF.
 - d. Kentile.
 - e. Or equal.
 - 2. Color and Pattern: As selected by the Engineer from manufacturer's full range of colors and patterns produced for tile complying with requirements indicated.
 - 3. Class: Class 2 (through-pattern tile).
 - 4. Wearing Surface: Smooth unless otherwise indicated.
 - 5. Thickness: 1/8 inch.
 - 6. Size: 12 by 12 inches.

2.02 RESILIENT ACCESSORIES:

- A. Vinyl Wall Base: Products complying with FS SS-W-40, Type II and with requirements specified:

1. Color and Pattern: As selected by the Engineer from manufacturer's full range of colors and patterns produced for vinyl wall base complying with requirements indicated
 2. Style: Cove with top-set toe unless otherwise indicated.
 3. Minimum Thickness: 1/8 inch.
 4. Height: 4 inches.
 5. Lengths: Cut lengths longest practicable or coils in lengths standard with manufacturer, but not less than 96 feet.
 6. Outside Corners: Job formed.
 7. Inside Corners: Job formed.
 8. Surface: Smooth.
- B. Rubber Stair Treads: Products of style suitable for use indicated and complying with FS RR-T-650, Composition A and with requirements specified:
1. Manufacturers: including but not limited to:
 - a. R.C.A. Rubber Company.
 - b. Or equal.
 2. Color and Pattern: Terra Cotta.
 3. Design: Type 1 (smooth).
 4. Abrasive Strips: Provide abrasive strips as specified by the product designation indicated above in color selected by the Engineer from manufacturer's full range of colors.
 5. Nosing Style: Round.
 6. Nosing Height: ½ inch light color.
 7. Thickness: 5/16-inch tapering to 3/16-inch at back edge.
 8. Size: Lengths and depths to fit each stair tread in one piece.
 9. Fabrication: Fabricate nosing of stair tread to wrap around curved ends of step, to provide a uniform elevation appearance on three sides of step. Abrade at least 80 percent of the back of tread and nosing to assure adhesion to substrate. Fabricate nosing so that it will not delaminate or otherwise separate from the stair tread material.

2.03 INSTALLATION ACCESSORIES:

- A. Tile Reducer Edge Strip: Products complying with FS SS-T-312, beveled, one-inch wide, 1/8-inch thick. Color to match vinyl wall base.
- B. Trowelable Leveling and Patching Compounds: Latex-modified, portland-cement-based formulation provided or approved by flooring manufacturer for applications indicated.
- C. Tile Adhesive: Waterproof asphalt cut-back cement recommended by manufacturer to suit resilient products and substrate conditions indicated.
- D. Stair Tread Adhesive: Permanent, as recommended by tread manufacturer for adhesion to galvanized steel substrate.
- E. Stair Tread Nose Filler: Two-part epoxy compound recommended by tread manufacturer to fill nosing substrates that do not conform to tread contours.
- F. Primer: As recommended by adhesive manufacturer.

- G. Base Cement: Water-resistant, type recommended by manufacturer of vinyl wall base.
- H. Building Paper: FS UU-B-790.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine substrates, areas, and conditions where installation of resilient products will occur, with Installer present, for compliance with manufacturer's requirements. Verify that substrates and conditions are satisfactory for resilient product installation and comply with requirements specified
- B. Concrete Sub-floors: Verify that concrete slabs comply with ASTM F710 and the following:
 - 1. Slab substrates are dry and free of curing compounds, sealers, hardeners, and other materials that may interfere with adhesive bond. Determine adhesion and dryness characteristics by performing bond and moisture tests recommended by flooring manufacturer.

3.02 PREPARATION:

- C. General: Comply with resilient product manufacturer's written installation instructions for preparing substrates indicated to receive resilient products.
- D. Use trowelable leveling and patching compounds, according to manufacturer's written instructions, to fill cracks, holes, and depressions in substrates.
- E. Remove coatings, including curing compounds, and other substances that are incompatible with flooring adhesives and that contain soap, wax, oil, or silicone, using mechanical methods recommended by manufacturer. Do not use solvents.
- F. Broom and vacuum clean substrates to be covered immediately before product installation. After cleaning, examine substrates for moisture, alkaline salts, carbonation, or dust. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.03 RESILIENT FLOORING INSTALLATION:

- A. General: Comply with flooring manufacturer's written installation instructions.
- B. Leveling Floor: Level floor by grinding high spots and filling low spots with leveling and patching compound following manufacturer's recommendations to ensure plane surface free of imperfections.
- C. Lay out tiles from center marks established with principal walls, discounting minor offsets, so tiles at opposite edges of room are of equal width. Adjust as necessary to avoid using cut widths that equal less than one-half of a tile at perimeter.
 - 1. Lay tiles square with room axis, unless otherwise indicated.
- D. Uniformity of Color: Use tiles alternately from at least two cartons so that pattern will be uniform and not spotty due to variation that may be found in different cartons. Match tiles for

color and pattern by selecting tiles from cartons in the same sequence as manufactured and packaged, if so numbered. Cut tiles neatly around all fixtures. Discard broken, cracked, chipped, or deformed tiles.

- E. Application of Primer: Unless adhesive manufacturer recommends against priming, apply primer at rate and by method recommended.
- F. Application of Adhesive: Adhere tiles to flooring substrates using a full spread of adhesive applied to substrate to comply with tile manufacturer's written instructions, including those for trowel notching, adhesive mixing, and adhesive open and working times.
 - 1. Provide completed installation without open cracks, voids, raising and puckering at joints, telegraphing of adhesive spreader marks, and other surface imperfections.
- G. Laying of Tile:
 - 1. Scribe, cut, and fit tiles to butt neatly and tightly to vertical surfaces and permanent fixtures, including built-in furniture, cabinets, pipes, outlets, edgings, door frames, thresholds, and nosings.
 - 2. Extend tiles into toe spaces, door reveals, closets, and similar openings.
 - 3. Provide joints cut straight and true. Seal tile joints at pipes with waterproof cement.
 - 4. Embed tiles level, flush with surface and with tightly butted joints against adjoining tiles.
 - 5. Hand roll tiles according to tile manufacturer's written instructions.
- H. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on finish flooring as marked on subfloor. Use chalk or other nonpermanent, nonstaining marking device.

3.04 RESILIENT ACCESSORY INSTALLATION:

- A. General: Install resilient accessories according to manufacturer's written installation instructions.
- B. Vinyl Wall Base: Apply resilient wall base to walls, columns, pilasters, casework and cabinets in toe spaces, and other permanent fixtures in rooms and areas where base is required. Extend wall base into closets and offsets adjoining areas to receive wall base.
 - 1. Install wall base in lengths as long as practicable without gaps at seams and with tops of adjacent pieces aligned.
 - 2. Tightly adhere wall base to substrate throughout length of each piece, with base in continuous contact with horizontal and vertical substrates.
 - 3. Do not stretch base during installation.
 - 4. On masonry surfaces or other similar irregular substrates, fill voids along top edge of resilient wall base with manufacturer's recommended adhesive filler material.
 - 5. Form outside corners on job from straight pieces of maximum lengths possible, without whitening at bends. Shave back of base at points where bends occur and remove strips perpendicular to length of base that are only deep enough to produce a snug fit without removing more than half the wall base thickness.
 - 6. Form inside corners on job, from straight pieces of maximum lengths possible, by cutting an inverted V-shaped notch in toe of wall base at the point where corner is formed. Shave back of base where necessary to produce a snug fit to substrate.

- C. Rubber Stair Tread: Adhere nosing so that it will not delaminate or otherwise separate from the stair tread material.
- D. Tile Reducer Edge Strip: Install edge strips at edges of flooring that would otherwise be exposed.
 - 1. Where tile stops at doorways without saddles or thresholds, set edge strips directly under doors.
- E. Place resilient accessories so they are butted to adjacent materials and bond to substrates with adhesive.

3.05 CLEANING AND PROTECTING:

- A. Perform the following operations immediately after installing resilient products:
 - 1. Remove adhesive and other surface blemishes using cleaner recommended by resilient product manufacturers.
- B. After flooring is laid and adhesive thoroughly cured, clean and finish resilient floors as recommended by the resilient product manufacturer with approved compatible products.
- C. Keep traffic off finished floors during the remainder of construction period.
- D. Protect flooring against mars, marks, indentations, and other damage from construction operations and placement of equipment and fixtures during the remainder of construction period. Use protection methods indicated or recommended in writing by flooring manufacturer.
 - 1. Cover products installed on floor surfaces with reinforced kraft building paper and tape joints. Maintain such cover and otherwise protect floor until final acceptance.
 - 2. Do not move heavy and sharp objects directly over floor surfaces. Place plywood or hardboard panels over flooring and under objects while they are being moved. Slide or roll objects over panels without moving panels.

3.06 MAINTENANCE MATERIALS:

- A. After completion of the work, furnish and store where directed at least one percent of the total quantity of tile and one percent of base material, but not less than one full unopened container of each, for future maintenance.
- B. Include proportional quantities of each type and color in original containers clearly marked to show contents and area of placement of each type and color.

SECTION 09680

CARPET

PART 1 - GENERAL

1.01 SUMMARY OF WORK

- A. This Section includes tufted carpet.

1.02 RELATED WORK SPECIFIED ELSEWHERE

- A. Division 1 Section "Selective Demolition" for removing existing floor coverings.
- B. Division 9 Section "Resilient Flooring" for resilient wall base and accessories installed with carpet.
- C. Division 9 Section "Carpet Tile."

1.03 SUBMITTALS

- A. Product Data: For the following, including installation recommendations for each type of substrate:
 - 1. Carpet: For each type indicated. Include manufacturer's written data on physical characteristics, durability, and fade resistance.
- B. Shop Drawings: Show the following:
 - 1. Columns, doorways, enclosing walls or partitions, built-in cabinets, and locations where cutouts are required in carpet.
 - 2. Existing flooring materials to be removed.
 - 3. Existing flooring materials to remain.
 - 4. Seam locations, types, and methods.
 - 5. Type of subfloor.
 - 6. Type of installation.
 - 7. Pattern type, repeat size, location, direction, and starting point.
 - 8. Pile direction.
 - 9. Transition details to other flooring materials.
- C. Samples: For each of the following products and for each color and texture required. Label each Sample with manufacturer's name, material description, color, pattern, and designation indicated on Drawings and in schedules.
 - 1. Carpet: 12-inch- (300-mm-) square Sample.
 - 2. Exposed Edge, Transition, and other Accessory Stripping: 12-inch- (300-mm-) long Samples.
- D. Product Schedule: For carpet. Use same designations indicated on Drawings.
- E. Qualification Data: For Installer.
- F. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency.
- G. Maintenance Data: For carpet to include in maintenance manuals. Include the following:
 - 1. Methods for maintaining carpet, including cleaning and stain-removal products and

- procedures and manufacturer's recommended maintenance schedule.
2. Precautions for cleaning materials and methods that could be detrimental to carpet.

H. Warranties: Special warranties specified in this Section.

1.04 QUALITY ASSURANCE

- A. Installer Qualifications: An experienced installer who is certified by the Floor Covering Installation Board or who can demonstrate compliance with its certification program requirements.
- B. Fire-Test-Response Characteristics: Provide products with the critical radiant flux classification indicated in Part 2, as determined by testing identical products per ASTM E 648 by an independent testing and inspecting agency acceptable to authorities having jurisdiction.
- C. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1 Section "Project Management and Coordination." Review methods and procedures related to carpet installation including, but not limited to, the following:
 1. Review delivery, storage, and handling procedures.
 2. Review ambient conditions and ventilation procedures.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Comply with CRI 104, Section 5, "Storage and Handling."

1.06 PROJECT CONDITIONS

- A. Comply with CRI 104, Section 7.2, "Site Conditions; Temperature and Humidity" and Section 7.12, "Ventilation."
- B. Environmental Limitations: Do not install carpet until wet work in spaces is complete and dry, and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.
- C. Do not install carpet over concrete slabs until slabs have cured, are sufficiently dry to bond with adhesive, and have pH range recommended by carpet manufacturer.
- D. Where demountable partitions or other items are indicated for installation on top of carpet, install carpet before installing these items.

1.07 WARRANTY

- A. Special Warranty for Carpet: Manufacturer's standard form in which manufacturer agrees to repair or replace components of carpet installation that fail in materials or workmanship within specified warranty period.
 1. Warranty does not include deterioration or failure of carpet due to unusual traffic, failure of substrate, vandalism, or abuse.
 2. Failures include, but are not limited to, more than 10 percent loss of face fiber, edge raveling, snags, runs, loss of tuft bind strength, and delamination.
 3. Warranty Period: Lifetime of carpet.

1.08 EXTRA MATERIALS

- A. Furnish extra materials described below, before installation begins, that match products installed and that are packaged with protective covering for storage and identified with labels describing

contents.

1. Carpet: Full-width rolls equal to 5 percent of amount installed for each type indicated, but not less than 10 sq. yd. (8.3 sq. m).

PART 2 - PRODUCTS

2.01 TUFTED CARPET CPT-1

- A. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
- B. Basis of Design: Subject to compliance with requirements, provide one of the following
 1. Lees faculty IV Dk166 - broadloom.
 - a. Color: As selected by Architect from manufacturer's full range, minimum color per location (3).
- C. Fiber Content: 100 percent nylon 6, 6 or 100 percent nylon 6.
- D. Fiber Type: DuPont: Antron Legacy with duratech soil protection.
- E. Pile Characteristic: Level-loop pile.
- F. Pile Thickness: 0.145 inches for finished carpet per ASTM D 6859.
- G. Stitches: 8.3 per inch.
- H. Gage: 1/8"
- I. Face Weight: 26 oz./sq.yd.
- J. Total Weight: 72.2 oz./sq.yd. for finished carpet.
- K. Primary Backing: Woven polypropylene.
- L. Secondary Backing: Woven polypropylene.
- M. Backcoating: Thermoplastic copolymer.
- N. Backing System: Unibond by Lees.
- O. Width: 12 feet (3.7 m).
- P. integral Soil-Resistance Treatment: Duratech soil treatment by Dupont
- Q. Antimicrobial Treatment: Manufacturer's standard material.
- R. Performance Characteristics: As follows:
 1. Flamability: passes DOC-FF-1-70 Pill Test
 2. Flooring Radiant Panel Test: Meets NFPA Class I when tested under ASTM E-648.
 3. Smoke Density: NFPA 258-Less than 450 Flaming Mode.
 4. Electrostatic Propensity: Less than 3.5kV per AATCC 134.

2.02 INSTALLATION ACCESSORIES

- A. Trowelable Leveling and Patching Compounds: Latex-modified, hydraulic-cement-based formulation provided or recommended by carpet manufacturer.
- B. Adhesives: Water-resistant, mildew-resistant, nonstaining type to suit products and subfloor conditions indicated, that complies with flammability requirements for installed carpet and is recommended or provided by carpet manufacturer.
- C. Seam Adhesive: Hot-melt adhesive tape or similar product recommended by carpet manufacturer for sealing and taping seams and butting cut edges at backing to form secure seams and to prevent pile loss at seams.
- D. Metal Edge Strips: Extruded aluminum with mill finish of width shown, of height required to protect exposed edge of carpet, and of maximum lengths to minimize running joints.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for maximum moisture content, alkalinity range, installation tolerances, and other conditions affecting carpet performance. Examine carpet for type, color, pattern, and potential defects.
- B. Concrete Subfloors: Verify that concrete slabs comply with ASTM F 710 and the following:
 - 1. Slab substrates are dry and free of curing compounds, sealers, hardeners, and other materials that may interfere with adhesive bond. Determine adhesion and dryness characteristics by performing bond and moisture tests recommended by carpet[cushion] manufacturer.
 - 2. Subfloor finishes comply with requirements specified in Division 3 Section "Cast-in-Place Concrete" for slabs receiving carpet.
 - 3. Subfloors are free of cracks, ridges, depressions, scale, and foreign deposits.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. General: Comply with CRI 104, Section 7.3, "Site Conditions; Floor Preparation," and with carpet manufacturer's written installation instructions for preparing substrates.
- B. Use trowelable leveling and patching compounds, according to manufacturer's written instructions, to fill cracks, holes, depressions, and protrusions in substrates. Fill or level cracks, holes and depressions 1/8 inch (3 mm) wide or wider, and protrusions more than 1/32 inch (0.8 mm), unless more stringent requirements are required by manufacturer's written instructions.
- C. Remove coatings, including curing compounds, and other substances that are incompatible with adhesives and that contain soap, wax, oil, or silicone, without using solvents. Use mechanical methods recommended in writing by carpet manufacturer.
- D. Broom and vacuum clean substrates to be covered immediately before installing carpet.

3.03 INSTALLATION

- A. Comply with CRI 104 and carpet manufacturer's written installation instructions for the following:
 - 1. Direct-Glue-Down Installation: Comply with CRI 104, Section 9, "Direct Glue-Down Installation."
- B. Comply with carpet manufacturer's written recommendations and Shop Drawings for seam locations and direction of carpet; maintain uniformity of carpet direction and lay of pile. At doorways, center seams under the door in closed position.
- C. Do not bridge building expansion joints with carpet.
- D. Cut and fit carpet to butt tightly to vertical surfaces, permanent fixtures, and built-in furniture including cabinets, pipes, outlets, edgings, thresholds, and nosings. Bind or seal cut edges as recommended by carpet manufacturer.
- E. Extend carpet into toe spaces, door reveals, closets, open-bottomed obstructions, removable flanges, alcoves, and similar openings.
- F. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on finish flooring as marked on subfloor. Use nonpermanent, nonstaining marking device.
- G. Install pattern parallel to walls and borders to comply with CRI 104, Section 15, "Patterned Carpet Installations" and with carpet manufacturer's written recommendations.
- H. Comply with carpet cushion manufacturer's written recommendations.

3.04 CLEANING AND PROTECTING

- A. Perform the following operations immediately after installing carpet:
 - 1. Remove excess adhesive, seam sealer, and other surface blemishes using cleaner recommended by carpet manufacturer.
 - 2. Remove yarns that protrude from carpet surface.
 - 3. Vacuum carpet using commercial machine with face-beater element.
- B. Protect installed carpet to comply with CRI 104, Section 16, "Protection of Indoor Installations."
- C. Protect carpet against damage from construction operations and placement of equipment and fixtures during the remainder of construction period. Use protection methods indicated or recommended in writing by carpet manufacturer.

END OF SECTION

THIS PAGE NOT USED

SECTION 09920

FIELD PAINTING

PART 1 - GENERAL

1.01 SCOPE OF WORK:

- A. This section specifies furnishing and applying paint at the site.
 - 1. Specific surfaces and areas which require field painting and required paint systems are listed in the schedule of painting.
 - 2. Unless an item is shown not to be field painted or specified otherwise paint it in accordance with these specifications.

1.02 DEFINITIONS:

- A. Paint: Includes primers and undercoaters, sealers, stains, paint, varnish, enamel, epoxy and special coatings.

1.03 ITEMS NOT INCLUDED IN FIELD PAINTING:

- A. Stainless steel, ornamental metals, glass, resilient tile, ceramic tile, paving, acoustical tile, plastic laminate and similar items which are prefinished.
- B. Mill-, factory- and shop-applied primers and finishes.
- C. Corrosion-resistant structural steel, ASTM A242.
- D. High-strength structural corrosion-resistant steel shapes, plates and bars, ASTM A588.
- E. Galvanized-metal surfaces except fire stand pipes, unless exposed to public view.
- F. UL labels on fire-rated doors and frames.
- G. Precast or prestressed concrete with a sandblast finish, concrete sealer, or other special finish unless noted otherwise.
- H. Steel intended to be encased in concrete or otherwise coated with sprayed-on fire protective materials.

1.04 RELATED WORK SPECIFIED ELSEWHERE:

- A. Mill-, factory- and shop-applied prime and finish coats: Specified with the product.

1.05 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Samples:
 - 1. Three each of each color and texture, with identification of materials keyed to those specified and application methods.
 - 2. Samples of paint scheduled for application to smooth finishes applied to 12-inch square hardboard or metal panels.

3. Samples of paint scheduled for application to concrete masonry units applied to 16-inch square by two-inch thick panel of concrete masonry units, including one tooled masonry joint. Subdivide panel to define prime or filler, intermediate and finish coats.

1.06 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 1. Comply with codes and regulations of the jurisdictional authorities.
 2. FS: TT-E-489, TT-E-490, TT-E-509, TT-F-336, TT-F-1098, TT-P-19, TT-P-29, TT-P-636, TT-P-641, TT-P-645, TT-P-650, TT-P-664, TT-P-1510, TT-P-001984, TT-S-71, TT-S-300, TT-V-86, TT-V-119.
 3. ASME: A13.1.
 4. ANSI: Z535.1.
 5. ASTM: A242, A588, B117, C476, C920.

1.07 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to the jobsite in their original unopened containers clearly labeled with the manufacturer's name and brand designation, referenced specification number and type, as applicable.
- B. Store products in an approved ventilated dry area, protect from contact with soil and from exposure to the elements. Always keep products dry. Do not allow paint to freeze.
- C. Handle products in a manner that will prevent breakage of containers and damage to products.

1.08 JOB CONDITIONS:

- A. Environmental Requirements:
 1. Do not apply paint to non-protected surfaces in wet weather or to surfaces on which ice, frost, water or dampness is visible.
 2. Do not apply exterior paint when the temperature is below 40F or expected to fall below this temperature. Do not apply interior paint when the temperature is lower than 60F or expected to fall below this temperature.
 3. Avoid painting steel which is at a temperature which can cause blistering, porosity, or otherwise be detrimental to the life of the paint. When paint is applied in hot weather or thinned in cold weather ensure that the specified thickness of paint coating is obtained.
 4. Do not apply paint in rain, wind, snow, fog or mist or when the steel surface temperature is below the dew point, resulting in condensation of moisture.
 5. Do not apply interior paint when, in the Engineer's opinion, satisfactory results cannot be obtained due to high humidity and excessive temperature; however, failure of the Engineer to notify the Contractor of the conditions will not relieve the Contractor of responsibility to produce satisfactory results.

PART 2 - PRODUCTS

2.01 GENERAL:

- A. To the maximum extent practicable, use the materials of one manufacturer throughout the project. No claims as to the suitability of a material specified, or of inability to produce first-

class work with these materials, will be considered unless such claims are made in writing and submitted with the Contractor's Bid Proposal.

- B. Provide a primer suitable for each substrate type and which is manufactured or recommended by the paint manufacturer as part of a complete painting system.
- C. Previously Primed Surfaces:
 - 1. If surfaces have been primed off-site at the mill, factory or shop, omit specified primer, but only if the off-site primer is acceptable to the paint system manufacturer for best performance of the specified paint system.
 - 2. For touch-up of off-site primer, use primer of the same composition as the mill, factory or shop primer.
- D. VOC Requirements: Provide products in compliance with local volatile organic compound regulations. If the listed product of a manufacturer does not comply, provide an accepted equivalent product which does comply.
- E. Colors:
 - 1. Prior to beginning work, the Contractor will be furnished sample color chips and a Color and Material Schedule for surfaces to be painted.
 - 2. Match the colors of the chips and submit samples before proceeding. Label samples for surface finishes such as satin, flat or gloss as listed in the Color and Material Schedule.
 - 3. Tint each coat of paint slightly lighter or darker than the preceding coat or the finish coat.
 - 4. Final approval of colors will be made by the Engineer on samples applied on the job.
 - 5. Safety Colors: Items specified to be safety colors, e.g. OSHA red (safety red) and ANSI orange, to be in compliance with ANSI Z535.1, Safety Color Code.
- F. Listed materials are a guide to quality intended. Substitute materials and paint systems acceptable to the Engineer, as an equal or of superior quality for each intended use, may be used in the work at no additional cost to the Authority.
- G. Accessory Materials:
 - 1. General: Provide miscellaneous materials and accessories, whether listed or not, as necessary to complete the work in an approved manner.
 - 2. Caulk: Single-component, chemically curing, synthetic rubber, non-sag, ASTM C920, Type S, NS, Class 25.
 - 3. Spackling compound: Ready-mixed type, U.S. Gypsum Ready-Mixed Joint Compound - Topping, ASTM C476 or equal.
 - 4. Thinner: As recommended by the paint manufacturer.

2.02 EXTERIOR PAINTING SYSTEMS:

- A. Exterior Paint Schedule: Provide the paint systems scheduled below for the various substrates, as indicated. Provide a complete paint system by one manufacturer for each substrate. Unless otherwise indicated, provide the following:
 - 1. Concrete and masonry (except concrete masonry units): Acrylic, flat.
 - 2. Concrete masonry units: Acrylic, flat.
 - 3. Portland cement plaster (soffits): Acrylic, flat.
 - 4. Ferrous metal: Silicone-alkyd, semigloss.
 - 5. Zinc-coated metal: Silicone-alkyd, semigloss.
 - 6. Aluminum: Alkyd, semigloss.
 - 7. Wood: Acrylic-enamel, semigloss.

8. Mechanical and electrical items (not finish painted): See substrate materials above.
- B. Concrete, Masonry (except concrete masonry units), and portland cement plaster - Acrylic, Flat: Two coats with total dry film thickness not less than 2.5 mils.
1. Undercoat: Quick-drying, flat, acrylic paint for use on the exterior over concrete, masonry, and portland cement plaster (FS TT-P-19):
 - a. Con-Lux: Mason-Plex 800 Series.
 - b. Devoe: 15XX Wonder-Shield Exterior Acrylic Latex Flat House Paint.
 - c. Moore: Moore's Flat Exterior Latex Masonry & House Paint #105.
 2. S-W:A-100 Acrylic Latex Flat Exterior Finish, A-6 Series. Finish Coat: Quick-drying, flat, acrylic paint for use on the exterior over concrete, masonry, and portland cement plaster (FS TT-P-19)
 - a. Con-Lux: Mason-Plex 800 Series.
 - b. Devoe: 15XX Wonder-Shield Exterior Acrylic Latex Flat House Paint.
 - c. Moore: Moore's Flat Exterior Latex Masonry & House Paint #105.
 - d. S-W: A-100 Acrylic Latex Flat Exterior Finish, A-6 Series.
- C. Concrete Masonry Units - Acrylic, Flat: Two coats over block filler with total dry film thickness not less than 2.5 mils, excluding the block filler.
1. Block Filler: High performance latex block filler used for filling open textured concrete masonry block before application of top coats:
 - a. Con-Lux: Block-Plex 85 White.
 - b. Devoe: 52901 Bloxfil Acrylic Latex Block Filler.
 - c. Moore: Moorcraft Block Filler #145.
 - d. S-W: Heavy-Duty Block Filler B42W46.
 2. Undercoat: Quick-drying, flat, acrylic paint for use on the exterior over concrete masonry block (FS TT-P-19):
 - a. Con-Lux: Mason-Plex 800 Series.
 - b. Devoe: 15XX Wonder-Shield Exterior Acrylic Latex Flat House Paint.
 - c. Moore: Moore's Flat Exterior Latex Masonry & House Paint #105.
 - d. S-W: A-100 Acrylic Latex Flat Exterior Finish, A-6 Series.
 3. Finish Coat: Quick-drying, flat, acrylic paint for use on the exterior over concrete masonry block (FS TT-P-19):
 - a. Con-Lux: Mason-Plex 800 Series.
 - b. Devoe: 15XX Wonder-Shield Exterior Acrylic Latex Flat House Paint.
 - c. Moore: Moore's Flat Exterior Latex Masonry & House Paint #105.
 - d. S-W: A-100 Acrylic Latex Flat Exterior Finish, A-6 Series
- D. Ferrous Metal - Silicone-Alkyd, Semigloss: Two coats over primer.(Apply a second coat of primer on steel which is at grade, at slab, or passing through floor slabs. Apply to a uniform line six inches above top of grade or slab.)
1. Primer: Lead and chromate-free high solids primer which chemically inhibits rusting and is recommended by the manufacturer for application to steel which has been prepared in accordance with SSPC SP2. Rated 10 (less than 0.01% surface rusting) when tested in accordance with ASTM B117 for 500 hours. Exceeds performance requirements of FS TT-P-636:
 - a. Con-Lux: Rust Arrestor 50.
 - b. S-W: Kem Kromik Universal Metal Primer B50NZ6.
 - c. Thnemec: Series P10.
 2. Undercoat: Alkyd enamel recommended by manufacturer of finish coat as an intermediate coat over specified primer for application of silicone-alkyd finish coat:

- a. Con-Lux: Ferrox Primer.
 - b. S-W: Silicone Alkyd Enamel B-56 Series.
 - c. Tnemec: Series 23 Enduratone.
 - 3. Finish Coat: Silicone-alkyd enamel with a minimum of 30% silicone content meeting the qualitative requirements of FS TT-E-490:
 - a. Con-Lux: Steel-Master 9500 Series.
 - b. S-W: Silicone Alkyd Enamel B-56 Series.
 - c. Tnemec: Series 82 Silicone-Alkyd Enamel.

- E. Ferrous Metal - Alkyd, Semigloss: Two coats over primer (primer is not required on shop-primed items):
 - 1. Primer: Quick-drying, rust-inhibiting primer for priming ferrous metal under alkyd enamel (FS TT-P-664):
 - a. Con-Lux: Ferrox Primer, 25 Red.
 - b. Devoe: 41820 Bar-Ox Alkyd Shop/Field Primer.
 - c. Moore: Ironclad Retardo Rust-Inhibitive Paint #163.
 - d. S-W: Kem Kromik Metal Primer B50N2/B50W1.
 - 2. Undercoat: Weather-resistant, air-drying, semigloss alkyd enamel for use on the exterior over prime-coated ferrous metal (FS TT-E-489, Class A):
 - a. Con-Lux: Enamelite Semi-Luster Series
 - b. Devoe: 70XX Mirrolac Interior/Exterior Alkyd Enamel.
 - c. Moore: Impervo Enamel #133.
 - d. S-W: Industrial Enamel, B-54Z Series.
 - 3. Finish Coat: Weather-resistant, air-drying, semigloss alkyd enamel for use on the exterior over prime-coated ferrous metal (FS TT-E-489, Class A):
 - a. Con-Lux: Enamelite Semi-Luster Series.
 - b. Devoe: 70XX Mirrolac Interior/Exterior Alkyd Enamel.
 - c. Moore: Impervo Enamel #133.
 - d. S-W: Industrial Enamel, B-54Z Series.

- F. Zinc-Coated Metal - Silicone-Alkyd, Semigloss: Two coats over factory-applied primer:
 - 1. Primer: Galvanized metal primer used to prime zinc-coated (galvanized) metal surfaces (FS TT-P-641), or one of the following.
 - a. Con-Lux: Bond-Plex 46 Barrier Green.
 - b. Devoe: 13201 Mirrolac Galvanized Metal Primer.
 - c. Moore: Ironclad Galvanized Metal Latex Primer #155.
 - d. S-W: Industrial Water Based Acrylic Paint B42W110.
 - 2. Undercoat: Alkyd enamel recommended by manufacturer of finish coat as an intermediate coat over factory-applied primer for application of silicone-alkyd finish coat:
 - a. Con-Lux: Ferrox Primer.
 - b. S-W: Silicone Alkyd Enamel B-56 Series.
 - c. Tnemec: Series 23 Enduratone.
 - 3. Finish Coat: Silicone-alkyd enamel with a minimum of 30% silicone content meeting the qualitative requirements of FS TT-E-490:
 - a. Con-Lux: Steel-Master 9500 Series.
 - b. S-W: Silicone Alkyd Enamel B-56 Series.
 - c. Tnemec: Series 82 Silicone-Alkyd Enamel.

- G. Zinc-Coated Metal - Alkyd, Semigloss: Two coats over primer:
 - 1. Primer: Galvanized metal primer used to prime zinc-coated (galvanized) metal surfaces (FS TT-P-641), or one of the following:
 - a. Con-Lux: Bond-Plex 46 Barrier Green.
 - b. Devoe: 13201 Mirrolac Galvanized Metal Primer.
 - c. Moore: Ironclad Galvanized Metal Latex Primer #155.

- d. S-W: Industrial Water Based Acrylic Paint B42W110.
 2. Undercoat: Weather-resistant, air-drying, semigloss alkyd enamel for use on the exterior over prime-coated zinc-coated (galvanized) metal (FS TT-E-489, Class A):
 - a. Con-Lux: Enamelite Semi-Luster Series.
 - b. Devoe: 70XX Mirrolac Interior/Exterior Alkyd Enamel.
 - c. Moore: Impervo Enamel #133.
 - d. S-W: Industrial Enamel, B-54Z Series.
 3. Finish Coat: Weather-resistant, air-drying, semigloss alkyd enamel for use on the exterior over prime-coated zinc-coated (galvanized) metal (FS TT-E-489, Class A):
 - a. Con-Lux: Enamelite Semi-Luster Series.
 - b. Devoe: 70XX Mirrolac Interior/Exterior Alkyd Enamel.
 - c. Moore: Impervo Enamel #133.
 - d. S-W: Industrial Enamel, B-54Z Series.
- H. Aluminum - Alkyd, Semigloss: Two coats over primer:
1. Primer: Alkyd-type zinc chromate primer used for priming aluminum under alkyd enamels (FS TT-P-645), or one of the following.
 - a. Con-Lux: Bond-Plex 46 Barrier Green.
 - b. Devoe: 41839 Bar-Ox Zinc Chromate Primer.
 - c. Moore: Ironclad Retardo Rust Inhibitive Paint #163.
 - d. S-W: Zinc Chromate Primer B50Y1.
 2. Undercoat: Weather-resistant, air-drying, semigloss alkyd enamel for use on the exterior over prime-coated aluminum (FS TT-E-489, Class A):
 - a. Con-Lux: Enamelite Semi-Luster Series.
 - b. Devoe: 70XX Mirrolac Interior/Exterior Alkyd Enamel.
 - c. Moore: Impervo Enamel #133.
 - d. S-W: Industrial Enamel, B-54Z Series.
 3. Finish Coat: Weather-resistant, air-drying, semigloss alkyd enamel for use on the exterior over prime-coated aluminum (FS TT-E-489, Class A):
 - a. Con-Lux: Enamelite Semi-Luster Series
 - b. Devoe: 70XX Mirrolac Interior/Exterior Alkyd Enamel.
 - c. Moore: Impervo Enamel #133.
 - d. S-W: Industrial Enamel, B-54Z Series.
- I. Wood - Acrylic Enamel, Semigloss: Two coats over primer with total dry film thickness not less than 2.5 mils:
1. Primer: Exterior alkyd or latex primer made for use on wood under an acrylic enamel (FS TT-P-001984):
 - a. Con-Lux: Wood-Plex 700 Primer.
 - b. Devoe: 1102 All-Weather Exterior Alkyd House Paint Primer.
 - c. Moore: Moorwhite Primer #100.
 - d. S-W: A-100 Exterior Latex Wood Primer
 2. Undercoat: Semigloss, waterborne, exterior, acrylic enamel made for use as an undercoat over a primer on wood under an acrylic enamel (FS TT-P-1510):
 - a. Con-Lux: Weather-Plex 700 Series
 - b. Devoe: 17XX Wonder-Shield Semi-Gloss Exterior Acrylic latex House and Trim Paint.
 - c. Moore: MoorGlo Latex House and Trim Paint #096.
 - d. S-W: A-100 Exterior Latex Satin.
 3. Finish Coat: Semigloss, waterborne, exterior, acrylic enamel made for use as a finish coat over an acrylic enamel (FS TT-P-1510):
 - a. Con-Lux: Weather-Plex 700 Series.
 - b. Devoe: 17XX Wonder-Shield Semi-Gloss Exterior Acrylic latex House and Trim Paint.
 - c. Moore: MoorGlo Latex House and Trim Paint #096.

- d. S-W: A-100 Exterior Latex Satin.
- J. Wood - Stained-Varnish: Two coats over sealer over stain plus filler on open-grain wood. Wipe filler before applying first varnish coat.
1. Stain Coat: Match interior stained-varnish finish.
 2. Sealer: Phenolic varnish for use on exterior natural-finished woodwork (FS TT-V-119), thinned as recommended by manufacturer:
 - a. Con-Lux: Imperial 71 Spar Varnish.
 - b. Devoe: 87 Spar Varnish.
 - c. Moore: Impervo 440 Spar Varnish.
 - d. S-W: Exterior Varnish A67V4
 3. Undercoat: Phenolic varnish for use on exterior natural-finished woodwork (FS TT-V-119):
 - a. Con-Lux: Imperial 71 Spar Varnish.
 - b. Devoe: 87 Spar Varnish.
 - c. Moore: Impervo 440 Spar Varnish.
 - d. S-W: Exterior Varnish A67V4.
 4. Finish Coat: Phenolic varnish for use on exterior natural-finished woodwork (FS TT-V-119):
 - a. Con-Lux: Imperial 71 Spar Varnish.
 - b. Devoe: 87 Spar Varnish.
 - c. Moore: Impervo 440 Spar Varnish.
 - d. S-W: Exterior Varnish A67V4.

2.03 INTERIOR PAINTING SYSTEMS:

- A. Interior Paint Schedule: Provide the paint systems scheduled below for the various substrates, as indicated. Provide a complete paint system by one manufacturer for each substrate. Unless otherwise indicated, provide the following:
1. Concrete and masonry (except concrete masonry units and concrete floors): Latex, flat.
 2. Concrete masonry units (except ground-faced CMU, which is to be left unpainted): Latex, flat.
 3. Concrete floors: Epoxy, gloss, with anti-slip aggregate.
 4. Gypsum plaster, veneer plaster, and GFRG: Latex, eggshell.
 5. Acoustical plaster: Unpainted.
 6. Gypsum board: Latex, flat.
 7. Woodwork: Stained-varnish finish, except alkyd, semigloss where painted is indicated.
 8. Ferrous metal:
 - a. Exposed steel structure: Silicone-alkyd, semigloss.
 - b. Other interior ferrous metal: Alkyd, semigloss.
 9. Zinc-coated metal: Alkyd, semigloss; except silicone-alkyd where part of ferrous metal assemblies painted with silicone-alkyd.
 10. Non-ferrous metal: Alkyd, semigloss.
 11. Cotton and canvass covering over insulation: Latex, flat.
 12. Mechanical and electrical items (not finish painted): See substrate materials above.
- B. Concrete and Masonry (Except concrete masonry units) - Latex, Flat: Two coats.
1. Undercoat: Flat latex-based paint made for use as an undercoat over concrete and masonry under a flat latex paint (FS TT-P-29):
 - a. Con-Lux: Jet-Plex 495 Primer.
 - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
 - c. Moore: Moore's Latex Quick-Dry Prime Seal 201.

- d. S-W: Pro-Mar 200 Latex Flat B30W200.
 - 2. Finish Coat: Flat latex-based paint made for use as a flat finish over concrete and masonry (FS TT-P-29):
 - a. Con-Lux: Wall-Plex 400 Series.
 - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
 - c. Moore: Regal Wall Satin 215.
 - d. S-W: Pro-Mar 200 Latex Flat Wall Paint B30W200 Series.
- C. Concrete and Masonry (Except concrete masonry units) - Alkyd, Semigloss: Two coats over primer with total dry film thickness not less than 3.5 mils.
 - 1. Primer: Flat latex-based paint made for use as a primer over concrete and masonry under an odorless alkyd enamel (FS TT-P-29):
 - a. Con-Lux: Wall-Plex 400 Series.
 - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
 - c. Moore: Moore's Latex Quick-Dry Prime Seal 201.
 - d. S-W: Pro-Mar 200 Latex Flat B30W200.
 - 2. Undercoat: Enamel undercoat made for use on the interior as an undercoat over a primer on concrete or masonry under an odorless alkyd enamel:
 - a. Con-Lux: Enamel Underbase 54 White.
 - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
 - c. Moore: Moore's Alkyd Enamel Underbody 217.
 - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
 - 3. Finish Coat: Semigloss odorless alkyd enamel made for use over a primer and undercoat on concrete and masonry (FS TT-E-509):
 - a. Con-Lux: Satin-Lite 900 Series
 - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
 - c. Moore: Moore's Satin Impervo Enamel 235.
 - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
- D. Concrete and Masonry (Except concrete masonry units) - Epoxy, Semi-Gloss: Two coats over primed surface.
 - 1. Primer: Sealer made for use as a primer over masonry wall surfaces and under an epoxy enamel:
 - a. Con-Lux: Jet-Plex 495 Primer.
 - b. Duron: Acrylic Enamel Undercoater.
 - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
 - d. S-W: Kem Cati-Coat Epoxy Filler/Sealer.
 - 2. Undercoat: Epoxy enamel undercoat made for use under a semi-gloss epoxy enamel:
 - a. Con-Lux: Epolon Semi-Luster Series.
 - b. Duron: Polyamide Epoxy.
 - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
 - d. S-W: Heavy Duty Epoxy.
 - 3. Finish Coat: Semi-gloss epoxy enamel finish coat made for use over an epoxy enamel undercoat:
 - a. Con-Lux: Epolon Semi-Luster Series.
 - b. Duron: Polyamide Epoxy.
 - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
 - d. S-W: Heavy Duty Epoxy.
- E. Concrete Masonry Units (Except ground-faced CMU, which is to be left unpainted) - Latex, Flat: Two coats over filled surface.
 - 1. Block Filler: High-performance latex block filler made for use for filling open textured concrete masonry block before application of top coats (FS TT-F-1098):
 - a. Con-Lux: Block-Plex 85 White.

- b. Devoe: 52901 Bloxfil Acrylic Latex Block Filler.
 - c. Moore: Moorcraft Interior and Exterior Block Filler 173.
 - d. S-W: Heavy-Duty Block Filler B42W46.
 - 2. Undercoat: Flat latex-based paint made for use as an undercoat over filled concrete masonry block under a flat latex paint (FS TT-P-29):
 - a. Con-Lux: Wall-Plex 400 Series.
 - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
 - c. Moore: Moore's Latex Quick-Dry Prime Seal 201.
 - d. S-W: Pro-Mar 200 Latex Flat B30W200.
 - 3. Finish Coat: Flat latex-based Paint made for use as a flat finish over filled concrete masonry block (FS TT-P-29):
 - a. Con-Lux: Wall-Plex 400 Series.
 - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
 - c. Moore: Regal Wall Satin 215.
 - d. S-W: Pro-Mar 200 Latex Flat Wall Paint B30W200 Series.
- F. Concrete Masonry Units (Except ground-faced CMU, which is to have clear anti-graffiti coating over unfilled surface) - Alkyd, Semigloss: Two coats over filled surface with total dry film thickness not less than 3.5 mils, excluding filler coat
 - 1. Block Filler: High-performance latex block filler made for use for filling open textured concrete masonry block before application of top coats (FS TT-F-1098):
 - a. Con-Lux: Block-Plex 85 White.
 - b. Devoe: 52901 Bloxfil Acrylic Latex Block Filler.
 - c. Moore: Moorcraft Interior and Exterior Block Filler 173.
 - d. S-W: Heavy-Duty Block Filler B42W46.
 - 2. Undercoat: Enamel undercoat made for use on the interior as an undercoat over a block filler on concrete masonry block under an odorless alkyd enamel:
 - a. Con-Lux: Enamel Underbase 54 White.
 - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
 - c. Moore: Moore's Alkyd Enamel Underbody 217.
 - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
 - 3. Finish Coat: Semigloss odorless alkyd enamel made for use over a block filler and undercoat on concrete masonry block (FS TT-E-509):
 - a. Con-Lux: Satin-Lite 900 Series.
 - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
 - c. Moore: Moore's Satin Impervo Enamel 235.
 - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
- G. Concrete Masonry Units (Except ground-faced CMU, which is to have clear anti-graffiti coating over unfilled surface) - Epoxy, Semi-Gloss: Two coats over filled surface.
 - 1. Filler: Filler made for use as a primer over masonry wall surfaces and under an epoxy enamel:
 - a. Con-Lux: Jet-Plex 495 Primer; or Block-Plex Block Filler.
 - b. Duron: Acrylic Enamel Undercoater; or Block Kote Latex Block Filler.
 - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel; or Moorcraft Interior and Exterior Block Filler.
 - d. S-W: Kem Cati-Coat Epoxy Filler/Sealer; or Heavy Duty Block Filler.
 - 2. Undercoat: Epoxy enamel undercoat made for use under a semi-gloss epoxy enamel:
 - a. Con-Lux: Epolon Semi-Luster Series.
 - b. Duron: Polyamide Epoxy.
 - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
 - d. S-W: Heavy Duty Epoxy.

3. Finish Coat: Semi-gloss epoxy enamel finish coat made for use over an epoxy enamel undercoat:
 - a. Con-Lux: Epolon Semi-Luster Series.
 - b. Duron: Polyamide Epoxy
 - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
 - d. S-W: Heavy Duty Epoxy.

- H. Concrete Floor Surfaces - Epoxy, Gloss: Two coats over primer, with anti-slip aggregate in finish coat:
 1. Primer: Epoxy sealer made for use as a primer over concrete floor surfaces and under an epoxy enamel:
 - a. Con-Lux: None required.
 - b. Duron: Acrylic Enamel Undercoater
 - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
 - d. S-W: ArmorSeal 3300LV Epoxy Primer/Sealer.
 2. Undercoat: Epoxy enamel undercoat made for use over an epoxy primer and under a gloss epoxy enamel:
 - a. Con-Lux: Epolon Series with Epolon 145 Reducer.
 - b. Duron: Polyamide Epoxy.
 - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
 - d. S-W: ArmorSeal 1000HS.
 3. Finish Coat: Epoxy enamel finish coat made for use over an epoxy enamel undercoat:
 - a. Con-Lux: Epolon Series with anti-slip aggregate.
 - b. Duron: Polyamide Epoxy with anti-slip aggregate.
 - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel with anti-slip aggregate.
 - d. S-W: ArmorSeal 1000HS with anti-slip aggregate.

- I. Gypsum Plaster, Veneer Plaster, and GFRG - Latex, Eggshell (Low-Gloss): Two coats over primer; plus sealer for GFRG.
 1. Sealer for GFRG: Same as primer coat, to expose hot spots and facilitate sanding to remove "fiber bloom".
 2. Primer: Flat latex-based paint made for use as a primer on plaster under an eggshell latex paint (FS TT-P-29):
 - a. Con-Lux: Jet-Plex 495 Primer.
 - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
 - c. Moore: Moore's Latex Quick-Dry Prime Seal 201.
 - d. S-W: Wall and Wood Primer B99WZ2.
 3. Undercoat: Eggshell latex paint made for use over a primer on plaster (Performance requirements of FS TT-P-29):
 - a. Con-Lux: Luster-Plex 2000 Series.
 - b. Devoe: 34XX Wonder-Tones Interior Latex Eggshell Enamel.
 - c. Moore: Regal AquaVelvet 319.
 - d. S-W: Pro-Mar 200 Latex Eggshell Enamel B20W200 Series.
 4. Finish Coat: Eggshell latex paint made for use over a primer and undercoat on plaster (Performance requirements of FS TT-P-29):
 - a. Con-Lux: Luster-Plex 2000 Series.
 - b. Devoe: 34XX Wonder-Tones Interior Latex Eggshell Enamel.
 - c. Moore: Regal AquaVelvet 319.
 - d. S-W: Pro-Mar 200 Latex Eggshell Enamel B20W200 Series.

- J. Gypsum Plaster, Veneer Plaster, and GFRG - Alkyd, Semigloss: Two coats over primer with total dry film thickness not less than 2.5 mils; plus sealer for GFRG.

1. Sealer for GFRG: Same as primer coat, to expose hot spots and facilitate sanding to remove "fiber bloom".
 2. Primer: Flat latex-based paint made for use as a primer on plaster under an odorless alkyd enamel (FS TT-P-29):
 - a. Con-Lux: Jet-Plex 495 Primer.
 - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
 - c. Moore: Moore's Latex Quick-Dry Prime Seal 201.
 - d. S-W: Wall and Wood Primer B99WZ2.
 3. Undercoat: Enamel undercoat made for use as an undercoat over a primer on plaster under an odorless alkyd enamel:
 - a. Con-Lux: Enamel Underbase 54 White.
 - b. Devoe: 26XX Velour Alkyd Semigloss Enamel
 - c. Moore: Moore's Alkyd Enamel Underbody 217.
 - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series
 4. Finish Coat: Semigloss odorless alkyd enamel made for use over a primer and undercoat on plaster (FS TT-E-509):
 - a. Con-Lux: Satin-Lite 900 Series.
 - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
 - c. Moore: Moore's Satin Impervo Enamel 235.
 - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
- K. Gypsum Board - Latex, Flat: 1 coat over primer.
1. Primer: Latex-based white primer made for use on interior gypsum board under a flat latex paint (FS TT-P-650):
 - a. Con-Lux: Jet-Plex 495 Primer.
 - b. Devoe: 50801 Wonder-Tones Latex Primer and Sealer.
 - c. Moore: Moore's Latex Quick-Dry Prime Seal 201.
 - d. S-W: Pro-Mar 200 Latex Wall Primer B28W200.
 2. Finish Coat: Flat latex-based paint made for use as a flat finish over prime-coated gypsum board (FS TT-P-29):
 - a. Con-Lux: Wall-Plex 400 Series.
 - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
 - c. Moore: Regal Wall Satin 215.
 - d. S-W: Pro-Mar 200 Latex Flat Wall Paint B30W200 Series.
- L. Gypsum Board - Alkyd, Semigloss: Two coats over primer with total dry film thickness not less than 2.5 mils.
1. Primer: Latex-based white primer made for use on interior gypsum board under an odorless alkyd enamel (FS TT-P-650):
 - a. Con-Lux: Jet-Plex 495 Primer.
 - b. Devoe: 50801 Wonder-Tones Latex Primer and Sealer.
 - c. Moore: Moore's Latex Quick-Dry Prime Seal 201.
 - d. S-W: Pro-Mar 200 Latex Wall Primer B28W200.
 2. Undercoat: Enamel undercoat made for use on the interior as an undercoat over a primer on interior gypsum board under an odorless alkyd enamel:
 - a. Con-Lux: Enamel Underbase 54 White.
 - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
 - c. Moore: Moore's Alkyd Enamel Underbody 217.
 - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
 3. Finish Coat: Semigloss odorless alkyd enamel made for use over a primer and undercoat on interior gypsum board (FS TT-E-509):
 - a. Con-Lux: Satin-Lite 900 Series.
 - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
 - c. Moore: Moore's Satin Impervo Enamel 235.
 - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.

- M. Woodwork, Stained-Varnish: Two coats over sealer over stain plus filler on open-grain wood. Wipe filler before applying first varnish coat.
1. Stain Coat: Slow-penetrating oil-type wood stain made for general use on interior wood surfaces under a varnish finish (FS TT-S-71):
 - a. Devoe: 96XX Wonder Woodstain Alkyd Stain.
 - b. Moore: Moore's Interior Wood Finishes Penetrating Stain 241.
 - c. S-W: Oil Stain A-48 Series.
 2. Sealer: Quick-drying, rosin-free, clear, general-purpose shellac varnish made for use on the interior over stained-finished woodwork under a varnish finish (FS TT-S-300, Grade A):
 - a. Devoe: 4900 Wonder Woodsealer Quick-Dry Sealer.
 - b. Moore: Moore's Interior Wood Finishes, Quick-Dry Sanding Sealer 413.
 - c. S-W: Pro-Mar Varnish Sanding Sealer B26V3.
 3. Filler: Solvent-based, air-drying, paste-type wood filler made for use on open-grain wood on interior wood surfaces (FS TT-F-336):
 - a. Devoe: 4800 Wonder Woodstain Interior Paste Wood Filler.
 - b. Moore: Benwood Paste Wood Filler.
 - c. S-W: Sher-Wood Fast-Dry Filler.
 4. Undercoat: Clear varnish made for use on interior stained-finished woodwork (FS TT-V-86):
 - a. Devoe: 4600 Wonder Wood Satin Alkyd Satin Varnish.
 - b. Moore: Benwood Satin Finish Varnish 404.
 - c. S-W: Oil Base Varnish, A66V91/A66F90.
 5. Finish Coat: Clear varnish made for use on interior stained-finished woodwork (FS TT-V-86):
 - a. Devoe: 4600 Wonder Wood Satin Alkyd Satin Varnish.
 - b. Moore: Benwood Satin Finish Varnish 404.
 - c. S-W: Oil Base Varnish, A66V91/A66F90.
- N. Woodwork, Painted - Alkyd, Semigloss: Two coats over primer.
1. Primer: Enamel undercoat made for use as a primer over wood under an odorless alkyd enamel:
 - a. Con-Lux: Enamel Underbase 54 White.
 - b. Devoe: 50501 Interior Alkyd Primer and Vapor Barrier
 - c. Moore: Moore's Alkyd Enamel Underbody 217.
 - d. S-W: Wall and Wood Primer B49WZ2.
 2. Undercoat: Semigloss odorless alkyd enamel made for use over a primer on wood (FS TT-E-509):
 - a. Con-Lux: Satin-Lite 900 Series.
 - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
 - c. Moore: Moore's Satin Impervo Enamel 235.
 - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
 3. Finish Coat: Semigloss odorless alkyd enamel made for use over a primer and undercoat on wood (FS TT-E-509):
 - a. Con-Lux: Satin-Lite 900 Series.
 - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
 - c. Moore: Moore's Satin Impervo Enamel 235.
 - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
- O. Ferrous Metal - Silicone-Alkyd, Semigloss: Two coats over primer:
1. Primer: Lead and chromate-free high solids primer which chemically inhibits rusting and is recommended by the manufacturer for application to steel which has been prepared in accordance with SSPC SP2. Rated 10 (less than 0.01% surface rusting)

when tested in accordance with ASTM B117 for 500 hours. Exceeds performance requirements of FS TT-P-636:

- a. Con-Lux: Rust Arrestor 50.
 - b. S-W: Kem Kromik Universal Metal Primer B50NZ6.
 - c. Tnemec: Series P10.
2. Undercoat: Alkyd enamel recommended by manufacturer of finish coat as an intermediate coat over specified primer for application of silicone-alkyd finish coat:
 - a. Con-Lux: FerroX Primer.
 - b. S-W: Silicone Alkyd Enamel B-56 Series.
 - c. Tnemec: Series 23 Enduratone.
 3. Finish Coat: Silicone-alkyd enamel with a minimum of 30% silicone content meeting the qualitative requirements of FS TT-E-490:
 - a. Con-Lux: Steel-Master 9500 Series.
 - b. S-W: Silicone Alkyd Enamel B-56 Series.
 - c. Tnemec: Series 82 Silicone-Alkyd Enamel.
- P. Ferrous Metal - Alkyd, Semigloss: Two coats over primer with total dry film thickness not less than 2.5 mils.
1. Primer: Quick-drying, rust-inhibiting primer made for priming ferrous metal under an odorless alkyd enamel (FS TT-P-664):
 - a. Con-Lux: FerroX Primer.
 - b. Devoe: 41820 Bar-Ox Alkyd Shop/Field Primer.
 - c. Moore: Ironclad Retardo Rust-Inhibitive Paint 163
 - d. S-W: Kem Kromik Metal Primer B50N2/B50W1.
 2. Undercoat: Enamel undercoat made for use as an undercoat over a primer on ferrous metal under an odorless alkyd enamel:
 - a. Con-Lux: Satin-Lite 900 Series.
 - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
 - c. Moore: Moore's Alkyd Enamel Underbody 217.
 - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
 3. Finish Coat: Semigloss odorless alkyd enamel made for use over a primer and undercoat on ferrous metal surfaces (FS TT-E-509):
 - a. Con-Lux: Satin-Lite 900 Series.
 - b. Devoe: 26XX Velour Alkyd Semigloss Enamel
 - c. Moore: Moore's Satin Impervo Enamel 235.
 - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
- Q. Ferrous Metal - Epoxy, Gloss: Two coats over primer:
1. Primer: Corrosion-inhibitive primer recommended by manufacturer for priming ferrous metal under an epoxy undercoat:
 - a. Con-Lux: Epolon Mastic 36 White.
 - b. Duron: Dura Clad Universal Phenolic Alkyd Fast Dry Metal Primer.
 - c. Moore: IronClad Epoxy Rust Inhibitive Primer
 - d. S-W: Recoatable Epoxy Primer.
 2. Undercoat: Epoxy undercoat made for use as an undercoat over a primer on metal under a gloss epoxy enamel:
 - a. Con-Lux: Epolon Series.
 - b. Duron: Dura Clad Polyamide Epoxy.
 - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
 - d. S-W: ArmorSeal 100HS Series.
 3. Finish Coat:
 - a. Gloss epoxy enamel made for use over a primer and epoxy undercoat on metal surfaces.
 - 1) When the finish coat is applied to a floor surface, add anti-slip aggregate.

- b. Con-Lux: Epolon Series.
 - c. Duron: Dura Clad Polyamide Epoxy.
 - d. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
 - e. S-W: ArmorSeal 100HS Series.
- R. Zinc-coated Metal - Alkyd, Semigloss: Two coats over primer, with total dry film thickness not less than 2.5 mils.
- 1. Primer: Galvanized metal primer made for use on zinc-coated (galvanized) metal surfaces (FS TT-P-641), or one of the following:
 - a. Con-Lux: Bond-Plex 46 Barrier Green.
 - b. Devoe: 13201 Mirrolac Galvanized Metal Primer.
 - c. Moore: Ironclad Galvanized Metal Latex Primer 155.
 - d. S-W: Industrial Water Based Acrylic Paint B42W110.
 - 2. Undercoat: Enamel undercoat made for use as an undercoat over a primer on zinc-coated metal under an odorless alkyd enamel:
 - a. Con-Lux: Satin-Lite 900 Series.
 - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
 - c. Moore: Moore's Alkyd Enamel Underbody 217.
 - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
 - 3. Finish Coat: Semigloss odorless alkyd enamel made for use over a primer and undercoat on zinc-coated (galvanized) metal surfaces (FS TT-E-509):
 - a. Con-Lux: Satin-Lite 900 Series.
 - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
 - c. Moore: Moore's Satin Impervo Enamel 235.
 - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
- S. Zinc-Coated Metal - Silicone-Alkyd, Semigloss: Two coats over factory-applied primer:
- 1. Primer: Galvanized metal primer used to prime zinc-coated (galvanized) metal surfaces (FS TT-P-641), or one of the following.
 - a. Con-Lux: Bond-Plex 46 Barrier Green.
 - b. Devoe: 13201 Mirrolac Galvanized Metal Primer.
 - c. Moore: Ironclad Galvanized Metal Latex Primer #155.
 - d. S-W: Industrial Water Based Acrylic Paint B42W110.
 - 2. Undercoat: Alkyd enamel recommended by manufacturer of finish coat as an intermediate coat over factory-applied primer for application of silicone-alkyd finish coat:
 - a. Con-Lux: FerroX Primer.
 - b. S-W: Silicone Alkyd Enamel B-56 Series.
 - c. Tnemec: Series 23 Enduratone.
 - 3. Finish Coat: Silicone-alkyd enamel with a minimum of 30% silicone content meeting the qualitative requirements of FS TT-E-490:
 - a. Con-Lux: Steel-Master 9500 Series.
 - b. S-W: Silicone Alkyd Enamel B-56 Series.
 - c. Tnemec: Series 82 Silicone-Alkyd Enamel.
- T. Zinc-Coated Metal - Epoxy, Gloss: Two coats over primer:
- 1. Primer: Primer recommended by manufacturer for priming galvanized metal under an epoxy undercoat:
 - a. Con-Lux: Metal Bond 47 Primer.
 - b. Duron:
 - 1) Vinyl Wash Primer for surfaces subject to abrasion;
 - 2) Dura Clad Acrylic Galvanized Metal Primer for surfaces not subject to abrasion.
 - c. Moore: IronClad Galvanized Metal latex Primer.
 - d. S-W: ArmorSeal 100HS Series.

2. Undercoat: Epoxy undercoat made for use as an undercoat over a primer on metal under a gloss epoxy enamel:
 - a. Con-Lux: Epolon Series.
 - b. Duron: Dura Clad Polyamide Epoxy.
 - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
 - d. S-W: ArmorSeal 100HS Series.
 3. Finish Coat;
 - a. Gloss epoxy enamel made for use over a primer and epoxy undercoat on metal surfaces.
 - 1) When the finish coat is applied to a floor surface, add anti-slip aggregate.
 - b. Con-Lux: Epolon Series.
 - c. Duron: Dura Clad Polyamide Epoxy.
 - d. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
 - e. S-W: ArmorSeal 100HS Series.
- U. Non-Ferrous Metal - Alkyd, Semigloss: Two coats over primer with total dry film thickness not less than 2.5 mils.
1. Primer: Corrosion inhibitive primer recommended by manufacturer for priming non-ferrous metal under an odorless alkyd enamel:
 - a. Con-Lux: Bond-Plex 46 Barrier Green.
 - b. Devoe: 13201 Mirrolac Galvanized Metal Primer.
 - c. Moore: Ironclad Retardo Rust-Inhibitive Paint 163.
 - d. S-W: Kem Kromik Metal Primer B50N2/B50W1.
 2. Undercoat: Enamel undercoat made for use as an undercoat over a primer on non-ferrous metal under an odorless alkyd enamel:
 - a. Con-Lux: Satin-Lite 900 Series.
 - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
 - c. Moore: Moore's Alkyd Enamel Underbody 217.
 - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
 3. Finish Coat: Semigloss odorless alkyd enamel made for use over a primer and undercoat on non-ferrous metal surfaces (FS TT-E-509):
 - a. Con-Lux: Satin-Lite 900 Series.
 - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
 - c. Moore: Moore's Satin Impervo Enamel 235.
 - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100
- V. Cotton or Canvas Covering over Insulation - Latex, Flat: 2 coats.
1. Undercoat: Flat latex-based paint with fungicidal agent added (to render fabric mildew-proof) made for use as a sealing coat (size) on cotton or canvas covering over insulation:
 - a. Con-Lux: Wall-Plex 400 Series.
 - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
 - c. Moore: Regal Wall Satin 215.
 - d. S-W: Pro-Mar 200 Latex Flat Wall Paint B30W200 Series.
 2. Finish Coat: Flat latex-based paint with fungicidal agent added (to render fabric mildew-proof) made for use as a sealing coat (size) on cotton or canvas covering over insulation:
 - a. Con-Lux: Wall-Plex 400 Series.
 - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
 - c. Moore: Regal Wall Satin 215.
 - d. S-W: Pro-Mar 200 Latex Flat Wall Paint B30W200 Series.

PART 3 - EXECUTION

3.01 PREPARATORY WORK:

- A. Inspect surfaces for their suitability to receive a finish. In the event that imperfections due to materials or workmanship appear on surfaces, make the appropriate corrections at no additional cost to the Authority. Correct damage to painted or decorated finishes due to carelessness or negligence of other trades.
- B. Protect hardware, hardware accessories, plates, lighting fixtures and similar items installed prior to painting; remove protection upon completion of each space. Where necessary to remove installed products to ensure their protection, arrange for removal and reinstallation by mechanics of the trade involved. Disconnect equipment adjacent to walls; where necessary, move to permit painting of wall surfaces, and following completion of painting, replace and reconnect.
- C. Clean surfaces to be painted as necessary to remove dust and dirt. Sand as necessary to properly prepare surfaces to receive paint or varnish.
- D. Wash metal surfaces with benzine or mineral spirits to remove dirt, oil or grease before applying paint. Where rust or scale is present, wire brush or sandpaper clean before painting. Apply galvanized metal primer to degreased galvanized metal before applying additional coats.
- E. Prepare masonry surfaces to be painted by removing dirt, dust, oil and grease stains and efflorescence. The method of surface preparation is at the discretion of the Contractor provided that the results are approved. Clean masonry and plaster surfaces to be painted until they are free from alkali and thoroughly dry before applying paint. Test masonry and plaster surfaces for alkali, using red litmus paper, prior to painting.
- F. Clean concrete surfaces free from dirt, or film left from form oil or concrete curing compounds, or loose or excess mortar. Steam clean or wash the surfaces with water. Use cleaning additive with discretion, in accordance with paint manufacturer's recommendation and to the satisfaction of Engineer.
- G. Cut out cracks, scratches and other imperfections in plaster surfaces as required, fill with spackling compound and sand flush with adjacent surface. Fill voids in concrete with cement grout before painting.
- H. Fill nail holes and cracks after first coat with non-shrinking putty of a color to match that of the finish.
- I. Sand, dust and touch up scratches, abrasions or other disfigurements and remove foreign matter from prime coats before proceeding with the following coat. Feather edge spot priming or spot coating into adjacent coatings to produce a smooth and level surface.
- J. Test concrete and plaster surfaces for moisture, using moisture meter, prior to painting. Do not apply paint to surfaces having meter reading above 15.
- K. Caulk joints between door and window frames and walls, and other joints as necessary.
- L. Coordinate the work of this section with the work of other trades.

3.02 APPLICATION:

- A. Touch-up painting of structural steel, miscellaneous metal, hollow-metal doors and frames, and other materials which have been prime coated as may be required where the shop coat

has been damaged by welding or abrasion during the handling and erection operations; also rivets, bolts and welds which are unpainted after assembly and erection.

- B. Apply paint by spray in accordance with the manufacturer's directions to achieve required dry film thickness (DFT). Where specifically approved by the Engineer, use rollers or brushes as best suited for material being applied. For covers on rollers use carpet with velvet back and high-pile sheep's wool or use short-hair covers, as best suited for material and texture specified. Except where otherwise noted, apply paint to a minimum dry-film thickness (DFT) of five mills, excluding filler coats, using no less than the number of coats specified in Part 2 – Products.
- C. Apply material evenly and smoothly without runs, sags or other defects with edges of paint adjoining other materials or color sharp and clean, without overlapping.
- D. Do not paint and finish while surfaces are damp. Allow sufficient time between coats, in accordance with manufacturer's directions to produce an evenly smooth finish.
- E. Do not apply final coats until after other trades, whose operations would be detrimental to finish painting, have finished their work in the areas to be painted and the areas have been approved for painting.

3.03 PROTECTION:

- A. Dispose of soiled cleaning rags and waste at the close of each day's work or store such soiled rags and waste in metal containers with tight-fitting covers. Provide buckets of sand during painting operations for use in the event of fire. Post NO SMOKING signs as necessary and as directed.
- B. Protect the work of other trades against damage or injury by use of suitable covering during the progress of the painting and finishing work. Repair damage to the satisfaction of the Engineer.

3.04 CLEANING:

- A. Upon completion of work, remove staging, scaffolding and containers from the site. Remove paint spots, oil or stains from glass, floors and other surfaces not to be painted, and leave job clean and acceptable to the Engineer.

3.05 COLOR CODING OF PIPING AND EQUIPMENT:

- A. General Requirements:
 - 1. Color coding is required for accessible piping systems and related equipment, except associated supports, brackets, hangers and similar accessories.
 - 2. Identify piping systems and related equipment which are to be color coded as follows:
 - a. Apply color to entire length of piping.
 - b. Apply lettered legends indicating the name of the contents of the system as specified.
- B. Location of Legends and Bands:
- C. Stencil lettered legends on the piping at the horizontal or vertical centerline. Where pipe lines are too close together and where located above the operator's normal line of vision, place the lettering below the horizontal centerline at a point which will be easily visible.
 - 1. Locate lettered legends and bands at points where pipes enter and leave rooms or spaces, at junction points and points of distribution, close to valves and equipment, at changes in direction, and at intervals along piping where necessary for identification.

2. Stencil piping in accordance with ASME A13.1 and as follows to show service and direction of flow, space within sight of each other and not more than 40 feet apart on long runs.

D. Size of Stencil Letters for Piping Identification:

Outside Diameter of Pipe Covering in Inches	Size of Letter in Inches	Width of Color Band in Inches
3/4 to 1-1/4	1/2	4
1-1/2 to 2-1/2	3/4	6
3 to 6	1-1/4	8
7 to 10	2-1/2	12
Over 10	3-1/2	12

E. Schedule of Colors and Legends:

Line	Pipe Color	Black Stenciled Legend
Hot water lines	Yellow	HW, HWR
Potable cold water lines	Blue	CW
Chilled water lines	Blue with yellow band	CHWS, CHWR
Fire lines	Red	F (use White Stencil instead of black)
Condensate lines	White	C
Condenser water lines	White with blue band	CWS, CWR
Soil and waste lines	White	S
Vent lines	Grey with white band	V
Storm Water lines	White	ST-W
Air and control air lines	Green	A

END OF SECTION

SECTION 10155

TOILET COMPARTMENTS AND SCREENS

PART1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing metal toilet compartments, urinal screens and metal screens for portable eye wash and body spray.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Toilet Accessories: Section 10810.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Product Data: For each type and style of toilet compartment and screen specified include details of construction relative to materials, fabrication, and installation. Include details of anchors, hardware, and fastenings.
- B. Shop Drawings: For fabrication and installation of toilet compartment and screen assemblies. Include plans, elevations, sections, details, and attachments to other work. Submit prior to ordering materials or beginning fabrication.
 - 1. Show locations of reinforcement and cutouts for compartment-mounted toilet accessories.
 - 2. Samples for Verification:
 - a. Three of each type of the following products used in the Work:
 - 1) Hardware.
 - 2) Sheet metal: Three inches by five inches.
 - b. Approved full-size samples will be returned and may be used in the Work.

1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ADA: Americans with Disabilities Act.
 - 3. ASTM: A666.
 - 4. NAAMM: Metal Finishes Manual for Architectural and Metal Products.
- B. Manufacturer Qualifications: Provide products of an established manufacturer regularly engaged in the production of toilet accessories.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver the products to the job site in original unopened containers clearly labeled with the manufacturer's name, brand designation and type as applicable.

- B. Store products in an approved dry area, protect from contact with soil and from exposure to the elements. Keep products dry.
- C. Handle products so as to prevent breakage of containers and damage to products.

1.06 PROJECT CONDITIONS:

- A. Field Measurements: Verify dimensions in areas of installation by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work
 - 1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating units without field measurements. Coordinate supports, adjacent construction, and fixture locations to ensure actual dimensions correspond to established dimensions.

PART 2- PRODUCTS

2.01 MANUFACTURERS:

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Ampco Products, Inc.
 - 2. General Partitions Mfg. Corp.
 - 3. Global Steel Products Corp.
 - 4. Knickerbocker Partition Corporation.
 - 5. Sanymetal
 - 6. Or equal.

2.02 MATERIALS:

- A. General: Provide materials that have been selected for surface flatness and smoothness. Exposed surfaces that exhibit pitting, seam marks, roller marks, stains, discolorations, telegraphing of core material, or other imperfections on finished units are unacceptable.
- B. Stainless-Steel Sheet: ASTM A666, Type 302 or 304, that is leveled to stretcher-leveled flatness, finished on exposed faces as indicated in the "Stainless-Steel Sheet Finishes" Article, and of the following minimum thicknesses:
 - 1. Pilasters (Overhead Braced): 0.0375 inch.
 - 2. Pilasters (Unbraced): 0.0500 inch.
 - 3. Panels and Screens: 0.0312 inch.
 - 4. Doors: 0.0312 inch.
 - 5. Tapping Reinforcement: 0.0781 inch.

- C. Core Material for Metal-Faced Units: Manufacturer's standard sound-deadening honeycomb of resin-impregnated kraft paper in thickness required to provide finished thickness of 1 inch minimum for doors, panels, and screens and 1-1/4 inches minimum for pilasters.
- D. Pilaster Shoes and Sleeves (Caps): ASTM A666, Type 302 or 304 stainless steel, not less than 0.0312 inch thick and 3 inches high, finished to match hardware.
- E. Stirrup Brackets: Manufacturer's standard ear or U-brackets for attaching panels and screens to walls and pilasters of the following material:
 - 1. Material: Stainless steel.
 - 2. Material: Chrome-plated brass.
- F. Full-Height (Continuous) Brackets: Manufacturer's standard design for attaching panels and screens to walls and pilasters of the following material:
 - 1. Material: Stainless steel.
 - 2. Material: Chrome-plated brass.
- G. Hardware and Accessories: Manufacturer's standard design, heavy-duty operating hardware and accessories of the following material:
 - 1. Material: Stainless steel.
 - 2. Material: Chrome-plated brass.
- H. Overhead Bracing: Manufacturer's standard continuous, extruded-aluminum head rail with antigrip profile in manufacturer's standard finish.
- I. Anchorages and Fasteners: Manufacturer's standard exposed fasteners of stainless steel or chrome-plated steel or brass, finished to match hardware, with theft-resistant-type heads. Provide sex-type bolts for through-bolt applications. For concealed anchors, use hot-dip galvanized or other rust-resistant, protective-coated steel.

2.03 COMPARTMENT AND SCREEN FABRICATION:

- A. General: Provide standard doors, panels, screens, and pilasters fabricated for compartment system. Provide units with cutouts and drilled holes to receive compartment-mounted hardware, accessories, and grab bars, as indicated.
 - 1. Provide internal reinforcement in metal units for compartment-mounted hardware, accessories, and grab bars.
- B. Metal-Faced Toilet Compartments and Screens: Pressure laminate seamless face sheets to core material and provide continuous, interlocking molding strip or lapped and formed edges. Seal corners by welding or clips. Grind exposed welds smooth.
- C. Overhead-Braced-and-Floor-Anchored Compartments: Provide manufacturer's standard corrosion-resistant supports, leveling mechanism, fasteners, and anchors at pilasters to suit floor conditions. Make provisions for setting and securing continuous head rail at top of each pilaster. Provide shoes at pilasters to conceal supports and leveling mechanism.
- D. Floor-Anchored Compartments: Provide manufacturer's standard corrosion-resistant anchoring assemblies complete with threaded rods, lock washers, and leveling adjustment nuts at pilasters for structural connection to floor. Provide shoes at pilasters to conceal anchorage.

- E. Ceiling-Hung Compartments: Provide manufacturer's standard corrosion-resistant anchoring assemblies complete with threaded rods, lock washers, and leveling adjustment nuts at pilasters for connection to structural support above finished ceiling. Provide assemblies that support pilasters from structure without transmitting load to finished ceiling. Provide sleeves (caps) at tops of pilasters to conceal anchorage.
 - 1. Provide manufacturer's standard 4-inch-high, overhead cross bracing.
- F. Floor-and-Ceiling-Anchored Compartments: Provide manufacturer's standard corrosion-resistant anchoring assemblies complete with leveling adjustment at tops and bottoms of pilasters. Provide shoes and sleeves (caps) at pilasters to conceal anchorage.
- G. Wall-Hung Urinal Screens and Eyewash Screens: Provide units 18 inches wide by 42 inches high, nominal, or of size as indicated of same construction and finish as compartment panels, unless otherwise indicated.
 - 1. Provide metal-faced screens with integral full-height flanges for attachment to wall.
- H. Floor-Anchored Screens: Provide pilasters and panels of same construction and finish as toilet compartments. Provide manufacturer's standard corrosion-resistant anchoring assemblies complete with threaded rods, lock washers, and leveling adjustment nuts at pilasters for structural connection to floor. Provide shoes at pilasters to conceal anchorage.
- I. Ceiling-Hung Screens: Provide pilasters and panels of same construction and finish as toilet compartments. Provide manufacturer's standard corrosion-resistant anchoring assemblies complete with threaded rods, lock washers, and leveling adjustment nuts at pilasters for connection to structural support above finished ceiling. Provide assemblies that support pilasters from structure without transmitting load to finished ceiling. Provide sleeves (caps) at tops of pilasters to conceal anchorage.
- J. Floor-and-Ceiling-Anchored Screens: Provide pilasters and panels of same construction and finish as toilet compartments. Provide manufacturer's standard corrosion-resistant anchoring assemblies complete with leveling adjustment at tops and bottoms of pilasters. Provide shoes and sleeves (caps) at pilasters to conceal anchorage.

2.04 DOOR FABRICATION:

- A. General: Unless otherwise indicated, provide 24-inch-wide in-swinging doors for standard toilet compartments and 36-inch-wide out-swinging doors with a minimum 32-inch-wide clear opening for compartments indicated to be handicapped accessible.
- B. Hardware: Provide doors with the following:
 - 1. Hinges: Manufacturer's standard self-closing type that can be adjusted to hold door open at any angle up to 90 degrees.
 - 2. Latch: Concealed latch unit designed for emergency access. Provide units that comply with accessibility requirements of authorities having jurisdiction at compartments indicated to be handicapped accessible.
 - 3. Combination Stop/Keeper.
 - 4. Coat Hook: Manufacturer's standard combination hook and rubber-tipped bumper, sized to prevent door from hitting compartment-mounted accessories.
 - 5. Door Pull: Manufacturer's standard unit that complies with accessibility requirements of authorities having jurisdiction at out-swinging doors. Provide units on both sides of doors at compartments indicated to be handicapped accessible.

2.05 STAINLESS-STEEL SHEET FINISHES:

- A. General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations relative to applying and designating finishes.
 - 1. Remove or blend tool and die marks and stretch lines into finish.
 - 2. Grind and polish surfaces to produce uniform, directional textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.
- B. Finish: Manufacturer's standard No. 4 directional polish.
- C. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.
- D. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipment.

PART 3 - EXECUTION

3.01 PREPARATION:

- A. Verify dimensions before proceeding and obtain measurements at the structure for work to be accurately fitted to other construction, including wall-to-wall dimensions, floor-to-ceiling dimensions and those controlled by other trades.
- B. Examine surfaces and parts of structure to which work is to be applied. Notify the Engineer of defects or conditions detrimental to proper installation so that remedial measures may be accomplished by trades involved.
- C. Remove foreign substances from surfaces to receive specified work.

3.02 INSTALLATION:

- A. General: Install units to the adjoining construction as shown on Contract Drawings and approved shop drawings.
- B. General: Comply with manufacturer's written installation instructions. Install units rigid, straight, plumb, and level. Provide clearances of not more than 1/2inch between pilasters and panels and not more than 1 inch between panels and walls. Secure units in position with manufacturer's recommended anchoring devices.
 - 1. Secure panels to walls and panels with not less than 2 stirrup brackets attached near top and bottom of panel. Locate wall brackets so holes for wall anchors occur in masonry or tile joints. Align brackets at pilasters with brackets at walls.
- C. Overhead-Braced-and-Floor-Anchored Compartments: Secure pilasters to floor and level, plumb, and tighten. Secure continuous head rail to each pilaster with not less than 2 fasteners. Hang doors level and plumb without twist or warp and adjust so tops of doors are parallel with overhead brace when doors are in closed position and with maximum clearance of 3/16-inch at vertical edges.
- D. Floor-Anchored Compartments: Set pilaster units with anchors penetrating not less than 2 inches into structural floor, unless otherwise indicated in manufacturer's written instructions.

Level, plumb, and tighten pilasters. Hang doors level and plumb without twist or warp and adjust so tops of doors are parallel with overhead brace when doors are in closed position and with maximum clearance of 3/16-inch at vertical edges.

- E. Ceiling-Hung Compartments: Secure pilasters to supporting structure and level, plumb, and tighten. Hang doors level and plumb without twist or warp and adjust so tops of doors are parallel with overhead brace when doors are in closed position and with maximum clearance of 3/16-inch at vertical edges.
- F. Floor-and-Ceiling-Anchored Compartments: Secure pilasters to supporting construction and level, plumb, and tighten. Hang doors level and plumb without twist or warp and adjust so tops of doors are parallel with overhead brace when doors are in closed position and with maximum clearance of 3/16-inch at vertical edges.
- G. Screens: Attach with anchoring devices according to manufacturer's written instructions and to suit supporting structure. Set units level and plumb and to resist lateral impact.
- H. Clean finished surfaces according to manufacturer's written instructions and leave them free from imperfections. Touch up marred painted surfaces with matching materials furnished by manufacturer.
- I. After installation, Provide final protection and maintain conditions that ensure toilet compartments and screens are without damage or deterioration at the time of Substantial Completion.

3.03 TESTING AND ADJUSTING OF COMPLETED WORK:

- A. Hardware:
 - 1. Test proper operation of hardware by opening and closed each door through ten cycles.
 - 2. Adjust and lubricate hardware according to manufacturer's written instructions for proper operation.
 - 3. Set hinges on in-swinging doors to hold open approximately 30 degrees from closed position when unlatched. Set hinges on out-swinging doors and swing doors in entrance screens to return to fully closed position.
 - 4. Adjust, repair or replace malfunctioning hardware.

3.04 CLEANING:

- A. Leave areas surrounding the work in broom-clean condition.

END OF SECTION

SECTION 10200

METAL LOUVERS

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing fixed, extruded aluminum and formed-metal louvers, blank-off panels and accessories.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Seals and Sealants: Section 07900.
- B. Metal Doors and Frames: Section 08110.
- C. Field Painting: Section 09920.
- D. Mechanical Equipment: Division 15.

1.03 DEFINITIONS:

- A. Louver Terminology: Definitions of terms for metal louvers contained in AMCA 501 apply to this Section, unless otherwise defined in this Section or in referenced standards.
- B. Standard Free Area: Free area of a louver 48 inches wide by 48 inches high, identical to that provided.
- C. Maximum Standard Airflow: Airflow at point of beginning water penetration through a louver 48 inches wide by 48 inches high, identical to that provided.
- D. Drainable-Blade Louver: Louver designed to collect and drain water to exterior at sill by means of gutters in front edges of blades and channels in jambs and mullions.

1.04 PERFORMANCE REQUIREMENTS:

- A. Structural Performance: Provide exterior metal louvers capable of withstanding the effects of loads and stresses from wind and normal thermal movement without evidencing permanent deformation of louver components including blades, frames, and supports; noise or metal fatigue caused by louver blade rattle or flutter; or permanent damage to fasteners and anchors.
 - 1. Wind Load: Uniform pressure (velocity pressure) of 20 lbf/sq. ft., acting inward or outward.
 - 2. Thermal Movements: Provide louvers that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, and other detrimental effects:

- a. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.
- B. Air-Performance, Water-Penetration, and Air-Leakage Ratings: Provide louvers complying with performance requirements indicated, as demonstrated by testing manufacturer's stock units 48 inches wide by 48 inches high. Test units according to AMCA 500.
 - 1. Perform testing on unpainted, cleaned, degreased units.
 - 2. Perform water-penetration testing on louvers without screens.

1.05 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Product Data: For each type of product specified provide manufacturer's printed product information.
- B. Shop Drawings: For louver units and accessories. Include plans; elevations; sections; and details showing profiles, angles, and spacing of louver blades. Show unit dimensions related to wall openings and construction; free area for each size indicated; profiles of frames at jambs, heads, and sills; and anchorage details and locations.
 - 1. For installed louvers and vents indicated to comply with design loadings, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- C. Samples for Initial Selection: Manufacturer's color charts showing the full range of colors available for units with factory-applied color finishes.
- D. Samples for Verification: Of each type of metal finish required, prepared on Samples of same thickness and material indicated for final Work. Where finishes involve normal color and texture variations, include Sample sets showing the full range of variations expected.
- E. Product Certificates: Signed by manufacturers of louvers certifying that the products furnished comply with requirements and are licensed to bear the AMCA seal based on tests made according to AMCA 500 and complying with AMCA's Certified Ratings Program.

1.06 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Codes and regulations of the jurisdictional authorities.
 - 2. AAMA: 603.8, 605.2, 607.1.
 - 3. AMCA: 500, 501.

4. ASTM: A653, a780, B26, B209, B221, C612, D1187.
5. AWS: D1.2, D1.3.
6. NAAMM: Metal Finishes Manual for Architectural and Metal Products.
7. SMACNA: Architectural Sheet Metal Manual.
8. SSPC: Paint 12.Codes, Regulations, Reference Standards and Specifications:
9. Codes and regulations of the jurisdictional authorities.
10. ASTM:
11. AWS: D1.2., D1.3.
12. NAAMM: Metal Finishes Manual for Architectural and Metal Products.SMACNA: Architectural Sheet Metal Manual.

- B. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of kind indicated. Engineering services are defined as those performed for installations of louvers that are similar to those indicated for this Project in material, design, and extent.
- C. Source Limitations: Obtain louvers and vents through one source from a single manufacturer where alike in one or more respects regarding type, design, or factory-applied color finish.
- D. Welding Standards: As follows:
1. Comply with AWS D1.2, "Structural Welding Code--Aluminum."
 2. Comply with AWS D1.3, "Structural Welding Code--Sheet Steel." Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification.
- E. SMACNA Standard: Comply with SMACNA's "Architectural Sheet Metal Manual" recommendations for fabrication, construction details, and installation procedures.

1.07 PROJECT CONDITIONS:

- A. Field Measurements: Verify louver openings by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish opening dimensions and proceed with fabricating louvers without field measurements. Coordinate construction to ensure that actual opening dimensions correspond to established dimensions.

PART 2 -PRODUCTS

2.01 MATERIALS:

- A. Aluminum Extrusions: ASTM B221, alloy 6063-T5 or T-52
- B. Aluminum Sheet: ASTM B209, alloy 3003 or 5005 with temper as required for forming, or as otherwise recommended by metal producer for required finish
- C. Aluminum Castings: ASTM B26/B26M, alloy 319.
- D. Galvanized Sheet Steel: ASTM A653/A653M, G90 zinc coating, mill phosphatized.
- E. Fasteners: Of same basic metal and alloy as fastened metal or 300 series stainless steel, unless otherwise indicated. Do not use metals that are incompatible with joined materials.
 - 1. Use types and sizes to suit unit installation conditions.
 - 2. Use Phillips flat-head screws for exposed fasteners, unless otherwise indicated.
- F. Anchors and Inserts: Of type, size, and material required for loading and installation indicated. Use nonferrous metal or hot-dip galvanized anchors and inserts for exterior installations and elsewhere as needed for corrosion resistance. Use toothed steel or expansion bolt devices for drilled-in-place anchors.
- G. Bituminous Paint: Cold-applied asphalt mastic complying with SSPC-Paint 12 but containing no asbestos fibers, or cold-applied asphalt emulsion complying with ASTM D1187.

2.02 FABRICATION, GENERAL:

- A. Assemble louvers in factory to minimize field splicing and assembly. Disassemble units as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.
 - 1. Continuous Vertical Assemblies: Where height of louver units exceeds fabrication and handling limitations, fabricate units to permit field-bolted assembly with close-fitting joints in jambs and mullions, reinforced with splice plates and without interrupting blade-spacing pattern.
- B. Maintain equal louver blade spacing to produce uniform appearance.
- C. Fabricate frames, including integral sills, to fit in openings of sizes indicated, with allowances made for fabrication and installation tolerances, adjoining materials' tolerances, and perimeter sealant joints.

- D. Include supports, anchorages, and accessories required for complete assembly. Provide vertical mullions of type and at spacings indicated, but not more than recommended by manufacturer, or 72 inches o.c., whichever is less. At horizontal joints between louver units, provide horizontal mullions, unless continuous vertical assemblies are indicated.
- E. Provide sill extensions and loose sills made of same material as louvers where indicated or required for drainage to exterior and to prevent water penetrating to interior.
- F. Join frame members to one another and to fixed louver blades with fillet welds, threaded fasteners, or both, as standard with louver manufacturer, concealed from view; unless otherwise indicated or size of louver assembly makes bolted connections between frame members necessary.

2.03 FIXED, EXTRUDED-ALUMINUM LOUVERS:

- A. Louver Construction: Provide fixed-blade louvers with extruded-aluminum frames and blades.
- B. Horizontal Louvers: Either drainable- or nondrainable-blade (as indicated) type complying with the following:
 - 1. Louver Depth: As indicated.
 - 2. Frame Thickness: 0.125 inch, or as indicated.
 - 3. Blade Thickness: 0.125 inch, or as indicated.
 - 4. Performance Requirements: As indicated.
 - 5. AMCA Seal: Mark units with AMCA Certified Ratings Seal.
- C. Continuous, Horizontal, Drainable-Blade Louvers: Fabricated with close-fitting, field-made splice joints in blades designed to permit expansion and contraction without deforming blades or framework and with mullions recessed from front edges of blades so blades have continuous appearance.
 - 1. Louver Depth: As indicated.
 - 2. Frame Thickness: 0.125 inch, or as indicated.
 - 3. Blade Thickness: 0.125 inch, or as indicated.
 - 4. Blade Profile: As indicated.
 - 5. Blade Angle and Spacing: As indicated.

2.04 FIXED, FORMED-METAL LOUVERS:

- A. Louver Construction: Provide fixed-blade louvers with frames and blades formed from metal sheet of metal indicated.

- B. Horizontal Louvers: Either drainable- or nondrainable-blade type (as indicated) complying with the following
1. Louver Depth: As indicated.
 2. Frame and Blade Material: Galvanized steel sheet, 0.052 inch.
 3. Performance Requirements: As indicated.

2.05 LOUVER SCREENS:

- A. General: Provide each exterior louver with louver screens complying with the following requirements:
1. Screen Location for Fixed Louvers: Interior face.
 2. Screening Type: Bird screening, unless otherwise indicated.
 3. Screening Type: Insect screening, as indicated.
- B. Secure screens to louver frames with stainless-steel machine screws, spaced a maximum of 6 inches from each corner and at 12 inches o.c.
- C. Louver Screen Frames: Fabricate screen frames with mitered corners to louver sizes indicated and to comply with the following requirements:
1. Metal: Same kind and form of metal as indicated for louver to which screens are attached..
 - a. Reinforce extruded-aluminum screen frames at corners with clips.
 2. Finish: Same finish as louver frames to which louver screens are attached.
 3. Type: Rewirable frames with a driven spline or insert for securing screen mesh.
- D. Louver Screening for Aluminum Louvers: As follows:
1. Bird Screening: Aluminum, ½-inch-square mesh, 0.063-inch wire
 2. Insect Screening: Aluminum, 18-by-16 mesh, 0.012-inch wire.
- E. Louver Screening for Galvanized Steel Louvers: As follows:
1. Bird Screening: Galvanized steel, ½-inch square mesh, 0.047-inch wire.
 2. Insect Screening: Galvanized steel, 18-by-14 mesh, 0.011-inch wire.
 3. Insect Screening: Aluminum, 18-by-16 mesh, 0.012-inch wire.
- F. Louver Screening for Galvanized Steel Louvers: As follows:
1. Bird Screening: Galvanized steel, 1/2-inch-square mesh, 0.047-inch wire.
 2. Insect Screening: Galvanized steel, 18-by-14 mesh, 0.011-inch wire.

2.06 BLANK-OFF PANELS:

- A. General: Fabricate blank-off panels from materials and to sizes indicated and comply with the following requirements:
 - 1. Finish: Same as finish applied to louvers.
 - 2. Attach blank-off panels to back of louver frames with clips.

- B. Insulated, Blank-off Panels: Laminated metal-faced panels consisting of insulating core surfaced on back and front with metal sheets, complying with the following requirements:
 - 1. Thickness: 1 inch.
 - 2. Metal Facing Sheets: Aluminum sheet, 0.032 inch thick.
 - 3. Insulating Core: Unfaced, rigid, glass-fiberboard insulation complying with ASTM C612, Class 1 and 2.
 - 4. Edge Treatment: Trim perimeter edges of blank-off panels with louver manufacturer's standard extruded-aluminum-channel frames 0.081 inch -thick, with corners mitered and with same finish as panels.

2.07 FINISHES, GENERAL:

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

- B. Finish louvers after assembly.

2.08 ALUMINUM FINISHES:

- A. Finish designations prefixed by AA comply with system established by the Aluminum Association for designating aluminum finishes.

- B. Class II, Clear Anodic Finish: AA-M12C22A31 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class II, clear coating 0.010 mm or thicker) complying with AAMA 607.1.

- C. Baked-Enamel Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Apply baked enamel complying with paint manufacturer's specifications for cleaning, conversion coating, and painting.
 - 1. Organic Coating: Thermosetting, modified-acrylic enamel primer/topcoat system complying with AAMA 603.8, except with a minimum dry film thickness of 1.5 mils, medium gloss.
 - 2. Color: As selected by the Engineer from manufacturer's full range of colors.

- D. High-Performance Organic Coating Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
 - 1. Fluoropolymer Three-Coat Coating System: Manufacturer's standard three-coat, thermocured system consisting of specially formulated inhibitive primer, fluoropolymer color coat, and clear fluoropolymer topcoat, with both color coat and clear topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; complying with AAMA 605.2.
 - a. Color and Gloss: As selected by the Engineer from manufacturer's full range of colors and glosses.

2.09 GALVANIZED STEEL SHEET FINISHES:

- A. Surface Preparation: Clean surfaces of dirt, grease, and other contaminants. Clean welds, mechanical connections, and abraded areas and repair galvanizing according to ASTM A780. Apply a conversion coating of type suited to organic coating applied over it.
- B. Baked-Enamel Finish: Immediately after cleaning and pretreating, apply manufacturer's standard two-coat, baked-enamel finish consisting of prime coat and thermosetting topcoat, with not less than 1.0-mil dry film thickness for topcoat. Comply with paint manufacturer's written instructions for applying and baking to achieve a minimum dry film thickness of 2.0 mils.
 - 1. Color and Gloss: As selected by the Engineer from manufacturer's full range of colors and glosses.

PART 2 - EXECUTION

3.01 PREPARATION:

- A. Coordinate Setting Drawings, diagrams, templates, instructions, and directions for installation of anchorages that are to be embedded in concrete or masonry construction. Coordinate delivery of such items to Project site.

3.02 INSTALLATION:

- A. Locate and place louver units level, plumb, and at indicated alignment with adjacent work.
- B. Use concealed anchorages where possible. Provide brass or lead washers fitted to screws where required to protect metal surfaces and to make a weathertight connection.

- C. Form closely fitted joints with exposed connections accurately located and secured.
- D. Provide perimeter reveals and openings of uniform width for sealants and joint fillers, as indicated
- E. Repair finishes damaged by cutting, welding, soldering, and grinding. Restore finishes so no evidence remains of corrective work. Return items that cannot be refinished in the field to the factory, make required alterations, and refinish entire unit or provide new units.
- F. Protect galvanized and nonferrous-metal surfaces from corrosion or galvanic action by applying a heavy coating of bituminous paint on surfaces that will be in contact with concrete, masonry, or dissimilar metals.
- G. Install concealed gaskets, flashings, joint fillers, and insulation, as louver installation progresses, where weathertight louver joints are required. Comply with Section 07900 for sealants applied during louver installation.

3.03 ADJUSTING, CLEANING, AND PROTECTING:

- A. Test operation of adjustable louvers and adjust as needed to produce fully functioning units that comply with requirements.
- B. Periodically clean exposed surfaces of louvers and vents that are not protected by temporary covering to remove fingerprints and soil during construction period. Do not let soil accumulate until final cleaning.
- C. Before final inspection, clean exposed surfaces with water and a mild soap or detergent not harmful to finishes. Thoroughly rinse surfaces and dry.
- D. Protect louvers and vents from damage during construction. Use temporary protective coverings where needed and approved by louver manufacturer. Remove protective covering at the time of Substantial Completion.
- E. Restore louvers and vents damaged during installation and construction so no evidence remains of corrective work. If results of restoration are unsuccessful, as determined by Architect, remove damaged units and replace with new units.
 - 1. Clean and touch up minor abrasions in finishes with air-dried coating that matches color and gloss of, and is compatible with, factory-applied finish coating.

END OF SECTION

THIS PAGE NOT USED

SECTION 10431

INTERIOR SIGNAGE

PART I - GENERAL

1.01 SUMMARY OF WORK

- A. This section specifies providing interior signs.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Exterior Signage: Section 10436.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Codes and regulations of the jurisdictional authorities.
 - 2. ADA: Americans with Disabilities Act.
 - 3. ANSI: A117.1.
- B. Qualifications of Sign Manufacturer. Provide the products of an established manufacturer, regularly engaged in the production of interior signage of the types specified herein.

1.04 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings:
 - 1. Drawings showing sign graphics and details of fabrication and mounting for each sign type.
 - 2. Full-size layout of graphics for approval prior to fabricating signs. Include art work, symbol pictograms and inter-letter and inter-word spacings.
 - 3. Technical data and manufacturer's specifications for all sign materials, and other product data as directed.
- B. Samples: Submit three samples of each required type of sign with specified color and finish.
- C. Signage Schedule: Provide sign schedule listing sign types, door numbers, room names, and room numbering system coordinated with the Authority Representative.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to the job site in their original unopened containers clearly labeled with the manufacturer's name, brand designation and description of contents as applicable.
- B. Store products in an approved dry area, protected from contact with soil and exposure to the elements. Keep products dry at all times.
- C. Handle products in a manner that will prevent breakage of containers and damage to products.

PART 2 - PRODUCTS

2.01 MATERIALS:

2.02 INTERIOR PLAQUE SIGNS, Type A and B.

Provide matte and finish plaques in sizes as specified. Fabricate of 1/8 inch phenolic photopolymer and with raised and braille characters and symbols. Provide 1/2 inch radius corners. Comply with ADA and ANSI.

- A. Sign Type A: 4 inches by 8 inches for permanent rooms and spaces.
- B. Sign Type B: 8 inches by 8 inches for Toilet Rooms with pictograms.

2.03 GRAPHICS APPLICATION:

- A. Raised Letters:
 - 1. Raised Characters and Symbols: Raised 1/32 inch minimum and at least 5/8 inch high. Meet width/stroke to height ratios. Locate Room Number below Room Name and Braille below Room Name.
 - 2. Mounting Location and Height Locate along side door on latch side mounted 60 inches above the bottom of the door to sign center line.

2.04 BRAILLE:

- A. Grade II Braille, justified to copy, below text copy.

2.05 PLAQUE MESSAGES:

- A. Message content shall be as scheduled.
 - 1. Typeface: Standard Medium.
 - 2. Type size: 5/8 inch high minimum uppercase.
 - 3. Background color: Medium Bronze.
 - 4. Message color: White.
 - 5. Contrast: 70 percent minimum.

2.06 MOUNTING:

- A. Vinyl Tape:
 - 1. Provide 1/16 inch foam tape with adhesive on both sides in sufficient quantity to securely mount plaque to substrate.

2.07 FABRICATION:

- A. General:
 - 1. Fabricate signs to be smooth, free of scratches, gouges, bubbles, bulging, embedded materials between surface and background color, and other imperfections.
 - 2. Fabricate signs of the materials and to the dimensions shown, with straight lines, smooth curves, sharply delineated graphics and flat planes.
- B. Characters and Symbols:
 - 1. Characters (letters and numbers): Standard medium, upper case.

2. Symbols:
 - a. Symbol pictograms for men, women, and handicapped accessibility.

C. Layout:

1. Position all graphics and pictograms to comply with ADA.
2. Spacing: Inter-letter and inter-word spacing to meet sign manufacturer's standards.

PART 3 - EXECUTION:

3.01 Preparation:

- A. Examine condition of surfaces on which signs will be installed.

3.02 INSTALLATION:

- A. General:
 1. Install work plumb, level, and properly aligned.
 2. Install signs so as not to catch clothing on edges or otherwise create a hazardous condition.
 3. Provide attachments and fastenings as required for secure and rigid anchorage.

3.03 CLEANING AND PROTECTION:

- A. Thoroughly clean installed work using materials and methods recommended by the sign manufacturer.
- B. Protect installation from damage or soiling.

END OF SECTION

THIS PAGE NOT USED

SECTION 10436

EXTERIOR SIGNAGE

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing exterior signs.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Pavement striping and handicap parking symbol: Section 02765.
- B. Interior signage: Section 10436.

1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Codes and regulations of the jurisdictional authorities.
 - 2. OSHA Regulations.
 - 3. ADA: Americans with Disabilities Act.
 - 4. ANSI: A117.1
 - 5. Standard Specification for Construction of Roads and Bridges on Federal Highway Projects.
- B. Qualifications of Sign Manufacturer: Provide the products of an established manufacturer, regularly engaged in the production of exterior and interior signage of the types specified herein.
- C. Testing: Perform the following tests on 12-inch by 12-inch samples of sign materials processed in the production run. Furnish copies of test results to the Engineer.
 - 1. Sign surfaces and finishes to show no discernable color change or chalking when exposed for 1,000 hours in an Atlas Twin Arch Weatherometer Model HVDI-X or equal, when tested in accordance with ASTM D822.

1.04 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings:
 - 1. Drawings showing sign graphics and details of fabrication, erection and mounting connections, including inserts and anchors for each sign type.
 - 2. Full-size layout of graphics for approval prior to fabricating signs. Include art work for arrow forms and symbol pictograms and use proper inter-letter and inter-word spacing.
 - 3. Technical data and manufacturer's specifications for all sign materials, paints, fasteners and other product data as directed.
 - 4. Manufacturer's current recommended installation procedures for the cast aluminum characters.
- B. Samples: Submit three samples of each required type of the following products with specified color and finish:

1. Cast aluminum characters.
2. Vinyl graphics sign: 12-inch lengths.
3. Aluminum sign with shop-applied reflective vinyl graphics.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to the job site in their original unopened containers clearly labeled with the manufacturer's name, brand designation and description of contents as applicable.
- B. Store products in an approved dry area, protected from contact with soil and exposure to the elements. Keep products dry at all times.
- C. Handle products in a manner that will prevent breakage of containers and damage to products.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Cast Aluminum Characters: Aluminum Alloy 214.
 1. Textural finish:
 - a. Faces: Medium satin, NAAMM AA-M32.
 - b. Sides: Medium matte, NAMM AA-M43.
 2. Color finish: Chemical-pre-anodic cleaning followed by light bronze or gold integral color anodized class 1 finish, NAAMM AA-C12A-42, color tone as approved by Engineer.
- B. Vinyl Graphics: Adhesive-backed vinyl film with graphics screen printed with permanent vinyl inks as recommended by manufacturer, clear top coated and carrier mounted. Use 3M Company products or equal.
 1. Quality: Provide vinyl graphics materials and application that will not fade, discolor, peel, crack, blister or delaminate from the substrates for at least 5 years.
 2. Provide vinyl graphics materials, including films, adhesives, inks and coatings, by one manufacturer in order to ensure total compatibility of each sign system component.
 3. Adhesive: Pressure sensitive in accordance with the recommendations of the manufacturer. Use positionable adhesive film equal to Controltac by 3M for all field-applied graphics.
 4. Clear Coating: Clear vinyl ink with UV inhibitors, equal to Scotchcal Screen Printing Ink by 3M.
- C. Aluminum Signs with Shop-Applied Reflective Vinyl Graphics:
 1. Sheet Aluminum: ASTM B209, Alloy 3003-H14, standard one-side bright finish, flat sheet, minimum 0.08 inch thick.
 2. Reflective Vinyl: Same as specified above for Vinyl Graphics, but with the following additional requirements:
 - a. Reflective Vinyl: High intensity reflective acrylic film containing encapsulated optical lenses. Durability and retroreflective qualities are to be equal to or exceed the following standards for at least ten years:
 - 1) FS L-S-300C, Table VIII Reflectivity 2 and Durability 2200 hours.
 - 2) Standard Specification for Construction of Roads and Bridges on Federal Highway Projects, FP-79, for sheet reflective material, Table V-A, Type III 633.06, and Testing Procedures 718.01.
 - b. Graphics: Silk-screen applied in transparent acrylic ink colors equal to 3M Scotchlite 880 series inks, in colors as shown; die cut and carrier mounted.

Clear coat in the shop all silk recommended by manufacturer.

- c. Adhesive: For shop-applied graphics, use either pressure sensitive or dry vacuum-applied and heat-activated adhesive.
- d. Quality and source: Equal to 3M Scotchlite High Intensity Grade reflective sheeting; Series 3870 (pressure sensitive adhesive) or Series 2870 (dry adhesive).

D. Paint for Sign Backs:

- 1. Epoxy Primer: High-build epoxy-polyamide corrosion-resistant prime coating for application to substrates shown.
 - a. Dry film thickness: three to five mils per coat.
 - b. Source: 66-1211 Hi-Build Epoxy Primer as manufactured by Tnemec or equal.
- 2. Urethane Paint: Aliphatic polyester polyurethane enamel, gloss finish.
 - a. Dry film thickness: 1.5 to 2.5 mils per coat.
 - b. Colors: As shown.
 - c. Source: Series 70 Endura-shield as manufactured by Tnemec or equal.

E. Colors: As shown on drawings, matching the WMATA standard colors for graphics, as approved: gloss finish, Munsell System of Color Notation, Federal Spec Color System or Pantone Matching System as applicable.

F. Concrete for Footings of Post-Mounted Signs: As specified in Section 3300, Cast-In-Place-Concrete.

G. Hardware: Non-corrosive *or* type and size shown or required, unless otherwise specified.

- 1. Bolts, nuts, screws, metal washers: Steel, ASTM A307 hot-dip galvanized per ASTM A153, or stainless steel ASTM A193 alloy 304 as shown or specified, hexagonal head, round head or flathead as shown, tamper proof.
- 2. Neoprene rubber spacer. Use at cast aluminum characters. ASTM D1056 polychloroprene synthetic rubber *or* size required. Shore durometer hardness *of* 80, plus or minus 10, in accordance with ASTM D2240.
- 3. Steel channel for fence mounting: 1 'A inch by 3/4 inch by 16 gauge, hot-dip galvanized; 1.23 ounces *o* of zinc per square foot, ASTM A123; with galvanizing repair paint at cuts MIL-P-21-35 applied in two coats.

2.02 GRAPHICS APPLICATION:

A. Raised Letters:

- 1. Raised Characters and Symbols: Raised 1/32 inch minimum and at least 5/8 inch high. Meet width/stroke to height ratios. Locate Room Number below Room Name and Braille below Room Name.

2.03 BRAILLE:

A. Grade II Braille, justified to copy, below text copy.

2.04 FABRICATION:

A. General:

- 1. Fabricate signs to be smooth, free of scratches, gouges, burrs, bubbles, bulging, embedded materials between surface and background color, and other imperfections.

2. Fabricate signs of the materials and to the dimensions shown, with straight lines smooth curves, sharply delineated graphics and flat planes.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Examine condition of surfaces on which signs will be installed
- B. Take field measurements for work fabricated to fit job conditions. Note field measurements as such on shop drawings

3.02 INSTALLATION:

- A. General:
 1. Install work plumb, level and properly aligned, securely braces as necessary until permanent anchorage is made.
 2. Carefully cut, drill and fit as necessary to produce expert results.
 3. Install signs so as not to catch clothing on edges or otherwise create a hazardous condition.
 4. Provide attachments, supports and fastenings as required for secure and rigid anchorage.
- B. Vinyl Graphics:
 1. Apply without air bubbles or other defects in accordance with film manufacturers recommendations.
 2. Shop apply graphics wherever possible. Where field application is necessary, carefully verify location, lightly touch graphic sheeting to activate tacking ability while still mounted on carrier film. Adjust position, retacking as necessary until correctly located, then finish the application.

3.03 CLEANING AND PROTECTION:

- A. Thoroughly clean installed work using materials and methods recommended by the sign manufacturer.
- B. Protect installation from damage or soiling.

END OF SECTION

SECTION 10505

METAL LOCKERS

PART 1 -GENERAL

1.01 SCOPE OF WORK:

- A. This section specifies providing metal wardrobe lockers and wood benches.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Cast-in-Place Structural Concrete: Section 03300.
- B. Concrete Unit Masonry: Section 04220.
- C. Rough Carpentry: Section 06100.
- D. Seals and Sealants: Section 07900.
- E. Tile: Section 09320.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Product Data: Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type of locker and bench.
- B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other Work.
 - 1. Show locker fillers, trim, base, sloping tops, and accessories. Include locker-numbering sequence.
- C. Samples for Initial Selection: Manufacturer's color charts showing the full range of colors available for units with factory-applied color finishes.
- D. Samples for Verification: For the following products, in manufacturer's standard sizes, showing the full range of color, texture, and pattern variations expected. Prepare Samples from the same material to be used for the Work.
 - 1. Lockers: Three samples, on metal, of each color and finish to be provided on lockers.
 - 2. Locker benches: Three samples of finished wood.

1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ADA: Americans with Disabilities Act.
 - 3. ASTM: A366.
 - 4. NAAMM: Metal Finishes for Architectural and Metal Products.
- B. Source Limitations: Where practical, obtain locker units and accessories through one source from a single manufacturer.

1.05 DELIVERY, STORAGE, AND HANDLING:

- A. Do not deliver lockers until spaces to receive them are clean, dry, and ready for locker installation
- B. Ship lockers assembled with number plates attached.
- C. Protect lockers from damage during delivery, handling, storage, and installation.
- D. Deliver master keys, control keys, and combination control charts to the Engineer.

1.06 COORDINATION:

- A. If applicable, coordinate size and location of concrete bases. Concrete, reinforcement, and formwork requirements are specified in Section 03300 "Cast-in-Place Concrete."

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Cold-Rolled Steel Sheet: ASTM A366/A366M, matte finish, suitable for exposed applications, and stretcher leveled or roller leveled to stretcher-leveled flatness.
- B. Fasteners: Zinc- or nickel-plated steel, slotless-type exposed bolt heads, and self-locking nuts or lock washers for nuts on moving parts.

2.02 LOCKERS:

- A. Body: Form backs, tops, bottoms, sides and intermediate partitions from steel sheet; flanged for double thickness at back vertical corners. Comply with the following:
 - 1. Back-Material Sheet Thickness: 0.0478-inch-thick minimum.
 - 2. Side-Material Sheet Thickness: 0.0598-inch-thick minimum.
- B. Frames: Form channel frames from minimum 0.0598-inch-thick steel sheet; lapped and welded at corners. Form continuous integral door strike on vertical frame members. Provide resilient bumpers to cushion door closing.
 - 1. Latch Hooks: Form from minimum 0.1046-inch-thick steel; welded or riveted to door frames.
 - 2. Cross Frames: Form intermediate channel cross frames between tiers from minimum 0.0598-inch-thick steel sheet. Weld to vertical frame members.
- C. Solid Steel Doors: One-piece steel sheet, formed into channel shape at vertical edges and flanged at right angles at top and bottom edges. Fabricate to prevent springing when opening or closing, and to swing 180 degrees. Comply with the following:
 - 1. Sheet Thickness: 0.0598 inch minimum.
 - 2. Reinforcement: Brace or reinforce inner face of doors more than 15 inches wide.
 - 3. Louvered Vents: Stamped, louvered vents in door face, as follows:
 - a. Single-Tier Lockers: No fewer than six louver openings at top and bottom.
 - b. Double-Tier Lockers: No fewer than three louver openings at top and bottom.
- D. Shelves: Provide hat shelf in single-tier units, fabricated from minimum 0.0598-inch-thick formed-steel sheet; flanged on all edges.

- E. Hinges: Steel, full loop, five or seven knuckle; tight pin; minimum 2 inches high. Weld to inside of door frame and attach to door with at least two factory-installed fasteners that are completely concealed and tamper resistant when door is closed.
 - 1. Provide at least three hinges for each door more than 42 inches high and at least two hinges for each door 42 inches high or less.
- F. Continuous Hinges: Manufacturer's standard, steel continuous hinge mounted to door and frame.
- G. Recessed Handle and Latch: Manufacturer's standard housing, formed from 0.0359-inch-thick nickel-plated steel or stainless steel, with integral door pull, recessed for latch lifter and locking devices; nonprotruding latch lifter; and automatic, prelocking, pry-resistant latch, as follows:
 - 1. Provide minimum three-point latching for each door more than 42 inches high; minimum two-point latching for each door 42 inches high or less.
 - a. Provide strike and eye for padlock.

2.03 LOCKER ACCESSORIES:

- A. Interior Equipment: Furnish each locker with the following items, unless otherwise indicated:
 - 1. Hooks: Manufacturer's standard zinc-plated, ball-pointed steel. Provide one double-prong ceiling hook, and not fewer than two single-prong wall hooks for single-, double-, and triple-tier units. Attach hooks with at least two fasteners.
 - 2. Coat Rods: Manufacturer's standard galvanized steel. Provide rod in lieu of ceiling hook for lockers 18 inches deep or greater.
- B. Number Plates: Manufacturer's standard etched, embossed, or stamped, aluminum number plates with numerals at least 3/8 inch high. Number lockers in sequence as directed by Engineer. Attach plates to each locker door, near top, centered, with at least two aluminum rivets.
- C. Continuous Metal Base: Minimum 0.0598-inch-thick steel sheet, 4 inches high or as indicated on approved shop drawings, channel or zee profiled for stiffness, fabricated in lengths as long as practicable to enclose base and base ends of lockers, and finished to match lockers.
- D. Individually Sloping Tops: Manufacturer's standard, fabricated from minimum 0.0239-inch-thick steel sheet, for installation in place of flat locker tops. Fabricate tops in width to fit one locker frame, with integral back, finished to match lockers. Provide fasteners, filler plates, supports, and wedge-shaped divider panels for each locker upright.
- E. Recess Trim: Manufacturer's standard; fabricated from minimum 0.0478-inch-thick steel sheet, minimum 2-1/2-inch face width, and finished to match lockers. Fabricate trim in lengths as long as practicable.
- F. Filler Panels: Manufacturer's standard; fabricated from minimum 0.0478-inch-thick steel sheet in an unequal leg angle shape, and finished to match lockers. Provide slip joint filler angle formed to receive filler panel.
- G. Finished End Panels: Manufacturer's standard; fabricated from minimum 0.0239-inch-thick steel sheet, finished to match lockers, and designed for concealing exposed ends of nonrecessed lockers.

1. Provide one-piece panels for double-row (back-to-back) locker ends.

2.04 LOCKER BENCHES:

- A. Bench Tops: Provide manufacturer's standard one-piece units, of the following material, minimum 9-1/2 inches wide by 1-1/4 inches thick, with rounded corners and edges:
 1. Laminated maple with one coat of clear sealer on all surfaces, and one coat of clear lacquer on top and sides.
- B. Pedestals: Provide manufacturer's standard pedestal supports, with predrilled fastener holes, complete with fasteners and anchors, and as follows:
 1. Type: Tubular steel, minimum 1-1/2-inch diameter, threaded on both ends, with standard pipe flange at top and bell-shaped cast base; baked-enamel finish; floor anchored with concealed fasteners..
 - a. Color: As selected by the Engineer from manufacturer's full range.
- C. Furnish a minimum of two pedestals for each bench, with pedestal spacing not more than 72 inches o.c.

2.05 FABRICATION:

- A. Unit Principle: Fabricate each locker with an individual door and frame, individual top, bottom, back, and shelves, and common intermediate uprights separating compartments.
- B. All-Welded Construction: Preassemble lockers by welding all joints, seams, and connections, with no bolts, screws, or rivets used in assembly. Grind exposed welds flush.
- C. Fabricate lockers square, rigid, and without warp, with metal faces flat and free of dents or distortion. Make exposed metal edges free of sharp edges and burrs, and safe to touch. Weld frame members together to form a rigid, one-piece assembly.
 1. Form locker-body panels, doors, shelves and accessories from one-piece steel sheet, unless otherwise indicated.

2.06 FINISHES, GENERAL:

- A. Finish all steel surfaces and accessories, except prefinished stainless-steel and chrome-plated surfaces.
- B. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- C. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- D. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.07 STEEL SHEET FINISHES:

- A. Surface Preparation: Clean surfaces of dirt, oil, grease, mill scale, rust, and other contaminants that could impair paint bond. Use manufacturer's standard methods.
- B. Baked-Enamel Finish: Immediately after cleaning and pretreating, apply manufacturer's standard baked-enamel finish consisting of a thermosetting topcoat. Comply with paint manufacturer's written instructions for applying and baking to achieve a minimum dry film thickness of 1.4 mils on doors, frames, and legs, and 1.1 mils elsewhere.
 - 1. Color and Gloss: As selected by the Engineer from manufacturer's full range.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine concrete bases for suitable conditions where metal lockers are to be installed.
 - 1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION:

- A. Install metal lockers and accessories level, plumb, rigid, and flush according to manufacturer's written instructions.
- B. Connect groups of all-welded lockers together with standard fasteners, with no exposed fasteners on face frames.
- C. Anchor lockers to floors and walls at intervals recommended by manufacturer, but not more than 36 inches o.c. Install anchors through backup reinforcing plates where necessary to avoid metal distortion, using concealed fasteners.
- D. Fit exposed connections of trim, fillers, and closures accurately together to form tight, hairline joints, with concealed fasteners and splice plates.
 - 1. Attach recess trim to recessed lockers with concealed clips.
 - 2. Attach sloping top units to lockers, with closures at exposed ends.
- E. Attach finished end panels with fasteners only at perimeter to conceal exposed ends of nonrecessed lockers.
- F. Anchor locker benches to floors Uniformly space pedestals not more than 72 inches apart, and securely fasten to bench top and anchor to floor.

3.03 ADJUSTING, CLEANING, AND PROTECTION:

- A. Adjust doors and latches to operate easily without binding. Verify that integral locking devices operate properly.
- B. Clean interior and exposed exterior surfaces and polish stainless-steel and nonferrous-metal surfaces.
- C. Protect lockers from damage, abuse, dust, dirt, stain, or paint. Do not permit locker use during construction.

- D. Touch up marred finishes, or replace locker units that cannot be restored to factory-finished appearance. Use only materials and procedures recommended or furnished by locker manufacturer.

END OF SECTION

SECTION 10600

STORAGE RETRIEVAL SYSTEM

PART 1 - GENERAL

1.01 DESCRIPTION

A. The general extent and scope of work to be performed under this Section consist of the furnishing and installation of a storage and retrieval system, including storage equipment noted below, in the new Component Parts Storage rooms at the Greenbelt Annex and the Shady Grove Shop. The existing storage and retrieval system in the Greenbelt Shop may be dismantled and reused in the Shady Grove Shop with modifications as necessary to generally conform to the requirements of this specification.

- 1 Storage and Retrieval System
- 2 Storage Cabinet, Drawer Type, 8-Drawer
- 3 Storage Cabinet, Drawer Type, 10-Drawer
- 4 Storage Cabinet, Drawer Type, 6-Drawer
- 5 Storage Cabinet, Drawer Type, Double Wide
- 6 Cabinet, Tool Lock-Up
- 7 Cage, Gas Cylinder
- 8 Shelving Unit, 18 in Deep
- 9 Pallet rack (4'x9')
- 10 Storage Cabinet
- 11 Safety Storage Cabinet

B. The provisions of Section 11001 Equipment General Requirements, apply to work of this Section

1.02 QUALITY ASSURANCE:

A. Experience: Equipment shall be produced by a manufacturer of established reputation with a minimum of five years experience supplying specified equipment

B. Manufacturer's of drawer cabinet units shall provide documentation from an independent testing laboratory, certifying that the drawer suspension system has been tested under full rated load conditions and has experienced an average of 3,000 cycles without failure

C. Reference Standards

- 1 ANSI - American National Standards Institute
- 2 OSHA - Occupational Safety & Health

1.03 SUBMITTALS:

A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each

- 1 Certificates: Fourteen days prior to shipment, submit four copies of certification that equipment to be delivered is in compliance with applicable codes

2. **Shop Drawings:** In accordance with the requirements of Section 01330; Design Construction Submittal Procedures, submit six copies of complete shop drawings to the Authority for approval, including but not limited to:
 - a. Equipment arrangement
 - b. Equipment outline dimensions
 - c. Assembly and subassemblies
 - d. Air systems
 - e. Wiring diagrams and schematics
 - f. Installation
3. **Operations and Maintenance Manual:** Submit in accordance with the requirements of General Conditions, Section 01780; Closeout Submittals.
4. **Operations and Maintenance Training:** Submit in accordance with requirements of General Conditions, Section 01820; Demonstration and Training, and Section 11001; Equipment General Requirements
5. **Contract Record Drawings:** Submit in accordance with the General Requirements, Section 01330; Design Construction Submittal Procedures, and Section 01780; Closeout Submittals

1.04 DELIVERY, STORAGE, AND HANDLING:

- A Ship equipment upon notification by the Engineer
- B Package, handle and store to prevent damage

1.05 WARRANTY

- C Furnish warranty for the work in this Section in accordance with the General Conditions
- D Provide a Manufacturer's full service, parts and labor, warranty for a period of 3 years from date of acceptance by the Authority.

1.06 TRAINING PROGRAM:

- A Design Builder is responsible for training as outlined in General Requirements Section 01820; Demonstration and Training, and Section 11001; Equipment General Requirements
- B Number of Personnel to be Trained and class size

Level of Training	Approximate Number of Individuals to be Trained	Maximum Class Size	Minimum Number of classes
Level I	8	8	1
Level II	4	4	1

PART 2 - PRODUCTS

2.01 STORAGE RETRIEVAL SYSTEM:

- A General. This specification covers a storage retrieval system employing 1) integral lifting forks mounted on top of 2) variable location racks which accept 3) removable steel pallets. It includes the physical and mechanical requirements of that equipment, as well as the engineering assistance to be supplied by the vendor.
- B Features and Construction
- 1 Storage racks
 - a The storage rack shall have a maximum capacity of 25,000 pounds per section and 50,000 pounds per bay.
 - b The overall height of the storage rack shall be 13'-0"
 - c The clear opening between columns shall be 1 1/2" greater than the pallet width
 - d The overall depth of each rack shall be 1 1/2" greater than the pallet depth
 - 2 Columns
 - a Columns shall be accurate and straight
 - b Columns shall be 13'-0" long.
 - c Roll formed front columns shall be a minimum of 3 1/2" wide (left to right) by a minimum 2 1/2" deep by a minimum 12 gauge thick steel and shall rest on a 5 1/2" by 8" (minimum of 44 sq. in.) Bearing pad
 - d Formed rear columns shall be a minimum 7-7/8" wide (left to right) by a minimum 2-5/8" deep by a minimum 10 gauge steel and shall rest on a 5 1/2" by 8" (minimum of 44 sq. in.) Bearing pad
 - e Each bearing pad shall be anchored to the floor with a minimum of two 1/2" diameter expansion anchors.
 - f Each bearing pad shall have a minimum 1/2" diameter leveling screw, independent of the anchors, with a vertical adjustment of 5/16" minimum
 - g Each column shall have pallet retainer notches spaced a maximum of 3-7/8" on center.
 - h The notches on the front columns shall be hooked for positive pallet engagement, while the notches on the rear columns shall be designed to facilitate loading and unloading without resistance or snagging.
 - i Column spacing shall be a maximum of 5" on center greater than the pallet width

3 Bridge Assembly

- a The bridge assembly shall run on rails mounted lengthwise on the top of the storage rack and shall support the trolley and mast assemblies free and clear above the floor
- b The bridge shall be constructed of rectangular welded box construction using 6" x 12 pound/ft wide flange beam construction and shall be capable of supporting 2,000 pounds live load.
- c The bridge wheels shall be 9" diameter double flange type with needle roller bearings with pressure grease fittings
- d A rail sweep shall be mounted in front of each wheel for derailment protection
- e Bridge shall have a cantilevered extension at one end

4 Trolley Assembly

- a The trolley assembly shall run on four wheels inside the flanges of the bridge beam and shall support the mast assembly
- b The wheels shall be a minimum 5" diameter flange-less wheel with permanently lubricated ball bearings
- c The trolley must be capable of supporting 2,000 pounds live load and shall be constructed of integral flanged steel plate to prevent binding of the turntables
- d In addition to the load bearing wheels, four stabilizing bearings shall be used to keep the trolley aligned within the bridge
- e Multiple trolleys shall be provided to serve all aisles

5 Rails

- a The rails shall be constructed of a minimum 20 pound per yard ASCE steel
- b The rails shall be mounted with sufficient accuracy to provide a smooth riding runway and must be capable of supporting the weight of the bridge, trolley mast assemblies, and a 2,000 pound load.
- c Rails shall terminate with stops capable of restraining a fully loaded bridge/mast assembly

6 Mast Assembly

- a The mast shall be constructed of two 6" minimum steel channels connected by ladder type truss members and shall be mounted to the trolley with a 360 degree continuous rotation turntable.
- b The turntable shall be a ball bearing type and capable of free rotation when carrying a 2,000 pound load
- c The rollers supporting the fork mounting plate assembly must operate inside the channels on high strength machined rails

- d. There shall be sufficient rollers to keep the fork assembly square and stable as it is raised and lowered by the chain hoist.
 - e. The mast shall be provided with a positive stop lock mechanism to prevent free-fall of the fork assembly in case of hoist chain breakage. The mechanism must restrain the free falling load in 3/4" travel or less.
 - f. Mast operating handles shall be mounted outboard of the mast for ease of rotation and shall be shrouded to prevent operator injury.
 - g. A minimum of 1/4" thick Plexiglass viewing window that is a minimum of 17" square shall be located in the mast at eye level.
 - h. A protective canopy and a trolley stop shall be provided over the operator for operator safety.
7. Forks
- a. The forks shall be mounted, adjustable for pitch and width, and have a 2,000 pound capacity measured 21" from the root.
 - b. The forks shall be minimum 4" wide by 1 1/4" thick by a minimum of 1" less than the depth of the pallet.
8. Pallets
- a. Steel pallets shall be capable of holding 2,000 pound uniformly distributed load
 - b. The pallets shall mate with the racks and be adjustable using the forks of the mast assembly described above.
 - c. The pallets shall be a minimum of No. 16 gauge steel and shall be reinforced with three to five "v" supports running left to right or perpendicular to the forks
 - d. The pallets shall have two-way (front to back) entry with enclosed fork guides on the front and shall have hooks at the front to provide self-centering engagement on the front columns
 - e. Provide 5 pallets per individual storage section. Design Builder to verify total number of pallets prior to shipping. Pallets shall each have a back lip 1 1/2" high and a magnetic label holder
9. Tub Kits
- a. A tub kit shall consist of four sidewalls which can be attached to a pallet to form a tub
 - b. Each tub shall be designed such that it can be divided into four equal size compartments using one partition (running back to front) and two dividers (running left to right)
 - c. Sidewalls, partitions, and dividers shall be a minimum No. 14 gauge steel

- d. Provide six tub kits, each with a wall height of 8 3/4".

10. Electrical Operation

- a. Each mast and trolley/bridge system shall be provided with an electrically operated hoist capable of raising and lowering a 2,000 pound load at a speed of 16 feet per minute.
- b. The hoist shall have a 1 HP motor and shall be dual voltage with electrical characteristics 208 volt, 3 phase, 60 hertz, or 460 volt, 3 phase, 60 hertz. The hoist shall be wired for 208 volt, 3 phase, 60 hertz for this project. All 115V power requirements for controls and lights shall be provided through a step-down transformer.
- c. The hoist shall be provided with a mechanical load brake (positive-stop type) connected to the load sheave, a solenoid-operated spring set multiple disc-type motor brake, and an overload limiting clutch (wet cone type) located in the hoist transmission.
- d. An insulated four bar power system and sliding power collector with replaceable shoes shall be provided to supply the electrical power to the trolley/bridge as specified above. Three of the bars shall supply power and the fourth bar shall be ground.
- e. Up/down controls operating with 115V control circuit shall be by push-button and located on the mast assembly convenient to a standing operator.
- f. The system shall have a key-lock power on/off switch. The key shall not be removable in the ON position. All key-lock power switches shall be keyed alike.
- g. Two 150 watt minimum reflector type flood lights shall be mounted on the trolley/bridge to provide in-use illumination. The lights shall operate on 115 VAC.
- h. The light control shall be integral with the on/off switch such that the lights are on when the system is on.
- i. Electrical components of the system shall conform to the applicable standards of UL and NEMA. All items of the same type and rating shall be identical.
- j. All electrical wiring shall conform to the standards of the National Electric Code and applicable UL standards.
- k. Protective insulated bushings shall be provided at all places where wiring passes through openings in metal panels and frames.
- l. All electrical connections shall be suitably supported to prevent breakage and other damage.
- m. Wiring shall be coded so that each wire can be easily identified from maintenance manuals, wiring schematics, and other documentation.

11. Safety Mesh

- a. Safety Mesh shall be provided to cover the rear of the individual storage bays and the open ends.

12. Finish

- a. Color shall be manufacturer's standard blue for the storage support structure, green for the pallets and safety yellow for the mast.
- b. All painted surfaces shall be cleaned and iron phosphated and shall be coated with enamel and backed in accordance with supplier's directions.
- c. The finish shall level out to produce a smooth, uniform surface without runs, wrinkles, grit areas of thin film, and separation of color.

13. Manufacturer

- a. Specifications are based on equipment identified herein by Manufacturer's name and model, and shall serve as the basis for determining acceptable standards of quality, performance, workmanship, construction and minimum features. Storage and retrieval System as manufactured by:

Stanley Vidmar
11 Grammess Road
Allentown, Pennsylvania 18103
Telephone: (215) 797-6600;
or approved equal.

2.02 DRAWER TYPE STORAGE CABINETS

- A. Drawer type storage cabinets as specified herein shall be furnished and installed as indicated on the Contract Drawings

1. Dimensions and Capacities

- a. Overall Dimensions
 - (1) 27 3/4 inches deep
 - (2) 30 inches wide
 - (3) 59 inches high
- b. Capacity 400 lbs per drawer

2. Performance Criteria

- a. Drawers, loaded to their maximum rated capacity, shall perform minimum average of 3,000 cycles each without failure
- b. Drawers, loaded to one-half their maximum rated capacity, shall perform minimum average of 12,000 cycles each without failure
- c. Test Parameters: Manufacturer shall provide documented evidence from an independent laboratory, that the drawer suspension system has been tested

under full rated load conditions and has experienced an average of 3,000 cycles without failure. A cycle shall be defined as full extension and return with a maximum required pull force of 50 pounds.

- d. All drawers shall extend 100% out of the housing exposing all contents to reach and visibility.
- e. **Useable Drawer Space:** Drawers shall be square measuring 25.5" x 25.5" with a minimum base drawer area of 650 sq. in. Drawers shall have a minimum 631 square inches of usable drawer space. Total useable drawer space of 631 square inches times the total number of drawers specified per each unit, times the quantity of units, establishes the total square inches of drawer space for this Project

3 Features and Construction

- a. Draw cabinet shall be of unitary design and unwelded construction. Provide welded on pallet base with detachable kick-plates
- b. All drawer runners and carriage brackets shall be manufactured from high strength steel to provide a hardened surface for bearing wear. All drawers shall have a capacity rating of 400 pounds and a fail-safe carriage and drawer stop system which is strong enough to repeatedly contain working drawers without damage. All drawers shall have full suspension carriage systems
- c. Each drawer front shall have a drawer pull and label system at least 22" long, and so designed to accept a label at least 1-1/8" high. Label and its clear plastic shield shall be retained in a positive manner, with plastic end caps that shield the drawer pull end from sharp edges and contribute to an enclosed system.
- d. Each drawer cabinet shall have matching shelf cabinet securely mounted on top. The shelf cabinet shall be from the same manufacturer as the drawer unit. The shelf cabinet shall be 33 inches high and have matching width and depth dimensions with the drawer unit. Each shelf cabinet shall be equipped with two (2) shelves each with a capacity of 800 lbs
- e. Each drawer cabinet shall be lockable with a single built-in lock cylinder. One key for each cabinet shall be supplied
- f. All free standing cabinets shall be bolted together following manufacturer's recommendations and using manufacturer's hardware
- g. All cabinets shall be fully assembled with all partitions screwed in place and dividers installed
- h. The finish shall be of durable enamel in the Manufacturer's standard color

4 Model Numbers

- a. Eight (8) drawer cabinets, Stanley Vidmar Model #SEP 3163-AL with 104 compartments, or equal
- b. Ten (10) drawer cabinets, Stanley Vidmar Model #SEP 3110-AL with 164 compartments, or equal

- c Six (6) drawer cabinets, Stanley Vidmar Model #SEP 3203-AL with 64 compartments, or equal.

2.03 CABINETS, DRAWER, DOUBLE WIDTH

- A Double wide, drawer type storage cabinets as specified herein shall be furnished and installed as indicated on the Contract Drawings
 - 1 Dimensions and Capacities:
 - a Dimensions:
 - (1) 60 inches wide
 - (2) 27-3/4 inches deep
 - (3) 59 inches high
 - b Capacities: 400 lbs per drawer
 - 2 Performance Criteria:
 - a Drawers, loaded to their maximum rated capacity, shall perform minimum average of 3,000 cycles each without failure
 - b Drawers, loaded to one-half their maximum rated capacity, shall perform minimum average of 12,000 cycles each without failure
 - c Test Parameters: Manufacturer shall provide documented evidence from an independent laboratory, that the drawer suspension system has been tested under full rated load conditions and has experienced an average of 3,000 cycles without failure. A cycle shall be defined as full extension and return with a maximum required pull force of 50 pounds
 - d All drawers shall extend 100% out of the housing exposing all contents to reach and visibility
 - e Useable Drawer Space: Drawers shall be square measuring 55 7/8" x 25 5/8" with a minimum base drawer area of 1422 sq. in. Drawers shall have a minimum 1391 square inches of usable drawer space. Total useable drawer space of 1391 square inches times the total number of drawers specified per each unit, times the quantity of units, establishes the total square inches of drawer space for this Project.
 - 3 Features and Construction:
 - a Draw cabinet shall be of unitary design and uniweld construction. Provide welded on pallet base with detachable kick-plates
 - b All drawer runners and carriage brackets shall be manufactured from high strength steel to provide a hardened surface for bearing wear. All drawers shall have a capacity rating of 400 pounds and a fail-safe carriage and drawer stop system which is strong enough to repeatedly contain working drawers without damage. All drawers shall have full suspension carriage systems
 - c Each drawer front shall have a drawer pull and label system at least 22" long, and so designed to accept a label at least 1-1/8" high. Label and its clear

plastic shield shall be retained in a positive manner, with plastic end caps that shield the drawer pull end from sharp edges and contribute to an enclosed system. Provide label and covers.

- d. Each drawer cabinet shall have matching shelf cabinet securely mounted on top. The shelf cabinet shall be from the same manufacturer as the drawer unit. The shelf cabinet shall be 33 inches high and have matching width and depth dimensions with the drawer unit. Each shelf cabinet shall be equipped with two (2) shelves each with a capacity of 800 lbs.
 - e. Each drawer cabinet shall be lockable with a single built-in lock cylinder. One key for each cabinet shall be supplied.
 - f. All free standing cabinets shall be bolted together following manufacturer's recommendations and using manufacturer's hardware.
 - g. All cabinets shall be fully assembled with all partitions screwed in place and dividers installed.
 - h. The finish shall be of durable enamel in the Manufacturer's standard color.
4. Model Numbers:
- a. Seven (7) drawer cabinets, Stanley Vidmar Model Number RP 3457, with 68 compartments, or equal.

2.04 CABINET, TOOL LOCK-UP

- A. Tool Lock-Up/Storage cabinets, as specified here shall be furnished and installed as indicated on the Contract Drawings.
- 1. Dimensions and Capacities:
 - a. Dimensions
 - (1) 27 3/4 inches deep
 - (2) 30 inches wide
 - (3) 59 inches high
 - b. Capacities: 800 lbs per shelf
 - 2. Features and Construction
 - a. Tool cabinet shall be a Stanley Vidmar Model SD-340, with three (3) shelves, model CS-80L, or equal.
 - b. Each cabinet shall have a lockable door.
 - c. Each drawer cabinet shall have matching shelf cabinet securely mounted on top. The shelf cabinet shall be from the same manufacturer as the drawer unit. The shelf cabinet shall be 33 inches high and have matching width and depth dimensions with the drawer unit. Each shelf cabinet shall be equipped with two (2) shelves each with a capacity of 800 lbs.

- d. The finish shall be of durable enamel in the Manufacturer's standard color.

2.05 GAS CYLINDER CAGE

A. Portable gas cylinder cage as specified herein shall be furnished and installed as indicated on the Contract Drawings.

1. Dimensions and Capacity:

a. Dimensions:

- (1) 56 inches wide
- (2) 42 inches deep
- (3) 68-1/2 inches high

b. Capacity Sixteen (16), 9-inch diameter tanks

2. Features and Construction:

- a. All welded heavy angle frame construction with flattened expanded mesh on all four sides, and top.
- b. Two hinged doors, lockable
- c. The finish shall be of durable enamel in the Manufacturer's standard color
- d. "NO SMOKING" sign riveted to door
- e. Gas cylinder cage shall be a Hodge Manufacturing Co. Model EVC-4256, or equal

2.06 GENERAL SHELVING UNITS-36" WIDE

A. Closed offset shelving unit shall be furnished, assembled and installed as indicated on the Contract Drawings

1. Dimensions and Capacities

a. Dimensions

- (1) 36 inches wide
- (2) 18 inches deep
- (3) 84 inches high
- (4) The installed shelf height from finish floor shall be

- (a) Top shelf; 84 inches
- (b) Second shelf; 75 inches
- (c) Third shelf; 66 inches
- (d) Fourth shelf; 52.5 inches
- (e) Fifth shelf; 36 inches
- (f) Sixth shelf; 19.5 inches
- (g) Bottom shelf; 1.5 inches

b. Capacity

- (1) Shelf: Minimum 1300 lbs per shelf for an evenly distributed load
- (2) Upright: Minimum 10,000 lbs per upright.

2. Features and Construction:

- a. The shelf shall be of a Class 2 rating and constructed of 18 gauge steel with continuous roll formed channel along the shelf perimeters. Front and back edges shall be triple flanged, sides shall be double flanged. Front and rear shelf edge reinforcing angles shall be installed for all shelves.
- b. The uprights shall consist of T-Post rear and front upright, constructed of minimum 16 gauge steel with bracket slots punched on 1-1/2 inch centers for vertical shelf adjustment. The shelves shall be secured by slip-in shelf brackets to reinforce and securely lock shelves into place on all four corners.
- c. The shelving units shall be equipped with a back panel and side panels. Where shelving unit are placed back to back or side to side, one back panel for the two units will be acceptable.
- d. Label holders shall be provided for the length of each shelf.
- e. These units shall be designed for assembly and adjustment without tools.
- f. All units shall be anchored to the floor.
- g. The finish shall be of durable enamel in the Manufacturer's standard color.
- h. Shelving unit as manufactured by Lyon Metal Products, Aurora Illinois, or Lista International, Holliston, Massachusetts, or equal.

2.07 PALLET RACK (4'x 9')

A Pallet racks with wire metal decks shall be furnished and installed as indicated on the Contract Drawings

1 Dimensions and Capacities

a Dimensions

- (1) Beams 108 inches long x 6 inches high, minimum
- (2) Upright 48 inches deep x 144 inches high
- (3) Upright Post 3 inches x 3 inches, minimum.
- (4) Installed height, top of beam to finished floor

- (a) 48 inches
- (b) 96 inches
- (c) 144 inches

b Capacity

- (1) Beams 10,000 lbs per pair, with max. deflection of 0.60" for an evenly distributed load
- (2) Uprights 32,000 lbs per upright, with 60" max. vertical spacing of beams. Minimum 3 inch x 3 inch post constructed of 13 gauge steel
- (3) Decking Minimum 4,000 lbs. capacity per section

2 Features and Construction

- a The upright frame shall be continuous steel uprights with heavy duty cross and diagonal members, fabricated from minimum 13 gauge steel. They shall be punched to accept horizontal beams, adjustable at 4 inch increments on center
- b The base plate shall be of heavy gauge steel arc welded to uprights with holes for anchoring to the floor
- c The beam construction shall be of a minimum 6" high, welded step-type minimum 14 gauge steel box channel. Step shall measure 1-5/8"H x 3/4"D. There shall be three pair per section
- d Decking shall be heavy wire mesh type. Decking shall measure 48"D x 52"W and shall be constructed of minimum #4 gauge wire on a 2" x 4" pattern, with reinforcing channels as required to support specified capacity. The reinforcing channels shall be designed to fit the step beam specified above. Decking shall be finished with an aluminum paint
- e The pallet racks shall be anchored to the floor using a minimum of two 1/2" x 3" expansion bolts per anchor plate
- f Post protectors shall be provided for the aisle side of the upright frame
- g The finish shall be of durable enamel in the Manufacturer's standard color
- h Pallet rack as manufactured by Material Storage Products, Valdosta, Georgia, or Republic Storage Systems Company, Canton, Ohio, or Lyon Metal Products, Aurora, Illinois, or equal

2.08 STORAGE CABINET

A Storage Cabinets shall be furnished and installed as indicated on the Contract Drawings

1 Dimensions and Capacities

a Dimensions

- (1) Width 36 inches
- (2) Depth 20 inches
- (3) Height 42 inches

b Capacity Minimum 1400 pounds per shelf

2 Features and Construction

- a Full welded construction
- b Shelves adjustable in two inch increments
- c Shelves - 14 gauge steel
- d Sides and Bottom Shelf 12 gauge, one piece wrap-around construction

- e Doors - 12 gauge; 8 gauge welded hinges; 200 degree swing
- f Handle: 3 point locking device
- g Storage cabinets, Strong Hold Products Model Number 33 5-202, or equal

2.09 SAFETY STORAGE CABINET

A. Safety storage cabinets shall be furnished and installed as specified herein and indicated on the Contract Drawings.

1. Dimensions and Capacities

a. Dimensions:

- (1) 43 inches wide
- (2) 18 inches deep
- (3) 65 inches high

b. Capacity: 45 gallons per cabinet

2. Features and Construction:

- a. Flammable storage cabinets shall meet NFPA code #30 and OSHA requirements
- b. Cabinets shall have two middle shelves adjustable on 1 5/8 inch centers
- c. Each cabinet shall be equipped with self-closing doors
- d. The finish shall be of durable enamel in safety yellow
- e. Each cabinet shall be marked "FLAMMABLE MATERIALS" with minimum 3" red letters
- f. Safety storage cabinet as manufactured by Equipto, Aurora, Illinois, Model Number 1792SC or equal

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install equipment specified herein in strict accordance with the approved shop drawings and manufacturer's installation instructions
- B. Install material storage units at locations indicated on the approved Design and Shop Drawing following installation procedures recommended by the manufacturer. Provide mounting hardware as required.

3.02 FIELD QUALITY CONTROL:

- A. Provide the services of a qualified manufacturer's representative to perform the following
 - 1. Supervise installation

2. Supervise testing, in the presence of the Engineer to ensure proper operation of the equipment.
3. Provide instruction to the Authority's personnel in the proper operation and maintenance of the equipment.

END OF SECTION

SECTION 10605

WIRE MESH PARTITIONS

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing woven wire mesh panels for the following:
 - 1. Wire mesh partitions.
 - 2. Wire mesh window guards.
 - 3. Wire mesh railing insert panels.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Handrails and Railings: Section 05521.
- B. Aluminum Entrances and Storefronts: Section 08410 for lock cylinders.

1.03 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Engage a firm experienced in manufacturing wire mesh partitions similar to those indicated for this Project and that have a record of successful in-service performance.
- B. Structural Performance: As specified in Section 05521 for railing insert panels.
- C. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of wire mesh partitions and wire mesh insert panels that are similar to those indicated for this Project in material, design, and extent.

1.02 DEFINITIONS

- A. The types of weaves for the wire mesh specified in this Section and defined in ASTM E 437 and its Appendix X4.2:
 - 1. Plain Weave: Wires pass over one and under the next adjacent wire in both directions.
 - 2. Lock Crimped: Deep crimps at points of intersection to lock the wires securely in place.
 - 3. Intercrimped: Similar to plain weave with extra crimps between the intersections.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the Special Conditions and with the additional requirements as specified for each:

- A. Product Data for each type of product specified, consisting of manufacturer's specification, technical data, and installation instructions.

- B. Shop Drawings showing fabrication and installation of wire mesh partitions, window guards, railing insert panel and access panels, including plans, elevations, and large-scale details showing anchorage and accessory items. Provide location template drawings for items supported or anchored to permanent construction.
 - 1. For steel channel and tube framing of wire mesh partitions and railing insert guards, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- C. Samples of a 12-by-12-inch-300-by-300-mm wire mesh panel constructed of specified frame members, wire mesh, and color charts.

1.04 JOB CONDITIONS

- A. Field Measurements: Check actual locations for wire mesh products by accurate field measurements before fabrication and show recorded measurements on Shop Drawings. Coordinate fabrication and delivery schedules with construction progress to avoid delaying the Work.
 - 1. Where field measurements cannot be made without delaying the Work, guarantee location dimensions and proceed with fabricating wire mesh products without field measurements. Coordinate wall, column, floor, and ceiling construction to ensure that actual location dimensions correspond to guaranteed dimensions.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Woven wire partitions, Window Guards and Insert Panels: Manufactured by the G - S Company, or provide systems, as approved by the Engineer, of similar quality and appearance to match construction quality and appearance of the specified manufacturer.

2.02 MATERIALS

- A. Steel Channels, Angles, Plates, and Bars: ASTM A 36ASTM A 36M.
- B. Steel Sheet: ASTM A 568ASTM A 568M.
- C. Cold-Rolled Steel Channels: Formed from steel sheet.
- D. Square Steel Tubing: Cold-formed structural steel tubing, ASTM A 500.
- E. Galvanized Steel Wire: ASTM A 641ASTM A 641M.
- F. Galvanized Steel Sheet: Commercial-quality, hot-dip-coated steel sheet, ASTM A 653, with G60 or A60ASTM A 653M, with Z180 or ZF180 coating.
- G. Bent Plate Channel: Formed from galvanized steel sheet.

2.03 WIRE MESH PARTITIONS:

- A. Mesh: 0.135-inch-3.4-mm- diameter, plain-weave, galvanized steel wire woven into 3 inch38-mm square pattern, insert through frame members, and welded into frame square pattern, inserted through.
- B. Frames: Provide galvanized steel fasteners and other items shown or necessary for partition

installation.

1. Vertical Members: 1-1/4-by-5/8-by-0.108-inch hot dipped galvanized steel C-Section channels with 1/4-inch- diameter bolt holes approximately 18 inches 450 mm o.c.
 2. Horizontal Members: 1-by-1/2-by-1/8-inch hot dipped galvanized steel channels, mortised and tenoned to vertical members.
 3. Horizontal Reinforcing Members: 1-by-1/2-by-1/8-inch hot dipped galvanized steel channels with wire woven through or two 1-by-1/2-inch galvanized steel channels bolted or riveted toe-to-toe through mesh, and secured to vertical members. Provide number of horizontal reinforcing members to suit panel height as recommended by partition manufacturer.
- C. Top Capping Bars: 2-1/4-by-1-inch hot dipped galvanized steel channels, secured to top framing channels with 1/4-inch- diameter, galvanized "U" bolts spaced not more than 28 inches o.c.
- D. Corner Posts: 1-1/4-by-1-1/4-by-1/8-inch hot dipped galvanized steel angles with floor shoe galvanized per ASTM A 123 and 1/4-inch- diameter bolt holes to align with bolt holes in vertical frame members.
- E. Floor Shoes: Cast aluminum or steel galvanized per ASTM A 123, sized to suit vertical framing and to provide approximately 3 inches 75 mm of clear space between finished floor and bottom horizontal frame members. Furnish units with set screws for leveling adjustment.

2.04 DOORS:

- A. Hinged Door: Door frame of 1-1/4-by-1/2-by-1/8-inch hot dipped galvanized steel c-section channels with 1-1/4-by-1/8-inch flat steel bar cover plates on 3 sides, and 1/8-inch- thick angle strike bar and cover on lock side. Provide 1-1/2 pairs of 3-by-3-inch butt hinges riveted or welded to door and frame, and mortise-type cylinder lock operated by key outside with recessed knob inside. Align bottom of door with bottom of adjacent panels.
- B. Provide manufacturer's standard cylinders for lock.

2.05 WINDOW GUARDS

- A. Mesh: 0.135-inch-diameter, lock-crimped galvanized steel wire woven into a 4-inch , 45 degree pattern, inserted through frame holes and welded into frame.
- B. Frames:
1. Frames 1 1/4-by-1/2-by-1/8-inch hot dipped galvanized, cold-rolled steel channels.
 2. Frames at Window Guards: Hot dipped galvanized bent plate channel, sized to fit adjacent to curtainwall framing.
- C. Anchorage Devices: Furnish appropriate types and quantities of anchorage devices to provide adequate anchorage to adjacent structures.
- D. Access Panels: Provide the following at bridge walkway guards where shown:
1. Jamb: Provide 1-1/4-by-1-1/4-by-1/8-inch steel angle jamb bars with bolt holes for anchorage spaced a maximum of 24 inches o.c.
 2. Hinging: Furnish 1 pair of 3-by-3-inch butt hinges.
 3. Locking Device: mortise l- type cylinder lock as specified in Section 08410.

2.06 STAIRWAY PARTITIONS RAILING INSERT PANELS:

- A. Mesh: 0.135-inch-diameter, plain-weave galvanized steel wire woven into a 3-inch square pattern, inserted through frame holes and welded into frame. Vertical wires are plumb. Horizontal wires are perpendicular to vertical wires.
- B. Frames: 1 1/4 -by-1/2-by-1/8-inch hot dipped galvanized cold-rolled steel channels.

2.07 FABRICATION:

- A. Do not use components less than sizes indicated. Use larger-size components as recommended by partition component manufacturer.
- B. Provide bolts, hardware, and accessories for complete installation.

2.08 FINISHES:

- A. Wire Mesh Partitions and Doors: Manufacturer's standard shop - applied enamel finishes.
- B. Stairway Partitions and Railing insert panels:
 - 1. Manufacturer's standard shop - applied enamel finish.
- C. Window Guards:
 - 1. Manufacturer's standard polyester powered coat finish.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Coordinate and furnish anchorages, setting drawings, diagrams, templates, instructions, and directions for installing anchorages, including concrete inserts, sleeves, anchor bolts, and miscellaneous items having integral anchors embedded in concrete or masonry construction. Coordinate delivery of such items to Project site.

3.02 INSTALLATION

- A. Erect partitions plumb, rigid, properly aligned, and securely fastened in place, complying with Drawings and manufacturer's recommendations.
- B. Provide additional field bracing as shown on approved shop drawings or necessary for rigid, secure installation. Installer to provide additional clips and bracing as required.
- C. Attach window guards to inside face of aluminum curtain wall as shown on approved shop drawings. Fasten screws into pre-drilled holes with vinyl insert to prevent contact between dissimilar metals. Provide fasteners spaced evenly to screw to curtain wall system as shown on the approved shop drawings.

3.03 ADJUSTING AND CLEANING

- A. Adjust moving components for smooth operation without binding.
- B. Touch up damaged finish after completing installation using field-applied paint to match color of shop-applied finish.

END OF SECTION

SECTION 10810

TOILET ACCESSORIES

PART 1 - GENERAL

1.01 SUMMARY OF WORK:

- A. This section specifies providing toilet accessories, including:
 - 1. Sanitary napkin vendors.
 - 2. Sanitary napkin disposal units.
 - 3. Framed mirrors with shelves.
 - 4. Framed mirrors without shelves.
 - 5. Liquid soap dispensers.
 - 6. Toilet paper dispensers.
 - 7. Clothes hook and bumpers.
 - 8. Paper towel dispensers.
 - 9. Waste receptacles.
 - 10. Grab bars.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Tile: Section 09320.
- B. Toilet Compartments: Section 10155.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop drawings: Detailed shop drawings, including fastenings, manufacturer's installation instructions and other information. Submit prior to ordering materials or beginning installation.
- B. Samples:
 - 1. For each accessory item to verify design, operation, and finish requirements. One each
 - 2. Special anchors, plates or embedded items required because of the conditions in this project. One each. Submit with the related accessory samples. Delete subparagraph below if not applicable.
- C. Setting Drawings: For cutouts required in other work; include templates, substrate preparation instructions, and directions for preparing cutouts and installing anchoring devices.. Retain paragraph below for large, complicated projects. Revise to suit Project.

1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ADA (Americans with Disabilities Act).

3. ASTM: A666, C1036, F446.
 4. FS: DD-M-411.
- B. Manufacturer Qualifications: Provide products of an established manufacturer regularly engaged in the production of toilet accessories.
- C. Source Limitations: Provide products of same manufacturer for each type of accessory unit and for units exposed to view in same areas, unless otherwise approved by the Engineer. Retain paragraph below if products are listed in schedule at the end of Part 3. See Evaluations. Retain one of three subparagraphs below, depending on Specification method selected. Correlate with Part 2 "Manufacturers" Article and schedule at the end of Part 3. See descriptions of specifying methods and examples of completed schedules in the Evaluations.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to the job site in original unopened containers clearly labeled with the manufacturer's name, brand designation and type as applicable.
- B. Store products in an approved dry area, protect from contact with soil and from exposure to the elements. Keep products dry.
- C. Handle products so as to prevent breakage of containers and damage to products.

1.06 COORDINATION:

- A. Coordinate accessory locations with other work to prevent interference with clearances required for access by disabled persons, proper installation, adjustment, operation, cleaning, and servicing of accessories.
- B. Deliver inserts and anchoring devices set into concrete or masonry as required to prevent delaying the Work..

PART 2 - PRODUCTS

2.01 MATERIALS, GENERAL:

- A. Provide toilet accessories of an approved manufacturer; provided complete with fasteners appropriate for surface which applied. Satin-finish stainless steel unless otherwise noted.
- B. Exposed fastenings finished to match accessories.
- C. Labels, decals and cast-in or embossed identification in conspicuous places on accessories is prohibited.
- D. Use only products which comply with barrier-free accessibility guidelines of ADA.
- E. Quantity and location are as shown.

2.02 MATERIALS:

- A. Stainless Steel: ASTM A666, Type 304, with No. 4 finish (satin), in 0.0312-inch minimum nominal thickness, unless otherwise indicated.
- B. Mirror Glass: ASTM C1036, Type I, Class 1, Quality q2, nominal 6.0 mm thick, with silvering, electroplated copper coating, and protective organic coating complying with FS DD-M-411.
- C. Fasteners: Screws, bolts, and other devices of same material as accessory unit, tamper and theft resistant when exposed, and of galvanized steel when concealed.

2.03 PRODUCTS:

- A. Sanitary Napkin Vendor: Provide stainless-steel sanitary napkin vendor complying with the following:
 - 1. Products: Bobrick B-2800, or equal.
 - 2. General: Fabricate cabinet of all-welded construction. Provide seamless door with returned edges and secured by tumbler lockset. Provide identification reading "Napkins" and "Tampons"; brand-name advertising is not allowed. Capacity not less than 15 napkins and 20 tampons.
 - 3. Mounting: Surface-mounted type.
 - 4. Operation: Single-coin operation, 10 cents.
- B. Sanitary Napkin Disposal Unit: Provide stainless-steel sanitary napkin disposal unit complying with the following:
 - 1. Products: Bobrick 270, or equal.
 - 2. Surface-Mounted Type: With seamless exposed walls; self-closing top cover; locking bottom panel with stainless-steel, continuous hinge; and removable, reusable receptacle.
- C. Framed Mirror with Shelf: Provide framed mirror with shelf complying with the following:
 - 1. Products: Bobrick B-166-1836, or equal.
 - 2. Glass: 1/4-inch float/plate glass, No. 1 quality.
 - 3. Stainless-Steel, Channel-Framed Mirror: Fabricate frame from stainless-steel channels in manufacturer's standard satin finish with square corners mitered to hairline joints and mechanically interlocked. Provide concealed wall mounting bracket for theft-proof installation.
 - a. Integral Shelf: Stainless steel in thickness recommended by manufacturer, but not less than thickness of mirror frame, approximately 5 inches deep by width of mirror, with edges turned down and returned for rigidity; secure shelf to bottom of mirror frame.
- D. Framed Mirror without Shelf: Provide framed mirror without shelf complying with the following:
 - 1. Products: Bobrick B-165-1836, or equal.
 - 2. Glass: 1/4-inch float/plate glass, No. 1 quality.
 - 3. Stainless-Steel, Channel-Framed Mirror: Fabricate frame from stainless-steel channels in manufacturer's standard satin finish with square corners mitered to hairline joints and mechanically interlocked. Provide concealed wall mounting bracket for theft-proof installation.
- E. Liquid Soap Dispenser: Provide liquid soap dispenser complying with the following:
 - 1. Products: Bobrick B-2112, or equal.

2. Liquid Soap Dispenser, Horizontal-Tank Type: Surface-mounted type, minimum 40-oz. capacity tank with stainless-steel piston, springs, and internal parts designed to dispense soap in measured quantity by pump action; and stainless-steel cover with unbreakable window-type refill indicator. Vandal resistant.
 - a. Soap Valve: Designed for dispensing soap in liquid form.
- F. Toilet Tissue Dispenser: Provide toilet tissue dispenser complying with the following:
1. Products: Bobrick B-274, or equal.
 2. Type: Double-roll dispenser.
 3. Mounting: Surface mounted with concealed anchorage.
 4. Material: Satin-finish aluminum bracket with plastic spindle.
 5. Operation: Eccentric-shaped, molded-plastic spindle revolves one-half revolution per dispensing operation for controlled delivery; core cannot be removed until roll is empty.
 6. Capacity: Designed for tissue rolls up to 6-inch-diameter.
- G. Clothes Hook and Bumper: Provide clothes hook and bumper complying with the following:
1. Products: Bobrick B-212, or equal.
 2. Material: Solid aluminum casting with matte finish. Rubber bumper protects wall or partition surfaces.
- H. Paper Towel Dispenser: Provide stainless-steel paper towel dispenser complying with the following:
1. Products: Bobrick B-262, or equal.
 2. Surface-Mounted Type: Sized for minimum of 400 C-fold or 525 multifold paper towels without using special adapters; with hinged front equipped with tumbler lockset; and with refill indicators that are pierced slots at sides or front.
- I. Waste Receptacle: Provide stainless-steel waste receptacle complying with the following:
1. Products: Bobrick B-275, or equal.
 2. Surface-Mounted Type: With seamless exposed walls; continuously welded bottom pan; and minimum 20-gal. capacity, reusable, vinyl liner secured at not less than four points with grommets and hooks.
- J. Grab Bar: Provide stainless-steel grab bar complying with the following:
1. Products: Bobrick B-6106, or equal. Comply with ADA.
 2. Material: Bar 18-gauge wall Type 304 stainless steel.
 3. Mounting: Exposed with manufacturer's standard flanges and anchors.
 4. Gripping Surfaces: Smooth, satin finish, unless otherwise noted.
 5. Outside Diameter: 1-1/2 inches for heavy-duty applications.
 6. At water closets for the handicapped, provide the following unless otherwise shown:
 - a. Back wall: 36-inch minimum length grab bar behind the water closet.
 - b. Side wall: 42-inch minimum length grab bar to the side of the water closet.

2.04 FABRICATION:

- A. General: Names or labels are not permitted on exposed face of accessories. On interior surface not exposed to view or back surface of each accessory, provide printed, waterproof label or stamped nameplate indicating manufacturer's name and product model number.

- B. Surface-Mounted Toilet Accessories: Unless otherwise indicated, fabricate units with tight seams and joints, and exposed edges rolled. Hang doors and access panels with continuous stainless-steel hinge. Provide concealed anchorage where possible.
- C. Framed Glass-Mirror Units: Fabricate frames for glass-mirror units to accommodate glass edge protection material. Provide mirror backing and support system that permits rigid, tamper-resistant glass installation and prevents moisture accumulation.
 - 1. Provide galvanized steel backing sheet, not less than 0.034 inch and full mirror size, with nonabsorptive filler material. Corrugated cardboard is not an acceptable filler material.
- D. Mirror-Unit Hangers: Provide mirror-unit mounting system that permits rigid, tamper- and theft-resistant installation, as follows:
 - 1. Heavy-duty wall brackets of galvanized steel, equipped with concealed locking devices requiring a special tool to remove
- E. Keys: Provide universal keys for internal access to accessories for servicing and resupplying. Provide minimum of six keys to the Engineer.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Coordinate with other trades for concealed back plates, blocking and anchoring devices embedded or built into work of other trades.
- B. After mounting surfaces have been painted, install accessories in accordance with manufacturer's recommendations.
- C. Install accessories according to manufacturers' written instructions, using fasteners appropriate to substrate indicated and recommended by unit manufacturer. Install units level, plumb, and firmly anchored in locations and at heights recommended by the manufacturer unless otherwise shown or required by regulations. Comply with ADA.
 - 1. At water closets for the handicapped, mount grab bars as follows unless otherwise shown:
 - a. Back wall: Mount grab bar at a height between 33 and 36 inches above finish floor and to extend a minimum of 12 inches beyond the center of the water closet toward the side wall and a minimum of 24 inches toward the open side for either a left or right side approach.
 - b. Side wall: Mount grab bar at a height between 33 and 36 inches above finish floor and spaced 12 inches maximum from the back wall and extending a minimum of 54 inches from the back wall.
 - 2. At water closets for the handicapped, mount toilet paper dispenser at a minimum height of 19 inches above finish floor.
- D. Secure mirrors to walls in concealed, tamper-resistant manner with special hangers, toggle bolts, or screws. Set units level, plumb, and square at locations indicated, according to manufacturer's written instructions for substrate indicated.
- E. Install grab bars to withstand a downward load of at least 250 lbf, when tested according to method in ASTM F446.

- F. After installation, protect the toilet accessories from damage and soiling.

3.02 TESTING AND ADJUSTING OF COMPLETED WORK:

- A. Test accessories for unencumbered, smooth operation and verify that mechanisms function properly.
- B. Replace damaged or defective items.
- C. Test for required strength and for pull-out and pull-off of grab bars. Remove and reattach as needed.

3.02 CLEANING:

- A. Remove temporary labels and protective coatings.
- B. Before final acceptance, clean and polish exposed surfaces according to manufacturer's written recommendations.
- C. Leave areas surrounding the work in broom-clean condition.

END OF SECTION

SECTION 11001

EQUIPMENT GENERAL REQUIREMENTS

PART 1 - GENERAL

RELATED DOCUMENTS:

- A. Drawings and general provisions of the Contract apply to this section.
- B. Coordinate with Division 1, Section 01810 and 01820.
- C. Coordinate with Sections under Divisions 11 and 14.

1.01 DESCRIPTION:

- A. Furnish and install where shown all equipment as specified, complete and ready for operation. Each item shall be specifically designed for the intended function. Provide necessary accessories, items of equipment, mechanical, electrical and structural items, whether specified or not in order to provide properly installed and functional equipment.
- B. Equipment provided shall be suitable for installation in the space shown and operation on the available building utilities. Any modification or redesign to the building elements (i.e. structure, foundation) or utilities shown on the Contract Drawings because of a specific equipment selection by the Contractor shall be provided by the Contractor at no additional cost to the Authority and shall be as approved by the Engineer.
- C. In all cases where a device or part of the equipment is referred to in the singular number, it is intended that such reference shall apply to as many such devices as are required to complete the installation.
- D. Major Shop Equipment: Appendix 'A' of this Section 11101 identifies the Major Shop Equipment to be evaluated in accordance with Section 00204.D, Phase II, Technical Evaluation Factors.

1.02 QUALITY ASSURANCE:

- A. General:
 - 1. When two or more items of equipment are required, they shall be products of a single manufacturer.
 - 2. All work shall be performed in a neat and workmanlike manner by workers skilled in their respective trades, and all materials and equipment shall be installed as recommended by the manufacturers and in accordance with specified codes and standards.
 - 3. Touch-up or repaint to match original finish, all factory finishes or painted equipment and materials which are scratched or marred during shipment or installation.
 - 4. For purposes of designating type and quality of work under Divisions 11 and 14, the Drawings and Specifications are based on products by manufacturers listed first in Part 2 - Products, of each individual Section. Contractor shall be responsible for modifying the building structure, foundations, and utilities as required to accommodate products of manufacturers listed second or third for the individual equipment items, or equipment approved as equal.
- B. Certificates of Compliance: Upon delivery of the equipment, submit certificates of compliance.

Each certificate shall be signed by an authorized representative of the manufacturer stating that the equipment complies in all respects with the Contract requirements.

1.03 SUBMITTALS:

- A. Submit the following in accordance with the requirements of General Requirements, and as specified in the various Sections of Equipment Specifications.
 - 1. Shop drawings.
 - 2. Product data.
 - 3. Samples.
 - 4. Installation instructions.
 - 5. Operations and Maintenance Data.
 - 6. Equipment Manual.

- B. Sequence of Approval:
 - 1. Tentative Approval of Equipment: Before submittal of shop drawings, submit to the Engineer for approval, drawings, specifications and lists of equipment to be incorporated in the work. This list shall include catalog numbers, cuts, and such other descriptive data as may be required to assure compliance with these specifications. No consideration will be given to partial lists submitted from time to time. Approval of equipment will be tentative subject to submission of complete shop drawings indicating compliance with the Contract Documents.
 - 2. Final Approval of Equipment: After receiving tentative approval of the equipment lists, submit shop drawings, product data and installation instructions for final approval.

- C. Shop Drawings: Shop drawings shall consist of the following as applicable:
 - 1. Layout drawings showing equipment layout, elevations, conduit runs, utility layout and hook-ups, and all required dimensions.
 - 2. Fabrication drawings, including bill of materials.
 - 3. Detail drawings.
 - 4. Foundation and structural support drawings including anchor bolt plan and elevation.
 - 5. Utility connection plan.
 - 6. Electrical control diagram.
 - 7. Electrical wiring diagram.
 - 8. Electrical equipment layout, with all motors, limit switches, solenoid valves, disconnect, control panels, etc. located and labeled.
 - 9. Piping systems including pipe routing, sizing, valving, lubricators, regulators, pumps, nozzles etc., fully noted and scheduled.
 - 10. HVAC and exhaust air systems including duct routing, duct sizes, fittings, dampers, grilles, supports, etc., fully noted and scheduled including elevations, in addition to details of penetrations and equipment connections.

- D. Product Data: Manufacturer's literature including catalog cuts, pamphlets, descriptive literature, equipment specifications, performance *and* test data, and brochures which adequately describe the piece of equipment or product.

- E. Installation Instructions: Manufacturer's recommended installation instructions and manufacturer's installation drawings.

- F. Equipment Manual: After receiving final approval of all equipment items specified herein, Contractor shall submit two complete Equipment Manuals to the Authority prior to final acceptance of the Equipment. Equipment Manual shall consist of at least one clear catalog cut sheet or manufacturer's product data sheet for each equipment item furnished under this Contract. Cut-sheets or data forms shall include as a minimum, machine manufacturer, model

number, machine specifications and capacities. Each catalog cut shall be marked with the name of the item and the Equipment Identification Number shown on the Drawings. Arrange catalog cut-sheets by shop and provide dividers to separate each shop within the manual. Manual shall be prepared using a three ring binder with appropriate title sheet and table of contents. Cut-sheet pages shall be reinforced near punched holes.

1.04 OPERATIONS AND MAINTENANCE DATA:

- A. Manuals shall be submitted for each equipment item in accordance with the requirements of General Requirements and as follows:
- B. General Requirements for Manuals:
 - 1. Manufacturer's operating manuals giving complete instructions relative to assembly, installation, operation, adjustment, lubrication, maintenance, and complete parts list shall be furnished by the Contractor for every item of machinery and equipment furnished by the Contractor.
 - 2. Manuals furnished may be manufacturer's standard publications in regard to size and binding provided they comply with specified requirements relative to quantity of information and data.
 - 3. Manuals shall be bound in hard or flexible covers. Illustrations shall be clear, and printed matter, including dimensions and lettering on drawings, shall be easily legible. If reduced drawings are incorporated into manuals, original lines and letters shall be heaved-up as necessary to retain their legibility after reduction. Larger drawings may be folded into manuals to page size.
- C. Format Manuals in accordance with the requirements set forth in General Requirements Section 01780, and as follows:
 - 1. Title page: Include the name and function of the equipment, manufacturer's name, address, and telephone number, Contractor's name, address, and telephone number and the Project Specifications number and title.
 - 2. Table of contents, in numerical order listing each section and subsection title of the Operations and Maintenance Manual with reference to the page on which each starts and a list of included diagrams and drawings.
 - 3. Index, in alphabetical order.
 - 4. Frontispiece: Recognition illustration of the equipment described in the Operation and Maintenance Manual.
 - 5. Catalog, model and serial number of equipment installed. Include WMATA unit numbers where applicable.
 - 6. Manufacturer's literature describing each piece of equipment, including major assemblies and subassemblies, and giving manufacturer's model number and drawing number.
 - 7. Operation instructions including step-by-step preparation for starting, operation, shutdown and draining, and emergency requirements.
 - 8. Control diagrams, as-installed by the manufacturer.
 - 9. Sequence of operation by the control manufacturer.
 - 10. Wiring diagrams, as-installed and color codes, of electrical motor controllers, connections and interlock connections.
 - 11. Diagrammatic location, function and tag numbers of each valve.
 - 12. Maintenance instructions: Include step-by-step procedures for inspection, operation checks, cleaning, lubrication, adjustments, repair, overhaul, disassembly, and reassembly of the equipment for proper operation of the equipment. Include list of special tools which are required for maintenance with the maintenance information.
 - 13. Possible breakdowns and repairs.
 - 14. Manufacturer's parts list of functional components, control diagrams and wiring

- 15. diagrams, giving manufacturer's model number and manufacturer's part number.
- 16. "Long-Lead-Time" spare parts list for spare parts not readily available on the open market or for which it is anticipated ordering and delivery time will exceed 10 days.
- 17. List of nearest local suppliers of all equipment parts.
- 18. Lubrication schedule indicating type and frequency of lubrication.
- 19. Manufacturer's warranty and guarantee data in accordance with the General Conditions.
- 20. Spare parts data in accordance with the General Requirements Section 01780.
 - a. Complete list of parts and supplies, with current unit prices and sources of supply.
- 21. Appendix: Include safety precautions, a glossary, and, if available at time of submittal, copies of test reports, and other relevant material not specified to be submitted.
- 22. Delete information on material or equipment not used in the work from the Operations and Maintenance Manual.

D. Operating Diagrams:

- 1. Piping systems, electrical wiring diagrams, fuel oil, lubricating oil, water capacity diagrams, and other diagrams necessary for operation of machinery and equipment shall be furnished and installed where designated by the Engineer.
- 2. No single diagram shall show more than one system, or parts thereof.
- 3. Diagrams shall be reproduced by photographic process to a size not to exceed 18 inches by 24 inches and shall be complete and legible in all respects. Systems shall be subdivided into portions which are operable from location where diagrams are installed, and to provide intelligible information within specified size. They shall be made on white paper and vacuum-sealed in transparent plastic material impervious to moisture and oil, and resistant to abrasion. Other formats which are equal in clarity, sharpness, durability and permanence will be considered.

1.05 TRAINING PROGRAM:

- A. General Requirements: The Contractor is responsible for training as outlined in General Requirements, Section 01820 and as follows:
 - 1. Maintenance management classes shall take place two weeks prior to the occupancy of the facility by the Authority.
 - 2. Mechanics training will commence only after installation of equipment is complete and is fully operational as determined by the Engineer.
 - 3. Training shall be conducted at a WMATA facility as directed by the Authority.
 - 4. Hours for training shall be between 7:00 a.m. and 7:00 p.m. unless specifically permitted otherwise.
- B. The Contractor is responsible for insuring that the instructors teaching these training courses are not only familiar with technical information, but able to utilize proper methods of instruction, training aids, audiovisuals, etc., to insure effective presentations.
- C. The Contractor is responsible for providing all training aids, audiovisual equipment and visual aids for the conduct of these courses.
- D. All training materials are to become the property of the Authority at the conclusion of training.
- E. Submission and Approval of Training Plans shall be in accordance with the General Requirements.
- F. Submission and Approval of Training Plans: Submit to the Construction Manager, at least 30 days prior to scheduled delivery of equipment, a detailed outline of the proposed training

program for the operation personnel. Include such information as the duration of the program, material and literature to be utilized, topics to be covered, and any material and equipment required to be provided by WMATA. WMATA will provide rail vehicles and rail vehicle components required for the training program.

- G. Include each piece of equipment's operation and maintenance manual as a basic text for instruction. Organize the program to permit WMATA to develop, within its own organization, the capability to continue the education of its personnel in the proper operation and repair of the equipment. Assume no prior knowledge, on behalf of the WMATA personnel, of the equipment.
- H. Levels of Training: Training shall be provided as specified in the individual Equipment Specification Sections and pursuant to the requirements set forth herein.
 1. Level I: Include 8 hours of "hands-on" training to familiarize the operating personnel with equipment operation, performance, features, safety features and requirement, and detailed instruction in operation and light maintenance of equipment. Class size shall be limited as indicated in subparagraph 1.05 I.
 2. Level II: Include a minimum of 18 hours of "hands-on" training to familiarize the plant and equipment personnel on parts and component replacement and repair, including anticipated major repairs. Class size shall be limited as indicated in subparagraph 1.05 I.
 3. Level III: Include a minimum of 18 hours of initial "hands-on" training to familiarize personnel on the programming requirements of the equipment, with 8 hours of follow-up training 3 months later, or earlier if requested. Class size shall be limited as indicated in subparagraph 1.05 I.

I. Number of Personnel To Be Trained And Class Size.

Level Of Training	Approximate Number of Individuals	Maximum Class Size	Minimum Number of Classes
Level I		8	
Level II		4	
Level III		4	

1.06 GENERAL DESIGN AND FABRICATION REQUIREMENTS:

- A. Equipment shall be designed , fabricated, installed and adjusted to secure the best commercially available results with respect to smooth, quiet, convenient and efficient operation, durability, economy of maintenance and operation, and the highest standards of safety.
- B. It is not the intent of these Specifications of detail the design and fabrication of the several parts of the equipment, but the type, material, design, workmanship and fabrication of each and every part shall be fully adequate for the service required, durable, properly coordinated with all other parts, in accordance with the best commercial standards and of the highest commercial efficiency. The components of electric circuits shall be of ample and proper size, design and material to avoid injurious heating and arcing, and all other objectionable effects which may reduce the efficiency of operation and economy of maintenance and upkeep below the best commercially available results. Minimum requirements are given herein for the certain parts of equipment. Equivalent requirements approved by the Engineer shall apply to such parts as are of special design, construction or material and to which the specified requirements are not directly applicable. These minimum requirements as a whole shall also be considered as

establishing proportionate general minimum standards for all parts of the equipment.

- C. The Engineer may permit variations from the requirements of these Specifications to permit the use of the manufacturer's standard equipment, provided such standard equipment is in every way adequate for the intended use and meets the full intent of these Specifications. All such variations proposed by the Contractor shall be called to the attention of the Engineer in writing and shall be made only if approved in writing.
- D. Certain design limitation, tests, etc., are herein specified as a partial check on the adequacy of design, fabrication, and materials. These requirements do not cover all features necessary to insure satisfactory and approved operation of the equipment. Conformity with these requirements shall, in no way, supersede the general requirements as to satisfactory and efficient operation of the equipment.

1.07 NOISE AND VIBRATION ISOLATION:

- A. Noise and vibration isolation pads shall be provided where required and shall be approved type equipped with necessary bearing plates and bolts. They shall be specifically designed for the weights, speeds and vibration characteristics of the equipment supported. The pads shall provide proper distribution of weight to avoid distortion of the bed plates.
- B. Bolts and other fastenings in the connection with these pads shall also be effectively isolated.

1.08 SHOP PAINTING:

- A. Equipment shall be given one shop prime coat of approved rust-inhibitive paint containing at least 25 to 30 percent rust-inhibitive pigments and manufacturer's standard finish coat system. Shop drawings shall indicate brand and type of paint.

1.09 ELECTRICAL REQUIREMENTS

- A. Power supply for equipment shall be 480 volts, 3-phase, 60 hertz unless otherwise specified.
- B. Provide transformer for equipment as required to step down the specified supply voltage to provide lower voltage for controls and accessories and to provide voltage compatible with equipment as required.
- C. Wiring shall be provided for complete installation of all equipment and accessories and shall be adequate for proper operation of equipment. Provide disconnect switch for each equipment item requiring electric power. Disconnect switch shall meet the requirements of the respective equipment item manufacturer and the requirements of Division 16. Permanently label each disconnect switch to identify corresponding equipment item: labeling method shall be subject to approval of the Construction Manager. Electrical Trade will bring power wiring to line side of disconnect switch. Make connection to secondary side of disconnect switch and provide all wiring and conduit from this point, including wiring to controllers and starters. Provide 480 volt and 208 volt equipment. All disconnect switches shall be fused with 200,000 amp limiter fuses. Provide 120 volt equipment with electric thermal overload disconnecting means sized as required for each equipment item. Wire and cable for light, power and signal circuits shall conform to those specified in the National Electrical Code. In no case shall maximum current exceed that specified by National Electrical Code for type of conductor used. Provide conduit where required; all wiring and conduit shall be in accordance with the requirements of Division 16.

- D. Motors:
1. Motors shall be high efficiency makes, each bearing the UL label and constructed to standard of NEMA, IEEE, ANSI, and AFBMA.
 2. Motors shall be suitable for operation on the electrical service indicated.
 3. Horsepower ratings and sizes shall be selected at 40° C ambient temperature for service as specified in Section 16225 - Motors. Provide motors with epoxy encapsulated insulation for severe usage in a corrosive atmosphere.
 4. Motors rated one horsepower or greater shall have a full-load power factor of 85 percent or higher. Motors rated 50 horsepower and over shall be designed for reduced voltage starting.
- E. Drives:
1. Guards shall be provided for each coupling and belt drive in conformance with applicable codes.
 2. Belt drives shall have adjustable motor drive pulleys, and pulleys shall be replaced by the Contractor if required to properly operate the equipment provided.
 3. Provide sliding motor bases where adjustable motor drive pulleys are provided.

1.10 GASKETS AND FASTENERS:

- A. Provide new gaskets wherever gasketed mating equipment items or pipe connections have been dismantled. Gaskets shall be in accordance with manufacturer's recommendations.
- B. Replace all assembly bolts, studs, nuts and fasteners of any kind which are bent, flattened, corroded, or have their threads, heads or slots damaged.
- C. Furnish all bolts, studs, nuts and other fasteners for make-up of all connections to equipment and replace any of these items damaged in storage, shipment or moving.

1.11 EQUIPMENT:

- A. Equipment, machinery and materials shall be as specified in the various Sections of Divisions 11 and 14.
- B. Equipment shall be factory-finished with manufacturer's standard primer and finish coats of paint.
- C. Starters, controllers, disconnect switches and start-stop stations shall be provided for all equipment. Correct sizing of starters and disconnect switches shall be the responsibility of the Contractor.
 1. Electrical enclosures shall be NEMA 12 for indoor units and NEMA 4 for outdoor units unless otherwise shown.
 2. Starters shall be complete with two sets of auxiliary contacts; one set normally open; one set normally closed.
 3. For motors 25 HP or greater provide auto-transformer type reduced voltage starters.
- D. Control devices necessary for proper operation shall be provided and shall be located to permit efficient operation of the equipment, and where possible shall be grouped in a factory fabricated NEMA approved control panel complying with requirements specified in Division 16.
- E. Switches, lights and control functions shall be identified with legend plates. The plates shall be constructed of polyvinyl-chloride material of laminated multiple constructions, and rout engraved

with appropriate legends. The size of letters, colors and legend shall be submitted for approval. The legend plats shall be mounted on the equipment in an approved manner. No decals will be accepted.

- F. Piped services for equipment are specified as work of Division 15 - Mechanical and are terminated near the piece of equipment in a shut-off means. As part of the work of this Section, extend these piped services to the equipment and make the associated connections.
- G. Provide piping, fittings, valves, connections, etc., of a type and size as recommended by the equipment manufacturer that will properly interface with the piped services provided under Division 15 - Mechanical.
- H. All piping, valves, fittings, conduits and wiring required for the equipment installation shall be in accordance with the applicable portions of Divisions 15 and 16.

1.12 INSTALLATION REQUIREMENTS:

- A. Furnish common and skilled labor, tools, rigging equipment, scaffolding, shims, dowels, and other materials necessary to make complete installation of equipment specified and shown.
- B. Receive, unload, check and store equipment in suitable facilities. All equipment should be kept clean, dry, and free from damage and be marked and tagged with equipment item numbers.
- C. Examine equipment for concealed damage and report any damage.
- D. Be responsible for safety and protection from loss or damage of equipment received until work is complete.
- E. Pay demurrage charges and claims for damage resulting from unloading operations.
- F. Reassemble equipment items which were dismantled for shipment or moving. Assemble items which are delivered knocked down, or disassembled.
- G. Coordinate the installation of equipment with other trades.
- H. Protect equipment during storage and prior to start-up, which shall include covering of openings, protection against rust and other damage, etc. Equipment may be stored outdoors only with approval of the Engineer.
- I. Furnish and install grout, shim material and miscellaneous steel necessary for brackets, anchors, or supports required in installation of equipment.
- J. Accomplish field machining that might be required to fit equipment together or to install equipment.
- K. Lubricate apparatus before start-up.
- L. Field check for clearance and interferences before fabrication or installation and relocate material and equipment furnished as required to eliminate interferences.
- M. Details listed in these specifications are given for a better understanding of the work required by the Contractor, and do not place a limitation on the amount of work to be done nor do they relieve the Contractor of additional work that may be required for a complete installation.

- N. Perform mechanical and electrical work required to install the equipment in accordance with the requirements of the jurisdictional authorities and the current codes and standards for practice employed by these trades.

1.13 HOLES, OPENINGS AND INSERTS:

- A. Provide holes and openings in floors, wall, ceilings and roofs as required.
- B. Core drill holes in existing work using dustless method. Grout in holes in concrete walls, floor and roof slabs after installation of equipment, and leave them in a completely neat and sealed condition.
- C. Install concrete inserts and flashings as required.

1.14 SETTING AND ALIGNING EQUIPMENT:

- A. Equipment shall be set and aligned in accordance with manufacturers's recommendations, approved shop drawings and applicable standards of trade practice.
- B. Equipment shall be set true and level. Demonstrate adequate leveling of installed equipment.
- C. Re-tighten bolted connections after installation.

1.15 CLEANING AND PROTECTION:

- A. Clean fabricated assemblies and equipment items thoroughly before and after operating and testing.
- B. Protect equipment from damage, deterioration, paint or coating spills or spots, corrosion, or harm from any source.

1.16 CONCRETE FOUNDATIONS:

- A. Concrete and reinforcement shall be in accordance with Sections 03300 and 03200.
- B. Provide anchor bolts as required for equipment to be mounted. Anchor bolts shall be in accordance with Section 05500.
- C. Provide grouting as necessary to stabilize equipment bases to concrete foundations.
- D. Provide hard rubber shims as recommended by the equipment manufacturer for leveling of equipment.

1.17 EQUIPMENT TEST AND CHECK-OUT:

- A. Before Final Acceptance, the Contractor-furnished equipment shall be tested in the presence of the Engineer to his satisfaction and demonstrated to be correctly connected and installed. Submit a testing schedule to the Engineer for approval prior to the start of the equipment test and check-out.

- B. Testing and check-out procedures of the manufacturer shall be carried out completely.
- C. The Authority will provide railcars and railcar components to be used during the testing procedures as required by the Contractor.
- D. Equipment tests shall not only be performed to demonstrate that the equipment has been properly installed and connected and operates properly but also to demonstrate that the equipment performs the work for which it is intended.
- E. Contractor is responsible, at his expense, to conduct any and all tests necessary to demonstrate that the equipment performs as specified and submitted. Tested equipment found to be defective or inoperable to any extent shall be reported to the Engineer immediately.
- F. Any operating difficulty or defective item shall be repaired or replaced and put into proper operation by the Contractor immediately, at no additional expense to the Authority.
- G. Protect equipment and surrounding areas from damage resulting from testing operations. Clean-up spills or leakage from testing.
- H. The Contractor shall bear all expenses of all tests, including the furnishing of all necessary instruments, lubricant, hydraulic fluids, supplies, data recorders, and operating personnel. Provide and bear all expenses for fuel/power required to operate the equipment during the tests.
- I. At the sole discretion of the Engineer, the Contractor will be required to repeat any test at no additional cost to the Authority.

1.18 MOTORS AND DRIVES:

- A. Motors and drives shall be checked carefully for correct rotation and alignment before placing equipment into operation.
- B. Couplings shall be disconnected and realigned before placing into service or testing.
- C. Belt drives shall be adjusted and worn belts replaced in sets. Speed adjustment shall be subject to approval of the Engineer.

1.19 INSPECTION:

- A. Work will be inspected by the Engineer periodically during the course for construction.
- B. Provide for inspections by all others having jurisdiction over the work performed under the various Sections of Divisions 11 and 14, and Section 01060, during the progress of the work.
- C. At time of final inspection, furnish certificate or certificates of final approval by all others having jurisdiction as applicable.

1.20 FIELD PAINTING:

- A. Unless otherwise specified in other Sections of these Specifications, all lubricants, cleaning compounds, and similar operating materials will be furnished by the Authority during instruction of the Authority's personnel.

- B. After all equipment and systems have been installed, connected and tested, proceed with the simultaneous start-up and initial operation of the entire facility as well as the instruction of Authority's personnel in the operation and maintenance of equipment. The Contractor shall provide sufficient personnel to adequately complement personnel made available by the Authority.
- C. During this period, provide qualified representatives of equipment manufacturers for instruction of the Authority's personnel in operation and maintenance of the equipment.
- D. The Authority will provide railcars and railcar components required for the instruction of the Authority's personnel in the operation of the equipment.

APPENDIX A

MAJOR SHOP EQUIPMENT LISTING

NOTE: The Brand Name products specified are intended for descriptive purposes only. They represent similar equipment that is currently installed in other WMATA facilities. Design-Builders are permitted to propose products equal to those stated. All major equipment proposed will be evaluated for availability, reliability, and maintainability as stated under Section 00204.D as well as for compliance with the applicable Specification Sections shown below.

	Equipment	Schedule A Greenbelt	Schedule B Shady Grove	Schedule D Brentwood	Brand Name	Model No.	Spec Section
1	Car Hoist System - Married Pair with Car Body Posts	-	2	-	Whiting	Custom	14100
2	Car Hoist System - Married Pair with Spinning Posts	-	2	6	Whiting	Custom	14100
3	Truck Repair Hoist System - Single Truck with Spinning Posts	8	2	-	Whiting	Custom	14520
4	Motorized Turntables	15	9	2	Whiting	Custom	11300
5	Vertical Milling Center	1	-	-	Haas	VF-4	11100
6	Combination Double End Mount/Demount Press - 600T	1	-	-	Simmons-Farrel	-	11200
7	Bridge Crane -15 Ton	3	-	-	-	-	14401

SECTION 11100
VERTICAL MILLING CENTER

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

- A. Drawings and general provisions of the Contract apply to this section.
- B. Related Sections include Section 11001, Equipment General Requirement.

1.02 SUMMARY:

- A. This section includes the Vertical Machining center.

1.03 TRAINING:

- A. Contractor is responsible for training as outlined in Section 01820, Demonstration and Training and Section 11001, Equipment General Requirements.
- B. Number of Personnel To Be Trained And Class Size.

Level Of Training	Approximate Number	Maximum Class Size	Minimum Number of Classes
Level I	40	8	6
Level II	8	4	2
Level III	8	4	2

- C. Levels of Training:
 - 1. Level I: Familiarizing Training
 - 2. Level II: Training for P&E Personnel
 - 3. Level III: Programming Training

PART 2 - PRODUCTS:

2.01 PRODUCT DATA:

- A. Description: the vertical machining center shall be 50" x 20" x 25" (1,270 x 508 x 635 mm) xyz travels and shall consist of cast-iron components, and have a 40-taper cartridge spindle driven by a 20 hp vector Dual-Drive motor, produces either 75 ft-lb of

torque at 1,200 rpm, or 250 ft-lb at 450 rpm with the optional 2-speed gearbox—and shall run up to 7,500 rpm in 1.2 seconds for finishing aluminum.

- B. Options and Accessories for a Vertical Milling Center machine tool shall be coordinated with the owner.

TRAVELS	S.A.E.	Metric
Maximum X Axis	50 "	1270 mm
Maximum Y Axis	20 "	508 mm
Maximum Z Axis	25 "	635 mm
Spindle nose to table (min)	4 "	102 mm
Spindle nose to table (max)	29 "	737 mm
STANDARD TABLE	S.A.E.	Metric
Length	52 "	1321 mm
Width	18 "	457 mm
Max Weight on Table	3500 lb	1588 kg
T-slot Width	.625 "	15.875 mm
T-slot Center Distance	3.15 "	80 mm
Number of T slots	5	5
SPINDLE	S.A.E.	Metric
Taper Size	#40 Taper "	#40 Taper
Spindle Max Speed	7500 rpm	7500 rpm
Drive System	Direct Speed Belt Drive	Direct Speed Belt Drive
Max Torque Standard	75 ft-lb @ 1400 rpm	102 Nm @ 1400 rpm
with Optional Gearbox	250 ft-lb @ 450 rpm	339 Nm @ 450 rpm
Spindle Motor Max. Rating	20 hp	14.9 kw
Bearing Lubrication	Air/Oil injection	Air/Oil injection
Cooling	Liquid Cooled	Liquid Cooled
AXIS MOTORS	S.A.E.	Metric
Max Thrust Rating X	2550 lb	11343 N
Max Thrust Rating Y	2550 lb	11343 N
Max Thrust Rating Z	4200 lb	18683 N
FEEDRATES	S.A.E.	Metric
Rapids on X Axis	1000 in/min	25.4 m/min
Rapids on Y Axis	1000 in/min	25.4 m/min
Rapids on Z Axis	1000 in/min	25.4 m/min
Max Cutting	650 in/min	16.5 m/min

TOOL CHANGER	S.A.E.	Metric
Capacity Standard	20	20
Tool Type / Taper	CT or BT/40	CT or BT/40
Max Tool Diameter Std (full)	3.5 "	89 mm
Maximum Tool Weight	12 lb	5.4 kg
Changer Type Standard (Optional)	Carousel (SMTC)	Carousel (SMTC)
Tool-to-Tool (avg)	4.2 sec	4.2 sec
Chip-to-Chip (avg)	4.5 sec	4.5 sec

SECTION 11160
LOADING DOCK EQUIPMENT

PART 1 - GENERAL

1.01 SUMMARY OF WORK

- A. This Section includes the following:
 - 1. Dock bumpers.
 - 2. Dock levelers.
 - 3. Truck levelers.
 - 4. Truck restraints.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

- A. Division 3 Section "Cast-in-Place Concrete" for concrete work for recessed loading dock equipment.
- B. Division 5 Section "Metal Fabrications" for curb angles at edges of recessed pits and loading dock platform edge channels.
- C. Division 8 Sections for overhead doors electrically interlocked to dock levelers.
- D. Division 15 Section "Plumbing Specialties" for pit drains for loading dock equipment permanently installed in pits.
- E. Division 16 Section "Interior Lighting" for dock lighting fixtures.
- F. Division 16 Sections for electrical wiring and connections for loading dock equipment.

1.03 DEFINITIONS

- A. Operating Range: Maximum amount of travel above and below the loading dock level.
- B. Working Range: Recommended amount of travel above and below the loading dock level for which loading and unloading operations can take place.

1.04 SUBMITTALS

- A. Product Data: Include construction details, material descriptions, rated capacities, operating characteristics, furnished specialties, accessories, dimensions of individual components and profiles, and finishes.
- B. Shop Drawings: Show fabrication and installation details. Include plans, elevations, sections, details, and attachments to other work.
 - 1. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
 - 2. Wiring Diagrams: Power, signal, and control wiring.
- C. Qualification Data: For Installer.
- D. Product Test Reports: Based on evaluation of tests performed by manufacturer and supervised and verified by a qualified independent professional engineer, indicate

compliance of dock levelers with requirements of MH 30.1 for determining rated capacity, which is based on comprehensive testing within the last two years of current products.

1. Submittal Form: According to MH 30.1, Appendix A.
- E. Maintenance Data: For loading dock equipment to include in maintenance manuals.
- F. Warranties: Special warranties specified in this Section.

1.05 QUALITY ASSURANCE

- A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.
1. Maintenance Proximity: Not more than two hours' normal travel time from Installer's place of business to Project site.
- B. Source Limitations: Obtain each type of loading dock equipment through one source from a single manufacturer.
- C. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1 Section "Project Management and Coordination."

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Comply with manufacturer's written instructions for minimum and maximum temperature requirements for storage.

1.07 PROJECT CONDITIONS

- A. Field Measurements: Indicate measurements on Shop Drawings.
1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish recessed pit dimensions, slopes of driveways, and heights of loading docks, and proceed with fabricating loading dock equipment without field measurements. Coordinate loading dock construction to ensure that actual dimensions correspond to established dimensions.

1.08 COORDINATION

- A. Coordinate installation of anchorages for loading dock equipment. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.
- B. Recessed Loading Dock Equipment: Coordinate size and location of pits to ensure proper clearances and operation of equipment.
1. Concrete, reinforcement, and formwork requirements are specified in Division 3 Section "Cast-in-Place Concrete."
 2. Asphalt paving requirements are specified in Division 2 Section "Hot-Mix Asphalt Paving."
- C. Electrical Requirements: Coordinate wiring requirements and current characteristics of loading dock equipment with building electrical system. See Division 16 Sections.

1.09 WARRANTY

- A. Special Warranty for Dock Levelers: Manufacturer's standard form in which manufacturer agrees to repair or replace dock-leveler components that fail in materials or workmanship within specified warranty period.
1. Failures include, but are not limited to, the following:
 - a. Structural failures including cracked or broken structural support members and load-bearing welds.
 - b. Deck plate failures including cracked plate or permanent deformation in excess of 1/4 inch (6 mm) between deck supports.
 - c. Hydraulic system failures including failure of hydraulic seals and cylinders.
 - d. Faulty operation of operators, control system, or hardware.
 2. Warranty Period for Structural Assembly: 10 years from date of Substantial Completion.
 3. Warranty Period for Hydraulic System: Five years from date of Substantial Completion.
 4. Warranty shall be for unlimited usage of the leveler for the specified rated capacity over the term of the warranty.

1.10 MAINTENANCE SERVICE

- A. Initial Maintenance Service: Beginning at Substantial Completion, provide 12 months' full maintenance by skilled employees of loading dock equipment Installer. Include quarterly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper equipment operation at rated speed and capacity. Provide parts and supplies same as those used in the manufacture and installation of original equipment.
1. Perform maintenance, including emergency callback service, during normal working hours.
 2. Include 24-hour-per-day, 7-day-per-week emergency callback service.
- B. Continuing Maintenance Service: Provide a continuing maintenance proposal from Installer to Owner, in the form of a standard yearly maintenance agreement, starting on date initial maintenance service is concluded. State services, obligations, conditions, and terms for agreement period and for future renewal options.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.02 MATERIALS

- A. Steel Plates, Shapes, and Bars: ASTM 36/A 36M.
- B. Rolled-Steel Floor Plate: ASTM A 786/A 786M, rolled from steel plate complying with ASTM A 572/A 572M, Grade 55 (380).

- C. Steel Tubing: ASTM A 500, cold formed.
- D. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.
- E. Wood: DOC PS 20 dimension lumber, select structural grade, kiln dried.
- F. Pressure-Treated Wood: DOC PS 20 dimension lumber, select structural grade, kiln dried, and pressure treated with waterborne preservatives to comply with AWPA C2.

2.03 DOCK BUMPERS

- A. Manufacturers:
 1. American Floor Products Company, Inc.
 2. Beacon Industries, Inc.
 3. Chalfant Dock Equipment.
 4. Durable Corporation.
 5. Ellis Industries, Inc.
 6. Flexon, Inc.
 7. Hugger Dock Equipment Company.
 8. Kelley Company, Inc.; a United Dominion Company.
 9. Maman Products, Inc.
 10. Pawling Corporation.
 11. Pioneer Loading Dock Equipment.
 12. R. C. Musson Rubber Co.
 13. Rite-Hite Corporation.
 14. Serco; a United Dominion Company.
 15. Super Seal Mfg. Ltd.
 16. Superior Bumper Products Inc.
 17. Tennessee Mat Company, Inc.
 18. Vestil Manufacturing.
- B. Laminated-Tread Bumpers: Fabricated from multiple, uniformly thick plies cut from fabric-reinforced rubber tires. Laminate plies under pressure on not less than two 3/4-inch- (19-mm-) diameter, steel supporting rods that are welded at one end to 1/4-inch- (6-mm-) thick, structural-steel end angle and secured with a nut and angle at the other end. Fabricate angles with predrilled anchor holes and sized to provide not less than 1 inch (25 mm) of tread plies extending beyond the face of closure angles.
- C. Molded-Rubber Bumpers: Fabricated from molded-rubber compound reinforced with nylon, rayon, or polyester cord; with Type A Shore durometer hardness of 80, plus or minus 5, when tested according to ASTM D 2240; of size and configuration indicated. Fabricate units with not less than two predrilled anchor holes.
- D. Extruded-Rubber Bumpers: Fabricated from ASTM D 2000, extruded synthetic rubber with Type A Shore durometer hardness of 75, plus or minus 5, when tested according to ASTM D 2240; of size and configuration indicated. Furnish units with predrilled anchor holes and concealed, flat, steel mounting bar.
- E. Steel-Face, Laminated-Tread Bumpers: Fabricated from multiple, uniformly thick plies cut from fabric-reinforced rubber tires and with 3/8-inch (9.5-mm) steel face plate of same size as rubber surface. Laminate plies under pressure on not less than two 3/4-inch (- 19-mm-) diameter, steel supporting rods that are welded at one end to 1/4-inch- (6-mm-) thick, structural-steel end angle and secured with a nut and angle at the other end. Fabricate

angles with predrilled anchor holes and sized to provide not less than 1 inch (25 mm) of tread plies extending beyond the face of closure angles. Weld face plate to two steel support brackets, which shall extend back to and engage 3/4-inch- (19-mm-) diameter support rods in elongated holes, allowing steel face to float on impact.

- F. Anchorage Devices: Hot-dip galvanized steel anchor bolts, nuts, washers, bolts, sleeves, cast-in-place plates, and other anchorage devices as required to fasten bumpers securely in place and to suit installation type indicated.

2.04 RECESSED DOCK LEVELERS

- A. General: Recessed, hinged-lip-type dock levelers designed for permanent installation in concrete pits preformed in the edge of loading platform; of type, function, operation, capacity, size, and construction indicated; and complete with controls, safety devices, and accessories required.
 - 1. Manufacturers:
 - a. Beacon Industries, Inc.
 - b. Blue Giant Equipment Corporation; Subsidiary of TBM Holdings, Inc.
 - c. Chalfant Dock Equipment.
 - d. DLM, Inc.
 - e. Ellis Industries, Inc.
 - f. Flexon, Inc.
 - g. Kelley Company, Inc.; a United Dominion Company.
 - h. McGuire, W. B. Co., Inc.; Division of Overhead Door Corporation.
 - i. Pentalift Equipment Corporation.
 - j. Pioneer Loading Dock Equipment.
 - k. POWERAMP; Division of Systems, Inc.
 - l. Rite-Hite Corporation.
 - m. Rol-Lift Corporation; Subsidiary of TBM Holdings, Inc.
 - n. Serco; a United Dominion Company.
 - o. Vestil Manufacturing.
- B. Quality Standard: MH 30.1, "Safety, Performance and Testing of Dock Leveling Devices."
- C. Function: Dock levelers shall compensate for differences in height between truck bed and loading platform in the following manner:
 - 1. Vertical Travel: Provide operating range above platform level of sufficient height to enable lip to extend and clear truck bed before contact.
 - 2. Automatic Vertical Compensation: Floating travel of ramp with lip extended and resting on truck bed shall compensate automatically for upward or downward movement of truck bed during loading and unloading.
 - 3. Automatic Lateral Compensation: Tilting of ramp with lip extended and resting on truck bed shall compensate automatically for canted truck beds of up to 4 inches (100 mm) over width of ramp.
 - 4. Lip Operation: Manufacturer's standard mechanism that automatically extends and supports hinged lip on ramp edge with lip resting on truck bed over dock leveler's working range, allows lip to yield under impact of incoming truck, and automatically retracts lip when truck departs.
 - 5. Automatic Ramp Return: Automatic return of unloaded ramp, from raised or lowered positions to stored position, level with platform, as truck departs.
- D. Mechanical Operating System: Spring-operated raising and walk-down lowering of unloaded ramp. Equip units with an upward-biased-spring counterbalancing mechanism

controlled by a hold-down device. Ramp raises to top limit of operating range by operating recessed control handle in ramp to disengage hold-down device. Ramp lowers below platform level with lip retracted by operating auxiliary, recessed control handle to release support legs.

1. Free-Fall Protection: Manufacturer's standard protection system to limit free fall of loaded ramps with front edge supported by truck bed.
- E. Hydraulic Operating System: Electric-powered hydraulic raising and hydraulic lowering of ramp, controlled from a remotely located push-button station. Equip leveler with a packaged unit including a unitized, totally enclosed, nonventilated electric motor, pump, manifold reservoir, and valve assembly of proper size, type, and operation for capacity of leveler indicated. Include means for lowering ramp below platform level with lip retracted behind dock bumpers. Provide a hydraulic velocity fuse connected to main hydraulic cylinder to limit loaded ramp's free fall to not more than 3 inches (76 mm.)
1. Remote-Control Station: Single-button station of the constant-pressure type, enclosed in NEMA ICS 6, Type 12 box. Ramp raises by depressing and holding button; ramp lowers at a controlled rate by releasing button.
 2. Remote-Control Station with Emergency Stop: Multibutton control station with an UP button of the constant-pressure type and an emergency STOP button of the momentary-contact type, enclosed in NEMA ICS 6, Type 12 box. Ramp raises by depressing and holding UP button; ramp lowers at a controlled rate by releasing UP button. All ramp movement stops, regardless of position of ramp or lip, by depressing STOP button. Normal operation resumes by engaging a manual reset button or by pulling out STOP button.
 - a. Dual-Panel Control Station: Remote-control station for operating side-by-side dock levelers.
 - b. Master Panel: Control panel with integral fused disconnecting means for operating dock leveler, dock door, and truck restraints.
 3. Independent Lip Operation: Electric-powered hydraulic raising and hydraulic lowering of lip, controlled independently of raising and lowering of ramp.
- F. Electric Operating System: Electric raising of ramp and automatic extending of lip, controlled from a remotely located push-button station. Equip leveler with a packaged unit including a unitized electric motor and shaft assembly of proper size, type, and operation for capacity of leveler indicated. Include means for lowering ramp below platform level with lip retracted behind dock bumpers.
1. Remote-Control Station: Single-button station of the constant-pressure type, enclosed in shielded NEMA ICS 6, Type 4 box. Ramp raises by depressing and holding button; ramp lowers at a controlled rate by releasing button.
 2. Remote-Control Station with Emergency Stop: Multibutton control station with an UP button of the constant-pressure type and an emergency STOP button of the momentary-contact type, enclosed in NEMA ICS 6, Type 12 box. Ramp raises by depressing and holding UP button; ramp lowers at a controlled rate by releasing UP button. All ramp movement stops, regardless of position of ramp or lip, by depressing STOP button. Normal operation resumes by engaging a manual reset button or by pulling out STOP button.
- G. Air-Bag Operating System: Electric, high-volume, low-pressure lifting of ramp, controlled from a remotely located push-button station. Equip leveler with a packaged unit including a PVC-coated polyester lifting bag and two-stage, single-speed electric fan of proper size, type, and operation for capacity of leveler indicated. Include dock-leveler supports controlled by release chain for lowering ramp below platform level without extending lip.
1. Remote-Control Station: Single-button station of the constant-pressure type, enclosed in shielded NEMA ICS 6, Type 4 box. Ramp raises by depressing and

holding button; ramp lowers at a controlled rate by releasing button.

- H. Construction: Fabricate dock-leveler frame, platform supports, and lip supports from structural- or formed-steel shapes. Weld platform and hinged lip to supports. Fabricate entire assembly to withstand deformation during both operating and stored phases of service. Chamfer lip edge to minimize obstructing wheels of material-handling vehicles.
1. Clean-Pit Frame: Designed to support leveler at sides of pit, with no side-to-side supports at front of pit floor.
 2. Hinged Lip: Full width, piano-type hinge with heavy-wall hinge tube and greased fittings, with gussets on lip and ramp for support.
 3. Toe Guards: Equip open sides of rising ramp over range indicated with metal toe guards mounted flush with ramp edges and projecting below ramp.
 - a. Finish: Factory finish dock levelers after assembly and testing. Paint toe guards yellow to comply with ANSI Z535.1.
 4. Cross-Traffic Support: Manufacturer's standard method of supporting ramp at platform level in stored position with lip retracted. Provide a means to release supports to allow ramp to descend below platform level.
 5. Maintenance Strut: Integral strut to positively support ramp in up position during maintenance of dock leveler.
 6. Integral Dock Bumpers: Fabricated from 4-inch- (100-mm-) thick, heavy molded-rubber compound reinforced with nylon, rayon, or polyester cord; with Type A Shore durometer hardness of 80, plus or minus 5, when tested according to ASTM D 2240. Provide two dock bumpers for each recessed dock leveler, attached to face of loading dock with expansion bolts.
- I. Accessories:
1. Curb Angles: 3-by-3-by-1/4-inch (76-by-76-by-6-mm) galvanized steel curb angles for edge of recessed leveler pit, with 1/2-inch- (13-mm-) diameter by 6-inch- (152-mm-) long concrete anchors welded to angle at 6 inches (152 mm) o.c.
 2. Self-Forming Pan: Manufacturer's standard prefabricated, self-forming steel form system for poured-in-place construction of concrete pit.
 3. Night Locks: Manufacturer's standard means to prevent extending lip and lowering ramp when overhead doors are locked.
 4. Side and rear weatherseals.
 5. Foam insulation under dock-leveler platform.
 6. Abrasive skid-resistant surface.
 7. Interlock: Leveler will not operate while overhead door is in closed position and truck restraint is not engaged.

2.05 TRUCK RESTRAINTS

- A. General: Manufacturer's standard device designed to engage truck's rear-impact guard and hold truck at loading dock. Restraint shall consist of an iron or steel restraining arm that raises until contacting rear-impact guard. Arm shall move vertically, automatically adjusting to varying height of truck due to loading and unloading operations.
1. Manufacturers
 - a. Beacon Industries, Inc.
 - b. Blue Giant Equipment Corporation; Subsidiary of TBM Holdings, Inc.
 - c. Chalfant Dock Equipment.
 - d. DLM, Inc.
 - e. Ellis Industries, Inc.
 - f. Flexon, Inc.
 - g. Kelley Company, Inc.; a United Dominion Company.
 - h. McGuire, W. B. Co., Inc.; Division of Overhead Door Corporation.

- i. Pentalift Equipment Corporation.
 - j. POWERAMP; Division of Systems, Inc.
 - k. Rite-Hite Corporation.
 - l. Serco; a United Dominion Company.
- B. Restraining Capacity: Capable of restraining total gross load indicated without permanent deflection or distortion.
 - C. Operating Range: Capable of restraining rear-impact guards within a range from 11 to 30 inches (279 to 762 mm) vertically above driveway, and from 0 to 12 inches (0 to 305 mm) horizontally in front of dock bumpers.
 - D. Power Operating System: Manufacturer's standard electromechanical or hydraulic unit.
 - 1. Remote-Control Station: Single-button station of the constant-pressure type, weatherproof, enclosed in NEMA ICS 6, Type 12 box. Restraint is engaged by depressing and holding button; restraint is released by releasing button.
 - 2. Interlock: Leveler will not operate while truck restraint is not engaged.
 - E. Mechanical Operating System: Restraint operates by use of a lifting rod or hook to raise engagement device.
 - F. Rear-Impact-Guard Sensor: Sensor detects presence of rear-impact guard and automatically returns to stored position if rear-impact guard is not engaged.
 - G. Caution Signs: Exterior, surface mounted; with black text on yellow background, and with sign copy as follows. Provide one sign at each truck-restraint location.
 - 1. Sign Copy in Forward and Reverse Text: "CAUTION, MOVE ON GREEN ONLY."

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of loading dock equipment.
- B. Examine roughing-in for electrical systems for loading dock equipment to verify actual locations of connections before equipment installation.
- C. Examine walls and floors of pits for suitable conditions where recessed loading dock equipment is to be installed. Pits shall be plumb and square and properly sloped for drainage from back to front of loading dock.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Coordinate size and location of loading dock equipment indicated to be attached to or recessed into concrete or masonry, and furnish anchoring devices with templates, diagrams, and instructions for their installation.
- B. Set curb angles in concrete edges of dock-leveler recessed pits with tops flush with loading platform. Fit exposed connections together to form hairline joints.

- C. Set curb angles in concrete edges of truck-leveler recessed pits with tops flush with driveway. Fit exposed connections together to form hairline joints.
- D. Place self-forming pan system for recessed dock levelers in proper relation to loading platform before pouring concrete.
- E. Clean recessed pits of debris.

3.03 INSTALLATION

- A. General: Install loading dock equipment, including motors, pumps, control stations, wiring, safety devices, and accessories as required for a complete installation.
 - 1. Rough-in electrical connections according to requirements specified in Division 16.
- B. Dock Bumpers: Attach dock bumpers to face of loading dock in a manner that complies with requirements indicated for spacing, arrangement, and position relative to top of platform and anchorage.
 - 1. Welded Attachment: Plug-weld anchor holes in contact with steel inserts and fillet weld at other locations.
 - 2. Bolted Attachment: Attach dock bumpers to preset anchor bolts embedded in concrete or to cast-in-place inserts or threaded studs welded to embedded-steel plates or angles. If preset anchor bolts, cast-in-place inserts, or threaded studs welded to embedded-steel plates or angles are not provided, attach dock bumpers by drilling and anchoring with expansion anchors and bolts.
 - 3. Screw Attachment: Attach dock bumpers to wood construction with lag bolts as indicated.
- C. Recessed Dock Levelers: Attach dock levelers securely to loading dock platform, flush with adjacent loading dock surfaces and square to recessed pit.
- D. Truck Restraints: Attach truck restraints in a manner that complies with requirements for arrangement and height required for device to engage vehicle rear-impact guard.
 - 1. Wall-Mounted Units: Weld truck restraints to steel curb angle, edge channel, or mounting plate embedded in loading dock edge.
 - 2. Wall-Mounted Units: Anchor truck restraints to loading dock face with expansion anchors and bolts.
 - 3. Driveway-Mounted Units: Anchor truck restraints to driveway with expansion anchors and bolts.
 - 4. Pit-Mounted Units: Anchor truck restraints to concrete pit with expansion anchors and bolts.

3.04 ADJUSTING AND CLEANING

- A. Adjust loading dock equipment for proper, safe, efficient operation.
- B. Test dock levelers for vertical travel within operating range indicated.
- C. Restore marred, abraded surfaces to their original condition.

3.05 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain loading dock equipment. Refer to Division 1 Section "Closeout Procedures or Demonstration and Training."

3.06 LOADING DOCK EQUIPMENT SCHEDULE

- A. Laminated-Tread Dock Bumper:
 - 1. Thickness: 4-1/2 inches (114 mm) or 6 inches (152 mm).
 - 2. Horizontal Style: 6 inches (152 mm), 10 inches (254 mm) or 12 inches (305 mm) high by length indicated on Drawings.
 - 3. Vertical Style: 8 inches (203 mm) wide by 20 inches (508 mm), 24 inches (610 mm), 36 inches (914 mm) high or height indicated on Drawings.

- B. Molded-Rubber Dock Bumper:
 - 1. Configuration: T shape, Inverted-L shape, Square, or rectangular. Thickness: 2 inches (50 mm), 3 inches (75 mm), 4 inches (100 mm), or 6 inches (150 mm).

- C. Extruded-Rubber Dock Bumper: Flat or ribbed, with 2-inch (50-mm) nominal thickness and 9-inch (229-mm) height, or 4-1/2-inch- (114-mm-) wide base and 4-inch (100-mm) depth with half-oval shape that compresses and returns to original shape.

- D. Steel-Faced, Laminated-Tread Dock Bumper:
 - 1. Thickness: 4-1/2 inches (114 mm) or 6 inches (152 mm).
 - 2. Horizontal Style: 6 inches (152 mm), 10 inches (254 mm), or 12 inches (305 mm) high by length indicated on Drawings.
 - 3. Vertical Style: 8 inches (203 mm) wide by 20 inches (508 mm), 24 inches (610 mm), 36 inches (914 mm), or height indicated on Drawings.

- E. Recessed Dock Leveler:
 - 1. Operation: Mechanical operating system.
 - 2. Operation: Hydraulic operating system with weatherproof, single-button or multibutton remote-control station.
 - 3. Operation: Electric-actuator operating system with weatherproof, single-button, or multibutton remote-control station.
 - 4. Operation: Air-bag operating system with weatherproof, single-button remote-control station.
 - 5. Rated Capacity: As determined by client.
 - 6. Platform Size: As indicated on Drawings.
 - 7. Vertical Travel: Minimum working range of 12 inches (305 mm) or 18 inches (457 mm) above and 12 inches (305 mm) or 14 inches (356 mm) below adjoining platform.
 - 8. Length of Lip Extension: 16 inches (406 mm), 18 inches (457 mm), or 20 inches (508 mm).
 - 9. Compensation Capacity: Automatic vertical, lateral, or vertical and lateral.
 - 10. Platform: 3/16-inch- (5-mm-), 1/4-inch- (6-mm-), or 3/8-inch- (9.5-mm-) thick, nonskid steel plate.
 - 11. Hinged Lip: 1/2-inch- (13-mm-), 5/8-inch- (16-mm-), 3/4-inch- (19-mm-), or 1-inch- (25-mm-) thick, nonskid steel plate.
 - 12. Frame: Manufacturer's standard type.
 - 13. Toe-Guard Range: Entire upper working or operating range.
 - 14. Accessories:
 - a. Night locks.
 - b. Side and rear weatherseals.
 - c. Foam-insulated deck.
 - d. Interlock to overhead door.
 - e. Interlock to truck restraint.
 - 15. Finish: Painted in manufacturer's standard color.

- F. Truck Restraint:
1. Power Operating System: Activated by single-button station, or activated by weatherproof, single-button station.
 2. Manual operating system.
 3. Restraining Capacity: as determined by client.
 4. Communication System: Caution signs and manual signal lights or automatic signal lights.
 5. Mounting: Wall, driveway or pit.
 6. Accessories: Interlock to dock leveler or Key switch.
 - a. Interlock to dock leveler.
 - b. Key switch.
 7. Finish: Painted in manufacturer's standard color.

SECTION 11200

COMBINATION DOUBLE END MOUNT/DEMOUNT PRESS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

- A. Drawings and general provisions of the Contract apply to this section.
- B. Related Sections include Section 11001, Equipment General Requirement.

1.02 SUMMARY:

- A. This section includes a combination double end mount/demount press

1.03 TRAINING:

- A. Contractor is responsible for training as outlined in Section 01820, Demonstration and Training and Section 11001, Equipment General Requirements.
- B. Number of Personnel To Be Trained And Class Size.

Level Of Training	Approximate Number of Individuals	Maximum Class Size	Minimum Number of Classes
Level I	40	8	6
Level II	8	4	2
Level III	8	4	2

- C. Levels of Training:
 - 1. Level I: Familiarizing Training
 - 2. Level II: Training for P&E Personnel
 - 3. Level III: Programming Training

PART 2 - PRODUCTS

2.01 PRODUCT DATA

- A. This specification describes a 600 Ton Universal Combination Mount/Demount Press. Proper tooling options must be selected suitable to handle transit wheel sets with inboard bearings, AAR standard freight wheel sets, and AAR standard locomotive wheel sets. The press shall be well suited to low and medium production shops, and must handle a wide variety of work pieces or handle complex work pieces efficiently such as transit wheel sets or locomotive wheel sets.
- B. The press shall consists of two opposing horizontal double acting hydraulic press rams,

a stationary abutment, and hydraulically operated tools located between the main cylinders and the stationary abutment.

- C. Upper and lower tension bars shall tie the two main cylinders and the center abutment together. The upper and lower tension bars shall be offset to allow overhead wheel set handling.
- D. A self-contained hydraulic power unit supplying all of the press requirements shall be located on the right hand end and to the rear of the press
- E. As illustrated below

2.02 FUNCTIONS

- A. The press must be able to perform the following processes:
 - 1. Low Tonnage Wheel Demounting
 - 2. High Tonnage Wheel Demounting
 - 3. Bearing Demounting
 - 4. Gearbox Demounting
 - 5. Gear Demounting
 - 6. Gear Mounting
 - 7. Gearbox Mounting
 - 8. Variable Tonnage Bearing Mounting
 - 9. Wheel Mounting
- B. The Press must be able to perform all functions listed above on the various series of rail cars possessed by WMATA. Different series of rail cars have differing gearbox mounting arrangements on the axles and the Press shall be able to support all arrangements. The Design Builder must demonstrate that the equipment supplied is capable of servicing all WMATA rail car types.

2.03 DESIGN DATA

A. Technical Design Data

Maximum pressing force	600 T(US)	5339 KN
Main ram diameter	18"	457 mm
Main ram working stroke	36"	914 mm
Max. opening between ram faces (w/o tools)	148"	3760 mm
Max. opening between ram faces (w/ std. tools)	116"	2945 mm
Tension bar cross-section	4 x 12"	100 x 300 mm
Vertical distance between tension bars	60"	1524 mm
Horizontal offset	9"	228 mm
Centerline Press to Floor (approx.) (standard pit design)	30"	762 mm
Operating Pressure	4500 PSI	300 bar
Ram rapid approach (per minute)	120"	3048 mm
Ram rapid retract (per minute)	140"	3556 mm
Press speed bearings mount 80 T	18"	457 mm
Press speed wheel mount 200 T	16.5"	419 mm
Press speed wheel demount 600 T	8.25"	209 mm
Pump motor	40 HP (30 KW)x1200 RPM Dbl Shaft	
Hydraulic fluid - ISO 32	(approx) 200 US gallons	
Overall floor space - approximate	380x186"	9652x4724 mm
Estimated Weight	56,000#	26,000 kg

B. Machine Construction

The Wheel Mount/Demount Press shall be of heavy-duty construction for long life in continuous duty service. The main rams shall be close-grained Meehanite castings, finished to a smooth ground surface. The pressing face shall be a removable steel plate. A large bronze ram bearing in the hydraulic cylinder beam shall be provided to assure accurate alignment of ram in the cylinder during press operation

2.04 MACHINE CONTROLS AND OPERATIONS

A. Main Press Assembly

1. The press consists of two main cylinders, one at each end of the press. The center abutment is located midway between the cylinders and is attached to the cylinders by tie bars.
2. Swing-in-swing-out tooling yokes shall be located between the center abutment and the cylinders and pivot on an axis located behind the lower tie bar. These yokes will be used for mounting wheels, gears and bearings.

3. The control pendant for mounting operations shall be located at the top of the center abutment. The main electrical power cabinet shall be located on the RH side of the hydraulic tank and behind it.
 4. The hydraulic tank and its controls shall be located at the RH end and back of the press.
 5. An overhead power transfer crane conveyor shall be located in front of and over the press. This crane shall have its own pendant for controlling its motion.
- B. Press Cylinder Beam
1. The press cylinder beams shall be made of ductile iron and are sleeved with brass bearings for the main ram.
 2. The main rams shall be made of cast iron and sealed with chevron packings. The main rams shall extend and retract by jack rams and shall be prevented from rotating by guide rods attached to the ram face plates.
 3. The cylinder beams shall have rectangular slots for accommodating the tie bars while round steel pins secure the tie bars to the beams. The cylinder beams shall rest on resilient pads to allow for expansion of the tie bars under high loads.
- C. Center Abutment
1. The center abutment shall be a heavy steel plate fabrication. The center abutment shall provide a structure for the three sliding abutments used in the demounting processes. Each abutment shall slide on anti-friction bearing ways for ease of movement. The right and left sliding abutments shall be powered into position while the smaller center sliding abutment is manually operated.
 2. The center abutment shall house the gearbox support table, which is powered up and down. The support table shall be removable to allow for more clearance in the center abutment opening. The center abutment shall have rectangular slots for accommodating the tie bars and shall be secured to the tension bars by round steel pins.
- D. Mounting Yokes
1. The mounting yokes shall be located between each cylinder beam and the center abutment. The yokes shall be comprised of heavy steel fabrications designed to withstand the forces of the mounting process. Each yoke shall pivot on a large shaft and shall be hydraulically actuated. Each yoke shall accept tools required for mounting of a particular size wheel set.
- E. Hydraulic Power Unit
1. The hydraulic power unit shall be a self-contained unit. It shall consist of two pumps powered by a 40 HP motor operating at 1200 RPM. The pumps and motor shall be located on a stand, which supports a 200 gallon fluid reservoir.
 2. One pump shall deliver fluid at fixed pressure while the second pump delivers at varying pressures determined by a proportional relief valve. The valve shall be controlled by the press controller, which monitors the press mode and shall automatically determine the pressure required.
 3. Return line filtration, with automatic clog indicator, shall be provided to eliminate contaminants in the fluid. A visual oil level and temperature gauge as well as automatic monitoring shall be provided.
- F. Wheel Set Transfer Crane

1. The optional transfer crane shall consist of a free-standing bridge crane with a runway of approximately 20', a span of approximately 15' and an under bridge height of approximately 9'. Option to be exercised by WMATA.
2. The transfer crane runway shall be supported in a manner that provides an open structure at the entrance of the runway that permits wheel sets and components to be moved to and from the pre-assembly area at the front of the press by any existing overhead shop crane.
3. The transfer crane bridge shall be electrically driven with two 2 1/2 ton hoists and one 1/2 ton hoist on a second bridge attached to the main bridge to facilitate gearbox handling.
4. A main pendant control station shall be provided which controls forward and backward movement of the bridge, and the simultaneous up and down movement of the 2 1/2 ton hoists. In addition, each of the two 1/2 ton hoists shall be provided with pendant stations to control their individual up and down movement.

2.05 MACHINE CONTROLS AND OPERATION

A. The Control System

The control system shall utilize a processor as the core of its hardware and used to control all discrete input and output devices, communicates with the Wheel Press Recorder, and shall provide operator interface communications.

B. Wheel Press Recorder

Computerized Wheel Press Recorder and Data Storage Unit. For wheel mounting operations, a computerized wheel press recorder and data storage unit shall be provided. This windows based unit shall offer:

1. Display and Storage Unit containing the operator's data entry station (computer and keyboard), CRT screen (video display), dedicated wheel chart printer,
2. Pressure Transducer,
3. Displacement Transducer.

The Wheel Press Recorder shall be mounted in a separate free-standing enclosure in order to assure complete freedom from vibration that may occur during wheel mounting operation. The Recorder shall be connected to the Press by a suitable mechanical linkage, hydraulic and electronic lines.

The Wheel Press Recorder shall monitor the wheel mounting force (tonnage) applied and distance, and plots the wheel fit chart on a CRT screen in accordance with the mandatory requirements established by the AAR. This graph shall also be printed on a dedicated printer thereby providing a permanent record of each wheel mounted.

A Bearing Spike Control feature shall be available to record the "spike" produced when the wheels are mounted to axles containing inboard bearings. The Wheel Press Recorder shall contain a Data Storage Unit to compile the following useful information particular to each wheel that is mounted.

1. Date and time of the wheel mount,
2. Operator identification code,

3. Mount side of the axle (left/right),
4. Maximum force (tonnage),
5. Axle serial number, type and size,
6. Wheel serial number, manufacturer, type and size,
7. Total mounts for the day (shift) and month.

This information shall be stored on floppy disk and may be further interfaced with a (owner provided) database software program to generate customized reports.

C. Operator Interface

The operator interface or display system shall use a touch screen display. The display shall be controlled by the Remote I/O. The O/I shall provide information such as ram position, tonnage, wheel set types, and components.

D. Machine Controls

Four control stations shall contain the pushbuttons, lights and switches necessary to operate the press. These control stations shall be the main control station, the demount station, the mount station, and the pendant station. Each station shall perform different operations.

E. Main Control Station

The main control station shall be located on the door of the electrical control cabinet. The pushbuttons and lights on the Main Control Station shall operate to enable system power and indicate hydraulic faults. The pushbuttons and lights shall be as described below.

1. Control ON: An illuminated green push button shall enable control power to the press output devices. The control must be on before any press operations can be performed.
2. Hydraulic Start: An illuminated green pushbutton shall turn on the hydraulic pump motor, which supplies hydraulic fluid for all press operations. This pushbutton shall only work if the control is on. The pushbutton shall light once the hydraulic pump is running.
3. Hydraulic Stop: An illuminated red pushbutton shall turn the hydraulic pump motor off. When the hydraulic motor is not running this pushbutton will light.
4. Filters Clogged: A light indicator shall be used to indicate that a clogged oil filter on the return line to the hydraulic tank. When the filter is clogged the indicator will light.
5. Oil Tank: A dual light indicator shall be used to indicate a fault in the oil tank. The "low level" light reports low oil level in the hydraulic tank. The "overtemp" light reports that too much heat in the hydraulic oil.
6. Emergency STOP: A self-latching, mushroom shaped, red pushbutton disables control power to wheel press output devices. Control power, hydraulic pump, and all machine motion will be terminated when this pushbutton is pressed. To re-establish control power the "Emergency Stop" pushbutton must be pulled out.

F. Demount Station

The demount station shall contain the pushbuttons needed to demount wheels and

bearings. The demount station shall be located on the press right cylinder beam. It shall be used during a demount process of over 200 tons and shall be located behind a sturdy metal shield with a safety glass window for operator protection. The pushbuttons on this station are described as follows:

1. Station Active Mount/Demount Switch: A two position, maintained contact switch selects the station active for operations. The "Demount" position shall be for 600 ton demounting, all other will be enabled in the "Mount" position.
2. Station Active Pilot Light: A green pilot light that illuminates when the demount station is active.
3. Demount to left pushbutton: A white, momentary contact, reports that the press is ready to start a demount of the left wheel at 600 ton maximum force.
4. Demount to right pushbutton: A white, momentary contact, reports that the press is ready to start a demount of the right wheel at 600 ton maximum force.
5. Emergency Stop: A self-latching, mushroom shaped, red pushbutton disables control power to wheel press output devices. Control power, hydraulic pump, and all machine motion will be terminated when this pushbutton is pressed. To reestablish control power the "Emergency Stop" pushbutton must be pulled out.

G. Mounting Station

The mounting station shall contain the necessary controls for all mounting and 200 ton demounting. The mounting station pendant shall be located at the top, middle of the press. The descriptions for this station is described below.

1. Mount Left (Right) Wheel: A momentary green-lighted pushbuttons shall allow mounting the left and right wheels of a chucked wheel set. Illumination of one of these buttons indicates that the yokes and abutments are position so that the left or right wheel can be mounted. Once lit, pressing the button extends the correct ram for the wheel you are setting up to mount.
2. Mount Left (Right) Bearing: A momentary green-lighted pushbuttons shall allow mounting the left and right bearings of a chucked wheel set. Illumination of one of these buttons indicates that the yokes and abutments are position so that the left or right bearing can be mounted. Once lit, pressing the button extends the correct ram for the bearing you are setting up to mount.
3. Demount to Left or Right: A momentary blue-lighted pushbuttons operate in the same manner as the Mount Left (Right) Wheel pushbuttons. The exception is that the yokes and abutments must be positioned to demount using only the 200-ton demount selections.
4. Left or Right Abutment In/Out: A two position, maintained contact switches determine the positioning of the abutments used to demount wheels and bearings. Switched to the "in" position, the respective abutment shall be moved towards the front of the press (to be used for demounting). Switched to the out position, the respective abutment shall be retracted to the back of the press. Interlocks not allowing abutment movement shall be displayed on the Operator Interface Screen.
5. Table Up/Down: A two position, maintained contact switch positions the gearbox support table. When switched to "up", the table shall be moved up to the end of the cylinder stroke. In the "down" position, the table is fully retracted to the down position.

6. Brg. / Wheel / 200T / 600T: A four position, maintained, selector switch shall allow the operator to select the operations to be performed by the press. This switch controls the system pressure applied on the rams when mounting or demounting. Maximum System Pressure is set to a specified amount when this switch is positioned. When mounting bearings, the switch shall be set to "brg". When this switch is set to bearing the remote I/O also looks at the "bearing pressure" potentiometer. When mounting wheels the switch shall be set to "wheel". When demounting at 200 ton the switch shall be set at "200T", and when demounting at 600 tons the switch should be set at "600T".
7. Bearing Pressure Potentiometer: A potentiometer controls the system pressure from 25 tons to 75 tons when the above switch is set to "brg". These settings are commonly used to vary the pressure when mounting bearings.
8. Axle Chuck: A white pilot light shall signify that the chuck pressure has been obtained.
9. Station Active: A green pilot light shall indicate that the mounting station is active as selected by the two-position switch located on the Demount Station.
10. Hydraulic Alarm: A red pilot light shall indicate that a hydraulic error has occurred. A similar lamp on the main control panel shall also light. A message for hydraulic fault shall be displayed on the Operator Interface Screen.
11. Recorder: An illuminated, momentary contact, green pushbutton shall tell the Wheel Press Recorder to record the following operation. When pressed, if the recorder is ready, the pushbutton shall signify that it is recording. If the button does not light within 30 seconds, an error message shall be displayed on the Operator Interface Screen.

H. Pendant Station

The pendant station shall contain pushbuttons and switches for manually positioning the yokes and rams. This pendant shall be located on a swivel arm in front of the press. Below are descriptions of the controls on the pendant station:

1. Ram Right/Left: A two-position selector switch shall allow the operator select between jogging either the left or right ram.
2. Ram Extend: A momentary contact pushbutton shall allow the operator to jog the selected ram toward the center of the press. This pushbutton is enabled whether "chuck mode" is on or off.
3. Ram Retract: A momentary contact pushbutton shall allow the operator to jog the selected ram away from the center of the press. This pushbutton shall only be enabled when the "chuck mode" is off.
4. Axle Chuck On/Off: A white lighted two position, selector switch shall allow the operator to enable or disable chuck mode. When "chuck on" is selected, the rams move toward the center of the press. The lighting of this selector switch indicates adequate chuck pressure. When "chuck off" is selected, chuck pressure shall be vented to the tank and the ram retract operations shall be enabled. To mount or demount, "axle chuck" must be "on" and lit.
5. Yoke Selector Lh Whl/Brg ; Rh Whl/Brg: A four-position selector switch shall allow the operator to select the yoke of the press to be positioned. In the "Lh Whl" position, the left wheel yoke shall be in position. In the "Lh Brg" position, the left bearing yoke shall be in positioned. In the "Rh Whl" position, the right wheel yoke shall be in position. In the "Rh Brg" position, the right bearing yoke shall be in positioned.

6. Yoke Up: A momentary contact pushbutton shall allow the operator to position the selected yoke to the "up" position. The selected yoke shall be determined by the "yoke selector" switch position. When pressed, the selected yoke shall move up until the position is reached or the pushbutton is released.
7. Yoke down: A momentary contact pushbutton shall allow the operator to position the selected yoke to the "down" position. The selected yoke is determined by the "yoke selector" switch position. When pressed, the selected yoke moves down until the position is reached or the pushbutton is released.
8. Emergency Stop: A self-latching, mushroom shaped, red pushbutton shall disable the control power to wheel press output devices. Control power, hydraulic pump, and all machine motion shall be terminated when this pushbutton is pressed. To reestablish control power the "Emergency Stop" pushbutton must be pulled out.

I. Message Display:

A display on the Remote I/O, shall be multiline display located on the control pendant. The display shall indicate the error messages and diagnostic messages generated by the control program to assist the operator

1. Error Messages: Error messages shall be shown on the display as long as the fault condition exists. Correcting the fault condition removes the message from the display.
2. Diagnostic Messages: Diagnostic messages shall be shown on the display to tell the operator why certain mounting and demounting operations cannot be performed. The six pushbuttons on the Mounting Station labeled "Mount Right/Left Wheel", "Mount Right/Left Bearing", and "Demount to Right/Left" shall be used to tell the control what operation to perform. When the press is configured to perform one of these operations, the corresponding pushbutton shall illuminate. When the illuminated pushbutton is pressed, the appropriate ram will move to perform the operation.

If the pushbutton is pressed while not lit, the operation shall not be performed, and the display will show a message telling the operator why the operation has not been performed. Only one message shall be displayed at a time. Once one fault condition has been corrected, and the light is still not lit, pressing the button again shall provide another message to be displayed. This is continued until the light is illuminated indicating the operation can now be performed.

SECTION 11300

MOTORIZED TURNTABLES

PART 1 - GENERAL

RELATED DOCUMENTS:

- A. Drawings and general provisions of the Contract apply to this section.
- B. Related Sections include Section 11001, Equipment General Requirement.

1.01 DESCRIPTION:

- A. This section specifies the design, fabrication, furnishing, and installation of motorized turntables as specified herein.

1.02 QUALITY ASSURANCE:

- A. Manufacturer Requirements:
 - 1. Furnish Motorized Turntables manufactured and designed as approved by WMATA's engineering, operation and maintenance departments.
 - 2. Minimum expected half life of this equipment shall be 25 years. All equipment furnished shall be heavy duty, industrial type.
 - 3. The Engineer reserves the right to inspect materials and their sources, shop or fabricating facility. The Engineer further reserves the right to be present for any or all shop tests of components, assemblies, or systems. The Manufacturer shall notify the Engineer two (2) weeks in advance of any tests.
 - 4. Manufacturer's Compliance:
 - a. All factory wired control panels shall be tested for operation, as specified herein, and submitted to Underwriters Laboratories Inc., for inspection, approval, and labeling.
 - b. Nameplates: Nameplates shall be securely attached, by mechanical means, in a prominent location on each major item of equipment.
 - c. The turntables shall meet the Federal Transit Administration Buy America Clause for equipment installed in an existing maintenance shop.
 - 5. Qualification of Manufacturer: Manufacturer shall be reputable and regularly engaged in the design and manufacture of the type of equipment specified herein. Assembled components, purchased by the Manufacturer for this Contract, such as motors, gear boxes, electrical devices, etc., shall be the standard products of qualified manufacturers. All similar items shall be the products of a single manufacturer. Prior to approval of the Manufacturer's proposal for the Turntables, the Manufacturer shall submit to the Engineer the following information:
 - a. A list of turntables, of his manufacture, similar in usage, where the proposed equipment has been in service, including the duration of service.
 - b. Name of contact person at each installation submitted above, who is familiar with the operation and maintenance of turntables by the Manufacturer.
 - c. The manufacturer of the turntables shall be ISO-9001 certified and registered. The manufacturer must submit with the bid response proof that it has implemented, maintained a quality system that fulfills the requirements of the ISO-9001 in the form of a certificate documenting the most recent

- quality audit and report.
- d. Based on the information supplied, and discussions with the contact persons named, the Engineer will determine the acceptability of the proposed Manufacturer and equipment.
- e. Manufactures standard quality assurance program to the authority for approval.
- d. Welders employed in making structural welds shall be certified per AWS D1.1. Prior to shipment, certification must be furnished to the Contract Administrator for the actual welders who performed the work.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the requirements set forth in the Divisions 00 and 01, and with the additional requirements as specified for each.
- B. Certificates: Fourteen days prior to shipment, submit four copies of certification that equipment to be delivered is in compliance with applicable codes as follows:

AGMA	American Gear Manufactures Association
AISC	American Institute of Steel Construction
AREMA	American Railway Engineering Association (Allowable Material Stress Value for Steel Structures)
ASTM	American Society for Testing and Materials (Material Specifications - ASTM A-36)
AWS	American Welding Society
NEC	National Electric Code
NEMA	National Electrical Manufactures Association
- C. Shop Drawings: In accordance with the General Requirements, submit six (6) copies of complete shop drawings to the Authority for approval, including but not limited to:
 - 1. Equipment arrangement.
 - 2. Equipment outline dimensions.
 - 3. Assembly and subassemblies
 - 4. Wiring diagrams and schematics.
 - 5. Installation Instructions.
- D. Operations and Maintenance Manual: Submit in accordance with the requirements of the General Requirements.
- E. Contract Record Drawings: Submit in accordance with the General Requirements.

1.04 TRAINING:

- A. Contractor is responsible for training as outlined in Section 01820, Demonstration and Training and Section 11001, Equipment General Requirements.
- B. Number of Personnel To Be Trained And Class Size.

Level Of Training	Approximate Number of Individuals	Maximum Class Size	Minimum Number of Classes
Level I	40	8	6
Level II	8	4	2
Level III	8	4	2

- C. Levels of Training:
1. Level I: Familiarizing Training
 2. Level II: Training for P&E Personnel
 3. Level III: Programming Training

1.05 PRODUCT DELIVERY, STORAGE, HANDLING AND WARRANTY:

- A. Ship equipment upon notification by the Engineer.
- B. Package, handle and store to prevent damage.
- C. This equipment shall comply with the delivery, storage and handling paragraphs in the Special Provisions.
- D. This equipment shall comply with the job site conditions paragraphs detailed in the Special Provisions.
- E. This equipment shall comply with the warranty conditions detailed in the Special Provisions.

PART 2 - PRODUCTS

2.01 Manufacturer

- A. The Turntables shall be as manufactured and designed as approved by WMATA's engineering, operation and maintenance departments.

2.02 General Requirements

- A. The equipment shall conform to the design of the equipment pits and shall be placed in accordance with the general arrangement as shown on the contract drawings. The general arrangement may be modified only as required to suit the specific equipment being supplied. Layout dimensions as shown may be modified to improve operating efficiency. Any modifications required to the building design to accommodate the equipment shall be the responsibility of the contractor and shall be provided at no additional cost. Changes shall be specifically approved by the Engineer.
- B. Parts and components must be interchangeable with existing turntables at Brentwood, Alexandria, Shady Grove, West Falls Church, Branch Avenue and New Carrollton Shops.

2.03 Design Requirements

- A. The equipment shall consist of a motorized operated turntable capable of rotating a single transit car truck.
- B. Dimensions and Capacities
- | | | |
|----|-----------------------------------------|----------|
| 1. | Table diameter | 11'-5" |
| 2. | Inside diameter of curb angle | 11'-6" |
| 3. | Standard track gauge | 4'-8 ½ " |
| 4. | Turning capacity | 7 ½ Tons |
| 5. | Rail rollover capacity | 25 Tons |
| 6. | Rotation | 1 RPM |
- C. The turntable shall have crossing rails that match-up with the shop running rails when the turntable is in its locked position at 90° increments.
- D. The turntable shall be mounted flush in the floor with rails recessed and set such that the gap between the shop rails and turntable rails shall not exceed 1/4 inch and the variation in horizontal and vertical alignment shall not exceed inch when the turntable is fully loaded and locked. The maximum gap between the turntable surface and the shop floor shall ½ inch. The rails used shall be suitable for the design loads and so configured as to provide smooth movement between shop rails and the turntable. Maximum variation in the plane of the table shall be ¼ inch measured between any two points on the surface of the deck under any of the loads specified here in.
- E. The turntable shall be constructed so that the entire assembly may be conveniently removed from the pit as a unit, except the drive and automatic locking mechanism.
- F. The turntable shall be of one piece welded construction. It shall be center pin guided by a heavy duty pin with a bronze thrust bearing. Mounted on the periphery shall be roller bearing casters that support the table and roll on a circular pit rail anchored to the pit floor. The casters shall be load carrying members and be capable of handling the entire turntable load. The top surface of the turntable shall be ¾ inch thick non-skid solid diamond steel plate capable of support shop vehicle traffic. The top shall be equipped with a door opening to provide access to components below. Design and position deck support beams so deck can support 300 pounds per square foot uniform load and a 6000 pound load on a 6 inch diameter circle.
- G. Turntable shall be capable of supporting a transit vehicle truck with a safety factor of not less the five (5) based on the ultimate strength of the materials for mechanical components. Structural components allowable stresses and loading shall be based on those specified in the AISC (ASD) 9th edition with the appropriate dynamic load factors applied.
- H. The turntables shall be complete with curb angles, to be supplied by the equipment manufacture and installed by the contractor. Curb angles shall be notched after installation to accept shop rails.
- I. Turntable rails shall be AISI 1045 minimum tensile 90,000 and Brinell hardness of

190.

- J. The drive unit shall be located under the turntable structure and drive the turntable through a heavy duty gear reducer.
- K. The drive motor shall consist of a totally enclosed, non-ventilated squirrel cage, reversible motor connected to a reducer. Provide an in-floor push button station through which the turntable can be controlled by momentary contact push buttons and reversing magnetic starters. The two (2) button control station shall be marked "Clockwise" and "Counterclockwise" with "On"- "Off" and "Run"- "Jog" selector switches.
- L. The automatic lock shall be located in a pit outside the turntable structure and automatically lock in each 90° degree segment of rotation to insure positive track alignment.
- M. Operation
 - 1. The turntable shall be powered by an electrical motor driving through a right angle gear reducer. A pinion on the output shaft of the gear reducer shall drive a ring gear on the underside of the turntable.
 - 2. The Turntable shall be capable of a rotation of 360° degrees in either direction.
 - 3. Automatic locking shall be provided at 90° degree positions and set to align the turntable rails with the shop rails.
- O. Controls
 - 1. An in-floor control station shall be provided, as shown on the contract drawings, to control the operation of the turntable.
 - 2. One (1) pushbutton control station shall be provided. All controls shall consist of individual pushbuttons which shall automatically stop all operations unless pressure is applied to the button. Individual buttons shall be provided to control clockwise and counterclockwise rotation of the turntable. "On"- "Off" and "Run"- "Jog" selector switches shall be provided.
- P. Electrical Requirements
 - 1. Power Supply - 460 volts, 3 phase, 60 hertz.
- Q. Motors
 - 1. The Motor shall be totally enclosed heavy duty type, equipped with sealed bearings and overload protection. Enclosures shall be steel or cast iron only, however, aluminum end bells are permitted. Provide overload protection for motor to permit operation within their rating under all design load conditions.
 - 2. Insulation shall be class "F." temperature rating and should not exceed that permitted by class "B" insulation.
 - 3. Provide each individual motor circuit with branch circuit over current protection in all three phases via safety fuses or fusetrons.

4. Noise level shall comply with NEMA and OSHA Article 1910,95 when measured in accordance with IEEE 85.

R. Motor Starters and Control

1. Motor Starters shall be incorporated into the motor control center. Provide motor starter with overload elements of the bimetal, thermal type on each phase.
2. Provide a stainless steel disconnect switch and stainless steel junction box mounted in a NEMA 4 enclosure installed at the motor location. Connect station to prevent operation of the motor when the station is in the "OFF" position, with provision for padlocking in the "OFF" position.

S. Pushbutton Station and Control Panel

1. The equipment shall be totally wired by the contractor, including the disconnect switches. Power feeders to the terminals of the disconnect switches are by the contractor. Interconnecting wire and conduit and connections shall be included under this division and shall be performed in accordance with the requirements of the electrical division.

T. Equipment Grounding

1. This shall be accomplished by means of a separate grounding conductor in each conduit, sized according to code. The grounding conductor shall have green insulation.

U. Isolation Ground and Cathodic Protection

1. The design requires that the turntables be electrically isolated from the other equipment and the building structure.
2. The running rails of the turntables shall be electrically isolated from the remaining portions of the turntable.

V. Painting

1. Turntables shall be given a primer coat of manufactures standard rust inhibiting primer to a dry film thickness of 1.5 mils. Two (2) finish coats of manufactures standard paint shall be factory applied over the primer coat. Each coat shall be a minimum of 2 mils dry film thickness. The paint shall be the manufactures standard safety yellow.
2. Surfaces shall be free of rust, scale, dirt and oil before painting. Matching touch-up paint shall be provided in the amount of one quart of each color used. Final touch-up shall be performed by the contractor.

PART 3 - EXECUTION

3.01 Fabrication

- A. Fabrication shall be in accordance with all specifications and approved shop drawings.

3.02 Installation

- A. It shall be the contractors responsibility that all information regarding the scheduling, delivery and preparations necessary for installation of the equipment to be supplied under this specification be verified with the equipment manufacture and approved by the engineer prior to commencement of the work.
- B. All shop rails shall be installed by the contractor afer equipment installation.
- C. Install equipment in accordance with approved shop drawings, to the proper lines and levels, plumb and without conflicts with other work.
- D. Use non-shrink grout to level equipment and to seal voids at perimeters of bases.
- E. Ensure that all equipment is ready for checkout and start up by the manufacture.
- F. Touch-up damaged areas of factory-finished surfaces, using paint supplied by the manufacture.

3.03 Factory and Field Tests

- A. Factory Test
 - 1. The contractor shall arrange with the equipment manufacture for the performance of functional and no load test as applicable to the item specified herein. These tests shall be performed at the factory and shall be performed prior to final painting of the equipment.
- B. Field Test
 - 1. Following installation, the contractor shall insure that the equipment manufacture performs an acceptance test. Prior to the test, the manufacture shall submit for approval by the engineer an acceptance testing program. The program shall be designed to show that the equipment meets all the conditions described by this section and that the equipment will perform as intended. The contractor shall provide all material and manpower required for the program except for a transit car truck which will be furnished and operated by the authority.

3.04 Training

The equipment manufacture shall submit for approval by the engineer, details of a program which shall be designed to adequately train personnel to correctly operate and maintain the equipment. The contractor shall be responsible for supplying all materials required for the program. Following installation, the contractor shall at the convenience of the authority, conduct a program for training the personnel. The training period shall be one (1) day.

SECTION 13110

STRAY CURRENT AND CATHODIC PROTECTION

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing and connecting stray-current and cathodic-protection equipment.
- B. Related Work Specified Elsewhere:
 - 1. Grading, excavation and backfilling: Section 02320.
 - 2. Corrosion control system testing: Section 13115.
 - 3. Grounding and bonding: Section 16060.
 - 4. Wire, cable and busways: Section 16120.
 - 5. Wire connection accessories: Section 16125.
 - 6. Raceways, boxes and cabinets: Section 16130.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of jurisdictional authorities.
 - 2. ICEA: S-61-402.
 - 3. ASTM: B418, D256, D570, D638, D693, D1248, E11.
 - 4. MS: MIL-A-18001.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings.
- B. Certification:
 - 1. Certified test reports of field quality-control testing.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Mark each item with manufacturer's name, brand designation, referenced standard, type, class and rating, as applicable.
- B. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- C. Store equipment in secure and dry storage facility.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. Cast-Iron Anodes:

1. Size and type: As shown.
2. Chemical composition:

	Element	Percent
a.	Silicon	14.33
b.	Chromium	4.5
c.	Carbon	0.85
d.	Manganese	0.65
e.	Iron	Remainder

3. Physical properties:
 - a. Tensile strength: 15,000 psi.
 - b. Compressive strength: 100,000 psi.
 - c. Brinell hardness: 520.
 - d. Density: 7.0 grams per cubic centimeter.
 - e. Melting point: 2,300F.
 - f. Specific resistance: 72 microhms per centimeter cube at 20C.
 - g. Coefficient of expansion: 7.33×10^{-6} per degree F from 32F to 212F.
4. Lead wire: Single-conductor insulated cable, 8AWG minimum, factory-connected to anode with connection sealed with cast epoxy-resin encapsulation.
5. Anode packaged as follows:
 - a. Stove pipe: Galvanized steel, 30-gauge minimum, in accordance with the one of the following:
 - 1) Diameter: Eight inches; Length: Eight feet.
 - 2) Diameter: Five inches; Length: Six feet.
 - b. Ends of pipe crimped to end seal of 1/2-inch interior-grade plywood.
 - c. Containing compacted backfill of coke breeze of graded coal or recalcined petroleum coke, with the following additional requirements:
 - 1) Resistivity on dry basis: 60 ohms per centimeter cube, maximum.
 - 2) Chemical composition:

	Material	Percent
(a)	Fixed carbon	78.22 - 78.40
(b)	Ash	18.6 maximum
(c)	Moisture	9.50 - 14.70
(d)	Volatile matter	3.00 - 3.14
(e)	Sulphur	1.2 maximum

- 3) Gradation:
 - a) Sieve size in accordance with ASTM E11.
 - b) Requirements:

Percent Passing	Sieve Size
-----------------	------------

- [1]
- [2]
- [3]

½ inch	100
3/8 inch	85
No. 6	65

B. Magnesium Anodes:

1. Packaged anodes, type and size as shown.
2. Chemical composition for high-potential type anodes:

	Element	Percent
a.	Aluminum	0.010 maximum
b.	Manganese	0.50 - 1.30
c.	Zinc	0.050 maximum
d.	Silicon	0.050 maximum
e.	Copper	0.020 maximum
f.	Nickel	0.001 maximum
g.	Iron	0.030 maximum

	Element (Cont.)	Percent (Cont.)
h.	Other metallic elements	0.050 each or 0.300 maximum total
i.	Magnesium	Remainder

3. Lead wire: Single-conductor insulated cable, 12AWG minimum, factory-connected to anode with connection sealed with cast epoxy-resin encapsulation.
4. Anode packaged in permeable cloth sack containing compacted backfill of mixture with the following requirements:

	Material	Percent
a.	Gypsum	75
b.	Bentonite	20
c.	Sodium sulphate	5

C. Zinc Anodes: MS MIL-A-18001, bare-ribbon 5/8 by 7/8-inch section or packaged anode, type and size as shown, with the following additional requirements:

1. Lead wire: Single-conductor insulated cable, 12AWG minimum, factory-connected to the anode with connection sealed with cast epoxy-resin encapsulation.
2. Anode packaged in permeable cloth sack containing compacted backfill of mixture consisting of 50-percent hydrated gypsum and 50-percent bentonite.

- D. Reference Electrode: ASTM B418, Type II, one galvanized-steel rod, factory-connected to electrode and equipped with two bolted connectors suitable for 12AWG single-conductor insulated cable.
- E. Test Boxes:
1. Cathodic-protection test boxes: Plastic, each five inches inside diameter by 18 inches long, with cast-iron lid, collar and terminal board.
 2. Stray-current test boxes: Six inches cubical, galvanized cast-iron box with watertight cover.
- F. Wire and Cable:
1. Header cable, bond wire and cast-iron anode lead wire in accordance with the following:
 - a. Single-conductor.
 - b. Size: As shown.
 - c. Insulation: HMWPE, 600 volt, in accordance with the following:
 - 1) ASTM D1248, Type I, Class C, Grade 5.
 - 2) ICEA S-61-402.
 2. Magnesium or zinc anode lead and test wire:
 - a. Single-conductor.
 - b. Size: 12AWG unless otherwise shown.
 - c. Color: As shown; anode lead as furnished.
 - d. Insulation: TW, 600-volt, moisture-resistant thermoplastic in accordance with UL 83.
- G. Pipeline-Casing Spacers:
1. Virgin polyethylene, molded.
 2. Runner height: Sufficient to provide ½-inch clearance between pipe, couplings and hubs as well as internal casing wall.
 3. Color: Natural.
 4. In accordance with the following:

	Characteristic	Reference	Requirement
a.	Compressive strength	ASTM D693	3,200 psi
b.	Tensile strength	ASTM D638,	3,100 - 5,500 psi
c.	Impact strength	ASTM D256	1.5 - 2.0 foot-pound per inch notch
d.	Water absorption	ASTM D570	0.1 percent
e.	Temperature	-	180F (80C) maximum

5. Bolts:
 - a. Steel, cadmium-plated.
 - b. Sizes: As standard with the manufacturer.
6. Nuts:
 - a. Steel, cadmium-plated, square.

- b. Sizes: To match bolts.
- H. Pipeline-Casing End Seals:
 - 1. Type L:
 - a. Modular mechanical-type.
 - b. Consisting of interlocking synthetic-rubber links with cadmium-plated steel nuts and bolts.
 - c. Depth limitations: As shown.
 - 2. Type H:
 - a. Compression-ring seals.
 - b. Nonconductive sleeve: Fiberglass reinforced epoxy (FRE), Adyl Type D or equal, with cadmium-plated steel nuts and bolts.
 - c. Depth limitations: As shown.
- I. Insulating Gasket:
 - 1. Asbestos, all-temperature.
 - 2. Full-face.
 - 3. Thickness: 1/8 inch.
 - 4. Johns-Mansville 71 or equal.
- J. Insulating Sleeves and Washers:
 - 1. Up to 300F:
 - a. Sleeve: Mylar tube, 1/32-inch thick.
 - b. Washer: Phenolic, 1/8-inch thick.
 - 2. 300F and above:
 - a. Sleeve: Klingerit or equal, 1/32-inch thick.
 - b. Washer: Johns-Mansville 71 or equal, Teflon.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Bury anodes or electrodes of type and at location shown. Excavate and backfill holes in accordance with Section 02320, with the following additional requirements:
 - 1. Wet packaged anode thoroughly before backfilling hole.
 - 2. Use fine clay soil, free from stones and bricks, for backfilling.
- B. Install header cable of size and at location shown, in accordance with Section 16120.
- C. Install test boxes of type and at location shown.
- D. Connect anode lead wires to header cable or test boxes as shown.
- E. Isolate pipes of different metals and Authority pipes from utility-company pipes using insulated union, compression insulating couplings, or insulated flange and bolt connections. Connect each side of insulated joints to test box using conductors as shown.
- F. Where Authority pipes cross utility-company pipes, connect Authority pipes to test boxes using two 12AWG and one 4AWG conductors as shown.

- G. Bond joints in buried metallic pipe and structure in accordance with Section 16060. Connect buried metallic pipe and structure to test boxes using single-conductor insulated cable of size shown.
- H. Install conduit of type shown, in accordance with Section 16130.
- I. Install single-conductor insulated cable in accordance with Section 16120. Leave one foot of slack in test boxes.
- J. Use thermit weld sealed with cast epoxy-resin encapsulation for splices made in direct-burial cable.
- K. Use compression-type connectors in accordance with Section 16125.
- L. Install casing spacers in accordance with manufacturer's recommendation, except maximum spacer distance not to exceed 10 feet.

3.02 IDENTIFICATION:

- A. Identify wire and cable in each test box using nonmetallic fiberboard or plastic tags or pressure-sensitive labels.

3.03 FIELD QUALITY CONTROL:

- A. Provide necessary equipment and perform testing in the presence of the Authority Representative in accordance with Section 13115.

END OF SECTION

SECTION 13115

CORROSION CONTROL SYSTEM TESTING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies test procedures for corrosion-control systems.
- B. Related Work Specified Elsewhere:
 - 1. Wire, cable and busways: Section 16120.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of jurisdictional authorities.
- B. Instrument Calibration:
 - 1. Calibrate test instruments within six months prior to use on this project.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Working Drawings:
 - 1. Layout of system being tested, showing location of system components, including test stations.
 - 2. Instrument hook-up for each test.
- B. Certification:
 - 1. Certified test report for each test conducted including the following:
 - a. Types, models, serial numbers, and dates of calibration of all instruments.
 - b. Data resulting from specified test procedures, in approved format.
 - 2. Certificates of inspection.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Wire and Cable: Section 16120.

PART 3 - EXECUTION

3.01 TEST EQUIPMENT:

- A. DC Voltmeter: Multi-scale, center zero, minimum sensitivity 50,000 ohm/volt, accurate to within one percent of full scale, covering the following full-scale ranges: 0-10 and 0-100 millivolts; 0-1, 0-10, 0-100 volts.

- B. DC Ammeter: Multi-scale, maximum shunt drop of 20-mV sensitivity, or millivolt meter and shunts, accurate to within one percent of full scale, covering the following full-scale ranges: 0-1, 0-10, 0-100 amperes.
- C. Resistivity Meter: Self-contained, synchronous-vibrator, battery-powered unit. Instrument readings unaffected by resistance of leads or probes.
- D. DC-Power Sources: Automotive wet-cell batteries, six or 12 volts. For circuits with high internal resistance use two or more batteries, a dc generator or cathodic-protection rectifier.
- E. Test Cable: Single-conductor cable, stranded copper, assorted sizes and lengths to suit test conditions.
- F. Steel probes for making electrical contact to buried structures in absence of test stations.
- G. Slide-Wire Resistors: 0-400 ohm, 15-ampere capacity over full-range of adjustment.
- H. Reference Half-Cell: 7/8-inch diameter by eight inches long, saturated copper-copper sulfate.

3.02 TEST PROCEDURES:

- A. Electrical Continuity:
 - 1. Test the following items for continuity:
 - a. Mechanical and bell-and-spigot pipe joints: Test after backfilling is completed. Test individual and multiple bonds.
 - b. Metallic tunnel-liner joints: Test after invert has been cast. Test longitudinal bonds individually or in sections not to exceed 150-linear feet.
 - c. Concrete reinforcement in tunnel, station, retaining wall, reinforced-concrete pipe, aerial, floating slab and building structures: Test after concrete has been cast. Test bonded joints individually or in sections not to exceed 150 feet for tunnel and station structures, not to exceed 500-linear feet for other structures.
 - d. Underpinning, soldier and structural piles: Test prior to backfilling or use leads in structure after backfilling. Test bonded piles individually or in longitudinal sections not exceeding 600-linear feet.
 - 2. Test Procedure:
 - a. Single bond: Connect instruments across bond to be tested as shown. Use separate set of wires and contact points to structures for voltage and current circuits. Beginning with highest scales on voltmeter and ammeter, close switch and observe meter readings. Reduce meter ranges until lowest possible scale is reached. Adjust current level to less than five amperes. Read ON values of voltage and current, break circuit and immediately read OFF values. Record ON and OFF readings on data sheet and determine incremental change for current and voltage. Obtain minimum of three readings to ensure accuracy. Determine and record bond resistance for each reading. Resistance of bond not to exceed calculated theoretical resistance by more than 10 percent.
 - b. Multiple bonds in parallel: Where two structures are bonded by multiple bonds in parallel, test as specified for single bond. Record resistance readings obtained. Actual resistance not to exceed 10 percent of calculated theoretical resistance of bonds.

- c. Multiple bonds in series: Connect instruments as shown. Determine and record resistance between points A and B, including bonds in series as specified for single-bond test. Total resistance measured between points A and B not to exceed 10 percent of theoretical resistance of sum of bonds plus theoretical resistance of structure between points A and B.
 - d. Multiple bonds in parallel on reinforcing steel: Connect instruments as shown. Determine and record resistance between points A and B, including bonds in parallel as specified for single-bond test.
- B. Insulating Joints:
- 1. Test the following for zero-percentage leakage through insulation.
 - a. Insulated flanges and unions: Test buried flanges and fittings after backfilling is completed. Test exposed flanges and fittings after installation is completed. Test each flange or union individually, using existing test wires.
 - b. Casing and sleeve insulation: Test prior to backfilling. Test each casing or sleeve individually.
 - 2. Test Procedures:
 - a. Set up instrumentation as shown. If pipe length is too short for proper test-connection spacing, use maximum possible spacing for L-value. With switches open, read and record value of E_0 . Close switch in I1 circuit. Read and record current, I1, and voltage, E1. Calculate calibration factor (K) for millivolt shunt using equation shown.
 - b. With switches open, read and record value of E_0 . Close switch in I2 circuit. Read and record current, I2, and voltage, E2. Determine difference between E_0 and E2.
 - c. Calculate and record percentage of leakage by equation shown.
- C. Cathodic-Protection Systems Using Cast-Iron Anode:
- 1. Test the following:
 - a. Hydraulic-elevator well casing: Test casing having cathodic-protection system after pit invert has been constructed. Test each system individually using test stations in elevator pit.
 - b. Buried chilled-water, steam and condensate piping: Test after backfilling is complete. Test each system individually, using existing test stations along pipeline.
 - 2. Procedures: Perform tests in the following order:
 - a. Electrical-continuity and insulating-joint tests as specified.
 - b. Anode tests:
 - 1) Structure-to-anode resistance:
 - a) Connect instruments as shown.
 - b) With switch open, record voltage reading 1 on E.
 - c) Close switch and record voltage and current readings.
 - d) Reduce current level to less than five amperes by adjusting power source. Record voltage and current readings.
 - e) Open switch and immediately record voltage as current-off value for potential.
 - f) Using different values of current and voltage, determine and record resistance using formula shown. Obtain a minimum of three sets of readings to ensure accuracy.
 - g) Take necessary corrective measures to ensure that resistance is not less than 0.3 ohms.
 - 2) Anode-to-earth resistance:

- a) Procedure:
 - (1) Place copper-copper sulfate reference half-cell at least 50 feet away from anode location and connect voltmeter to read anode-to-earth voltage as shown.
 - (2) Perform test as specified for structure-to-anode resistance.
- b) Acceptance criteria: Actual anode-to-earth resistance not to exceed 20 percent of design soil resistance.
- c) Design resistance: As specified in Exhibit 13115-1.
- d) Soil resistivity:
 - (1) If anode-to-earth resistance exceeds 20 percent of design resistance, obtain average soil resistivity in anode-location area.
 - (2) Make measurements by four-pin method as shown.
 - (3) Make measurements using suitable resistivity instrument or by battery, voltmeter and ammeter.
 - (4) Place pins at least 1.5-times pin spacing horizontally from underground metallic structures.

D. Cathodic-Protection Systems Using Magnesium Anode:

- 1. Test galvanic-anode cathodic-protection system for the following structures and utilities:
 - a. Buried potable-water, chilled-water and fire piping; sewage-ejector piping; and sewage-pump piping using test stations.
 - b. Piling: Test structures having cathodic-protection systems. Test each structure individually. Test electrical continuity between piles.
- 2. Procedures: Perform tests in the following order:
 - a. Electrical-continuity and insulating-joint tests as specified.
 - b. Anode tests:
 - 1) Structure-to-anode resistance: Perform test as specified for cathodic-protection systems using cast-iron anode.
 - 2) Anode-to-earth resistance test and soil resistivity: Perform tests as specified for cathodic-protection systems using cast-iron anode.

E. Wire and Cable: Install in accordance with Section 16120.

F. Coal-Tar Epoxy Coating:

- 1. Subject final coating to spark test for capability of maintaining dielectric integrity at 5,000 volts minimum.
- 2. Visually inspect coating prior to installation; repair damaged areas in accordance with field-correction recommendations of the coating manufacturer.
- 3. Backfilling prior to approval of coating is prohibited.

Exhibit 13115-1

G. Design Resistance:

Structure	Soil Resistance	Anodes	Anode-to-Earth Resistance

--	--	--	--

Exhibit 13115-1 (Cont.)

H. Evaluation:

1. When anode-to-earth resistance exceeds 20 percent of design value, use data from soil-resistivity test to recalculate design resistance.
2. If actual anode-to-earth resistance exceeds recalculated design resistance, install additional anodes as directed.

I. Recalculation: Resistance is calculated by use of the following formulae:

1. Single horizontal anode:

$$a. \quad R_{H(N=1)} = \frac{0.00521e}{L} \left\{ 2.3 \log \frac{4L^2 + 4L(S^2 + L^2)^{0.5}}{dS} + \frac{S}{L} - \frac{(S^2 + L^2)^{0.5}}{L} - 1 \right\}$$

b. Where:

- | | | |
|--------------|---|------------------------------------------------------------|
| $R_{H(N=1)}$ | = | Resistance to earth of the horizontal-ground anode (ohms). |
| e | = | Effective soil resistivity (ohm-cm). |
| L | = | Horizontal-anode length (feet). |
| d | = | Anode diameter (feet). |
| S | = | Twice anode depth (feet). |

2. Single vertical anode:

$$a. \quad R_{V(N=1)} = \frac{eK}{L}$$

b. Where:

- | | | |
|--------------|---|-------------------------------------------------------------|
| $R_{V(N=1)}$ | = | Resistance of single vertical anode-to-earth (ohms). |
| e | = | Effective soil resistivity (ohm-cm). |
| L | = | Length of anode (feet). |
| K | = | Shape function (anode length/ anode diameter) from Table 1. |

Exhibit 13115-1 (Cont.)

c. Table 1: The Shape Function:

L/d	K	L/d	K
1	.0056	16	.0201
2	.0092	18	.0207
3	.0113	20	.0213
4	.0128	25	.0224
5	.0140	30	.0234
6	.0150	35	.0242
7	.0158	40	.0249
8	.0165	45	.0255
9	.0171	50	.0261
10	.0177	55	.0266
12	.0186	60	.0270
14	.0194	-	-

3. Multiple vertical anodes in parallel:

a.
$$R_{V(N,S)} = \frac{R_{V(N=1)}}{N} + \frac{eP}{S}$$

b. Where:

$R_{V(N,S)}$ = Resistance-to-earth of vertical anodes in parallel (ohms).

$R_{V(N=1)}$ = Resistance-to-earth of single anode (ohms).

e = Effective soil resistivity (ohm-cm).

N = Number of vertical anodes in parallel.

S = Spacing between anodes (feet).

P = Parallel factor from Table 2.

Exhibit 13115-1 (Cont.)

c. Table 2: Parallel Factor:

n	P	n	P
2	.00261	14	.00168
3	.00289	16	.00155
4	.00283	18	.00145
5	.00268	20	.00135
6	.00252	22	.00128
7	.00237	24	.00121
8	.00224	26	.00114
9	.00212	28	.00109
10	.00201	30	.00101
12	.00182	-	-

4. Resistance-to-earth of the horizontal ground bed:

a. $R_{H(N,S)} = \frac{R_{V(N,S)}}{R_{V(N=1)}/N} \times \frac{R_{H(N=1)}}{N}$

b. Where:

$R_{H(N,S)}$ = Resistance-to-earth of the horizontal ground bed (ohms).

$R_{V(N,S)}$ = Resistance-to-earth of N anodes, at spacing S, installed vertically (ohms).

$R_{V(N=1)}$ = Resistance-to-earth of single vertical anode (ohms).

$R_{H(N=1)}$ = Resistance-to-earth of single horizontal anode (ohms)

N = Number of anodes.

SECTION 13905

FIRE PROTECTION, SUPPRESSION AND ALARM

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing dry standpipe, wet standpipe, sprinkler, exterior fire protection and clean agent fire-suppression systems.
- B. Related Work Specified Elsewhere:
 - 1. Water distribution system: Section 02515.
 - 2. Storm and sanitary system: Section 02535
 - 3. Firestopping: Section 07841.
 - 4. Field painting: Section 09920.
 - 5. Corrosion control system: Section 13115.
 - 6. Identification of mechanical equipment and piping: Section 15075.
 - 7. Piping system: Section 15205.
 - 8. Control equipment: Section 15900.
 - 9. Grounding and bonding: Section 16060.
 - 10. Wire and cable: Section 16120.
 - 11. Raceways, boxes and cabinets: Section 16130.
- C. Description of System:
 - 1. Dry standpipe system: Consists of siamese fire-department connection, dry fire line, check valves, automatic air vents, drain valves and angle hose valves.
 - 2. Wet standpipe system: Consists of siamese fire-department connection, wet fire line, check valves, drain valves, fire water-line surveillance valve, angle hose valves and capped branch connections for sprinkler systems where shown.
 - 3. Sprinkler system, other than escalator: Consists of sprinkler lines, fire water-line surveillance valve, flow-alarm check valve, drain valve, and sprinkler heads as well as heating tracers in areas subject to freezing temperatures, supplied from site water supply or relocated fire main as is applicable.
 - 4. Exterior fire-protection system: Consists of lead-ins to wet standpipe system, valves and accessories, supplied from the city water main.
 - 5. Automatic, total-flooding clean agent suppression system: Consists of smoke detectors, agent storage containers, nozzles, clean agent suppression system control and detection panel, manual pull station, alarm bell, evacuation horn, clean agent suppression system discharge visual alarm and necessary interface boxes for signals from and to HVAC and communications. Each room or hazard area to have its own system designed to provide a concentration of 7 percent by volume.

D. Area of Operation

AREA	CLASS	DENSITY	AREA OF OPERATION
Office Area	Light Hazard	.10 gpm/sf	1500
Parts & Storeroom	Ordinary Hazard (II)	.19 gpm/sf	2000
Battery Room	Extra Hazard (I)	.30 gpm/sf	1500
Inspection Pit	Ordinary Hazard (II)	.20 gpm/sf	1500
Vehicle Maintenance, Shops & Lube	Ordinary Hazard (II)	.19 gpm/sf	1500
Building Mech./Elec. Service Areas	Ordinary Hazard (II)	.15 gpm/sf	1500

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
1. Comply with codes and regulations of the jurisdictional authorities.
 2. AWS: A5.13
 3. FM Approval Guide.
 4. NFPA: 12A, 13, 14, 15, 24, 2001.
 5. UL: 262, 312, 1479, Fire Protection Directory.
 6. ANSI/ASME: B16.1, B16.5, B16.9, B31.1.
 7. ANSI: Z535.1.
 8. NEMA: 250.
 9. FS: A-A-1992 SS-C-153, WW-P-421, WW-P-501, WW-U-516, WW-U-531.
 10. MSS: SP-58.
 11. ASTM: A36, A47, A53, A135, A183, A234, A 240, A276, B766, D1752, D2000.
- B. Qualification of Welding Personnel: Section 05120.
- C. Design Criteria:
1. NFPA 12A, 13, 14, 15 and 2001 as applicable.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
1. Shop Drawings:
 - a. Methods of joining, welding, fastenings, and anchoring.
 - b. Materials and locations for wet standpipe, dry standpipe, sprinkler, clean agent suppression and external systems.
 - c. Pipes and piping layout, including pipe hangers and supports.
 - d. Pipe hangers and supports.
 - e. Valves.
 - f. Escutcheons.
 - g. Gauges.
 - h. Automatic air vents.
 - i. Pipe sleeves.
 - j. Mechanical couplings.

- k. Layout of sprinkler and clean agent suppression systems and detail drawings approved by Fire Marshal of jurisdiction in which work is to be performed.
 - l. Reports covering test materials.
2. Certification:
- a. Acceptance test results.
 - b. Manufacturer's certification that pipe-joint gaskets and lubricants are satisfactory for use with pipe and fittings specified and that couplings are designed and tested as specified.
3. Samples: Paint, Section 09920.
4. Operation and Maintenance Manuals.

1.04 JOB CONDITIONS:

- A. Do not perform welding when the temperature of the base metal is less than zero degree F.
- B. Do not perform welding when surfaces are wet or during periods of high winds unless operator and work are properly protected.
- C. Environmental Requirements: Paint, Section 09920.

1.05 OPERATION AND MAINTENANCE TRAINING:

- A. Upon completion of installation and in accordance with the General Requirements furnish for a period of not less than two consecutive man-days services of a manufacturer's field engineer with specialized experience in the components of the system to instruct Authority personnel in the proper operation and maintenance of the systems.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. General Requirements:
 - 1. In design and purchase of equipment, provide for interchangeability of items of piping and electrical equipment sub-assemblies, parts and relays.
- B. Pipe and Fittings:
 - 1. Exterior fire-protection system:
 - a. Ductile-iron pipe and fittings:
 - (1) Piping embedded or otherwise inaccessible: FS WW-P-421, Type III, Grade C, 250-pound pressure class.
 - (2) Piping from point of connection to inside of structure: FS WW-P-421, Grade C, 250-pound pressure class, flanged. Flanges: ANSI B16.1.
 - (3) Pipe coated on outside with bituminous coating and lined with cement mortar of twice standard thickness specified for pipe size used.
 - (a) Cement-mortar lining having seal coat of nontoxic, tasteless and odor-free bituminous material.
 - (4) Neoprene gaskets furnished for joints.
 - 2. Interior fire-protection system:

- a. Fire lines, embedded or otherwise inaccessible:
 - (1) Pipe: Galvanized steel, ASTM A53, Type E, Grade B, with the following additional requirements:
 - (a) Fire-protection piping: Extra-strong weight, Schedule 80.
 - (2) Fittings and flanges: Galvanized, furnished with wall thickness equal to or greater than that of adjacent pipe, with the following additional requirements:
 - (a) Fire lines: ASTM A234, Grade B, and ANSI B16.9 for dimensions and tolerances.
 - i. Flanges: ASTM A234 and ANSI B16.5 for dimensions and tolerances.
- b. Fire lines, exposed or otherwise accessible:
 - (1) Pipe:
 - (a) Galvanized steel: One of the following:
 - i. ASTM A53: One of the following:
 - 1. Type E, Grade B.
 - 2. Type F, Grade A.
 - ii. ASTM A13
 - (b) Welded or seamless.
 - (c) Standard weight, Schedule 40, with grooved ends. Use of Schedule 10 pipe is not allowed.
 - (2) Mechanical joint couplings: Keyed for joining grooved-end piping.
 - (a) Coupling housing: Malleable iron in accordance with ASTM A47, Grade 32510, galvanized, fabricated in two or more parts enclosing resilient gasket seal, with keys to fit machined grooves on pipe ends. Rated at 300-psig minimum pressure and factory-finished with manufacturer's standard paint coating.
 - (b) Coupling gasket: Chlorinated butyl, ASTM D2000, specification 3-BA-615-A14-B13, with following additional requirements:
 - i. Molded grooves.
 - ii. Pressure-responsive seal, integrity increasing with internal pressure.
 - (c) Coupling bolts and nuts: Oval-neck track-type bolts with hexagonal nuts conforming to ASTM A183 permitting single-wrench assembly, having minimum tensile strength of 110,000 psi, with cadmium-plated finish ASTM B766, Type III.
 - (3) Fittings:
 - (a) Grooved-end, fabricated of malleable-iron casting in accordance with ASTM A47, Grade 32510, galvanized; nonstandard fittings fabricated from Schedule 40 steel pipe.
 - (b) Mechanical branch outlets:
 - i. Victaulic 920 or equal.
 - ii. Victaulic Style 72 or equal.
 - (c) Threaded pipe fittings: FS WW-P-501, Type 1, Class B.
 - (d) Welding fittings made of same wall thickness as pipe.
 - i. Factory-made welding fittings.
 - ii. Mitered-joint elbows and field-made reducers are prohibited.
 - (e) Butt-welded fittings larger than 1-1/2 inches: ANSI B16.9.
 - (f) Flanges for welded piping system: ANSI B16.5, galvanized forged steel, welded-neck type, 175 pressure class for stations and 250 pressure class for tunnels.

(4) Paint, Primer, and Undercoat: Alkyd Semigloss System as specified in Section 09920, Color: OSHA Red (Safety Red) in compliance with ANSI Z535.1 for piping, White for stenciling.

c. Unions: WP 175 psig.

(1) 1-1/2 inches and smaller: Threaded, FS WW-U-531, Type B to match piping.

(2) Two inches and larger: Flanged.

(a) Two union flanges, 2-1/2 and three inches: Steel, FSA WW-U-531, or cast iron, ANSI B16.1.

(3) Four inches and larger: Forged steel, slip-on weld neck flanges, ANSI B16.5.

(4) Nonferrous piping unions: Brass, FS WW-U-516.

C. Valves:

1. Fire-line valves, outside stem and yoke (OS&Y), UL Fire Protection Directory listed or FM Approval Guide listed for 175-psig minimum, meeting requirements of listed NFPA Standards, with UL or FM symbol cast or stamped on valve body.

2. Gate valves: UL 262 or FM Approval Guide listed, 175-psig WP

3. Check valves: UL 312 or FM Approval Guide listed, 175-psig WP, flanged-end connections, swing-type, metal-to-metal, rubber-faced or equivalent, valve seat 15 degrees from perpendicular to direction of flow.

4. Sprinkler flow-alarm check valves: Designed to operate on 10 gpm or more with restriction bypass which allows restricted flow of water to pass from supply to system side of alarm-valve clapper, to decrease possibility of false alarms resulting from increase in supply water pressure or from water hammer.

a. Furnished with retarding chamber, test and drain connections and electric contact unit.

b. Cast-iron bodies with nonferrous-metal seat, rings, bearings and renewable clapper facing.

c. Contacts: Section 15900.

5. Fire water-line surveillance valve:

a. Double-disc, solid-wedge gate-type with outside stem and yoke (OS&Y) and renewable ring seats.

b. Designed for position indicator contact:

(1) Contacts open with valve fully open.

(2) Contacts close and alarm condition is initiated with two turns of hand wheel or when valve stem has moved one-fifth of distance from normal fully open position.

6. Sprinkler alarm check-valve surveillance: Contact closes on flow amounting to 10 gpm or greater.

7. Ball drip valves: 3/4 inch, threaded both ends and rated at 175-psig minimum.

8. Air and vacuum valves:

a. Automatic.

b. High-capacity; minimum flow, 3.0 cfs; pressure differential, 5.0-psig maximum.

c. Designed for maximum system working pressure; 175-psig minimum; suitable for working pressures from zero psig to maximum capacity.

9. Angle hose valves:

a. Cast bronze, male outlet, replaceable rubber disc and rising stem.

b. Rough-bronze body, polished-finish bonnet, nut and stem, complete with cap and chain.

c. Cast-iron or aluminum hand wheel, red-enameled.

d. Working pressure: 200 psig.

e. UL Fire Protection Directory listed with symbol cast or stamped on valve body.

f. American National Standard Fire Hose threads.

10. In-line cut-off valves:
 - a. Flanged gate valve, with outside stem and yoke
 - b. Comply with UL 262, UL Fire Protection Directory listed or FM Approval Guide listed with symbol cast or stamped on valve body.
 - c. Working pressure, 175 psig.
 - d. Cast-iron or aluminum hand wheel, red-enameled.

- D. Fire Department Siamese Connection:
 1. Free standing:
 - a. Paved areas: Double clapper, with sidewalk sleeve, sidewalk plate, two rocker-lug plugs and chains, polished brass, two female inlets with 2-1/2 inch American National Standard Fire Hose Threads, UL Fire Protection Directory listed or FM Approval Guide listed, working pressure of 200 psig and with cast recessed Type B Metro logo and inscription, as shown, except inside fenced Authority property.
 - b. Landscaped areas: As specified for paved areas, except no sidewalk sleeve or plate.
 - c. Paint, Primer, and Undercoat: Alkyd Semigloss System as specified in Section 09920, Color: OSHA Red (Safety Red) in compliance with ANSI Z535.1 for piping, White for stenciling.
 2. Wall-mounted: Double clapper rectangular wall plate for flush mounting, two rocker-lug plugs and chains, polished brass, two female inlets with 2-1/2 inch American National Standard Fire Hose Threads, UL Fire Protection Directory listed or FM Approval Guide listed, working pressure of 200 psig, and with cast raised Type B Metro logo and inscription as shown. Provide sill cock where necessary for drainage.

- E. Sprinkler Heads:
 1. Standard fusible-link type.
 2. Bronze finish, exposed and temperature rating of 165F in accordance with listed NFPA Standards.

- F. Sprinkler Test Connections:
 1. Drain piping, valves and fittings necessary for testing in accordance with listed NFPA Standards.

- G. Control System: Except as specified for clean agent suppression systems: Provided by other trades.

- H. Supporting Devices:
 1. Pipe hangers and supports:
 - a. Adjustable, stainless steel, clevis-type, threaded full length, with diameter consistent with pipe size and the load imposed: MSS SP-58.
 - b. Hanger rods: 3/8-inch minimum diameter, stainless steel, ASTM A276, Type 304, threaded full length, with diameter consistent with pipe size and the load imposed: MSS SP-58.
 - c. Nuts and washers: Stainless steel.
 - d. Supported from stainless steel inserts in concrete slab: MSS SP-58.
 2. Adjustable U-bolt type:
 - a. U-Bolt: Fabricated from stainless steel, MSS SP-58.
 - b. Nuts and washers: Stainless steel.
 - c. Chair: Cast iron or fabricated from stainless steel.
 3. Z-bar: Fabricated from stainless steel: ASTM A240, Type 304.
 4. Pipe anchors:
 - a. Designed to withstand a minimum of five times anchor load.
 - b. Vertical pipes anchored by means of clamps welded around pipes and secured to wall or floor construction.

5. Expansion-bolt anchors:
 - a. Consisting of bolt, expander, star lock washer and nut.
 - b. Fabricated of stainless steel, Alloy S30300 in accordance with ASTM E527, including expander and star lock washer.
 - c. Anchor assemblies: FS A-A-1992, Group II, Type 4, Class 1.
 6. Self-drilling anchors:
 - a. Self-drilling, expansion anchors with self-cutting annular broaching grooves.
 - b. Anchor and expander plug: Double-plated, FS A-A-1992, Group III, Type 1.
 7. Pipe sleeves:
 - a. Through interior masonry-unit walls: PVC, as shown, large enough to accommodate pipe but minimum two sizes larger than pipe size.
 - b. Through cast-in-place concrete interior walls and concrete ceilings: Factory-made cast iron with anchor flange and cast-iron plate collar screw-fastened to slab and pipe.
 - (1) Sleeves minimum two sizes larger than pipe; for floors and ceilings projecting four inches above finish floor.
 - c. Through exterior structural elements: Minimum two sizes larger than pipe and as shown.
 - d. Sleeves designed for pipe-movement allowance due to expansion and contraction.
 8. Escutcheon plates:
 - a. Polished brass or stainless steel, screw-fastened to wall or ceiling.
 - b. Plate collars caulked with silicone sealant or intumescent putty.
 - c. Sealant: UL-1479.
- I. Pressure Gauges: Spring pressure-type, 3-1/2 inch dial, in accordance with NFPA 14.
- J. Bonding Strap: 2AWG single-conductor cable: Section 16060.
- K. Preformed Joint Filler: ASTM D1752.
- L. Coal-Tar Epoxy: Section 02535.
 1. Thinner of type recommended by manufacturer of coating and used only when approved.
- M. Water-Flow Indicator: Vane-type water flow switch, UL Fire Protection Directory listed, FM Approval Guide listed. Electrical rating: 24 volts dc, 1.5 amperes, normally open contacts to actuate with flow of 10 gpm or more.
- N. Clean agent suppression system:
 1. Smoke detectors: Products of combustion, dual-chamber, ionization-type, operating voltage of 22 to 28 volts dc, 30 milli-amperes (ma) standby current drain at 24 volts dc and alarm current drain of 60 ma at 24 volts dc. Three amperes minimum alarm contact rating at 24 volts dc. Detector will activate alarm approximately five seconds after product of combustion particulate enters ionization chamber. Detectors equipped with indicator lamp which will remain lighted until reset. Unit listed by UL Fire Protection Directory and FM Approval Guide as signal and release device.
 2. Manual pull station: Contained in cast-metal housing for mounting on standard four-inch junction box unit to have dual-action release configuration such as discharge lever protected by lift cover, to prevent accidental discharge, and tamper-resistant screw to prevent unauthorized access to reset procedure. For operation at 24 volts dc. Listed by UL Fire Protection Directory as release device.
 3. Abort switch: A momentary, normally closed push-button switch. Time delay to restart at designated setting when abort switch is released. Switch to be accessible and labeled 'CLEAN AGENT ABORT.' Activation of the abort switch to silence discharge warning horn.

4. Clean agent suppression system control equipment:
 - a. Control panel: Multizone for operation by smoke detectors and manual pull station, singly or in combination, to activate prealarm or release of agent as required. Power source for operating extinguishing system as well as specified auxiliary functions.
 - (1) Panel enclosure: NEMA 250, Type 1 surface-mounted, dead front; indicators and control switches visible, mounted on panel behind hinged, locked glass-paneled door, complete with relays, trouble and alarm bell, silencing switch with ring-back feature, LED indicating lamps, nameplates, switches and terminals to provide relays for fire-alarm system tie-in, for HVAC systems fan shut-down, HVAC-damper closing, for test delay switch with automatic reset to permit testing fire-alarm system without activating auxiliary control functions.
 - (2) Operating circuitry: Solid-state electronics with plug-in circuit modules for detection and release circuits; 120-volt ac, 60-Hertz supply; 24 volts dc signal and release circuits including power for operating extinguishing sub-system and other functions. Power consumption 10 watts steady state, 200 watts peak.
 - (3) Functional circuitry: Provide two detection zones and two output circuits for signal and release, all Class B supervised. Detection circuits to accommodate smoke detectors and manual stations intermixed. Signal output circuit of the polarity-reversal type. Release circuit to include supervised abort switch and adjustable time delay. Provide separate relay output for each zone alarm, general alarm, trouble, pre-discharge and system-fired circuit; utilize 10-ampere contact.
 - (4) Operation: Activation of detector, circuit to light zone alarm lamp on indication panel, sound audible local alarm, activate the extinguisher system and energize auxiliary relays for remote alarm or equipment shut-down. Loss of dc power or discontinuity in detection circuits to light trouble lamp on indicator panel and actuate bell alarm; provide trouble bell silence switch with ring-back circuit to silence trouble bell alarm. Receipt of zone alarm to override trouble alarm. A single switch to reset control unit.
 - (5) Indicator lights, as follows:
 - (a) POWER ON: Green.
 - (b) TROUBLE: Yellow.
 - (c) ALARM ZONE 1: Red.
 - (d) ALARM ZONE 2: Red.
 - (e) PRE-DISCHARGE: Red.
 - (f) SYSTEM FIRED: Red.
 - b. Extinguishing system:
 - (1) Provide system designed to discharge seven-percent volume concentration of extinguishing agent with discharge not to exceed 10 seconds. The system to comply with NFPA 2001. Each extinguishing system to include the following
 - (a) Agent storage container: Container fabricated of high-strength alloy steel with burst-disc actuator valve assembly, safety plug, cable assembly, 0 - 600-psig pressure gauge, pressure switch and lifting ring. Container to conform to applicable DOT specifications; to automatically relieve between 850 psi and 100 psi in event of excessive pressure buildup. Super-pressurize filled container with dry nitrogen to 390 psig at 70F to assist rapid distribution. Container

- designed for on-site reconditioning and refilling. Actuator valve assembly to be an integral part of container.
- (b) Discharge nozzle: Provide series of one-piece, nonclogging nozzles to distribute agent in protected volume. Nozzle size selection determined by container size and geometry of volume to be protected. Nozzles connected through reducer, elbow and piping. Nozzle discharge pattern to deliver uniform agent coverage to all areas of enclosed hazard.
- (c) Actuator: Electrical device to operate on demand to provide path for relief and discharge of agent.
- (d) Mounting bracket: Designed for wall-mounting agent storage container and capable of withstanding 1,000-pound thrust for five seconds in any direction.
- (e) Agent: Liquefied compressed clean agent suppression system conforming to requirements of NFPA 2001.
- (f) Alarm bell: Motor driven, with six-inch gong, 24-volt dc operating voltage, 90 dBA sound-pressure level at one meter and OSHA Safety Red finish.
- (g) Evacuation horn: Vibrating, 24-volt dc, 0.063 amperes, 97 dBA sound-pressure level at one meter.
- (h) Discharge indication light: Flashing device with legend CLEAN AGENT DISCHARGE; 24-volt dc.
- (i) Clean agent suppression system interface box: Data-transmission system (DTS) cabinet specified in Section 16130, with the following additional requirements:
 - i. Cabinet: Hoffman A161206LP.
 - ii. Terminal strip: 16 terminals minimum.
 - iii. Exterior finish color: OSHA Safety Red.
 - iv. Identify cabinet on cover with COMMUNICATION INTERFACE in one-inch high yellow letters.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Fit equipment and appurtenances to space provided and make serviceable.
- B. Provide support beams, concrete pads, platforms, and hangers necessary for proper installation of equipment as recommended by manufacturer.
- C. Install complete fire-protection systems as shown and as specified. During installation, protect work, equipment, and materials. Plug or cap pipe openings.
- D. Flush underground mains before connection to wet-standpipe risers at following minimum flow rates:
 - 1. Six-inch pipe: 750 gpm.
 - 2. Eight-inch: 1,000 gpm.
 - 3. 10-inch pipe: 1,500 gpm.
 - 4. 12-inch pipe: 2,000 gpm.
- E. Fasten escutcheon plates to wall or ceiling. Seal plate collars watertight with mastic.
- F. Welding Procedure:
 - 1. As specified in Section 05120, with the following additional requirements:

- a. Manual metallic arc process, except for pipe sizes four inches and smaller where oxyacetylene welding may be used.
 - (1) Use electrodes and rods of composition recommended by AWS A5.13 for pipe.
 - (2) Heat surface within three inches from point where weld will start to a temperature warm to hand before welding.
 - b. Leave joint surfaces smooth, uniform and free from fins, tears and other defects which adversely affect proper welding.
 - c. After each pass of weld on multiple-pass welding, clean weld free of slag and other deposits before applying next pass.
 - d. Peen with light blows of blunt-nosed peening hammer. Do not peen surface layers or first pass in groove welds.
 - e. For groove welds, center surface pass substantially on seam, smooth and free from depressions.
 - f. Fillet weld with minimum cutting back of outside surface of pipe.
 - (1) Leave throat of full fillet weld not less than 0.707 of thickness of pipe.
 - (2) Repair excess cutting back and undercutting of base metal in pipe adjoining the weld.
 - (3) Fill craters to full cross section.
 - g. Position pipes to be welded so that joints will be in alignment. Joints misaligned more than 20 percent of pipe wall thickness or maximum of 1/8 inch are prohibited.
 - h. Install welding pipe in accordance with ANSI B31.1.
2. Cut ends of screw-jointed pipes squarely to seat in bottom of recess of fittings. Ream after cutting so waterway is not reduced in size.
 3. Apply thread dope or compound to male thread only.
 4. Where cathodic protection is shown, apply coal-tar epoxy coating as specified in Section 02535 and test as specified in Section 13115.
- G. Buried Ductile-Iron Pipe: Install as specified in Section 02515, except use mechanical joints.
- H. Steel-Pipe Installation:
1. Maintain OSHA required head clearance.
 - a. Install horizontal piping with minimum pitch of one inch in 40 feet.
 - b. Provide drains at low points: Minimum 3/4-inch valves with hose connection.
 - c. Install vertical pipes near wall from which they are supported.
 2. Make connections to equipment without placing strain on piping and equipment.
 3. Joints for fireline piping of mechanical-type, grooved or welded couplings for lines four inches and larger and screwed or welded for lines under four inches, except that mechanical-type grooved couplings must be accessible.
 - a. Provide number of mechanical couplings necessary to allow minimum 1-1/4 inch expansion per 100 feet of main.
 - b. Use reducing tee for mechanical couplings or mechanical branch outlet at main-to-branch connections.
 - c. Make in-line cut-off valves accessible from floor or walkway level.
- I. Mechanical-Type Groove Couplings: Install couplings according to manufacturer's instructions and as follows:
1. After grooving, remove indentations, projections and roll warps as necessary. Cut pipe ends square to tolerance of plus-or-minus 0.03 inch. Provide zinc coating on exposed surface.
 2. Lightly coat pipe ends and coupling gasket with non-petroleum-based lubricant.
 3. Center gasket, install housing and ensure that keys are securely located in pipe grooves.
 4. Install bolts and nuts tightened uniformly to manufacturer's recommended limits using torque wrench, without pinching gaskets.

- 5. Provide bonding across couplings for stray-current protection.
- J. In-Line Valves: Install in-line valves by bolting fitting to valve and welding fitting to pipe.
- K. Pipe Anchors: Securely anchor piping as specified, where shown and where necessary for proper installation to force pipe expansion in proper direction.
- L. Expansion-Bolt Anchors: Drill holes and install expansion-bolt anchors in manner recommended by anchor-bolt manufacturer. Do not install less than eight inches from concrete edge.
- M. Pipe Sleeves: Fill annular space between pipe and sleeves with preformed joint filler, tightly placed to form effective seal against groundwater.
- N. Bonding: In accordance with Section 16060, and with the following additional requirements:
 - 1. Bond mechanical joints and fittings, including valves, by exothermic-welding method.
 - 2. Make welds in accordance with manufacturer's recommendations. Clean and coat with coal-tar epoxy.
 - 3. Bond pipe using bonding strap welded to each side of joint not less than six inches from joint. Allow sufficient slack in conductor for expansion of pipe.
- O. Air Vents: Install high-capacity automatic air vent(s) at opposite end(s) of dry-standpipe system from fire-department siamese connection or where shown. Pipe air-vent outlet to nearest drain or as directed.
- P. Firestopping: Section 07841.

3.02 PROTECTION OF PIPING AND EQUIPMENT:

- A. Protect pipe, openings and valves from dirt, foreign objects and damage during construction.
- B. Replace damaged piping, valves and other appurtenances, should damage occur prior to final acceptance of the work.

3.03 FIELD QUALITY CONTROL:

- A. Field Tests:
 - 1. Flush piping with water until clean and free of scale, slag, dirt, oil, grease and other foreign material.
 - 2. Perform final testing, acceptance, and certification in accordance with NFPA 13, 14, and 24, as applicable.
 - 3. Test electrical continuity of bonded joints by measuring resistance. Total resistive value of joint not to exceed calculated resistance of bond cable plus 10 percent.
- B. Water-Pressure Testing:
 - 1. In the presence of the Engineer, test piping, prior to burial or concealment, using specified procedures specified.
 - 2. In the presence of the Engineer, completely test piping system for leaks until approved.
 - 3. Notify the Engineer at least 36 hours prior to tests.
 - 4. Test piping at the following pressures:
 - a. Fire-protection piping, inaccessible: 400 psi-minimum.
 - b. Ductile-iron pipe: At lowest point in system, 150 psi or 1-1/2 times maximum working pressure, whichever is greater.

- c. Fire-protection piping, exposed and accessible: At lowest point in system, 150 psi or 1-1/2 times maximum working pressure, whichever is greater.
- C. Test Procedures:
- 1. Test fire-protection piping in accordance with NFPA.
 - 2. Fire-protection piping, inaccessible:
 - a. Avoid excessive pressure on safety devices and mechanical seals.
 - b. Fill entire system with water and vent air from system at least 24 hours before test pressure is applied.
 - c. Apply test pressure when water and average ambient temperature are approximately equal and constant.
 - d. Maintain test pressure for six hours minimum without drop after force pump has been disconnected.
 - 3. Water-test entire system with pressure at highest point of 250 psig.
 - 4. After filling system, shut off water supply and allow it to stand for two hours under test without loss or leakage.
 - 5. Coordinate with and assist local fire department in performing flow tests. After performing hydrostatic test, drain water from firelines. Perform flow test at rate of 500 gpm with pumper connected to siamese connection, starting testing with sudden full flow into empty firelines.
 - 6. Drain system immediately after hydrostatic and flow testing.
- D. Repair of Leaks:
- 1. The following are prohibited:
 - a. Repair of leaks by mechanical caulking.
 - b. Introduction of material inside piping system to stop leakage.
 - 2. Repair leaks in threaded piping by breaking joint, cutting new threads on pipe and installing new pipe fitting.
 - 3. Coat field welds and repair damages to zinc-coated surfaces as follows:
 - a. Wire brush areas to be coated to bright metal.
 - b. Apply galvanizing repair compound at rate of two ounces per square foot.
 - 4. Replace defective coupling assembly as necessary.
 - 5. Remove defective welds by chipping or gouging.
 - a. Reweld the chipped-out places.
 - b. When base metals of fillet welds are cut back or throat of welds are less than specified, repair defect by adding additional weld metal.

3.04 CLEANING:

- A. Flush firelines with water to remove sediment after completion of tests, repairs or replacements.
- B. Disinfect firelines connected to potable-water system as follows:
 - 1. Use chlorine for disinfection in form of hypochlorite solution or in form of compressed gas applied through approved chlorinator.
 - 2. Operate valves and equipment during chlorination to ensure that chlorine reaches entire system.
 - 3. Feed water and chlorination agent into system at rate providing for 50 ppm of chlorine and allow to stand 24 hours before flushing.
 - 4. Residual chlorine, at end of 24-hour retention period, not less than 10 ppm.
 - 5. Flush treated water from system completely after disinfection.
 - 6. Continue flushing until samples show that quality of water delivered is comparable to public water supply and satisfactory to public-health authority having jurisdiction.
 - 7. Do not take samples from hydrants or through unsterilized hose.

3.05 FIELD PAINTING: Section 09920.

- A. Prepare piping, apply primer, undercoat and finish coats in accordance with Section 09920.

3.06 IDENTIFICATION OF PIPING AND VALVES: Section 15075.

3.07 CLEAN AGENT SUPPRESSION SYSTEM:

A. General:

1. Redundant system shall be provided in accordance with county code requirements. Smoke detectors to be cross-zoned so that at least one detector from each loop shall react to smoke before extinguishing system will be activated. First detector actuated to sound alarm bell, illuminate indicator lamp for appropriate alarm zone and energize fan shut-down relays and close dampers of HVAC systems serving involved space. Second detector actuated to energize evacuation time-delay relay in clean agent suppression system control panel, sound evacuation time horn and illuminate SYSTEM FIRED indicator light at clean agent suppression system control panel to indicate system discharged. Time delay shall allow sufficient time for dampers to close before release of FM200 agent. All dampers connected to the protected room shall be motorized. Actuation of manual pull station shall immediately activate sound evacuation horn, energize fan shut-down and close dampers of HVAC system serving area and release FM200. Time-delay shall be provided to allow sufficient time for dampers to close

B. Trouble Operation:

1. Opens or ground in wiring to ring bell on FM200 control panel. Silencing switch to silence trouble bell during correcting of fault.

C. Remote Alarms:

1. Activation of the following to generate alarm indicators at clean agent suppression system control panel:
 - a. Alarm Zone 1.
 - b. Alarm Zone 2.
 - c. System fired.
 - d. Trouble.

D. Performance Testing:

1. Performance-test completed system except smoke detectors.
2. Provide instrumentation and test gases-test systems including detection system in accordance with jurisdictional requirements.
3. Operate mechanical and electrical systems.
4. Inspect nozzles and agent storage containers.
5. Full equivalent test of gas discharge into each zone area. Use meter to verify delivery of specified concentrations within required time and maintained for minimum of 10 minutes.
6. After completion of satisfactory testing, refill storage containers.

END OF SECTION

THIS PAGE NOT USED

SECTION 14100

TWO (2) SCREW CAR HOISTS AND BODY HOISTS DEEP PIT DESIGN

PART 1 - GENERAL

RELATED DOCUMENTS:

- A. Drawings and general provisions of the Contract apply to this section.
- B. Related Sections include Section 11001, Equipment General Requirement.

1.01 DESCRIPTION

- A. Furnish one (1) complete de-trucking system per the Base Bid of the Proposal Form. The de-trucking system will include Car Hoists, Body Hoists/Body Supports and all required power and control components complete with panel enclosures (motor control center, master control station and remote control stations), non embedded conduit and interconnecting wiring from power supply to equipment. All equipment shall comply with ASME A17.1 and ADAAG, and all state or local jurisdictional codes and requirements.
- B. Each Car Hoist and Body Hoist/Body Support shall be of the deep Pit Design. Each Car Hoist and Body Hoist/Body Support shall be supported from the pit floor, which shall be approximately 13'-6" below the shop floor.
- C. Body Supports are actually Body Hoists which have the capacity to raise a married pair of cars. We shall specify this item only as Body Supports in the following documents.

1.02 QUALITY ASSURANCE:

- A. Manufacturer Requirements:
 - 1. Furnish Car Body Hoists manufactured and designed as approved by WMATA's engineering, operation and maintenance departments.
 - 2. Minimum expected half life of this equipment shall be 25 years. All equipment furnished shall be heavy duty, industrial type.
 - 3. The Engineer reserves the right to inspect materials and their sources, workmanship, and construction methods at any time, at the Manufacturer's shop or fabricating facility. The Engineer further reserves the right to be present for any or all shop tests of components, assemblies, or systems. The Manufacturer shall notify the Engineer two (2) weeks in advance of any tests.
 - 4. Manufacturer's Compliance:
 - a. All factory wired control panels shall be tested for operation, as specified herein, and submitted to Underwriters Laboratories Inc., for inspection, approval, and labeling.
 - b. Nameplates: Nameplates shall be securely attached, by mechanical means, in a prominent location on each major item of equipment
 - 5. Qualification of Manufacturer: Manufacturer shall be reputable and regularly engaged in the design and manufacture of the type of equipment specified herein.

Assembled components, purchased by the Manufacturer for this Contract, such as motors, gear boxes, electrical devices, etc., shall be the standard products of qualified manufacturers. All similar items shall be the products of a single manufacturer. Prior to approval of the Manufacturer's proposal for the Truck Repair Hoists, the Manufacturer shall submit to the Engineer the following information:

- a. A list of truck repair hoists, of his manufacture, similar in usage, where the proposed equipment has been in service, including the duration of service.
- b. Name of contact person at each installation submitted above, who is familiar with the operation and maintenance of all hoisting equipment provided by the Manufacturer.
- c. The truck repair hoists shall meet the Federal Transit Administration Buy America Clause for equipment installed in an existing maintenance shop.
- d. The manufacturer of the truck repair hoists shall be ISO-9001 certified and registered. The manufacturer must submit with the bid response proof that it has implemented and maintain a quality system that fulfills the requirements of the ISO-9001 in the form of a certificate documenting the most recent quality audit and report.
- e. Based on the information supplied, and discussions with the contact persons named, the Engineer will determine the acceptability of the proposed Manufacturer and equipment.
- f. Furnish manufactures ISO 9001 quality assurance program to the authority for approval.

1.03 TRAINING:

A. Contractor is responsible for training as outlined in Section 01820, Demonstration and Training and Section 11001, Equipment General Requirements.

B. Number of Personnel To Be Trained And Class Size.

Level Of Training	Approximate Number of Individuals	Maximum Class Size	Minimum Number of Classes
Level I	40	8	6
Level II	8	4	2
Level III	8	4	2

C. Levels of Training:

1. Level I: Familiarizing Training
2. Level II: Training for P&E Personnel
3. Level III: Programming Training

PART 2 - PRODUCTS

2.01 GENERAL OPERATING CHARACTERISTICS

A. The de-trucking system will raise, lower, or hold the Transit Authorities vehicles. This shall be accomplished from a master control station through a selector switch which shall allow

all Car Hoists and Body Supports to act simultaneously for married-pair vehicle lifting and support. The Car Hoists and Body Supports shall be operated from the master control station by "raise-lower" pushbuttons.

- B. Each Car Hoist and associated Body Supports of the de-trucking system shall be operated individually from a remote control station through the selector switch mounted on the master control station. The master control station shall be locked out when a remote control station is activated by the selector switch. Use of the remote control station will allow individual transit vehicle trucks to be lowered to track level.
- C. De-trucking (truck removal and installation) shall be accomplished with the assistance of Body Supports. Each pair of electro/mechanical powered Body Supports shall operate simultaneously to support the transit vehicle at any position up to fully extended when the system is operated from the master control station. Sensors in the Body Supports shall stop their operation when full contact with the jack pads is made. Each Body Support will be equipped with a head, which when positioned shall support the vehicle by the jack pad.

2.02 CAR HOISTS

- A. General:
 - 1. Each Car Hoist will be operated by an electro/mechanical drive system that is automatically self-locking at any elevation. The drive system shall be completely below shop floor level and raise a superstructure with eleven-foot long (11'-0") rails from floor level to the specified elevation or any intermediate elevation. The superstructure shall be open ended without cross-members above floor level to allow free access to the truck.
- B. Performance:
 - 1. Each Car Hoist will have a minimum raising and lowering capacity of 50,000 pounds. In the fully lowered position the car hoist shall have a roll-over capacity of 50,000 pounds on a single four wheel truck with the load equally distributed on each wheel.
 - 2. In any raised position the maximum variation from horizontal for any single hoist will be 1/4 inch measured from end-to-end or center-to-center of the rails.
 - 3. The maximum variation in level between all four hoists in the de-trucking system supporting a transit vehicle through a lifting cycle will be 1 inch.
 - 4. The maximum variation in alignment among a group of hoists will be 1/8 inch in the down position and 3/4 inch in any raised position.
 - 5. Total travel of the Car Hoist will be 60 inches maximum. Lifting speed shall be 4.5 feet per minute.
 - 6. Each group of Car Hoists shall be capable of supporting the transit vehicle with a safety factor of not less than 5:1 based on the ultimate strength of the materials for Mechanical Components. Structural Components allowable stresses and loadings shall be based on those specified in the AISC (ASD) 9th edition with the appropriate dynamic load factors applied.
- C. Car Hoist Frame Base:
 - 1. The frame base is the main structural weldment which supports all other structural members and drive machinery. It shall be anchored to the foundation floor by Anchor Bolts embedded in the pit floor. The frame shall be fabricated from structural steel rectangular tubes (ASTM A500B) and structural steel plates (ASTM A36).

2. Leveling screws shall be mounted on the frame base capable of supporting the entire car hoist against the foundation floor. The screw shall be designed to provide ease and accuracy in leveling the car hoist during installation.
3. The motor mounting base plate and hoist gear case mounting base plates shall be attached to the frame base by welding. The base plates shall be machined (milled) to true flatness one to another, to provide positive motor/gear case alignment and total bearing surface between the drive machinery and base plates.
4. Two (2) structural columns will be mounted on each frame base and attached to the base by bolted connections. The columns are to provide structural stability for the upper frame assembly which in turn supports the car hoist rails. Each column shall have two (2) vertical machined surfaces to provide long wearing, accurate guidance of the upper hoist frame.
5. Hoist Motor. The hoist shall be driven by a squirrel cage motor with a brake. The motor shall be totally enclosed-non vented heavy duty and equipped with shielded sealed bearings. Motor will be NEMA "D" design, Class "H" insulation not to exceed Class "B" temperature rise for 15 minute rating. The Motor Reducer shall have a double extension shaft to couple each end to the bevel gear cases. The motor shall be mounted to the frame base with the armature shaft perpendicular to the shop service rails.
6. Couplings. The Motor Reducer shall be coupled at each end to the bevel gear cases by solid couplings.
7. Gear Cases/Lifting Screws. The bevel gear case input shaft shall be coupled to the Motor Reducer. The input shaft shall be from alloy steel on which is an integrally machined and ground steel pinion. The pinion shall mesh and drive a high tensile bevel gear. The bevel gear shall be keyed to the lifting screw at the screw's base. The lifting screw shall be a buttress thread design and be self locking (load or no load). It shall be machined from heat treated alloy steel. The Buttress Screw shall have a pitch diameter of 3 ½ inches with an inside diameter of 3 inches and an outside diameter of 4 inches. The lifting screw which extends from the gear case vertically shall rest and rotate on a spherical thrust roller bearing and be guided by an antifriction roller bearing at the bottom of the screw. The gear case shall be splash lubricated with the gear case housing fabricated from steel. The gearing used shall be rated for the horsepower of the hoist motor.
8. Hoist Nut. The hoist nut shall be machined from nonferrous material. It shall be compatible and travel (raise/lower) on the rotating buttress threads of the lifting screw. The nut shall bear against and be locked from rotation by pins in the nut adapter plate. The adapter plate shall be attached by four (4) bolts to the upper hoist frame. The nut shall be designed to provide minimum wear when subjected to maximum stress conditions.

D. Upper Hoist Frame.

1. The upper hoist frame shall be the structural member to raise and lower a Transit Car, guided by the columns of the base frame. The frame structure also provides the bridge section and rail system to carry the crossing load of a transit car or raise/lower/support a Transit Car.
2. The upper hoist frame shall be a weldment, fabricated from structural steel rectangular tubes (ASTM A500B); plates, channels, bar stock, and wide flange beams (ASTM A-36).
3. The upper frame assembly shall be designed to provide a clear unobstructed area between the hoist rails when the hoist is fully raised. Each car hoist rail shall be supported by a wide flange beam on a yoke type structure consisting of two rectangular steel tubes acting as columns, per side, supported by a common structure which remains below floor level when the hoist is fully raised. The structure shall bear against the hoist nuts and be supported by the lifting screws.

4. The car hoist rails shall be hardened to avoid damage due to end batter, and manufactured from an AISI 1045 steel bar with a minimum tensile strength of 90,000 P.S.I., and a Brinell Hardness of 190.
 5. Automatic wheel stops shall be actuated when car hoists are raised greater than two inches (2") from the full down position. The wheel stops shall be a mechanical design, not requiring an electrical interface. The stops shall be held positively clear of the flange way and railhead when the car hoists are in the lowered position. Four (4) automatic stops shall be installed on the car hoist at the ends of the running rails. Also, four (4) manual wheel stops shall be provided per car hoist.
- E. Guide System:
1. The Car Hoists shall be provided with a positive roller guide system. The system shall provide guidance and stability to the upper hoist frame during raising/lowering/static modes. The system shall be designed to transfer all eccentric or side loading, imposed on the upper hoist frame, into the frame base, leaving the lifting screws subjected to compressive loads only.
 2. Guide Roller System. McGill Camrol bearing shall be mounted to the upper hoist frame and operate with running clearance against the machined surface on the columns, of the frame base. Eight (8) bearings shall be used in the design to transfer lateral loads which are perpendicular to the service track. The bearings shall be properly spaced with four bearings opposing on each side of the upper hoist frame.
- F. Design
1. The design shall protect against damage due to the nut running past the limit switch. Each car hoist shall have an operating upper and lower limit switch which limits travel of the upper hoist frame. There shall also be an upper overtravel limit switch and a redundant lower travel limit switch. A runoff area shall be provided at the lower end of nut travel to disengage the lifting nut from the upper frame assembly upon over travel past the limit switches. All limit switches shall be actuated directly by the jack screw nuts.
 2. Fully loaded, the hoist shall not deflect more than 1/4 inch measured at the top of the running rail with 1.2 kips applied horizontally in any direction at the rail.
- G. Centralized Lubrication System:
1. When used in conjunction with the protective sleeves, it shall shorten the cleanup time and extend the period between major cleanups by minimizing contaminants which adhere to the exposed screws.
 2. The PLC controlled lubrication system shall provide lubrication to the jack nuts and screws for the shop's car lifting equipment.
 3. Lubricant shall be distributed from a centrally located 55 gallon drum through a system of pipes to control panels mounted on the equipment. A network of tubing and hoses shall feed the lubricant directly to the jack nuts in controlled portions when the equipment is in operation.
 4. Electrically controlled and programmed feeder valves and cycles switches, connected to the PLC at the motor control centers, will feed only the nuts in operation.
 5. When four car hoists are used to raise a married pair of transit cars, all eight (8) nuts and screws shall receive lubrication. When two to eight body hoists are engaged to the car(s), only the active pair(s) are lubricated. If only a single body hoist is used to straighten a tilted car body, both body hoist screws be lubricated as a pair. Since this operation occurs on an occasion timed interval, and the travel

- distances are short, the excess lubricant is negligible.
6. The pump shall be pneumatically operated through a filter-lubricator, connected to shop air. It requires approximately 50 PSI, and regulation of the lubricant supply shall be controlled at this point. Lubricant entering the system from the pump passes through an in-line strainer to ensure clean lubricant.
 7. High pressure reset indicators in the feeders shall isolate high pressure problems at the nuts. A data Panel located on the Motor Control Center (MCC) door shall indicate a lubrication fault and its pit location. A green indicator light on the car hoist lifting frame shall activate during operation to visually indicate proper operation from the shop floor level.

Note: The system is not intended to apply the initial coat of lubricant required after a periodic cleaning.

A hand applied coat will still be required. The system shall apply a sufficient quantity of lube to replace that amount lost during normal operation.

H. Maintainability:

1. Hoist Motor Reducer. The Motor Reducer shall be removable by disconnection of the mounting bolts and couplings, without disturbance to other components.
2. Bevel Gear Case/Lifting Screws. A gear case/lifting screw shall be removable from the pit by removing the center pit cover; upper frame; disconnecting motor reducer coupling and removal of gear case mounting bolts. External lifting devices will only be required for lifting pit cover and gear case/lifting screw from pit.
3. Guide Rollers. Guide rollers shall be accessible and replaceable by use of small hand tools only. No major disassembly shall be required.

I. Lifting Nut and Wear Detection System

1. Lifting nuts shall have the capability of being removed for replacement or inspection without the necessity of removing the jack screw or performing major disassembly of the unit.
2. Removal/replacement of lifting nut shall be accomplished by blocking upper hoist frame at any elevation. Remove four mounting bolts supporting nut adapter plate and two (2) upper bearing capsule bolts. Rotate nut off end of screw. Work shall be accomplished with small hand tools and blocking. External lifting devices will not be required.

J. Nut Wear Detection System:

1. The wear nut detection system shall provide for positive identification of excessive wear on the hoist nuts and the ultimate shut down of the equipment if periodic inspections are not conducted.
2. In connection with the above, an additional nut or follower nut is accommodated beneath the main hoist nut. It shall serve a dual purpose, as a load support in the event of hoist nut failure and as a partial support for the sensor arrangement.
3. Nut wear is detected by an inductive sensor at each hoist nut on the Car Hoists. The Body Supports are not provided with this feature.
4. The Data Panel connected to the PLC shall indicate a nut fault and location.
5. Nut wear proximity sensors automatically stop hoisting motion when any nut in a Car Hoist System requires replacement due to wear. The controls shall allow the lowering motion of hoists to remove cars at floor level. Once the lower limit switch on the hoist is activated, all motion is locked out. As a precaution, an additional "redundant" switch is provided and activates if the regular lower limit switch should

fail.

K. Car Hoist with Spinning Post:

1. These car hoists shall be identical both mechanically and electrically to the car hoist described within this specification.
2. Wheel spinning posts shall occupy the space between the rails on the car hoist. They shall be anchored to the floor below on the same level as the car hoist bases.
3. Wheel spinning posts shall be counter-weighted columns that can be manually pivoted from a horizontal storage position to a locked vertical position.
4. In the storage position, the spinning post shall be concealed beneath hinged portions of the floor plate.
5. An internal locking pin shall be provided to hold the spinning posts in a vertical position.
6. Aluminum adapter beams are to be provided for placement between the vertical spinning posts to hold the car at the truck jacking pad locations.

2.03 BODY HOISTS/BODY SUPPORTS

A. General:

1. The body hoist/support shall be operated by a mechanical drive system that is automatically self-locking at any elevation and requiring power to raise or lower. The drive system shall be contained completely below shop floor level and the top of the support will be flush with the floor in the lowered position. Clearance shall be provided between the raised body supports so as to allow passage of a disconnected truck. The body supports shall be utilized for load support and can be used to raise or lower a transit vehicle at their jacking pads.

B. Performance

1. Each group of body hoists/supports shall be capable of supporting the transit vehicle with a safety factor of not less than 5: 1 based on the ultimate strength of the materials for Mechanical Components. Structural Components allowable stresses and loadings shall be based on those specified in the AISC (ASD) 9th edition with the appropriate dynamic load factors applied.
2. The total travel of the body supports shall be approximately 90 inches. Lifting and lowering speed will be approximately 4.5 feet per minute.
3. The maximum variation in level between body supports supporting a transit vehicle shall be 1/2 inch with respect to the body support on the opposite side of the transit vehicle and 1 inch over all for a married pair.

C. Body Hoists/Support Frame Base:

1. The frame base is the structural weldment which supports all other structural members and drive machinery. It shall be mounted on steel beams supported by the foundation floor slab.

D. Body Hoists/Support Frame:

1. The frame shall be the structural machinery mount and housing for all screw jack machinery and column mast guidance equipment.
2. A screw shall be mounted to the support frame. The screw jack shall be designed to lift/lower the dead load consisting of the body support column mast with head assembly. A limit switch located in the body support head will shut down the hoist motor upon contact with a load, i.e., transit car jacking pad. The basic components of the Body Hoist/Support shall consist of the hoist motor, input shaft coupling,

- gear case, lifting screw and hoist nut.
3. Support Motor. The hoist/support shall be driven by a squirrel cage motor reducer with a brake. The motor reducer shall be totally enclosed, non-vented heavy duty and equipped with shielded sealed bearings. Motor will be NEMA "D" design, Class "H" insulation not to exceed Class "B" temperature rise for 15 minutes rating. The motor reducer shall have a single extension shaft to couple the reducer shaft to the screw. The motor reducer shall be horizontally mounted and bolted to the body support frame.
 4. Couplings. The motor reducer shall be coupled to the screw by a flexible coupling.
 5. Gear cases/Lifting screws. The gear case input shaft shall be coupled to the hoist motor. The input shaft shall be from alloy steel on which is an integrally machined and ground steel worm. The worm shall mesh and drive a high tensile bronze worm gear. The worm gear shall be keyed to the lifting screw at the upper base. The lifting screw shall be a Buttress Thread Design and be self locking (load or no load). It shall be machined from heat treated alloy steel. The Buttress Screw shall have a pitch diameter of 3 1/2" inches with an inside diameter of 3 1/16" and an outside diameter of 3 15/16 inches. The worm gear will rotate on antifriction roller bearings. The lifting screw which is suspended from the gear case vertically will rest and rotate on tapered thrust roller bearings. The gear case shall be lubricated with the gear case housing manufactured from a ductile iron, machined casting. The gear case shall be rated for the horsepower of the hoist motor. The gear case will be mounted inverted rotating. It will be attached to the body support frame by mounting bolts.
 6. Hoist Nut. The hoist nut shall be machined from nonferrous material. It will be compatible and travel (raise/lower) on the rotating Buttress Threads of the lifting screw. The nut shall bear against and be locked from rotation by the lifting bracket, attached to the base of the column mast. The lifting bracket shall be bolted to the column mast. The nut shall be designed to provide minimum wear when subjected to maximum stress conditions.

E. Guide System:

1. The Body Hoist/Support shall be provided with a positive guide system. The system shall provide guidance and stability of the column mast, in all directions, during raising/lowering/static modes. The system shall be designed to transfer all eccentric or side loading, imposed on the column mast into the body support frame, leaving the lifting screws subjected to compressive loads only.

F. Column Mast

1. The column mast shall be designed and located to allow a disconnected truck to pass through and between the column masts, with the masts in a raised position.
2. The head attached to the top of the column mast shall have adequate extension to reach under and provide proper bearing area to the jacking pad of the Transit car.
3. A lifting bracket shall be bolted to the base of the column mast. The lifting bracket shall serve as the attachment of the lifting screw/nut which raises/lowers/supports the column mast.
4. Column Mast Support shall be designed to endure all compressive loads of the column mast when in a lowered position. The structural support shall be located on centerline with the column mast. It's elevation shall be adjustable with shim placed between the hoist support frame and steel beams supported by the foundation floor slab. The base of the column mast shall be in bearing against the top of the support when the mast is at its lower travel and the top surface of the mast shall be level with the shop floor/pit cover. The Body Hoist/Support shall be shimmed for elevation

and bolted to its support beams.

G. Design:

1. The design shall protect against damage due to the lifting nut running past limit switches. Each Body Hoist/Support shall have operating upper and lower limit switches which limit travel of the column mast. All limit switches shall be actuated by a limit switch trip. The lifting screw shall also have a nut run off area at the lower end of the screw to disengage the nut from further lowering. At such time of over travel, the lifting screw can rotate without either raising or lowering the column mast. This condition shall not cause any damage to the lift equipment. The limit switch must them be inspected/reset before the lift system can be placed back in operation. There shall also be a load sensing switch to prevent raising or lowering of the column mast with a live load contacting the column mast head.

H. Maintainability.

1. Hoist Motor. The motor shall be removable by removing pit cover, disconnection of the mounting bolts and motor couplings, without disturbance to other components.
2. Gear cases/Lifting screws. A gear case/lifting screw shall be removable from the pit by removing pit cover; lowering column mast on cribbing (approximately twelve inches thick) placed between the bottom of the mast and the lower column mast support; removing lifting nut from end of lifting screw; disconnection of motor coupling; removal of gear case mounting bolts. External lifting devices shall only be required for lifting pit cover and gear case/lifting screw, from pit.
3. Lifting nut. Removal/replacement of lifting nuts will be accomplished by lowering column mast onto cribbing (approximately twenty four inches thick) placed between the bottom of the mast and the pit floor and rotating hoist nut off lower end of lifting screw.

2.04 PIT COVERS AND ACCESS COVERS

- A. The main pit cover and body hoist/support pit covers shall be provided. Pit edge configuration will be as shown on the drawings. Pit covers shall be 3/8" floor plate and designed to support a concentrated load of 4,000 pounds, distributed as though it were imposed by the wheel of a fork lift truck having an imprint not less than 6 inches in diameter. Pit covers shall be in place at all operating heights. Gaps between the pit covers and the floor shall not exceed 1/2 inch.

2.05 CONTROL AND POWER WIRING

A. Power Supply:

1. The motor control center, master control station and remote control stations shall be furnished complete. All non embedded conduit and interconnecting wiring shall be provided.

B. Control Arrangement:

1. A master control station shall be provided for the de-trucking system. The master control station will contain constant pressure type push button switches to operate hoists in unison for raising the transit vehicle. Selector switches, various indicator and pilot lights and push button controls as detailed in the following will be provided.

C. Master Control Station:

1. The master control station shall be a floor mounted pedestal type with the control panel surface inclined at an angle of approximately 30 degrees from horizontal.
2. The wiring enclosure will be a NEMA 12 type with a hinged cover. An engraved legend plate shall be laminated gray plastic with black lettering attached to the enclosure cover. Control devices mounted in the cover shall be shop wired, bundled and wired to a terminal strip mounted to a stand-off panel in the enclosure.
3. The master control station panel will include control devices with suitable legends as follows:
 - Car Hoists with Body Hoists Master Control Station -
 - a. "Hoist Power On/Off" Selector Switch.
 - b. "Body Hoists normal/Bypass" Selector Switch.
 - c. "Car Hoists Remote" Push Button (momentary).
 - d. "Body Hoists Remote" Push Button (momentary).
 - e. "Car Hoists Up" Push Button (momentary).
 - f. "Car Hoists Down" Push Button (momentary).
 - g. "Body Hoists Up" Push Button (momentary).
 - h. "Body Hoists Down" Push Button (momentary).
 - i. "Malfunction Light" (red).
 - Car Hoists Master Control Station -
 - a. "Hoist Power On/Off" Selector Switch.
 - b. "Car Hoists Remote" Push Button (momentary).
 - c. "Car Hoists Up" Push Button (momentary).
 - d. "Car Hoists Down" Push Button (momentary).
 - e. "Malfunction Light" (red)
4. Operational and Interlock Design Parameters:
 - a. Interlocks shall be provided to allow the lowering of a single car hoist only when the transit vehicle is supported by body supports.
 - b. Interlocks shall be provided to allow the body supports to operate only when the car weight is removed from the body supports.

D. Remote Control Stations:

1. Remote control stations shall be floor mounted "swing-up" type with the control panel surface inclined at an angle of approximately 30 degrees from horizontal.
2. The Remote Control Stations shall include control devices with suitable legends as follows:
 - Car Hoists with Body Hoists Remote Control Station -
 - a. "Hoist Power On/Off" Selector Switch.
 - b. "Car Hoist Up" Push Button (momentary).
 - c. "Car Hoist Down" Push Button (momentary).
 - d. "Body Hoist Up" Push Button (momentary).
 - e. "Body Hoist Down" Push Button (momentary).
 - Car Hoists Remote Control Stations -
 - a. "Hoist Power On/Off" Selector Switch.
 - b. "Car Hoists Up" Push Button (momentary).
 - c. "Car Hoists Down" Push Button (momentary).

3. The wiring enclosure shall be NEMA 12 with a hinged cover. An engraved legend plate shall be attached to the enclosure cover. Control devices mounted in the cover shall be shop wired bundled and wired to a terminal strip mounted to a stand-off panel in the enclosure.

E. Motor Control Center:

1. The Motor Control Center (MCC) which shall be free standing, equipped with 600 Amp horizontal and 300 AMP vertical bus bar and having a NEMA 12 hinged cover type electrical enclosure. The motor control center shall include an externally operated disconnect switch, control circuit transformer, Programmable Logic Controller (PLC) (master relay panel) and circuit breakers. A hinged shelf shall be included for setting the lap top computer on. Devices will be completely internally wired to a terminal strip with wires properly numbered to correspond to the electrical diagrams. Wiring shall be completed in a neat workmanship like manner using wiring troughs and wire bundles for cover devices.
2. NEMA type C wiring will be provided. Disconnects shall be motor circuit protectors.
3. The MCCs shall be provided with a ground buss with motor ground terminals.
4. All logic circuitry shall be handled by means of a Programmable Controller. The Programmable Controller will be microprocessor-based General Electric Fanuc 9030 and of sufficient memory size to incorporate all logic controls. The controller will retain current position memory in the event of a power failure with a EEPROM. The unit will incorporate status lights to indicate the on or off conditions of any input or output device, such as limit switches, motor starter coils, etc. to facilitate trouble shooting along with a Data Panel Model 160 detailing the fault. Two spares of the following are required for each model logic controller used: I/O rack, CPU, Input Module, and Power Supply.
 - a. A Portable (Lap Top) Computer capable of reading and displaying circuit condition will be furnished. It can be used for trouble shooting and reprogramming if needed.
5. Operational and Interlock Design Parameters:
 - a. The drop out of a single motor starter, when being used in conjunction with another starter in the operation of either the car hoist system or the body support system will cause the other starter to drop out and thereby shut the system down.
 - b. Operation of any over travel limit switch, raising or lowering, shall automatically shut down the entire hoist and body support system. A "malfunction" pilot shall indicate location of the over travel.
 - c. Electrical push button, selector switches and pilot light devices shall be the heavy duty oil tight machine tool type.
 - d. Motor Starters: Individual motor starters shall be supplied for each motor within the free standing motor control center. The starters shall be a proper size AC. reverse combination starter with motor circuit protector assembled in a NEMA 12 enclosure.

F. Warning Devices:

1. A warning bell, audible within the shop will sound when any motor in that pit is energized for lifting or lowering operation.

G. Negative Return Bonding:

1. Structure Return Current Connections: The running rails of the car hoists shall be at

the same potential as the running rails embedded in the adjacent shop floor at all times. Two (2) 500 MCM insulated flexible copper cables shall be used to connect the car hoist running rails to the adjacent embedded running rails.

H. Isolation:

1. Structure Electrical Isolation: The car hoist structure, guides, control, power and transmission equipment shall be electrically isolated from the car hoist running rails and all embedded shop track running rails at all times.

I. Grounding:

1. Electrical Equipment Grounding: No hoist or support electrical equipment will be grounded through its attachment to the hoisting equipment or hoist equipment embeds. Case grounding will be through a continuous ground wire in a nonmetallic conduit or flexible liquid tight wiring conduit with an integral copper ground wire. The grounding network shall be terminated on the motor control center ground buss.

2.07 PAINT AND FINISH

A. Painting:

1. All equipment, apparatus, piping, enclosures, structural framing and supports, conduits and related items to the equipment shall receive a shop prime coat and two finish coats of equipment enamel paint. All surfaces shall be clean of rust, scale, dirt, grease, and oil before painting.
2. Each coat shall be a minimum of 5 mils dry film thickness.
3. The motor control center and master control station enclosures shall be manufacturers standard finish.

PART 3 - EXECUTION

3.01 FABRICATION

- A. Fabrication shall be in accordance with the contract specifications. Proposal and approved shop drawings for each product specified herein,

3.02 FACTORY TEST:

- A. Functional testing shall be performed for each product specified herein. Tests will be performed per printed testing procedures and instructions.

3.03 INSPECTION:

- A. A factory representative shall be responsible for a pre-installation inspection of the work site to determine acceptable site conditions before starting to install equipment. Any unsuitable deficient site conditions pertaining to the equipment installation shall be documented at that time and corrected by the General Contractor and verified as corrected before installing the equipment.

3.04 FIELD SERVICE:

- A. A factory representative shall supervise all field installation, testing and adjusting of the car hoist and body support system. He shall perform the pre-installation inspection of the site to

determine its acceptability and conduct, the operation and maintenance training..

3.05 ERECTION:

- A. Mechanical and Electrical Installation shall be in accordance with approved shop drawings and under direct supervision of the field service representative.

3.06 FIELD ACCEPTANCE TESTING:

- A. Notify the Engineer five days prior final testing.
- B. The Authority shall furnish a coupled-pair of transit cars and one transit car truck to be used in testing the equipment.
- C. The Contractor shall furnish all test equipment and personnel to perform tests. The Authority will furnish the electrical power.
- D. Test each component through five cycles of operation before testing groups of components. Test components using transit car equipment through five cycles of operation or until approved. Perform final testing with transit car equipment only after satisfactory operation of all hoisting and related components is attained.

3.07 TRAINING:

- A. Instruction of the Authority's personnel for a maximum of 1 working day (8 hours) as to start-up, operation, shut-down and maintenance of the equipment will be provided.

3.08 OPERATION AND MAINTENANCE MANUALS:

- A. Operation and maintenance manuals will be furnished with the following sections.
 - 1. Operation
 - 2. Inspection
 - 3. Lubrication
 - 4. Adjustments
 - 5. Component Removal and Installation
 - 6. Control Operation Theory
 - 7. Electrical Control Physical Schematics
 - 8. Cable and Conduit Diagrams
 - 9. Assembly Drawings with Parts Identified for Ordering purposes
 - 10. Parts lists

END OF SECTION

THIS PAGE NOT USED

SECTION 14200

HYDRAULIC ELEVATORS

PART 1-GENERAL

1.01 DESCRIPTION

- A. Provide 3500 lb. capacity, 125 fpm speed, passenger hydraulic elevator.
- B. Furnish interior cab walls and ceiling panels, door panels, hoistway entrance frames, call buttons and hall lanterns with a satin stainless steel finish.
- C. Provide epoxy flooring coating in cab. The elevator installation and design shall conform to ADAAG and local regulatory requirements and to the manufacturer's standard written specifications.
- D. Provide manufacturer's written warranty for repair service of 12 months from date of Substantial Completion and a continuing maintenance proposal starting on date initial warranty period is concluded.
- E. Provide PVC pipe casing complying with ASME A17.1 for in-ground protective cylinder casing.
- F. Provide emergency communication system, complying with ASME A17.1 and ADAAG, that dials preprogrammed number on activation.
- G. System to provide two-way voice communication and visible signals that indicate when system has been activated and when monitoring station has responded.
- H. Provide PLC Allen Bradley SLC 503 elevator controller and Allen Bradley Panelview 550 annunciator panel.
- I. Software protocols shall be provided to simultaneously transmit fault finding annunciator data to the Authority's AEMS central computer, via an RS232 connection using an Allen Bradley DF1 protocol and Allen Bradley 1770-KF3 communication interface module. Annunciator panel shall be equipped with hardware required for downloading data to a laptop PC.
- J. Coordinate specific remote elevator reporting system requirements and other elevator operation requirements with the Authority's Representative.

1.02 SUBMITTALS

- A. Elevator manufacturer shall submit product data, shop drawings, samples, manufacturer certificates, maintenance and operations manuals for WMATA review.

1.03 TRAINING

- A. Instruct Authority's personnel in proper use, operations, and daily maintenance of elevators.
- B. Train Authority's personnel in procedures to follow in identifying sources of operation failures or malfunction.

PART 2-NOT USED

PART 3-NOT USED

END OF SECTION

SECTION 14401
OVERHEAD CRANE

PART 1 - GENERAL

RELATED DOCUMENTS:

- A. Drawings and general provisions of the Contract apply to this section.
- B. Related Sections include Section 11001, Equipment General Requirement.

1.01 DESCRIPTION:

- A. This section specifies the design, fabrication, furnishing, and installation of cranes with built-up ER hoist/trolley and subject package hoist and jib crane design.

1.02 QUALITY ASSURANCE:

- A. Manufacturer Requirements:
 - 1. Furnish electric overhead & jib cranes and hoist manufactured and designed as approved by WMATA's engineering, operation and maintenance departments.
 - 2. Minimum expected half life of this equipment shall be 25 years. All equipment furnished shall be heavy duty, industrial type.
 - 3. The Engineer reserves the right to inspect materials and their sources, workmanship, and construction methods at any time, at the Manufacturer's shop or fabricating facility. The Engineer further reserves the right to be present for any or all shop tests of components, assemblies, or systems. The Manufacturer shall notify the Engineer two (2) weeks in advance of any tests.
 - 4. Manufacturer's Compliance:
 - a. All factory wired control panels shall be tested for operation, as specified herein, and submitted to Underwriters Laboratories Inc., for inspection, approval, and labeling.
 - b. Nameplates: Nameplates shall be securely attached, by mechanical means, in a prominent location on each major item of equipment.
 - 5. Qualification of Manufacturer: Manufacturer shall be reputable and regularly engaged in the design and manufacture of the type of equipment specified herein. Assembled components, purchased by the Manufacturer for this Contract, such as motors, gear boxes, electrical devices, etc., shall be the standard products of qualified manufacturers. All similar items shall be the products of a single manufacturer. Prior to approval of the Manufacturer's proposal for the cranes, the Manufacturer shall submit to the Engineer the following information:
 - a. A list of crane & hoist, of his manufacture, similar in usage, where the proposed equipment has been in service, including the duration of service.
 - b. Name of contact person at each installation submitted above, who is familiar with the operation and maintenance of all hoisting equipment provided by the Manufacturer.
 - c. The cranes and hoists shall meet the Federal Transit Administration Buy America Clause for equipment installed in an existing maintenance shop.
 - d. The manufacturer of the cranes & hoists shall be ISO-9001 and QS-9000:98 TE Supplement certified and registered. The manufacturer must

submit with the bid response proof that it has implemented and maintains a quality system that fulfills the requirements of the ISO-9001 and the QS-9000 TE Supplement in the form of a certificate documenting registration from an ANSI-RAB accredited registrar.

- e. Based on the information supplied, and discussions with the contact persons named, the Engineer will determine the acceptability of the proposed Manufacturer and equipment.

- B. Furnish manufacturer's standard quality assurance program to the authority for approval.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the requirements set forth in the General Requirements, and with the additional requirements as specified for each.
- B. Shop Drawings: In accordance with the General Requirements, submit six (6) copies of complete shop drawings to the Authority for approval, including but not limited to:
 - 1. Crane general arrangements.
 - 2. Assembly and subassemblies
 - 3. Wiring diagrams.
 - 4. Installation Instructions / Drawings.
- C. Operations and Maintenance Manual: Submit in accordance with the requirements of the General Requirements.
- D. Operations and Maintenance Training: Submit in accordance with the requirements of the General Requirements.
- E. Contract Record Drawings: Submit in accordance with the General Requirements.

1.04 TRAINING:

- A. Contractor is responsible for training as outlined in Section 01820, Demonstration and Training and Section 11001, Equipment General Requirements.
- B. Number of Personnel To Be Trained And Class Size for Jib Cranes:

Level Of Training	Approximate Number of Individuals	Maximum Class Size	Minimum Number of Classes
Level I	24	8	3
Level II	8	4	2
Level III	0	0	0

Number of Personnel To Be Trained And Class Size for Bridge Cranes:

Level Of Training	Approximate Number of Individuals	Maximum Class Size	Minimum Number of Classes
Level I	24	8	3
Level II	4	4	1
Level III	4	4	1

C. Levels of Training:

1. Level I: Familiarizing Training
2. Level II: Training for P&E Personnel
3. Level III: Programming Training

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Ship equipment upon notification by the Engineer.
- B. Package, to prevent damage during shipping.

1.06 APPLICABLE CODES:

ABMA	American Bearing Manufacturers Association
AGMA	American Gear Manufacturers Association
AISC	American Institute of Steel Construction
ANSI	American National Standards Institute
ASCE	The American Society of Civil Engineers
ASME	The American Society of Mechanical Engineers
ASTM	American Society for Testing & Materials
AWS	American Welding Society
CMAA	Crane Manufacturers Association of American, Inc.
NEC	National Electrical Code
NFPA	National Fire Protection Association
NEMA	National Electrical Manufacturers Association
OSHA	U.S. Department of Labor, 29 CFR Part 1910 - Occupational Safety & Health Standards for General Industry

1.07 WARRANTY

- A. Furnish warranty for the work in this section in accordance with the General Conditions

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. Equipment: As follows:

1. Electric Overhead Traveling Cranes with Built-Up Hoists
 2. Hoist Units
 3. Jib Cranes
- B. Equipment to include all controls, enclosures, wiring, motors, structural members, and all items customarily related to the cranes and hoists.
 - C. All bearings, gears and pinions inside of gearcase are oil splash lubricated. Lifetime lubrication on all other bearings.
 - D. Equipment-Mounted Conduit: UL-listed.
 - E. Equipment Wiring and Cable: UL-listed.
 - F. C-track style festoon mounted off of B girder. Each crane includes an Electromotive SBP style pendant station mounted on a C-track. The system is designed to minimize field connections. Festoon cable is one continuous run from the P.B. junction box to the control panel mounted on the "A" girder.
 - G. Motors: Manufacturer's standard, conforming to NEMA MG-1, suitable for the intended purpose, and with electrical characteristics compatible with the building's electrical system.
 - H. Finish: Equipment Manufacturers standard - safety yellow..
 - I. Fasteners: Standard with the manufacturer.
 - J. Bridge Cond.: C-track style festoon, mounted off of B girder with standard level supports. Tow chain between trolleys helps eliminate stress on the cables. The system is designed to minimize field connections. Festoon cable is one continuous run from the trolley junction box to the control panel mounted on the "A" girder. Encoder cable is one continuous run from the hoist motor to the control panel.
 - K. Special Tools: Furnish one set of all special tools required for inspection, adjustment, maintenance and repair. Special tools are defined as those developed to perform a task unique to the equipment furnished and which are not available from commercial sources.
 - L. Wiring: Internal factory wiring of equipment: Manufacturer's standard.

2.02 DESIGN REQUIREMENTS:

- A. General: Manufacturer shall design and fabricate the equipment and controls to conform to these specifications and the dimensions and clearances indicated on the contract drawings. Manufacturer shall verify with the Engineer, the exact working dimensions, weights, and clearances of the transit car truck and related items for which crane and hoist will be designed to service. All cranes shall be designed for CMAA class "D" service. Monorail hoists and jib cranes to H4.
- B. Equipment Capacities & Features: Each crane & hoist shall be capable of lifting the rated capacity of the crane or hoist with a safety factor of not less than 5:1 on the rope based on the ultimate strength of the rope. Structural components allowable stresses and loadings shall be based on those specified in the CMAA specification #70.

C. ER Bridge Built Up Crane

1. GIRDERS : All girders are designed per CMAA standards. Wide Flange Beams with reinforcement plates mounted on inside of girders for added strength, when required. Up to 60'-0 span and welded box section with A36 steel over 60'-0 span.
2. BRIDGE RAILS: ASCE 30# rail. Rails are center mounted, held in place with opposing rail clips welded on 3'-0" centers. Rail splices when necessary, fall over an internal diaphragm. Anti-creep bars are welded to rail ends.
3. TRUCKS : Structural tube sections with flange cartridge bearing assemblies, mounted on plates which are welded to the tube trucks. Plates are machined in-line after all welding is complete to ensure proper alignment. Drop bars, rail sweeps, and polyurethane bumpers designed per CMAA standards are included. Bridge wheels R.S.R.T., double flanged, tapered tread design. Driver axles are key fit, idler axles are press fit.
4. BRIDGE DRIVES: CMAA A-4 drive arrangements, torque arm supported gear-motors hollow-shaft mounted to the drive axle extension shafts. Minimum 1.4 Service Factor for all units. Inverter Duty Squirrel Cage motors, TEFC, 1800 RPM, with Class H insulation. Minimum 10,000 hour bearing life, Unicase gray cast Iron construction (SAE Class 30), Helical gearing in compliance with ANSI/AGMA standard 2001-B88, Gears are Carburized to a hardness of 58-62 Rockwell. Double lip oil seals on output shafts, captured keys, and each unit includes oil level sight glasses as standard.
5. DRIVE WALK: Checkered plate full-length, 4 in. min. toe board and 42 in. handrail with intermediate rail.
6. IDLER WALK : Checkered plate min. 12 ft long, 4 in. min. toe board, and 42 in. handrail with intermediate rail.
7. BUMPERS : Four (4) polyurethane-type, mounted on end trucks with safety cables.
8. COLLECTORS : Crane is shipped with three (3) tandem shoe collectors. Collector staff is designed for mounting below bridge trucks. (Insul-8 or equal). A fourth conductor can be furnished for grounding.
9. RUNWAY COND. GUARD: Crane is provided with one (1) pipe-type guard to protect runway conductors from a swinging hook.

D. BUILT-UP TROLLEY SPECIFICATIONS

1. FRAME: Built-up type, structural steel channel-type trucks, tube-type load girt, sheave nest (15-30 ton) mounted above deck for ease of maintenance and flanged cartridge wheel bearing assemblies.
2. HOIST GEARCASE: Model #20ER, cast iron, horizontally mounted, horizontally split, triple reduction with helical gearing on 1st 2 reductions; spur gearing for final reduction (4340 material). Ball bearings exceed CMAA Class D B-10 life. Gearcase has oil level dip stick, and gearing inspection cover. Gearcase without mechanical load brake.
3. HOIST BRAKE: AC shoe-type, self adjusting, solenoid actuated rated to 125% motor torque. Primary braking is via flux vector control with dynamic braking resistors.
4. DRUM: 12-3/8" diameter, schedule 160 seamless steel pipe.
5. REEVING: 4 parts double reeved. All reeving has two parts off drum for true vertical lift. Running sheaves are 12" P.D. (Ball bearings). Equalizer sheave is 8" P.D. (Bushing when used).
6. ROPE: ½" EIPS-IWRC 6 x 37 construction, 2 dead wraps on drum.
7. BLOCK: Semi-enclosed, close guarded, steel construction, with Crosby single barbed hook, mounted on a thrust bearing provided full 360 degree rotation. Sheaves

- are 12" P.D. with ball bearings. Heavy duty hook latch provided as standard.
8. WHEELS: 4 wheels - 8 inch Forged Steel - Rim Toughened. Wheels are straight tread.
 9. TROLLEY DRIVE: Mounted at one end, torque arm supported gearmotor hollow shaft mounted to the drive axle extension shaft. Minimum 1.4 service factor for all units. Inverter duty squirrel cage motors, TEFC, 1800 RPM, with Class 'H' insulation. Minimum 10,000 hour bearing life, unicase gray cast iron construction (SAE Class 30), helical-bevel gearing in compliance with ANSI/AGMA standard 2001-B88. Gears are carburized to a hardness of 58-62 Rockwell. Double lip oil seals on output shaft. Captured keys and unit includes oil level sign glass as standard.
 10. BUMPERS: Four (4) spring type, mounted on bridge.
 11. TOW ARM: Towing arm with junction box and terminal strips provided on trolley.
 12. LIMIT SWITCH: Control circuit weight type paddle limit switch for upper hoist travel limit is standard. Plus upper/lower screw type included.

E. ELECTRICAL PROPOSAL SPECIFICATIONS

1. HOIST MOTOR: Vector duty, squirrel cage motors, foot mounted, single shaft, rated 60' duty, 1800 RPM, TENV with Class 'H' insulation and 1024 PPR encoder.
2. TROLLEY MOTORS: Inverter duty, squirrel cage gear motors, integral mounted, rated continuous duty, 1800 RPM, TEFC, with Class 'H' insulation, with integral mounted DC disc brake.
3. HOIST CONTROLS: Flux vector controls with heavy duty dynamic braking resistors, brake contactor, swift lift (125% of nominal full load speed @ < 10% loads) and load float capabilities.
4. TROLLEY CONTROLS: Variable frequency controls with heavy duty dynamic braking resistors, brake contactor, reverse plugging simulation.
5. MAINLINE CONTROL: Each crane is furnished with a thru door type Fused Manual Magnetic Main line Disconnect switch, 750 Kva Transformer. Each motion includes fused line protection. All controls are mounted in a single NEMA12, lighted enclosure (lights on when door opens). Panel includes 3% line reactor to filter incoming power to all drives.
6. POWER: All cranes are designed for 3 phase, 60 hz, 460v nominal incoming power.

F. SPECIAL FEATURES

1. Application: Crane is designed for indoor CMAA Class D service.
2. Controls: Crane utilizes State-of-the-Art Flux Vector Hoist controls and VFD bridge and Trolley controls.
3. Crane Lights: Lights mounted on swing up supports on footwalk(s).
4. Jacking Pads: Jacking pads mounted on end trucks to facilitate wheel changes included.
5. Bumper Extensions: Bumper extensions to crane extremes included.
6. Warning Horn: Warning horn activated by bridge motion or push button included.
7. Flashing Light: Red flashing light activated by crane power or bridge motion included.
8. Radio Control: Stepless radio control system with Belly-box transmitter. System includes total isolation radio/pendant transfer switch, and externally mounted antenna. System includes spare transmitter. System includes charger and spare rechargeable battery.

2.03 GENERAL

- A. Design Criteria: All crane parts shall equal or exceed design criteria as established by C.M.A.A. specification #70.
The crane proposal should cover equipment which complies with the manufacturer's interpretation of the mandatory requirements of the William-Steiger Occupational Safety & Health Act of 1970 (OSHA) as amended June 27, 1974.
Mounting of control panels will provide for 30" minimum clearance in front of cabinets to comply with 1978 NEC Section 610.57
Floating rails shall not be used for runways. Rails shall be held firmly in all directions.
- B. Drawings: Crane manufacturer shall submit three (3) prints of standard crane general arrangement drawings for approval. These drawings shall show all critical clearance dimensions and other data that is pertinent to design and construction.
- C. Assembly: Crane shall be assembled at Manufacturer works, marked for reassembling, and taken apart sufficiently for proper handling and shipment. The manner and extent the crane is broken down for shipment is at the sole discretion of crane manufacturer.
- D. Painting: The crane will be cleaned and painted using a rust inhibiting primer, and a finish coat of yellow Ferrite Pigment type enamel.
Nuts, bolts, washers and piping shall be painted, or cadmium or zinc plated. Electrical equipment and purchased components will be furnished with manufacturer's standard finish.
- E. Notification of Inspection: Crane manufacturer shall provide advance notice, as required by the contract, when equipment will be ready for inspection. The following notification procedure shall be provided:
When a single inspection is required (usually of the no-load running test), crane manufacturer shall establish a tentative date for this inspection and notify the customer accordingly.
Within forty-eight (48) hours of the tentative date, crane manufacturer will confirm or revise the exact date of inspection.
When numerous inspections are required (e.g. running test, paint, loading), crane manufacturer shall give prior notice per contract requirements of a designated inspection period - approximately two (2) weeks - during which crane manufacturer shall require the inspector available on forty-eight (48) hour notice. Failure of the inspector to be present on the scheduled inspection date, or make other arrangements mutually agreed upon, shall constitute a waiver of the requirement and work/or shipment will proceed. In the event that inspection has been waived, shipment shall not be rejected at the site by owner due to lack of shipping release. Such waiver shall not relieve crane manufacturer in any way from its obligation under the contract.
- F. Storage of Equipment: The equipment shall be stored indoors in a heated and dry building. The equipment should not be stored for more than thirty (30) days.

2.04 PAINTING:

- A. Painting: All equipment, apparatus, piping, enclosures, structural framing and supports, and related items to the equipment shall receive a shop prime coat and two finish coats of equipment enamel paint. All surfaces shall be clean of rust, scale, dirt, grease, and oil before painting.

- B. Each coat shall be a minimum of 2 mils dry film thickness.

2.05 FABRICATION:

- A. Fabricate in accordance with approved shop drawings.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. All crane rail shall be installed by the building contractor.
- B. Install equipment in accordance with approved shop drawings.
- C. Ensure that all equipment is ready for checkout and startup by the manufacture.
- D. Touch-up damaged areas of factory-finished surfaces, using the same paint materials.

3.02 TESTING:

- A. Notify the engineer five days prior to shop no-load testing.
- B. The authority will furnish test weight to be used in load testing the equipment.
- C. The building / installation contractor shall furnish all test equipment and personnel to perform tests. The authority will furnish the electrical power.
- D. **Rated Load Testing:** Pursuant to the latest edition and interpretation of the Occupational Health and Safety Administration (OSHA) Regulation, 29 CFR § 1910.179 (k), each independent hoisting unit of a crane shall be given a rated load test not to exceed 125%, but no less than its rated load prior to putting the crane into service. The form of the rated load test is to be in accordance with requirements of the latest edition of OSHA regulation, 29 CFR § 1910.179 (k). A report of the rated load test is to be placed on file at a location accessible to the personnel assigned responsibility for the crane by the crane's owner. A rated load test is required for all new cranes.

It is the responsibility of the crane owner to ensure that a rated load test is performed and a report of said test is made and on file.

END OF SECTION

SECTION 14520

TRUCK REPAIR HOIST TWO (2) SCREW DEEP PIT DESIGN

PART 1 - GENERAL

RELATED DOCUMENTS:

- A. Drawings and general provisions of the Contract apply to this section.
- B. Related Sections include Section 11001, Equipment General Requirement.

1.01 DESCRIPTION:

- A. This section specifies the design, fabrication, furnishing, and installation of twelve (12) complete and operable two (2) screw deep pit truck repair hoists as specified herein.

1.02 QUALITY ASSURANCE:

- A. Manufacturer Requirements:
 - 1. Furnish Truck Repair Hoists manufactured and designed as approved by WMATA's engineering, operation and maintenance departments.
 - 2. Minimum expected half life of this equipment shall be 25 years. All equipment furnished shall be heavy duty, industrial type.
 - 3. The Engineer reserves the right to inspect materials and their sources, workmanship, and construction methods at any time, at the Manufacturer's shop or fabricating facility. The Engineer further reserves the right to be present for any or all shop tests of components, assemblies, or systems. The Manufacturer shall notify the Engineer two (2) weeks in advance of any tests.
 - 4. Manufacturer's Compliance:
 - a. All factory wired control panels shall be tested for operation, as specified herein, and submitted to Underwriters Laboratories Inc., for inspection, approval, and labeling.
 - b. Nameplates: Nameplates shall be securely attached, by mechanical means, in a prominent location on each major item of equipment.
 - 5. Qualification of Manufacturer: Manufacturer shall be reputable and regularly engaged in the design and manufacture of the type of equipment specified herein. Assembled components, purchased by the Manufacturer for this Contract, such as motors, gear boxes, electrical devices, etc., shall be the standard products of qualified manufacturers. All similar items shall be the products of a single manufacturer. Prior to approval of the Manufacturer's proposal for the Truck Repair Hoists, the Manufacturer shall submit to the Engineer the following information:
 - a. A list of truck repair hoists, of his manufacture, similar in usage, where the proposed equipment has been in service, including the duration of service.
 - b. Name of contact person at each installation submitted above, who is familiar with the operation and maintenance of all hoisting equipment provided by the Manufacturer.
 - c. The truck repair hoists shall meet the Federal Transit Administration Buy

- d. America Clause for equipment installed in an existing maintenance shop. The manufacturer of the truck repair hoists shall be ISO-9001 certified and registered. The manufacturer must submit with the bid response proof that it has implemented and maintain a quality system that fulfills the requirements of the ISO-9001 in the form of a certificate documenting the most recent quality audit and report.
- e. Based on the information supplied, and discussions with the contact persons named, the Engineer will determine the acceptability of the proposed Manufacturer and equipment.

C. Furnish manufactures standard quality assurance program to the authority for approval.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the requirements set forth in the General Requirements, and with the additional requirements as specified for each.
- B. Certificates: Fourteen days prior to shipment, submit four copies of certification that equipment to be delivered is in compliance with applicable codes as follows:

AGMA	American Gear Manufactures Association
AISC	American Institute of Steel Construction
AREA	American Railway Engineering Association (Allowable Material Stress Value for Steel Structures)
ASTM	American Society for Testing and Materials (Material Specifications - ASTM A-36)
AWS	American Welding Society
NEC	National Electric Code
NEMA	National Electrical Manufactures Association

- C. Shop Drawings: In accordance with the General Requirements, submit six (6) copies of complete shop drawings to the Authority for approval, including but not limited to:
 - 1. Equipment arrangement.
 - 2. Equipment outline dimensions.
 - 3. Assembly and subassemblies
 - 4. Wiring diagrams and schematics.
 - 5. Installation Instructions.
- D. Operations and Maintenance Manual: Submit in accordance with the requirements of the General Requirements.
- E. Operations and Maintenance Training: Submit in accordance with the requirements of the General Requirements.
- F. Contract Record Drawings: Submit in accordance with the General Requirements.

1.04 TRAINING:

- A. Contractor is responsible for training as outlined in Section 01820, Demonstration and Training and Section 11001, Equipment General Requirements.
- B. Number of Personnel To Be Trained And Class Size.

Level Of Training	Approximate Number of Individuals	Maximum Class Size	Minimum Number of Classes
Level I	40	8	6
Level II	8	4	2
Level III	8	4	2

- C. Levels of Training:
1. Level I: Familiarizing Training
 2. Level II: Training for P&E Personnel
 3. Level III: Programming Training

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Ship equipment upon notification by the Engineer.
- B. Package, handle and store to prevent damage.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. Equipment: As follows:
 1. Truck Repair Hoists
 2. Motor Starter Panels
 3. Master Control Stations
 - a. In-floor Mounted Control Housings
- B. Equipment to include all controls, enclosures, wiring, motors, and structural members, and all items related to the truck repair hoists and in-floor mounted control housings.
- C. Automatic lubrication system to assure proper lubrication of the jack nuts and hoisting screws. Lubrication fittings shall be provided to service all other moving parts which are not sealed lubricated assemblies.
- D. All in-floor hoist equipment to be covered by checkered steel deck plate, permitting uninterrupted travel over the floor when equipment is in the down position.
- E. Piping and Tubing: Materials, sizes and fittings suited to the pressure and use for which they are intended.
- F. Equipment-Mounted Conduit: UL-listed.
- G. Equipment Wiring and Cable: UL-listed.
- H. Master Control Stations: Push button stations designed to permit single-station operation. Provide stations with all apparatus and controls. Housings for in-floor mounted Control Stations shall be provided by the manufacturer.

- I. Motors: Manufacturer's standard, conforming to NEMA MGI, suitable for the intended purpose, and with electrical characteristics compatible with the building's electrical system.
- J. Finish: Equipment Manufacturers standard - safety yellow..
- K. Fasteners: Standard with the manufacturer.
- L. Non-Shrink Grout: EMBECO or equal.
- M. Special Tools:
 - 1. Furnish one set of all special tools required for inspection, adjustment, maintenance and repair. Special tools are defined as those developed to perform a task unique to the equipment furnished and which are not available from commercial sources.
- N. Wiring:
 - 1. Internal factory wiring of equipment: Manufacturer's standard.

2.02 DESIGN REQUIREMENTS:

- A. General: Manufacturer shall design and fabricate the equipment and controls to conform to these specifications and the dimensions and clearances indicated on the contract drawings. Manufacturer shall verify with the Engineer, the exact working dimensions, weights, and clearances of the transit car truck and related items for which this hoist will be designed to service. All equipment shall be designed for a 4'-8-1/2" track gauge.
- B. Equipment Capacities & Features
 - 1. Each truck repair hoist shall be capable of supporting a transit vehicle truck with a safety factor of not less than 5:1 based on the ultimate strength of the materials for mechanical components. Structural components allowable stresses and loadings shall be based on those specified in the AISC (ASD)9th edition with the appropriate dynamic load factors applied.
 - 2. Truck repair hoists, designed to support, lift and lower the weight of a complete transit car truck. Each hoist load-rated at 12 tons.
 - 3. Checkered steel plate decks with deck support beams designed and positioned to support 300 lbs. per square foot uniform load and 4,000 lbs. concentration load at any point. All in-floor hoist equipment openings shall be closed by steel plate decks when hoist equipment is in a full down position permitting uninterrupted travel over the floor.
 - 4. Parts and components must be interchangeable with existing truck repair hoists at Brentwood, Alexandria, Shady Grove, West Falls Church, Branch Avenue and New Carrollton Shops.
- C. Equipment Travel:
 - 1. Truck Repair Hoists: Five feet total.
- D. Operating Speed:
 - 1. Lifting and lowering speeds of hoists: 4.5 feet per minute.
- E. Safety Features:
 - 1. Visual and audible indications that a hoist is in operation.
 - 2. Each hoist assembly shall have an operating upper and lower limit switch which

limits travel of the upper hoist frame. There shall also be an upper over travel limit switch and a redundant lower travel limit switch. A runoff area shall be provided at the lower end of nut travel to disengage the lifting nut from the upper frame assembly upon over travel past the limit switches. All limit switches shall be actuated directly by the jack screw nuts.

3. Each hoist shall be equipped with automatic wheel stops to preclude truck movement at any time the hoist is not at floor level.
4. Each hoist shall be equipped with spring-set magnetic motor brake and self locking jack screws and nuts, so that the hoist may be stopped at any position between full-up and full-down and shall be in a locked attitude. Power must be applied to either raise or lower the hoists.
5. Steel plate closures shall be provided to close all floor openings not protected by equipment covers.

F. Equipment Design and Construction:

1. Truck Repair Hoists Base:
 - a. The frame base is the main structural weldment which supports all other structural members and drive machinery. It shall be anchored to the foundation floor by anchor bolts embedded in the pit floor. The frame shall be fabricated from structural steel shapes and plates.
 - b. Leveling screws shall be mounted on the frame base capable of supporting the entire truck repair hoist against the foundation floor. The screw shall be designed to provide ease and accuracy in leveling the truck repair hoist during installation.
 - c. The motor mounting base plate and hoist gear case mounting base plates shall be attached to the frame base by welding. The base plates shall be machined (milled) to true flatness one to another, to provide positive motor/gear case alignment and total bearing surface between the drive machinery and base plates.
 - d. Two (2) structural jack screw columns shall be mounted on each frame base and attached to the base by bolted connections. The columns are to provide structural stability for the upper frame assembly which in turn supports the truck repair hoist rails. Each column shall have two (2) vertical machined surfaces to provide long wearing, accurate guidance of the upper hoist frame.
 - e. Hoist Motor. The hoist shall be driven by a squirrel cage motor with a brake. The motor shall be totally enclosed-non vented heavy duty and equipped with shielded sealed bearings. Motor shall be NEMA "D" design, Class "H" insulation not to exceed Class "B" temperature rise for 15 minute rating. The Motor Reducer shall have a double extension shaft to couple each end to the bevel gear cases. The motor shall be mounted to the frame base with the armature shaft perpendicular to the shop service rails.
 - f. Couplings. The motor reducer shall be coupled at each end to the bevel gear cases by solid couplings.
 - g. Gear Cases/Lifting Screws. The zero bevel gear case input shaft shall be coupled to the motor reducer. The input shaft shall be from alloy steel on which is an integrally machined and ground steel pinion. The pinion shall mesh and drive a high tensile zero bevel gear. The bevel gear shall be keyed to the lifting screw at the screw's base. The lifting screw shall be a buttress thread design and be self locking (load or no load). It shall be machined from heat treated alloy steel. The buttress screw shall have a pitch diameter of 3 ½ inches with an inside diameter of 3 inches and an outside diameter of 4 inches. The lifting screw which extends from the gear case vertically shall

rest and rotate on a spherical thrust roller bearing and be guided by an antifriction roller bearing at the bottom of the screw. The gear case shall be splash lubricated using 80/90 gear lube with the gear case housing fabricated from steel. The gearing used shall be rated for the horsepower of the hoist motor.

- h. Hoist Nuts. The hoist nuts shall be machined from nonferrous material. They shall be compatible and travel (raise/lower) on the rotating buttress threads of the lifting screws. The nuts shall bear against and be locked from rotation by pins in the upper hoist frame nut adapter plates. The adapter plates shall be attached by four (4) bolts to the upper hoist frame. The nut shall be designed to provide minimum wear when subjected to maximum stress conditions.

2. Upper Hoist Frame.

- a. The upper hoist frame shall be the structural member to raise and lower transit car truck, guided by the columns of the base frame. The frame structure also provides the bridge section and rail system to carry the crossing load of a truck or raise/lower/support a truck.
- b. The upper hoist frame shall be a weldment, fabricated from structural steel rectangular tubes (ASTM A500B); plates, channels, bar stock, and wide flange beams (ASTM A-36).
- c. The upper frame assembly shall be designed to provide a clear unobstructed area between the hoist rails when the hoist is fully raised. Each truck repair hoist rail shall be supported by a wide flange beam on a yoke type structure consisting of two rectangular steel tubes acting as columns, per side, supported by a common structure which remains below floor level when the hoist is fully raised. The structure shall bear against the hoist nuts and be supported by the two (2) lifting screws.
- d. The truck repair hoist rails shall be hardened to avoid damage due to end batter, and manufactured from an AISI 1045 steel bar with a minimum tensile strength of 90,000 P.S.I., and a Brinell Hardness of 190.
- e. Automatic wheel stops shall be actuated when the truck repair hoist is raised greater than two inches from the full down position. The wheel stops shall be a mechanical design, not requiring an electrical interface. The stops shall be held positively clear of the flange way and railhead when the hoist is in the lowered position. Two (2) automatic stops shall be installed on the hoist at the ends of the running rails. Also two (2) manual wheel stops shall be provided per hoist.
- f. Fully loaded, the hoist shall not deflect more than 1/4 inch measured at the top of the running rail with 1.2 kips applied horizontally in any direction at the rail.

3. Guide System:

- a. The truck repair hoist shall be provided with a positive roller guide system. The system shall provide guidance and stability to the upper hoist frame during raising/lowering/static modes. The system shall be designed to transfer all eccentric or side loading, imposed on the upper hoist frame, into the frame base, leaving the lifting screws subjected to compressive loads only.
- b. Guide Roller System. McGill Camrol bearing shall be mounted to the upper hoist frame and operate with running clearance against the machined surface on the columns, of the frame base. Eight (8) bearings shall be used in the design to transfer lateral loads which are perpendicular to the service track. The bearings shall be properly spaced with four bearings opposing on

- each side of the upper hoist frame.
4. Maintainability:
 - a. Hoist Motor Reducer. The Motor Reducer shall be removable by disconnection of the mounting bolts and couplings, without disturbance to other components.
 - b. Jack Screw Column Assemblies. Gear case, lifting screw and column shall be removable from the pit by removing the center pit cover, upper frame, disconnecting motor reducer coupling and removal of gear case mounting bolts. External lifting devices shall only be required for lifting pit cover and jack screw column assemblies from pit.
 - c. Guide Rollers. Guide rollers shall be accessible and replaceable by use of small hand tools only. No major disassembly shall be required.
 5. Lifting Nut and Wear Detection System:
 - a. Lifting nuts shall have the capability of being removed for replacement or inspection without the necessity of removing the jack screw or performing major disassembly of the unit.
 - b. Removal/replacement of lifting nut shall be accomplished by blocking upper hoist frame at any elevation. Remove four mounting bolts supporting nut adapter plate and two (2) upper bearing capsule bolts. Rotate nut off end of screw. Work shall be accomplished with small hand tools and blocking. External lifting devices will not be required.
 6. Nut Wear Detection System:
 - a. The nut wear detection system shall provide for positive identification of excessive wear on the hoist nuts and the ultimate shut down of the equipment if periodic inspections are not conducted.
 - b. In connection with the above, and additional nut or follower nut is accommodated beneath the main hoist nut. It shall serve a dual purpose, as a load support in the event of hoist nut failure and as a partial support for the sensor arrangement.
 - c. Nut wear is detected by an inductive sensor at each hoist nut on the truck repair hoist.
 - d. Nut wear proximity sensors automatically stop hoisting motion when any nut on a truck repair hoist requires replacement due to wear. The controls shall allow the lowering motion of hoist to remove a truck at floor level. Once the lower limit switch on the hoist is activated, all motion is locked out. As a precaution, an additional "redundant" switch is provided and activates if the regular lower limit switch should fail.
- G. Electrical Characteristics:
1. All equipment for operation shall be 460-volt, three-phase, three-wire system and ground. Provide local transformation for 120-volt, single-phase control circuits.
 2. Motors shall be totally enclosed, heavy duty type, equipped with sealed ball bearings and overload protection. Overload protection shall be provided to operate within their rating under all design load conditions. Motors shall be capable of operating at 115% service factor.
 3. Method Of Wiring: Wiring shall be in conduit continuously grounded by means of couplings, boxes and fittings. Only new materials shall be used bearing the Underwriters Laboratories (UL) label.
 4. Motor Starters shall be provided with overload elements of the bimetal thermal type on each phase. Each motor shall have an emergency stop station wired in the control circuit and installed at the motor location. Station shall be connected so that it is impossible to operate the motor when the station is in the "Off" position.

Station will contain maintained contact devices and shall be mounted in stainless steel NEMA 4 enclosures. Station covers shall have a provision for padlocking in the "Off" position.

5. Conduit: All exposed conduit shall be rigid steel, heavywall. All buried conduit shall be of PVC construction, embedded in structural concrete, with a minimum cover of 6 inches. Embedded conduits shall be spaced on 6 inch centers. The minimum size conduit for control wires and power wires shall be 3/4 inch diameter.
6. Conductors: The minimum size shall be #12 AWG for power wiring. Minimum size for control wiring shall be #14 AWG. All splices #8 and larger shall be made with a mechanical pressure lug or connector.
7. Master Control Station: In-floor mounted control station shall be designed to permit single station operation and to preserve the intent and appearance of an unobstructed smooth floor when not in use. Floor control units shall be provided complete with all apparatus, controls, stainless steel boxes, cast iron frames with hinged cover.

H. Dimensional Data:

1. Design equipment for a 4-foot 8-1/2-inch track gauge.
2. Maintain working clearances under hoists and supporting members.
3. Furnish equipment to fit within openings and pits, including anchor mechanisms and equipment mounting devices and settings, shown on Contract Drawings.

I. Alignment Tolerances:

1. Maximum variation from horizontal for truck repair hoists: 1/4 inch end to end or center to center of rails.
2. Maximum horizontal deflection of hoists with full load plus 1200 lbs. applied horizontally in any direction at loading point:

J. Automatic Lubrication System:

1. General Description and Operation:
 - a. When used in conjunction with the protective screw covers, it shall shorten the cleanup time and extend the period between major cleanups by minimizing contaminants which adhere to the exposed screws.
 - b. Lubricant shall be distributed from a centrally located reservoir through a system of pipes to control panels mounted on the equipment. A network of tubing and hoses shall feed the lubricant directly to the jack nuts in controlled portions when the equipment is in operation.
 - c. Electrically controlled feeder valves and cycle switches will feed only the nuts while operating.
2. The pump shall be pneumatically operated through a filter-lubricator, connected to shop air. It requires approximately 50 PSI, and regulation of the lubricant supply shall be controlled at this point. Lubricant entering the system from the pump shall pass through an in-line strainer to ensure clean lubricant.
3. High pressure reset indicators in the feeders shall isolate high pressure problems at the nuts, which will shut down the affected area until the problem is corrected. A green indicator light on the Truck Repair Hoist lifting frame shall activate during operation to visually indicate proper operation from shop floor level.
THE SYSTEM IS NOT INTENDED TO APPLY THE INITIAL COAT OF LUBRICANT REQUIRED AFTER A PERIODIC CLEANING. A hand applied coat will still be required. The system shall apply a sufficient quantity of lube to replace that amount lost during normal operation.
4. Each system includes the, following material:
 - a. Grease pump, pneumatically operated, from the reservoir containing SCH-460 lubricant.

- b. Runway valve, prevents pump operation with empty drum.
 - c. Air filter-regulator-lubricator, near pump inlet side.
 - d. Lubricant strainer, in line near pump discharge.
 - e. Lubrication control panel with inlet valve, solenoid grease valve, divider valve, and electrical controls.
 - f. High pressure reset indicators on divider valves.
 - g. One (1) Lot Tubing, hoses and fittings to connect pump to control panel, and in turn to Jack Nut.
 - h. 1 Lot Electrical conduit, fittings, junction boxes and wire connecting control panels and sensors.
5. Exclusion of Foreign Material: The hoist system shall be designed to assure that foreign material cannot enter the hoist mechanism to jam any jack component or drive motor/power transmission component.

2.03 PAINTING:

- A. Painting: All equipment, apparatus, piping, enclosures, structural framing and supports, conduits and related items to the equipment shall receive a shop prime coat and two finish coats of equipment enamel paint. All surfaces shall be clean of rust, scale, dirt, grease, and oil before painting.
- B. Each coat shall be a minimum of 2 mils dry film thickness.

2.04 FABRICATION:

- A. Fabricate in accordance with approved shop drawings.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. All shop track shall be installed by the contractor after equipment installation.
- B. Install equipment in accordance with approved shop drawings, to the proper lines and levels, plumb and without conflicts with other work.
- C. Use non-shrink grout to level equipment and to seal voids at perimeters of bases.
- D. Ensure that all equipment is ready for checkout and startup by the manufacture.
- F. Touch-up damaged areas of factory-finished surfaces, using the same paint materials.

3.02 TESTING:

- A. Notify the engineer five days prior final testing.
- B. The authority will furnish a transit car truck to be used in testing the equipment.
- C. The contractor shall furnish all test equipment and personnel to perform tests. The authority will furnish the electrical power.
- D. Test each truck repair hoist through five cycles of operation. Perform final testing with a truck on the hoist only after satisfactory operation of all hoisting and related components is attained.

END OF SECTION

THIS PAGE NOT USED

SECTION 15050

BASIC MECHANICAL MATERIALS AND METHODS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This section specifies providing the following:
 - 1. Piping materials and installation instructions common to most piping systems.
 - 2. Transition fittings.
 - 3. Dielectric fittings.
 - 4. Mechanical sleeve seals.
 - 5. Sleeves.
 - 6. Escutcheons.
 - 7. Grout.
 - 8. Mechanical demolition.
 - 9. Equipment installation requirements common to equipment sections.
 - 10. Painting and finishing.
 - 11. Concrete bases.
 - 12. Supports and anchorages.

1.02 DEFINITIONS

- A. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe and duct shafts, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.
- B. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.
- C. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.
- D. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in duct shafts.
- E. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.
- F. The following are industry abbreviations for plastic materials:
 - 1. ABS: Acrylonitrile-butadiene-styrene plastic.
 - 2. CPVC: Chlorinated polyvinyl chloride plastic.
 - 3. PE: Polyethylene plastic.
 - 4. PVC: Polyvinyl chloride plastic.
- G. The following are industry abbreviations for rubber materials:
 - 1. EPDM: Ethylene-propylene-diene terpolymer rubber.
 - 2. NBR: Acrylonitrile-butadiene rubber.

1.03 QUALITY ASSURANCE

- A. Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code--Steel."
- B. Steel Pipe Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."
 - 1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
- 2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.
- C. Electrical Characteristics for Mechanical Equipment: Equipment of higher electrical characteristics may be furnished provided such proposed equipment is approved in writing

and connecting electrical services, circuit breakers, and conduit sizes are appropriately modified. If minimum energy ratings or efficiencies are specified, equipment shall comply with requirement

1.04 SUBMITTALS

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: For the following:
 - a. Transition fittings.
 - b. Dielectric fittings.
 - c. Mechanical sleeve seals.
 - d. Escutcheons.
 - 2. Welding certificates.

1.05 COORDINATION

- A. Arrange for pipe spaces, chases, slots, and openings in building structure during progress of construction, to allow for mechanical installations.
- B. Coordinate installation of required supporting devices and set sleeves in poured-in-place concrete and other structural components as they are constructed.
- C. Coordinate requirements for access panels and doors for mechanical items requiring access that are concealed behind finished surfaces. Access panels and doors are specified in Section 08305.

PART 2 - PRODUCTS

2.01 PIPE, TUBE, AND FITTINGS

- A. Refer to Section 15205 - "Piping Systems" for pipe, tube, and fitting materials and joining methods.
- B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

2.02 JOINING MATERIALS

- A. Refer to individual Division 15 piping Sections for special joining materials not listed below.
- B. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.
 - 1. ASME B16.21, nonmetallic, flat, asbestos-free.
 - 2. AWWA C110, rubber, flat face, 1/8 inch thick.
- C. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.
- D. Plastic, Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer.
- E. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.
- F. Brazing Filler Metals: AWS A5.8, BCuP Series, copper-phosphorus alloys for general-duty brazing, unless otherwise indicated; and AWS A5.8, BAg1, silver alloy for refrigerant piping.
- G. Welding Filler Metals: Comply with AWS D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.
- H. Solvent Cements for Joining Plastic Piping:
 - 1. ABS Piping: ASTM D 2235.
 - 2. CPVC Piping: ASTM F 493.
 - 3. PVC Piping: ASTM D 2564. Include primer according to ASTM F 656.

4. PVC to ABS Piping Transition: ASTM D 3138.

I. Fiberglass Pipe Adhesive: As furnished or recommended by pipe manufacturer.

2.03 TRANSITION FITTINGS

- A. AWWA Transition Couplings: Same size as, and with pressure rating at least equal to and with ends compatible with, piping to be joined.
- B. Plastic-to-Metal Transition Fittings: CVC and PVC one-piece fitting with manufacturer's Schedule 80 equivalent dimensions; one end with threaded brass insert, and one solvent-cement-joint end.
- C. Plastic-to-Metal Transition Adaptors: One-piece fitting with manufacturer's SDR 11 equivalent dimensions; one end with threaded brass insert, and one solvent-cement-joint end.
- D. Plastic-to-Metal Transition Unions: MSS SP-107, CPVC and PVC four-part union. Include brass end, solvent-cement-joint end, rubber O-ring, and union nut.
- E. Flexible Transition Couplings for Underground Nonpressure Drainage Piping: ASTM C 1173 with elastomeric sleeve, ends same size as piping to be joined, and corrosion-resistant metal band on each end.

2.04 DIELECTRIC FITTINGS

- A. Description: Combination fitting of copper alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.
- B. Insulating Material: Suitable for system fluid, pressure, and temperature.
- C. Dielectric Unions: Factory-fabricated, union assembly, for 250-psig minimum working pressure at 180 deg F.
- D. Dielectric Flanges: Factory-fabricated, companion-flange assembly, for 150- or 300-psig minimum working pressure as required to suit system pressures.
- E. Dielectric-Flange Kits: Companion-flange assembly for field assembly. Include flanges, full-face- or ring-type neoprene or phenolic gasket, phenolic or polyethylene bolt sleeves, phenolic washers, and steel backing washers.
- F. Dielectric Couplings: Galvanized-steel coupling with inert and noncorrosive, thermoplastic lining; threaded ends; and 300-psig minimum working pressure at 225 deg F.
- G. Dielectric Nipples: Electroplated steel nipple with inert and noncorrosive, thermoplastic lining; plain, threaded, or grooved ends; and 300-psig minimum working pressure at 225 deg F.

2.05 MECHANICAL SLEEVE SEALS

- A. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.

2.06 SLEEVES

- A. Galvanized-Steel Sheet: 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.
- B. Steel Pipe: ASTM A 53, Type E, Grade B, Schedule 40, galvanized, plain ends.
- C. Cast Iron: Cast or fabricated "wall pipe" equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.
- D. Stack Sleeve Fittings: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing.

- E. Molded PVC: Permanent, with nailing flange for attaching to wooden forms.
- F. PVC Pipe: ASTM D 1785, Schedule 40.
- G. Molded PE: Reusable, PE, tapered-cup shaped, and smooth-outer surface with nailing flange for attaching to wooden forms.

2.07 ESCUTCHEONS

- A. Description: Manufactured wall and ceiling escutcheons and floor plates, with an ID to closely fit around pipe, tube, and insulation of insulated piping and an OD that completely covers opening.

2.08 GROUT

- A. Description: ASTM C 1107, Grade B, nonshrink and nonmetallic, dry hydraulic-cement grout.
 - 1. Characteristics: Post-hardening, volume-adjusting, nonstaining, noncorrosive, nongaseous, and recommended for interior and exterior applications.
 - 2. Design Mix: 5000-psi, 28-day compressive strength.
 - 3. Packaging: Premixed and factory packaged.

PART 3 - EXECUTION

3.01 MECHANICAL DEMOLITION

- A. Refer to Division 1 Section 01730 for general demolition requirements and procedures.
- B. Disconnect, demolish, and remove mechanical systems, equipment, and components indicated to be removed.
 - 1. Ductwork or Piping to Be Removed: Remove portion of ductwork or piping indicated to be removed and cap or plug remaining work with same or compatible piping material.
 - 2. Ductwork or Piping to Be Abandoned in Place: Drain piping. Cap ductwork or piping with same or compatible material.
 - 3. Equipment to Be Removed: Disconnect and cap services and remove equipment.
 - 4. Equipment to Be Removed and Reinstalled: Disconnect and cap services and remove, clean, and store equipment; when appropriate, reinstall, reconnect, and make equipment operational.
 - 5. Equipment to Be Removed and Salvaged: Disconnect and cap services and remove equipment and deliver to Authority.
- C. If pipe, insulation, or equipment to remain is damaged in appearance or is unserviceable, remove damaged or unserviceable portions and replace with new products of equal capacity and quality.

3.02 PIPING SYSTEMS - COMMON REQUIREMENTS

- A. Install piping according to the following requirements and Division 15 Sections specifying piping systems.
- B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems.
- C. Install piping in concealed locations, except in equipment rooms and service areas.
- D. Install exposed piping and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited.
- E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.
- F. Install piping to permit valve servicing.
- G. Install piping free of sags and bends.

- H. Install fittings for changes in direction and branch connections.
- I. Install piping to allow application of insulation.
- J. Select system components with pressure rating equal to or greater than system operating pressure.
- K. Install escutcheons for penetrations of walls, ceilings, and floors.
- L. Sleeves are not required for core-drilled holes.
- M. Permanent sleeves are not required for holes formed by removable PE sleeves.
- N. Install sleeves for pipes passing through concrete and masonry walls, gypsum-board partitions, and concrete floor and roof slabs.
- O. Aboveground, Exterior-Wall Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
- P. Underground, Exterior-Wall Pipe Penetrations: Install cast-iron "wall pipes" for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
- Q. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Refer to Section 07841 for materials.
- R. Verify final equipment locations for roughing-in.
- S. Refer to the General Requirements and equipment specifications in other Division 15 Sections for roughing-in requirements.

3.03 PIPING JOINT CONSTRUCTION

- A. Join pipe and fittings according to the following requirements and Division 15 Sections specifying piping systems.
- B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.
- C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.
- D. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.
- E. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8.
- F. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID.
- G. Welded Joints: Construct joints according to AWS D10.12, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.
- H. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.
- I. Plastic Piping Solvent-Cement Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:
 1. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.

2. ABS Piping: Join according to ASTM D 2235 and ASTM D 2661 Appendixes.
 3. CPVC Piping: Join according to ASTM D 2846/D 2846M Appendix.
 4. PVC Pressure Piping: Join schedule number ASTM D 1785, PVC pipe and PVC socket fittings according to ASTM D 2672. Join other-than-schedule-number PVC pipe and socket fittings according to ASTM D 2855.
 5. PVC Nonpressure Piping: Join according to ASTM D 2855.
 6. PVC to ABS Nonpressure Transition Fittings: Join according to ASTM D 3138 Appendix.
- J. Plastic Pressure Piping Gasketed Joints: Join according to ASTM D 3139.
- K. Plastic Nonpressure Piping Gasketed Joints: Join according to ASTM D 3212.
- L. PE Piping Heat-Fusion Joints: Clean and dry joining surfaces by wiping with clean cloth or paper towels. Join according to ASTM D 2657.
1. Plain-End Pipe and Fittings: Use butt fusion.
 2. Plain-End Pipe and Socket Fittings: Use socket fusion.
- M. Fiberglass Bonded Joints: Prepare pipe ends and fittings, apply adhesive, and join according to pipe manufacturer's written instructions.

3.04 PIPING CONNECTIONS

- A. Make connections according to the following:
1. Install unions, in piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment.
 2. Install flanges, in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.
 3. Dry Piping Systems: Install dielectric unions and flanges to connect piping materials of dissimilar metals.
 4. Wet Piping Systems: Install dielectric coupling and nipple fittings to connect piping materials of dissimilar metals.

3.05 EQUIPMENT INSTALLATION - COMMON REQUIREMENTS

- A. Install equipment to allow maximum possible headroom.
- B. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces.
- C. Install mechanical equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.
- D. Install equipment to allow right of way for piping installed at required slope.

3.06 PAINTING

- A. Damage and Touchup: Repair marred and damaged factory-painted finishes with materials and procedures to match original factory finish.

3.07 CONCRETE BASES

- A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.
- B. Concrete Bases: Anchor equipment to concrete base according to equipment manufacturer's written instructions and according to codes at Project.

3.08 ERECTION OF METAL SUPPORTS AND ANCHORAGES

- A. Refer to Section 05120 for structural steel.
- B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor mechanical materials and equipment.

- C. Field Welding: Comply with AWS D1.1.

3.09 ERECTION OF WOOD SUPPORTS AND ANCHORAGES

- A. Cut, fit, and place wood grounds, nailers, blocking, and anchorages to support, and anchor mechanical materials and equipment.
- B. Select fastener sizes that will not penetrate members if opposite side will be exposed to view or will receive finish materials. Tighten connections between members. Install fasteners without splitting wood members.
- C. Attach to substrates as required to support applied loads.

3.10 GROUTING

- A. Mix and install grout for mechanical equipment base bearing surfaces, pump and other equipment base plates, and anchors.
- B. Clean surfaces that will come into contact with grout.
- C. Provide forms as required for placement of grout.
- D. Avoid air entrapment during placement of grout.
- E. Place grout, completely filling equipment bases.
- F. Place grout on concrete bases and provide smooth bearing surface for equipment.
- G. Place grout around anchors.
- H. Cure placed grout.

END OF SECTION

THIS PAGE NOT USED

SECTION 15070
VIBRATION ISOLATION

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing vibration isolation for mechanical equipment and piping.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
1. Comply with codes and regulations of the jurisdictional authorities
 2. ASTM: A123.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
1. Product Data: Include manufacturer's technical data for each model indicated, including rated capacities and load deflection curves.
 2. Shop Drawings: Detail equipment assemblies and indicate dimensions, method of field assembly, components, application and size and type of anchor plates for each field connection.
 3. Certification: Welding certificates.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
1. Vibration isolators selected to produce uniform loading and deflection even when equipment weight is not evenly distributed; steel components hot-dip galvanized after fabrication in accordance with ASTM A123.
 - a. Types of vibration isolators:
 - b. For equipment and piping:
 - 1) Floor-mounted: Spring isolators.
 - 2) Suspended: Suspension-type isolators with springs and neoprene combination.
 2. Spring isolators for floor-mounted equipment:
 - a. Free-standing, laterally stable without housing, complete with minimum 1/4-inch thick neoprene, acoustical friction pad in series with spring element.
 - b. Leveling bolts and adequate facilities for bolting to equipment and supporting structure using isolation washers.
 - c. Coil outside diameter: Not less than 0.8 of operating height of spring.
 - d. Horizontal stiffness: Not less than 0.8 of vertical stiffness.
 - e. Springs designed to have additional 50-percent capacity beyond rated load.
 - f. Springs designed so that ends remain parallel during and after spring deflection to operating height.
 - g. Vibration isolators selected for lowest operating speed of equipment.
 - h. Built-in adjustable limit stops with isolators provided for equipment of operating weight different from installed weights, to prevent rising of equipment when weight is removed and for equipment exposed to wind. Limit stops not to be in contact during normal operating conditions.
 - i. Welding of springs to load-plate assembly for vibration isolators with capacities of 6,000 pounds or less is prohibited.
 - j. Vibration isolators with capacities of 6,000 pounds or less are permitted use of cups or other positive means for restraining springs.
 3. Suspension-type isolation hangers for ceiling-suspended equipment:

- a. Combination of spring and neoprene in series.
 - b. Spring made of stable steel.
 - c. Encased in structurally stable steel bracket.
 - d. Spring diameter large enough to permit 15-degree angular misalignment of rod connecting hanger to equipment without rubbing on box
 - e. Designed to provide complete support for suspended units upon failure or rupture of isolator.
4. Inertia bases:
- a. Furnished by vibration-isolator manufacturer.
 - b. Complete with steel-reinforced concrete cast into welded structural-steel channel frame, mounting templates and brackets for vibration isolators with thickness equal to eight-percent minimum of longest base dimension.
 - c. Structural-steel work: Section 05500.
5. Concrete equipment subbases (housekeeping pads)
- a. Concrete: Sections 03100, 03200 and 03300.
 - b. Concrete subbases not less than six inches high provided for floor-mounted equipment. Subbases resting on structural floor and reinforced with steel rods interconnected with reinforcing bars of floor by means of tie bars hooked at both ends.
 - c. Clearance between subbases and inertia bases: Two inches minimum.
 - d. Subbase concrete: Class 2500, Finish No. 4.
6. Snubbers:
- a. As recommended by manufacturer of vibration isolator.
 - b. Compatible with vibration isolators provided.
- B. Isolation-Unit Types and Deflection:
1. Fans, ventilating units, evaporation units and air-conditioning units: Floor-mounted and ceiling-suspended.
- a. Spring isolators designed for a minimum of 1.5 inches deflection.
 - b. Snubbers: Where shown.
2. Pumps:
- a. Base-mounted pumps on inertia bases.
 - b. Inertia bases shaped to include base elbow supports for connected piping and at least 1-1/2 times weight of supported equipment or a minimum base thickness of eight percent of longest base dimension, whichever results in greater weight.
 - c. Springs with minimum deflection of 1.5 inches under imposed static load.
3. Chillers:
- a. Vertically restrained spring isolators designed for 1.5 inches minimum deflection. Inertia bases if recommended by chiller manufacturer.
4. Self-contained air-conditioning units:
- a. Spring-isolators designed for a minimum of one-inch deflection except through-wall units.
5. Remote air-cooled condenser or condensing units:
- a. Isolators: As specified for self-contained units.
6. Cooling towers:
- a. Steel beams mounted on vertically restrained spring isolators designed for 1.5 inches minimum deflection.
 - b. Rails: Acceptable, if performance requirements for spring isolators specified for cooling towers are met.
 - c. Height of steel beams designed to support loads and eight-percent minimum of longest span between isolators.
7. Air compressors:
- a. Temperature-control compressors: Spring isolators designed for 1.5 inches minimum deflection.
8. Piping:
- a. Ceiling-suspended piping: Combination spring and neoprene in shear element hangers as specified for ceiling-suspended equipment. Springs designed for 1.5-inch minimum deflection. First two isolation hangers of each pipe connected to equipment to have deflection equal to equipment isolation-support deflection.
 - b. Floor-mounted piping isolated by spring isolators with one-inch minimum static deflection. First two spring isolators of each pipe connected to

- equipment to have deflection equal to equipment isolation-support deflection.
9. Grout: Section 03300, premixed shrinkage-compensating grout.
 10. Isolation Curb: Rigid upper and lower steel structure with vibration isolation springs having two (2) inch deflection and vertical and horizontal restraints; with elastomeric waterproof membrane.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install vibration isolators where shown as recommended by the equipment manufacturer.
- B. Mount mechanical equipment on vibration isolators to isolate equipment from structure.
- C. Jack bases and equipment into position and wedge or block before vibration isolators are loaded.
- D. Use isolator leveling bolts for final leveling of equipment after equipment is in operation.
- E. Install springs so that ends remain parallel during and after deflection to operating height.
- F. Mount snubbers as close to vibration isolators as practicable.
- G. Grout void between pump bases and inertia-base concrete.
- H. Isolate piping connected to equipment isolated from structures as follows:
 1. Condenser-water piping in its entirety.
 2. Heating hot water and chilled-water piping: Piping connected to equipment, mounted on vibration isolators or suspended with vibration hangers, isolated for a distance of 50 feet from equipment. Piping with installed length less than 50 feet isolated in its entirety only when connected to equipment provided with vibration isolators.
 3. Compressed-air piping: Connected to compressors for a distance of 50 feet from compressor. Piping with installed length less than 50 feet isolated in its entirety.
 4. Gas Piping: Connected to burners for distance of 50 feet from equipment. Piping with installed length less than 50 feet isolated in its entirety.

END OF SECTION

THIS PAGE NOT USED

SECTION 15075

IDENTIFICATION OF MECHANICAL EQUIPMENT AND PIPING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing nameplates and tags on mechanical equipment and apparatus.
- B. Related Work Specified Elsewhere:
 - 1. Field painting: Section 09920.

1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Samples:
 - a. Labels and tags in each size.
 - 2. Documentation:
 - a. Charts for valves; include valve identification number, location and purpose.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. Nameplates: Laminated plastic.
- B. Tags: 18-gauge stainless steel.
- C. Identification Plates: Bronze, Authority-furnished.

PART 3 - EXECUTION

3.01 IDENTIFICATION:

- A. Equipment and Apparatus:
 - 1. Label equipment and apparatus with one-inch high white letters engraved on 1-1/2 inch high, black, laminated-plastic nameplates securely fastened to metal panels, showing function and unit number of item.
 - 2. Identify devices including transducers, controls and switches by means of 1/2-inch high white letters engraved on one-inch high, black, laminated plastic nameplates identifying manufacturer and function of equipment.
 - a. Provide same type nameplates on front cover for each pilot light and for mode-of-operation selector switches. Label positions of mode-selector switches AUTOMATIC/OFF/EMERGENCY.
 - 3. Nameplates for components located in fan-control cabinets to show symbol used on schematic diagram to represent component. Label fan-control cabinet terminals using same symbols and identification corresponding to that shown on schematic diagram.

- B. Piping:
 - 1. Stencil legends and bands on piping showing service and direction of flow as specified in Section 09920.
 - 2. Color coding of exposed piping and terminatings of piping is specified in Section 09920.
- C. Valves:
 - 1. Identify valves with 1-1/2 inch diameter, 18-gauge stainless-steel tags.
 - 2. Designate appropriate service on each tag with 1/4-inch stamped black-filled letters and valve number with 1/2-inch stamped black-filled numbers.
- D. Orifice Flange and Venturi Tube:
 - 1. Identify each orifice or venturi tube with integral tab or stainless-steel tag.
 - 2. Stamp on tag differential multiplier, orifice bore, rate of flow and equipment served.

3.02 INSTALLATION:

- A. Cement nameplates with permanent adhesive on equipment and apparatus.
- B. Affix labels to surface of control and switch boxes by means of sheet-metal rivets. Cement labels to surface with permanent adhesive when rivets cannot be used.
- C. Fasten tags securely to valves, orifice flange, venturi tube with brass jack chain, so as to permit easy reading.
- D. Mount valve charts in aluminum frames with clear Lucite front cover in locations as directed.
- E. Fire-Protection and Suppression System:
 - 1. Stencil legends on piping as shown to identify service and direction of flow.

END OF SECTION

SECTION 15080

INSULATION

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing insulation for ductwork, piping and equipment.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. NFPA: 90A.
 - 3. ASTM: C240, C534, C552, C1071, E84.
 - 4. FS: HH-I-558.
 - 5. MS: MIL-A-3316, MIL-B-19564, MIL-C-19565, MIL-C-20079.
 - 6. SMACNA: HVAC Duct Construction Standards – Metal and Flexible
- B. Each item listed in UL Building Materials Directory.
- C. Fire-Hazard Ratings:
 - 1. Determine fire-hazard ratings in accordance with ASTM E84.
 - a. Insulation, fastener, and jacketing materials, except flexible cellular plastic for expansion joints: Not exceeding 25 for flame spread, 50 for fuel contributed and 50 for smoke developed.
 - b. Use of flameproofing and fireproofing treatments for the purpose of achieving specified fire-hazard ratings for insulation not meeting specified requirements is prohibited.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: Include manufacturer's technical data for each type indicated, including materials and thermal characteristics.
 - 2. Shop Drawings: Show details of the following:
 - a. Application of protective shields, saddles, and inserts at hangers for each type of insulation and hanger.
 - b. Attachment and covering of heat tracing inside insulation.
 - c. Insulation application at pipe expansion joints for each type of insulation.
 - d. Insulation application at elbows, fittings, flanges, valves, and specialties for each type of insulation.
 - e. Removable insulation at piping specialties, equipment connections, and access panels.
 - f. Application of field-applied jackets.
 - g. Application at linkages of control devices.
 - h. Field application for ductwork and each equipment type.

B. PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Label each item with manufacturer's name and brand designation, referenced specification number, type, class and thermal and acoustical rating as applicable.
- B. Ship each type of insulation and accessory materials securely packaged and labeled for safe handling in shipment and to avoid damage.
- C. Store materials in secure and dry storage facility.

PART 2- PRODUCTS

2.01 PRODUCTS AND MATERIALS:

A. External Ductwork Insulation with Vapor-Barrier Facing:

- 1. Insulation:
 - a. Rigid board for exposed ductwork:
 - 1) Thickness: One inch.
 - 2) Density: Three pounds per cubic foot.
 - 3) Vapor-barrier facing: As specified, factory-applied.
 - 4) FS HH-I-558, Form A, Class 2.
 - b. Flexible duct wrap for concealed ductwork:
 - 1) Thickness: Two inches.
 - 2) Density: 1.5 pounds per cubic foot.
 - 3) Vapor-barrier facing: As specified, factory-applied.
 - 4) FS HH-I-558, Form B, Type I, Class 6.
- 2. Vapor-barrier facing: foil-reinforced kraft paper.

B. Internal Ductwork Insulation:

- 1. Optional materials:
 - a. Flexible insulation:
 - 1) Thickness: One inch.
 - 2) Density: Three pounds per cubic foot.
 - 3) Smooth coating on inside.
 - 4) ASTM C1071 and NFPA 90A.
 - b. Fibrous-glass insulation:
 - 1) Thickness: One inch.
 - 2) Density: Three pounds per cubic foot.
 - 3) Perforated, galvanized-sheet metal inner lining, lining as specified.
- 2. Minimum normal incidence sound absorption coefficients based on insulation thickness of one inch:
 - a. Cycles per
second 125 250 500 1000 2000 4000
 - b. Coefficient 0.11 0.22 0.60 0.85 0.82 0.91
- 3. Maximum increase in friction loss of air due to duct insulation: 15 percent at 2,000 feet per minute velocity.

C. Piping Insulation:

- 1. General:
 - a. Vapor-permeance resistance:
 - 1) Maximum vapor permeance: 0.5 percent by volume.
 - 2) Vapor-permeance ratings for piping insulation determined in accordance with ASTM C240.
- 2. Insulation for pump discharge lines, force sewer mains and hot/cold potable-water

pipng:

- a. Pipe, valves, flanges and fittings: Rigid premolded cellular glass: Covered with aluminum jacket 0.016 inch thick; ASTM C552. Insulation to consist of one layer, one-inch thick.
 - b. Rigid premolded insulation sleeving: Thermal-pipe and tube covering, mineral fiber, industrial- type covered with aluminum jacket 0.016-inch thick; ASTM C 552, All-service jacket.
 - c. Insulation not required on embedded or buried pipe.
 - 3. Refrigerant-piping insulation:
 - a. As specified for hot/cold potable-water piping.
 - 4. Heating hot water, chilled water, and exterior cooling water piping:
 - a. As specified for hot/cold potable-water piping.
- D. Sheet Metal Duct Lining: Galvanized sheet metal, 22 gauge, perforated with 3/32-inch holes on 3/16-inch centers, with 22-percent open area.
- E. Fabric Pipe Jacket: Prefabricated laminate containing 10-by-10 asphalt-impregnated glass fabric and aluminum foil one-mil thick, sandwiched between three layers of bituminous mastic, for use on embedded or inaccessible piping.
- F. Metal Pipe Jacket:
 - 1. Galvanized sheet steel, 24 gauge (U.S.S.) having Z-type longitudinal joint seam.
 - 2. Aluminum alloy, 0.016-inch thick, mill-finish, having Z-type longitudinal joint seam.
- G. Insulation-Hanger Shields: Aluminum alloy, minimum 0.050-inch thick, mill-finish, covering bottom 180 degrees of pipe insulation, lengths as follows:

Pipe Sizes/Inclusive	Shield Length
1/2 inch to 2 inches	6 inches
2-1/2 inches to 6 inches	9 inches
6 inches to 12 inches	12 inches

PART 3 - EXECUTION

3.01 APPLICATION OF INSULATION:

- A. General:
- 1. Do not apply insulation until all surfaces to be covered are clean, dry and free of foreign materials, such as oil, grease, rust, scale and dirt.
 - 2. Apply only clean and dry insulation.
 - 3. Install insulation in accordance with manufacturer's recommendations as a minimum requirement.
 - 4. Provide complete moisture and vapor seal wherever insulation terminates against metal hangers, anchors and other projections through insulation on cold surfaces.
 - 5. Provide continuous insulation through sleeves and openings except pipe sleeves piercing exterior walls, floors and ceilings below ground level.
 - 6. Stagger joints with respect to adjacent butt joints.
 - 7. Unless otherwise shown, insulate the following:
 - a. Air-conditioning ductwork, supply and return.

- b. Heating ductwork, ventilating ductwork and combined heating and ventilating ductwork, supply and return except ductwork within heated space.
 - c. Outside-air intake ductwork.
 - d. Exhaust-air ductwork between automatic damper on discharge side of fan and louver.
 - 8. The Contractor has the option of applying insulation internally or externally, except for the following required internal applications:
 - a. Where shown.
 - b. Insulated ductwork exposed to weather.
- B. External Ductwork Insulation:
 - 1. Install insulation continuously through openings provided for passage of ductwork and unbroken over seams, angles, hangers and other accessories.
 - 2. Do not use scrap pieces of insulation to make up full-length sections. Eliminate voids by refitting or replacing insulation,
 - 3. Rigid board for exposed ductwork:
 - a. Fasten to duct with mechanical fasteners spaced 12 inches to 18 inches on center, with minimum of two rows on each side of duct.
 - b. Secure with washers firmly embedded in insulation.
 - c. Seal joints, breaks and punctures with fire-resistant vapor-barrier coating reinforced with a three-inch wide vapor-barrier strip.
 - 4. Flexible duct wrap for concealed ductwork:
 - a. Adhere to duct with fire-resistant adhesive in sufficient quantities to prevent sagging.
 - b. Secure insulation tightly to the ducts with Type 316 stainless-steel insulation bands spaced 12 inches maximum center-to-center.
 - c. For duct widths over 30 inches, secure on underside of duct with mechanical fasteners on 18-inch centers.
 - d. Butt insulation, overlap joints with vapor-barrier facing two inches minimum; seal with fire-resistant vapor-barrier adhesive.
 - e. Seal breaks and punctures with vapor-barrier strip and coating.
- C. Internal Ductwork Insulation:
 - 1. Install insulation in accordance with manufacturer's recommendations based on velocity and duct dimensions and SMACNA HVAC Duct Construction Standards --Metal and Flexible.
 - 2. Where insulation has perforated galvanized-sheet-metal inner lining, fill space between liner and outer duct, leaving no void spaces or unlined sections.
 - 3. Do not use scrap pieces of insulation to make up full-length sections. Eliminate voids by retrofitting or replacing insulation.
 - 4. Apply adhesives, where required, in accordance with manufacturer's recommendations.
 - 5. Increase both width and height dimensions of duct by two inches from dimensions shown.
- D. Piping Insulation:
 - 1. Pump discharge lines, force sewer mains and potable-water piping:
 - a. Install insulation on pump discharge lines, force sewer mains, hot and cold potable-water piping, valves, flanges and fittings. Insulation consists of one, one-inch thick layer.
 - b. Asphalt-paper inner jacket not required.
 - 2. Refrigerant-piping insulation:
 - a. Install insulation consisting of one layer, one-inch thick.

3. Embedded or inaccessible-piping insulation:
- a. Install insulation consisting of layers or thickness specified for usage specified.
 - b. Provide inner jacket of prefabricated-fabric pipe jacket.
 - c. Coat exposed surface of fabric pipe jacket with protective plastic film and inner surface with special-release paper.
 - d. Apply jacket of galvanized steel over inner jacket.
 - e. For flanges, valves and other fittings, apply aluminum jacket with paper backing or asphalt adhesive over galvanized-steel jacket. Secure by means of straps as specified.
 - f. Over elbows provide mitered insulation covered with aluminum jacket material.

E. Application of Insulation on Pipe Saddles:

1. Cut two-inch thick piece of premolded pipe insulation of same material as used on piping, slightly larger than void formed by outer pipe circumference and pipe saddle.
2. Press insulation into void by hand pressure, so that both ends project slightly beyond each end of saddle.
3. Cut ends of insulation flush with saddle ends.
4. Use of filler, adhesive or other material to fill voids or imperfections in insulation is prohibited.

F. Expansion Joints for Piping Insulation:

1. Install expansion joints in both horizontal insulation and vertical runs of piping on centers not to exceed 50 feet.
2. Install joints one-half inch wide and fill with cushioning material in accordance with insulation manufacturer's recommendations.

G. Insulation for Anchors:

1. Insulate anchors which are secured directly to cold piping as specified for a minimum distance of eight inches from surface of pipe insulation and sufficient to prevent sweating.

END OF SECTION

SECTION 15120

COMPRESSION TANKS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing compression tanks complete with fittings and appurtenances.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ASME: Boiler and Pressure Vessel Code.
 - 3. International Plumbing Code 2003.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Shop Drawings:
 - a. Complete catalog information and shop drawings including piping diagrams.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. Compression Tank:
 - 1. Compression tank diaphragm type.
 - 2. Black-steel, welded plate with rustproof coating on exterior, capacity as shown.
 - 3. Designed for working pressure of 125-psig minimum; meeting ASME Boiler and Pressure Vessel Code.
 - 4. Diaphragm made of butyl, replaceable.
 - 5. System connection forged steel.
 - 6. Factory precharged to 12 psig.
 - 7. Provided with charging valve and drain plug.
- B. Nameplates:
 - 1. Securely attached plate on each tank showing manufacturer's name, model number and serial number.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install equipment and appurtenances within space provided and locate for easy servicing.
- B. Provide concrete pad, bracket supports, saddles and hangers for tanks.

END OF SECTION

SECTION 15121

COMPRESSED AIR SYSTEM

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing a fully automatic compressed air system, complete, tested, and placed in operation as specified herein. The system shall include compressors, air receiver, air dryer, compressed air piping, and all other appurtenances required for an automatic compressed air system.
- B. Related work specified elsewhere:
 - 1. Vibration Isolation: Section 15070.
 - 2. Piping System: Section 15205.
 - 3. Motors: Section 16225.

1.02 QUALITY ASSURANCE

- A. Experience: Equipment shall be produced by a manufacturer of established reputation with a minimum of five years experience supplying specified equipment.
- B. Manufacturer's Representative: Provide a qualified manufacturer's representative at site to supervise work related to equipment installation and check-out.

1.03 ELECTRICAL EQUIPMENT:

- A. All electrical equipment installed less than 18 inches above the finished floor shall be housed in explosion proof enclosures and installed in accordance with NEC Electrical Code Class 1, Division 2, Requirements.

1.04 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: Include manufacturer's technical data for each model indicated, including rated capacities, electrical characteristics, furnished specialties, and accessories.
 - 2. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 3. Operation and Maintenance Manual: Submit operation and maintenance manuals in accordance with General Requirements - Operation and Maintenance Data, of these Specifications. Provide complete parts, operating, and maintenance manual covering equipment at time of installation including, but not limited to:
 - a. Description of system and components.
 - b. Schematic diagrams.
 - c. Instruction: Manufacturer's printed operating and maintenance literature.
 - d. List of original manufacturer's parts including supplier's part numbers and

cuts, recommended spare parts stocking quantity, and local parts and service source.

4. Certification:
 - a. Manufacturer's certified performance and test data.
 - b. Certified motor data for the compressor motor and the motor manufacturer's complete brochure or bulletin on the motor.
 - c. Manufacturer's certified construction and foundation drawings.

1.05 PRODUCT DELIVERY, STORAGE, AND HANDLING:

2. Deliver equipment in Manufacturer's containers, appropriately packaged and/or crated for protection during domestic shipment and storage in humid, dusty conditions.
3. Indelibly label all containers, including those contained in others, on outside with item description(s) per title and Mark Number of these specifications.
4. Provide equipment and materials specified complete in one shipment for each equipment item. Split or partial shipments are not permissible.

1.06 OPERATION AND MAINTENANCE TRAINING:

- A. Upon completion of installation, in accordance with the General Requirements, furnish on-site services of the manufacturer's engineering representative with specialized experience in the system and its components to instruct Authority personnel in the proper operation and maintenance of each system.

1.07 LABELING:

- A. Securely attach in a prominent location on each major item of equipment a noncorrosive nameplate showing manufacturer's name, address, model number, serial number, and pertinent utility or operating data.

PART 2 - EQUIPMENT

2.01 COMPRESSED AIR SYSTEM

- A. General Description:
 1. Furnish and install as here-in specified, shown or scheduled on the drawings a complete compressed air system. System shall include but not be limited to the following components.
 - a. Air Compressor
 - b. Receiver
 - c. Filters
 - d. Air Dryer
 - e. Automatic Condensate Drain
 - f. Condensate Management System
 - g. Pipes, valves, fittings, gauges pressure reducing valves, etc.
- B. Air Compressor:
 1. Furnish and install a rotary screw air compressor of the capacity, arrangement, size and electrical characteristics as to satisfy the required needs.
 2. Air compressor shall be the rotary screw type, U.L. approved and be furnished with a built-in water-cooled aftercooler or cooler. Unit shall be furnished with an automatic

dual control for operating under full load and idling with time delay for limiting time. Unit shall be factory furnished with an across the line starter and shall be pre-wired for a single point electrical connection. Unit to be completely assembled and factory tested under load.

3. Furnish compressor with ES Series solid state, touch pad, microprocessor based controller includes:
 - a. Full programmability, Full text/digital display, Full electrical system diagnostics, Mode selection: Constant run, Low demand, Auto start/timed stop. Sequence up to 8 units (with identical controllers), stop.
 - b. Emergency stop button, Full Text/digital display: Hourmeter, Discharge air temperature-System pressure, Reservoir temperature, Reservoir pressure, Separator differential pressure Advisory points: Service air filter, Change separator, Change oil filter, Changeoil, Low ambient/high temperature.
 - c. Protective shutdowns: High temperature, Low oil pressure, Fan motor overload, Main motor overload, High pressure, Change separator, Power interruption protection, Electronic modulation control, Thermally controlled air cooled fan motor starting, Motor rotation jog function.
 - d. NEMA 12/IP-65 control/electrical enclosure includes: Rugged 460 volt main motor starters, Control voltage transformer.
4. Airend – Shall be of the rotary helical screw type with asymmetric rotor profile for minimal Internal leakage and maximum compressor efficiency. Rotors to be dynamically balanced and mounted on antifriction-type bearings, cylindrical roller and double row tapered thrust type. Heavy duty bearings, capable of B-10 bearing life in excess of 100,000 hours are to be used. Rotor shafts to be integral part of rotors. Seals are to be mechanical face type, made of high temperature rated carbon and hardened wear rings for maximum seal life.
5. Motor – Shall be NEMA B frame, 1800 RPM, 1.15 SF, squirrel cage, induction type with Class F insulation. Motor to be open, drip proof, 3 phase, 60 Hertz, 460 volt motor windings for reduced current starting.
6. Mounting – Motor to be D-flange mounted to the compressor to insure permanent alignment. Permanent alignment assures maximum coupling/bearing life. Drive motor to be direct, Non-geared, connected to air end by a resilient flexible coupling. Motor and compressor unit is to be mounted to rigid steel base using only all angle, elastomer vibration isolators. Vibration isolators and the permanently aligned D-flange mounting virtually eliminates vibration.
7. Inlet Air Filter– Heavy duty, dry-type inlet filter capable of removing 99% of all airborne particulate 5 micron and larger is to be used.
8. Lubrication – Shall be accomplished by inherent pressure differential and without the use of an external mechanical oil pump. A full flow 10 micron oil filter and oil after cooler assures cooling and filtering of the lubricant prior to reaching the air end. A thermostatic oil mixing valve is required to assure proper oil temperature and prevent moisture contamination due to condensation. Compressor to be filled with a synthetic lubricant rated for 8000 hours at normal operating conditions.
9. Separator System – Shall consist of a separate first stage reservoir utilizing a shotgun and baffle design to separate the oil from the air. The second stage of separation to be a replaceable wrapped separator element which will limit oil carryover to 2 PPM by weight at 100 PSIG full load operation. System to include pressure relief valve and automatic blowdown valve with muffler. Separator housing to be designed so that no piping or lines have to be disconnected to replace element.
10. Piping – The use of flexible hoses, black pipe and plastic control lines will not be acceptable. Lubrication system to include all galvanized steel fittings and steel piping. Control lines to be stainless steel. Adjustable minimum pressure valve and check valve to be installed in air discharge piping.

11. Enclosure (if required) – A sound attenuating enclosure rigidly fabricated of 14 gauge steel shall be provided.
12. Oilcooler/Aftercooler – Water cooled air/oil cooler shall be heavy duty, shell and tube type Cooler, moisture separator and automatic condensate trap are to be piped and mounted within the compressor package. Shipped loose is not acceptable.
- a. Materials:
- 1) Tubes - Copper.
 - 2) Headers - Brass.
 - 3) Shell - Brass.
 - 4) End Hubs - Brass.
 - 5) End Bonnets - Cast Iron.
 - 6) Baffles - Brass,
 - 7) Mounting Brackets - Steel.
 - 8) Gaskets - Nitrile Rubber.
 - 9) Nameplate - Aluminum Foil.

2.02 AIR RECEIVER TANK

- A. Furnish and install a vertical, ASME rated, air receiver of the size and capacity Indicated on the contract drawings.
- B. Tank shall be furnished with all inlet, outlet, and drain openings as required for a complete and operational system.
- C. Tank shall be factory furnished complete with the following accessories:
1. 150 psi max working pressure
 2. Bronze safety relief valve
 3. 0 – 200 psi, liquid filled pressure gauge with needle valve end snubber
 4. Timed electric automatic condensate drain
 5. Tank shall be fully primed and finished in manufacturer's standard finish.
- D. Automatic Condensate Drain
1. Furnish and install a fully automatic condensate drain of the size, capacity, arrangement, and electrical characteristics to satisfy the required needs.
 2. Automatic condensate drain shall be complete with valve and timer combination. Unit shall have power/valve status light, "on-off" adjustment, and 6 Ft 3-prong electrical cord with plug.
- E. Filters
1. Filter shall be mounted as indicated on contract drawings. Filters shall be finished with internal automatic drain and differential pressure gauge.
 2. Furnish one additional filter cartridge upon final acceptance of the system.
 3. Filter/housing shall be constructed to withstand 250 psig maximum working pressure. Furnish unit with wall mounting bracket for field installation.

2.03 HEATSINK CYCLING REFRIGERATED AIR DRYER

- A. Scope – This specification described a complete mechanical refrigerated drying system for the removal of moisture, oil aerosols and other contaminants from a compressed air or gas stream. This is accomplished by cooling the gas with a refrigeration unit to a temperature at which the contaminants condense and are separated from the gas stream. The dryer shall be complete in all respects, including integral component equipment, inter-connecting piping, wiring and controls.

- B. Components and Construction – Each dryer system shall be complete with the following items:
1. Precooler / Reheater exchanger.
 2. Cycling refrigerated chiller section.
 3. Refrigeration system equipped with hermetically sealed compressor and water or air-cooled condenser.
 4. Centrifugal air / moisture separator.
 5. Electronic solenoid drain to automatically discharge condensate.
 6. Microprocessor based control system to regulate and monitor system operation and control condensate removal.
- C. Precooler / Reheater – Dryer shall be equipped with a single air-to-air heat exchanger to Precool incoming compressed air and reheat outgoing compressed air. Air-to-air heat exchanger shall be of the smooth-bore tube-in-tube design to provide smooth, non-fouling exchange surfaces with minimal associated pressure drop. Exchanger shall be constructed of cooper to maximize thermal transfer efficiency. The maximum design pressure shall be 200 psig.
- D. Refrigeration System – The chiller system shall be designed to dry a set amount of compressed air. The refrigeration system shall consist of one hermetic reciprocating type compressor, refrigerant feed system, air or water cooled condenser and refrigerant to thermal mass evaporator. No hot gas by-pass valve or similar capacity modulating device shall be used in the refrigeration system. Refrigerant 22 shall be used to minimize environmental hazard. The amount of refrigerant shall be minimized, through the use of a measured charge system, to prevent liquid refrigerant floodback to the hermetic compressor.
- E. Moisture Separator – A vertical moisture separator shall be located within the chiller section. Compressed air and water condensed in the chiller section shall be delivered to the separator for the separation and subsequent removal of the water from the compressed air. Separation shall be performed at the coldest point in the system by means of centrifugal acceleration, expansion into an area of low velocity with sump area and change of air flow direction. These separation mechanisms shall provide for separation efficiency in excess of 99%.
- F. Microprocessor Controls And Instrumentation
1. The chiller section and associated refrigeration system shall be controlled and monitored by a fully integrated microprocessor.
 2. The microprocessor shall control the chiller section to prevent freeze-up and shall operate the electronic drain valve.
 3. Additionally, the microprocessor shall incorporate the following features:
 - a. Dewpoint Temperature Digital Readout
 - b. High Temperature Alarm Light
 - c. Low Temperature Alarm Light
 - d. Adjustable Exchanger Temperature
 - e. Percent Savings Digital Readout
 - f. Adjustable Drain Open Time
 - g. Adjustable Drain Close Time
 - h. Drain Test Switch
 - i. Built-in Crankcase Heater Delay
 - j. Anti-rapid-cycle timer
 - k. Fahrenheit or Centigrade Temperature Display
 - l. Remote Alarm Contacts
 4. Dryer shall include a refrigerant suction pressure gauge for refrigeration system. Microprocessor shall also incorporate field programmable dewpoint settings to allow the dryer to be more closely matched to seasonal demands. A higher dewpoint

setting shall allow refrigerant compressors to experience a lighter load thereby conserving more energy and further reducing compressor wear and tear.

G. Compustat: Shall include:

1. This microprocessor control cycles the refrigeration system to maintain the desired pressure dewpoint requirement. A digital display indicates the exchanger temperature. The control includes the following features:
 - a. Timed solenoid drain with adjustable off time from 1 to 60 minutes and adjustable open time from 1 to 60 seconds. Digital display is used to set times and (2) two indicating lights display open and closed functions. Time is set with up/down buttons.
 - b. On/off switch with light indicating power is to the unit and an additional light indicating the unit is turned on and off. A third light indicates when the refrigeration turns on and off.
 - c. A high temperature warning light and contacts for remote alarm are included. (Same contacts for high and low temperature alarm).
 - d. Includes anti-short cycle timer for compressor protection. Digital display indicates count down of time before unit can restart.

H. Coolant Recirculating System Sample Specification:

1. General: Furnish and install a coolant recirculating system designed to remove 332, 750BTU/HR of heat with 38 GPM of 50% Propylene Glycol solution cooled from 128°F to 105°F at 90°F ambient with a 3 fan drycooler. Further cooling capacity shall be available with an additional shell and tube heat exchanger which will reduce coolant temperature from 105°F to 95°F with 70°F plant water during extreme summer temperatures. Coolant recirculating system shall include as a minimum all equipment listed below. Ethylene Glycol is not permissible by WMATA.
 - a. Drycooler: Air cooled drycooler shall be arranged for vertical air flow and shall consist of a polished aluminum housing, galvanized steel supports, aluminum legs, copper coils with aluminum fins, rain slinger equipped 3/4 HP 460/3/60 volt fan motors with built-in thermal overload protection and direct driven zinc plated or aluminum cooling fans with corrosion resistant guards. Fan cycling control shall be included to cycle fans during cool ambient conditions and shall include a 24 volt control circuit with control transformer, fan contactors and temperature controls.
 - b. Pump Package: Shall be a factory packaged module, ready to set in place, including 120 gallon reservoir tank, control panel, (2) 3 HP 460/3/60 volt circulating pumps, pump suction strainers, triple duty valves, pump discharge pressure gauges, low level switch, modulating control valve, trim cooler with regulating valve and reservoir temperature indicator all piped, mounted and wired. An automatic air vent, compressor discharge temperature indicator, drycooler discharge temperature indicator and flow switch shall be furnished loose for installation if field piping. Reservoir tank shall gauge glass assembly with shut-off valves.
 - c. Controls: NEMA 12 microprocessor panel shall be furnished and include a main disconnect, magnetic starter(s) for circulating pumps, hand-off-automatic selectors, pump run lights, control voltage transformer, low coolant level light with alarm, flow failure light with alarm, alarm silence button and terminal strip for remote alarm indication.
 - d. Expansion Tank: Expansion tank for hot water heating systems. Heated water expands, and in a closed hot water system, provisions must be made for the expansion. This tank is designed to control the thermal expansion of hot water and to prevent system damage and unnecessary relief valve discharge in hydronic heating systems.

- 1) Precharged at 12 psi.
 - 2) Compatible with Glycol Systems.
 - 3) Max. Temperature 240°F.
 - 4) Max. Pressure 60 psi.
2. Tank model ET-15, Volume 2.1 gallon, Watts Regulator or approved equal.

2.04 FLEXIBLE PIPE CONNECTORS

- A. Inner Hose: Stainless steel or bronze.
- B. Exterior Sleeve: Single braided stainless steel or bronze.
- C. Pressure Rating: 125 psig WSP and 450 degrees F.
- D. Joint: Threaded 2-1/2 in. Flanges 3 in.
- E. Size: Use pipe sized units.

2.05 UNIONS

- A. Ferrous Pipe: 150 psig malleable iron threaded unions.

2.06 SPARE EQUIPMENT

- A. The Contractor shall furnish the following spare equipment for each compressor units:
 1. Two (2) oil filter elements.
 2. Four (4) air intake filter elements.
- B. Spare equipment shall be identical to that furnished with the compressors.

PART 3 - CONSTRUCTION METHODS

3.01 INSPECTION:

- A. Check location of rough-in work and utility stub-outs to assure match with equipment to be installed.
- B. Inspect delivered equipment for damage from shipping and exposure to weather. Compare delivered equipment with packing lists and specifications to assure receipt of all items.
- C. Report in writing to the engineer any damage, incorrectly fabricated, non-conforming materials or equipment, improper rough-in work or utility stub-outs, or any other condition requiring remedial or corrective action. Any remedial or corrective action shall be subject to the engineer's approval prior to the performance of such action.

3.02 INSTALLATION:

- A. Contractor shall install equipment in accordance with plans, approved shop drawing and Manufacturer's instructions:
 1. Make air cock and drain connection on horizontal casing.
 2. Install line size gate valve and check valve on compressor discharge.
 3. Install replaceable cartridge type filter/silencer of adequate capacity for each compressor.
 4. Connect condensate drains to nearest floor drain.

5. Install valved bypass around air dryer.
6. Install flexible connectors at compressor discharge.
7. Vibration Isolation.
- B. Compressor installation: Contractor shall place the compressor in position on the foundation anchor bolts. The base of the compressor shall be 1/2-inch to 3/4-inch above the top of the foundation and the compressor shall be leveled as closely as possible.
- C. Air receiver and dryer installation: The air receiver shall be anchor-bolted to the floor using 1/2-inch stainless steel anchor bolts. Upon installation, actual dewpoint of dryer shall be tested. Contractor shall be responsible for providing accurate dew meter. Dew point of dryer must fall within range of 39°F for 100°F ambient temperature, 100°F intake temperature, 100 psi, and 200 cfm for one hour.
- D. Positioning: Contractor shall place equipment in accordance with any noted special positioning requirements generally level, plumb and at right angles to adjacent work.
- E. Fitting: Where field cutting or trimming is necessary, Contractor shall perform in a neat, accurate, professional manner without damaging equipment or adjacent work.
- F. Anchorage: Contractor attach equipment securely to prevent damage resulting from inadequate fastenings. Fasteners shall be installed to avoid scratching or damaging adjacent surfaces.
- G. Upon completion of work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.
- H. Vibration Isolation:
1. Vibration isolators selected to produce uniform loading and deflection even when equipment weight is not evenly distributed; steel components hot-dip galvanized after fabrication in accordance with ASTM A123.
 2. Types of vibration isolators:
 - a. For equipment and piping:
 - 1) Floor-mounted: Spring isolators.
 3. Spring isolators for floor-mounted equipment:
 - a. Free-standing, laterally stable without housing, complete with minimum 1/4-inch thick neoprene acoustical friction pad in series with spring element.
 - b. Leveling bolts and adequate facilities for bolting to equipment and supporting structure using isolation washers.
 - c. Coil outside diameter: Not less than 0.8 of operating height of
 - d. Horizontal stiffness: Not less than 0.8 of vertical stiffness.
 - e. Springs designed so to have additional 50% capacity beyond rated load.
 - f. Springs designed so that ends remain parallel during and after spring deflection to operating height. equipment.
 - g. Vibration isolators selected for lowest operating speed of
 - h. Built-in adjustable limit stops with isolators provided for equipment of operating weight different from installed weights, to prevent rising of equipment when weight is removed and for equipment exposed to wind. Limit stops not to be in contact during normal operating conditions.
 - i. Welding of springs to load plate assembly for vibration isolators with capacities of 6,000 pounds or less is prohibited.
 - j. Vibration isolators with capacities of 6,000 pounds or less are permitted use of cups or other positive means for restraining springs.
 4. Suspension-type isolation hangers for ceiling-suspended equipment:

- a. Combination of spring and neoprene in series.
- b. Spring made of stable steel.
- c. Encased in structurally stable steel bracket.
- d. Spring diameter large enough to permit 14-degree angular misalignment of rod connecting hanger to equipment without rubbing on box.
- e. Designed to provide complete support for suspended units upon failure or rupture of isolator.

3.03 TESTING AND RESPONSIBILITY:

A. Per ASME, the Contractor shall be responsible for the procurement and installation of compatible components, and shall perform all modifications necessary for the proper operation of the equipment. The Contractor, if required by the Engineer or as otherwise required by the Specifications, shall make such tests during the installation and upon the completion thereof, as may be necessary to demonstrate the work and equipment, as installed, complies with the Contract Specifications and requirements of NYCT as provided herein. He shall provide all labor, instruments and apparatus required for such tests. If any of the work or equipment fails to meet the Contract requirements or to function properly, the defects shall be rectified by readjusting or by removing and replacing the faulty work or equipment, until under test, the requirements are met all at the Contractor's expense. The Engineer reserves the right to check the Contractor's instruments or to furnish his own instruments.

B. CLEANUP:

- A. Contractor shall touch-up damage to painted finishes.
- B. Contractor shall wipe and clean equipment of any oil, grease, and solvents, and make ready for use.
- C. Contractor shall clean area around equipment installation and remove packing or installation debris from job site.
- D. Contractor shall notify the Engineer for acceptance inspection.

END OF SECTION

THIS PAGE NOT USED

SECTION 15125

PIPING CONDUIT

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing complete factory-fabricated piping conduit and control-air piping conduit.
- B. Related Work Specified Elsewhere:
 - 1. Piping systems: Section 15205.
 - 2. Insulation: Section 15080.
 - 3. Raceways, boxes and cabinets: Section 16130.
 - 4. Grading, Excavating and Backfilling: Section 02320.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ANSI/ASME: B31.1.0.
- B. Source Quality Control:
 - 1. Prior to shipment, test carrier pipes at 800 psi until found leak-free.
 - 2. Test prefabricated-conduit sections and fittings at 15-psi air at the factory to ensure compliance with specified requirements and to prove weldtight.
- C. Inspection:
 - 1. Upon delivery to job site, visually inspect each section of prefabricated conduit to determine shipping damage, thickness of coating, necessary air space, bond of coating to conduit and conformance to specified requirements. Reject material not in conformance with special requirements or which displays shipping damage beyond that permitted by these Specifications.
 - 2. Coating test: After visual examination and prior to installation, perform coating dielectric-integrity test in accordance with manufacturer's instructions for test equipment.
 - 3. Repair of voids:
 - a. If voids detected by the above methods were caused by improper handling, and are such that the areas of patches extending a minimum of two inches from the outer periphery of the void total less than 100 square inches for sections of conduit up to 20 feet in length, or less than 200 square inches for sections up to 40 feet in length, the section may be repaired. Perform repairs using specified coating; repeat testing procedure.
 - b. Remove from job site sections requiring patches larger than specified and replace with new conduit sections.
 - 4. Perform inspections in the presence of the Engineer. Provide samples of coating and coating material for laboratory analysis when directed.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
1. Shop Drawings: Include manufacturer's technical data for conduit materials, insulation, and coatings. Detail joints and fittings. Indicate dimensions, weights, and method of field assembly.
 2. Certification:
 - a. Manufacturer's certification that installation has been made in accordance with manufacturer's recommendations and published instructions and meets specified requirements.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. Prefabricated-Piping Conduit:
1. Welded-piping conduit, factory-insulated armored piping, welded as specified for steel piping in Section 15205.
 2. Outer conduit: Steel, four-gauge minimum.
 3. Insulation consisting of two one-inch layers of cellular glass as specified in Section 15080 except insulation jacket consisting of outer wrap of asphalt-impregnated, fibrous-glass reinforced, asbestos pipeline felt, spirally wound under tension.
 4. Adequate air space between outer conduit and pipe insulation permitting expansion and contraction of piping without resulting damage.
 5. Outer conduit coated on inside with unmodified catalytic polyamide or versamid-cured epoxy.
 6. Outer conduit coated on outside with epoxy reinforced with two layers of fibrous-glass cloth.
 7. Finished-coat vehicle of 65-percent epoxy resin (450 - 525 epoxide equivalent) and 35-percent resinous-nitrogen curing agent with not more than five percent of vehicle as stabilizers and flow-control agents.
 8. Conduits incorporating the following features:
 - a. Pipe-support guides.
 - b. Watersheds, welded pipe only.
 - c. Leak plates.
 - d. Anchors.
 - e. End and gland seals.
 - f. Expansion loops:
 - 1) Factory-fabricated of casing, couplings, insulation and piping identical to that specified for straight runs.
 - 2) Designed and installed to ensure complete drainage.
 - 3) Designed with allowable-stress limits in accordance with in ANSI/ASME B31.1.0, for type of pipe used.
 - g. Loop casing:
 - 1) Sized to contain pipe movement without crushing insulation or causing other damage.
 - 2) Eccentric reducers and increasers, or welding collars serving same purpose, used to allow drainage through loop.

- 3) Welding collars not lighter than conduit casing and not less than 10 gauge.

B. Control-Air Piping Conduit:

1. PVC: Section 16130.

C. Conduit Monitoring System:

1. Control unit: Provided only in cases where conduit is buried or when approved.
 - a. Wall-mounted, liquid-tight, hinged cover.
 - b. Leak warning light, allowing reset by depressing, mounted on front cover.
 - c. Pressure gauge, mounted on front cover, indicating conduit internal pressure, covering conduit internal-pressure range of five to eight psi.
 - d. Compression fittings for gas inlet and gas outlet.
 - e. Gas regulator capable of adjustment from zero psig to 20 psig.
2. Copper tubing: As specified by manufacturer of monitoring system.
3. Source of dry nitrogen gas not to exceed 100 psi.
4. Relief valves as specified by the manufacturer.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Excavation and Backfill: Perform in accordance with the General Requirements, Section 02030 and manufacturer's recommendations.
- B. Installation:
 1. Install prefabricated piping conduit, including expansion loops and conduit monitoring system, in accordance with manufacturer's recommendations and under personal supervision of manufacturer's representative.
 2. Fabricate field joints to match factory fabrication and perform testing as specified.
 3. Clean and sandblast steel surfaces prior to coating.
 4. Apply coating to match factory-applied coating and perform testing as specified.

3.02 FIELD QUALITY CONTROL:

- A. Install prefabricated-piping conduit under personal supervision of manufacturer's qualified field-service representative.
- B. Field Testing:
 1. Prior to application of coating and before backfilling, test conduit sections and joints for leaks by application of 15 psig for one-hour minimum.
 2. Repair leaks in accordance with manufacturer's recommendations and retest until approved.
 3. After application of coating and prior to backfill, perform coating tests as specified on exterior surfaces including field joints.
 4. Repair coating voids to restore full dielectric integrity to system or replace conduit section and repeat testing procedures.
 5. After backfilling, test conduit system by application of 15 psig for eight hours minimum
 6. Locate and repair leaks detected by loss of gas pressure and retest until approved.

7. Ventilate air space in conduit with heated air at rate of two cfm. Continue until cool mirror located at exit port exhibits no fogging.
8. Charge to five psig and close off plugs.
9. Set monitoring system according to manufacturer's instructions for unattended surveillance.
10. Submit copy of installation and inspection report.

END OF SECTION

SECTION 15135

MISCELLANEOUS PUMPS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing pumps, complete with motor drives and controls, except drainage pumping systems, chilled-water pumps and condenser-water pumps.
- B. Related Work Specified Elsewhere:
 - 1. Piping systems: Section 15205.
 - 2. Raceways, boxes and cabinets: Section 16130.
 - 3. Wire, cable and busways: Section 16120.
 - 4. Motors: Section 16225.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. UL, NEMA 250.
- B. Source Quality Control:
 - 1. Select pumps based on capacity, total dynamic head and electrical characteristics shown.
 - 2. Test pumps at 1-1/2 times working pressure.
 - 3. Balance impeller statically, dynamically and hydraulically.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements specified for each:
 - 1. Product Data: Include manufacturer's technical data for each model indicated, including rated capacities, electrical characteristics, furnished specialties, and accessories.
 - 2. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, required clearances, method of field assembly, components, and location and size of each field connection.
 - 3. Certification.
 - 4. Operations and Maintenance Manuals.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIAL:

- A. General Requirements:
 - 1. In design and purchase of equipment, provide for interchangeability of subassemblies, parts, motors, starters and relays.

- B. Hot-Water Circulating Pump:
 - 1. Type: Centrifugal, single-stage, single-suction, in-line, hydraulically balanced and electric-motor-driven.
 - 2. Minimum capacity: As shown.
 - 3. Operating speed: 1,750 rpm.
 - 4. Designed in accordance with the following:
 - a. Standards of Hydraulic Institute.
 - b. Pump supported by piping system.
 - c. To permit complete servicing without severing pipe connection.
 - 5. Construction: Bronze, with stainless-steel or heat-treated steel shafts, with the following additional requirements:
 - a. Bearings: One of the following:
 - 1) Ball bearings, frictionless with permanent grease lubrication.
 - 2) Sleeve bearings, oil-lubricated.
 - b. Roller bearings, with oil reservoir.
 - 6. Casing: Suitable for working pressure of 125 psig.
 - 7. Seals: Mechanical, designed and guaranteed for long life in hot-water systems operating at 250F.
 - 8. Motors: As specified in Section 16225.

- C. Submersible Sump Pump:
 - 1. Type: Automatic, electric-motor-driven, centrifugal, wet-pit, close-coupled.
 - 2. To include single-phase, hermetically sealed, capacitor-start motor with built-in overload protection, upper and lower bearing factory-sealed, grease-lubricated ball-type, common shaft of stainless steel, Type 316, and sealed pump cable with neoprene cover and flexible armor. Motors to have cooling characteristics permitting continuous operation in totally submerged, partially submerged and non-submerged condition.
 - 3. Casing: Close-grain cast iron, volute-type.
 - 4. Impeller: Cast bronze, enclosed or semi-open, with vanes and back shroud, dynamically balanced.
 - 5. Intake protected with slotted cast-iron or perforated steel intake strainer with effective free area sufficient to prevent cavitation and poor efficiency.

- D. Liquid-Level Control:
 - 1. Simplex submersible, single-phase unit, one of the following:
 - a. Integral with pump, designed for direct switching of single-phase pumps, complete with ON/OFF, adjustable-level float switches.
 - b. Completely independent, designed for direct switching of single-phase pumps and consisting of control box, contactor and ON/OFF level float switches.
 - 1) Control box of heavy-duty plastic having three-prong male plug for plugging into standard three-wire grounded power-supply outlet; grounded female socket into which cable from pump motor is

- plugged and heavy-duty contactor with 90-ampere lock-rotor rating for direct switching of motor load.
- 2) Float switches for ON and OFF level switching connected to control box with extra-flexible, neoprene-jacketed electrical cable. Float switches UL-listed. Floats strapped to discharge pipe at required ON and OFF levels. Mercury switch with molybdenum contacts sealed in each double-walled float enclosure. Float enclosure of heavy-duty rigid plastic, resistant to attack by inorganic salt solutions, alkalis and mineral acids.
- 2. Duplex submersible, single-phase unit. Completely independent, designed for direct switching of two single-phase pumps and consisting of duplex control box, contactors, alternator, and ON/OFF and emergency-level float switches.
 - a. Weatherproof, UL-listed, steel control box with gasketed removable cover containing contactor with 90-ampere lock-rotor rating for each pump, electric-alternator circuit and control-circuit fuse. Pump starting alternated at ON level on successive cycles. Second pump starts at EMERGENCY level if inflow exceeds capacity of first pump or is inoperative.
 - b. Float switches for ON, OFF and EMERGENCY level switching, connected to control box with extra-flexible, neoprene-jacketed electrical cable. Float switches UL-listed. Floats strapped to discharge pipes at required ON, OFF and EMERGENCY levels. Mercury switch with molybdenum contacts sealed in each double-walled enclosure. Float enclosure of heavy-duty rigid plastic, resistant to attack by inorganic salt solutions and mineral acids.
 - c. Alternator:
 - 1) Electric, automatic.
 - 2) Designed to alternate pumps on each successive cycle of operation and to operate both pumps automatically when one pump is unable to handle flow.
 - 3) Enclosure for electrical components: NEMA 250, Type 1.
- E. Wiring:
 - 1. Control panel: Completely wired at the factory prior to shipment.
 - 2. Wiring and conduit: Sections 16130 and 16120.
- F. Nameplates:
 - 1. Securely attached to each major item of equipment as specified in Section 15075. In each case, show manufacturer's name, model number, serial number, electrical and operating characteristics.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Fit equipment and appurtenances within space provided and make readily serviceable.
- B. Provide hangers and anchor bolts required for proper installation of equipment as recommended by manufacturer.
- C. Install in accordance with manufacturer's instructions.

3.02 FIELD QUALITY CONTROL:

- A. Ensure that connections are secure and watertight.
- B. Test system through five complete operating cycles.
- C. Ensure that pump and motor operate without noticeable vibration.

END OF SECTION

SECTION 15155
DRAINAGE PIPING SPECIALTIES

PART 1 - GENERAL

1.01 SUMMARY

- A. This Section specified providing the following drainage piping specialties:
 - 1. Trench drains.
 - 2. Oil interceptors.

1.02 DEFINITIONS

- A. ABS: Acrylonitrile-butadiene-styrene plastic.
- B. FRP: Fiberglass-reinforced plastic.
- C. HDPE: High-density polyethylene plastic.
- D. PE: Polyethylene plastic.
- E. PP: Polypropylene plastic.
- F. PUR: Polyurethane plastic.
- G. PVC: Polyvinyl chloride plastic.

1.03 SUBMITTALS

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, and accessories for the following:
 - a. Oil interceptors.
 - 2. Shop Drawings: Show fabrication and installation details for frost-resistant vent terminals.
 - a. Wiring Diagrams: Power, signal, and control wiring.
 - 3. Operation and Maintenance Data: For drainage piping specialties to include in emergency, operation, and maintenance manuals.

1.04 QUALITY ASSURANCE

- A. Drainage piping specialties shall bear label, stamp, or other markings of specified testing agency.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- C. Comply with NSF 14, "Plastics Piping Components and Related Materials," for plastic sanitary and storm piping specialty components.

1.05 COORDINATION

- A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.
- B. Coordinate size and location of roof penetrations.

PART 2 - PRODUCTS

2.01 TRENCH DRAINS

- A. Trench Drains
 1. Standard: ASME A112.6.3 for trench drains.
 2. Material: Ductile or gray iron.
 3. Flange: Anchor.
 4. Grate Material: Ductile iron or gray iron.
 5. Top Loading Classification: As required for floor loading criteria.

2.02 OIL INTERCEPTORS

- A. Oil Interceptors:
 1. Type: Factory-fabricated interceptor for separating and removing oil from wastewater.
 2. Descriptive Type or Function: Tank shall be approved for use by the local wastewater district.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for piping joining materials, joint construction, and basic installation requirements.
- B. Install trench drains at low points of surface areas to be drained. Set grates of drains flush with finished surface.
- C. Install oil interceptors, including trapping, venting, and flow-control fitting, according to authorities having jurisdiction and with clear space for servicing. Coordinate oil-interceptor storage tank and gravity drain in accordance with Division 2.
- D. Install escutcheons at wall, floor, and ceiling penetrations in exposed finished locations and within cabinets and millwork. Use deep-pattern escutcheons if required to conceal protruding pipe fittings.

3.02 CONNECTIONS

- A. Piping installation requirements are specified in other Division 15 Sections.
- B. Install piping adjacent to equipment to allow service and maintenance.
- C. Oil Interceptors: Connect inlet, outlet, vent, and gravity drawoff piping to unit; flow-control fitting and vent to unit inlet piping; and gravity drawoff and suction piping to oil storage tank.
- D. Ground equipment according to Division 16 Section "Grounding and Bonding."
- E. Connect wiring according to Division 16 Section "Wire, Cable and Busways."

3.03 LABELING AND IDENTIFYING

- A. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplate or sign on or near each of the following:
 1. Oil interceptors.
- B. Distinguish among multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations, in addition to identifying unit. Nameplates and signs are specified in Section 15075.

3.04 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

3.05 PROTECTION

- A. Protect drains during remainder of construction period to avoid clogging with dirt or debris and to prevent damage from traffic or construction work.
- B. Place plugs in ends of uncompleted piping at end of each day or when work stops.

END OF SECTION

THIS PAGE NOT USED

SECTION 15185

HYDRONIC PUMPS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This section specifies providing heating hot water, chilled-water and cooling tower water pumps, complete with motor drives.
- B. Related Work Specified Elsewhere:
 - 1. Insulation: Section 15080.
 - 2. Vibration isolation: Section 15070.
 - 3. Motors: Section 16225.
 - 4. Variable Frequency Drives: Section 16269.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. NEC.
- B. Design Criteria:
 - 1. Select pumps based on capacity and total dynamic head required.
- C. Source Quality Control:
 - 1. Test pumps at 1-1/2 times working pressure.
 - 2. Balance impeller statically, dynamically and hydraulically.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: Include manufacturer's technical data for each model indicated, including rated capacities, electrical characteristics, furnished specialties, and accessories.
 - 2. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, required clearances, method of field assembly, components, and location and size of each field connection.
 - 3. Certification.
 - 4. Operations and Maintenance Manuals.

1.04 JOB CONDITIONS:

- A. Safety Requirements:
 - 1. Properly guard belts, pulleys, chains, gears and other rotating parts to prevent danger to personnel.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
1. In design and purchase of equipment, provide for interchangeability of items of piping equipment, subassemblies, parts, motors, starters and relays.
- B. Casings:
1. Close-grained cast iron, volute-type.
 2. Horizontal or vertical split case with flanged suction and discharge, designed for optimum-velocity change and hydraulic balance.
 3. Openings tapped for suction and discharge gauges, suction chamber, discharge-volute venting and casing drainage.
 4. Sections of casings bolted and doweled to permit access to impeller without removal of piping and to provide exact positioning at assembly, after inspection or replacement of parts.
 5. Split bearing brackets bolted and doweled for perfect alignment of rotor, wearing rings and bearings.
- C. Impeller:
1. Enclosed, double suction, cast bronze, one-piece.
 2. Secured to shaft by key and locking collars for exact alignment.
 3. Exterior surfaces machined.
 4. Interior surfaces and water passages deburred and hand-finished.
- D. Casing Wearing Rings:
1. Bronze, renewable-type, locked to prevent rotation.
- E. Shafts:
1. Solid, Alloy S30300 stainless steel.
 2. Sized to provide maximum 0.002-inch deflection at face of stuffing box.
- F. Mechanical Seals:
1. Single, inside-mounted, selection based on pressure, temperature, speed and shaft diameter.
 2. Seal parts:
 - a. 150 psi with shaft diameter to three inches:
 - 1) Temperature range: 40F to 225F.
 - 2) Shaft sealing member: Buna rubber.
 - 3) Rotating sealing member: Carbon.
 - 4) Metal parts of seal: Brass.
 - 5) Stationary sealing member: Nickel-alloy iron.
 - 6) Spring: Stainless steel.
 - b. Above 150 psi: As specified for 150 psi with shaft diameter to three inches, except stationary sealing member fabricated of tungsten carbide.
- G. Glands:
1. Mechanical seal, flush-type, drilled and tapped to provide clear, filtered liquid flush to seal face with separate stainless cyclone separator.
 2. Fabricated of stainless steel, factory-mounted and piped for each seal.
- H. Bearings:
1. Grease or oil lubricated, designed for 150,000 hours average life.
 2. Bearing housings enclosed and protected from dirt and water.
- I. Coupling:

1. Flexible, nonlubricated, pin and bushing.
- J. Coupling Guard:
1. Fabricated steel-housing enclosure bolted to base plate.
- K. Bedplate:
1. Structural steel, ribbed for rigidity and with minimum five-inch diameter grout holes.
 2. Drip collection chamber provided with ½-inch IPS connection at low point of bedplate.
 3. Drilled and tapped to accommodate pump, motor and coupling guard.
- L. Motors: Section 16225 with the following additional requirements:
1. Sized for nonoverloading operation under all conditions on pump curve.
 2. Four-pole, squirrel-cage induction, dripproof and fully guarded.
- M. Flexible Connection:
1. Reinforced-rubber-type or contour-molded reinforced-Teflon-type with flanged ends at inlet and outlet of pump.
 2. Reinforcement: Monel or stainless-steel rings.
 3. Designed for 150 percent of maximum working pressure.
- N. Vibration Isolators: Section 15070.
- O. Nameplates: Section 15075.
1. Securely attached on each pump showing manufacturer's name, model number and serial number.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Fit equipment and appurtenances within space provided and make readily serviceable.
- B. Provide foundation for proper installation of equipment.
- C. Construct subbases for equipment in accordance with Section 15070.
- D. Insulate pumps as specified in Section 15080.
- E. Make final alignment on pump and motor coupling prior to operation.
- F. Mount pumps on vibration isolators where shown.
- G. Ensure that pump and motor operate without noticeable vibration after installation.
- H. Grout base.

END OF SECTION

THIS PAGE NOT USED

SECTION 15186

WATER TREATMENT SYSTEM

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing complete and operable water-treatment systems for heating hot water, chilled-water and cooling tower water systems.
- B. Related Work Specified Elsewhere:
 - 1. Piping systems: Section 15205.
 - 2. Insulation: Section 15080.
 - 3. Vibration isolation: Section 15070.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. NEMA: 250
- B. Design Criteria:
 - 1. Design automatic water-treatment systems to minimize corrosion and prevent fouling of components.
 - a. Chilled water: Select chemicals for control of corrosion, scale and algae that are not toxic to humans in concentrations found in operating system.
 - b. Cooling Tower water: Design a non-chemical water treatment system to minimize scale and reduce biological growth in the circulating cooling tower water system. The system shall use permanent magnetic technology and copper silver electrode assembly to reduce scale and biological growth respectively.
 - c. Heating hot water: Select chemicals for control of corrosion, scale and algae that are not toxic to humans in concentrations found in operating system.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Shop Drawings.
 - a. Complete catalog information and shop drawings for material and equipment including wiring and control diagram.
 - 2. Certification.
 - a. Manufacturer's certified test reports.
 - 3. Documentation:
 - a. Water analysis:
 - 1) Water-sample analysis. Submit prior to introducing chemicals into systems.
 - b. Chemical-quantity requirements:

- 1) Submit calculations showing total quantities of various chemicals required for two years operation of water-treatment systems
- 2) Base quantity of chemicals for 2,000 full-load operating hours per annum for designed tonnage and average of five cycles concentration of cooling tower water.
- c. Chemical-quality requirements:
 - 1) Submit chemical formulae and descriptions or generic names of materials used.
 - 2) Prior to acceptance, submit toxicity data of water treatment complying with applicable codes and regulations of jurisdictional authorities.
 - 3) If required by the jurisdiction, submit their approval of chemicals proposed for use
- d. MSDS approval by WMATA SAFE:
 - 1) Submit Manufacturers' Safety Data Sheets (MSDS) for approval by WMATA's Safety Office (SAFE) for use by WMATA personnel and for use in the WMATA system.

4. Operation and Maintenance Manuals.

1.04 JOB CONDITIONS:

- A. Safety Requirements:
1. Store and handle chemicals so as to prevent danger to personnel.

1.05 FIELD SERVICE:

- A. Engage services of specialist for two years from day air-conditioning system is first put into normal and continuous operation to supervise and train plant-operating personnel in correct water treatment. Specialist to be certified by water-treatment system manufacturer as qualified in operation of system provided.
- B. Specialist's services to include the following:
1. Supervision of pretreatment, startup and adjustment of automatic water-treatment systems.
 2. Minimum of six inspections, at startup and during cooling season for water analysis and to analyze and recommend changes in treatment as operating conditions vary during adjustment period.
 3. Inspections at not greater than five-week intervals and additional inspections upon request from the Authority.

1.06 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Ship products securely packaged and labeled for safe handling in shipment and to avoid damage and distortion.
- B. Label each item with manufacturer's name, brand, reference specification, type, class and other pertinent information as applicable.
- C. Supply dry chemicals in waterproof bag or containers weighing maximum of 100 pounds.

- D. Supply liquid chemicals in thirty-gallon polyethylene-lined steel drums or five-gallon plastic pails.
- E. Ship chemicals which are not used for initial startup to Authority-designated storage facility.
- F. Store products in a secure, dry storage facility.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. General Requirements:
 - 1. In design and purchase of equipment, provide for interchangeability of items of piping equipment, subassemblies, parts, motors, starters and relays.
- B. Cooling Tower Water Treatment:
 - 1. HydroPlex as manufactured by Quantum Magnetic System (QMS), Inc., Cleveland, Ohio, or equal. Equipment shall include, but not limited to the following:
 - a. Electrode:
 - 1) Copper Silver Alloy Type.
 - a) Low voltage direct current, max. 60 watts per electrode assembly.
 - b) Quick disconnect electrical connection.
 - c) Adjustable duty cycles.
 - d) Minimum 1 month before cleaning and 1 year before replacement.
 - e) A quick disconnect designed for removal without using special tools.
 - b. Solid removal:
 - 1) Cyclone type separator, capable of removing particles larger than 200 microns.
 - 2) Equipped with automatic purge valve capable of removing all solids from the system during purging cycle.
 - 3) Provide a manually adjusted throttling valve between the centrifugal device and the automatic purge valve. This valve shall be a gate valve or approved equivalent of the same pipe diameter as the automatic purge valve.
 - 4) Union fittings shall be supplied on both sides of the automatic purge valve and also and also both sides of the manual throttling valve for ease of valve removal.
 - c. Magnets for scale removal:
 - 1) An integral part of the piping system. Clamp-on type will not be acceptable.
 - 2) Effective operating life 50 years minimum.
 - d. Pump:
 - 1) Single stage, end suction, centrifugal type, capable of delivering minimum of 200 gpm at the designed pressure discharge.
 - 2) Pump and motor mounted on common steel base.
 - 3) Pump fitted with ball bearings and double mechanical shaft seal.

- 4) Pump motor: Manufacturer's standard motor suitable for intended use.
 - 5) One spare part/repair kit provided with pump.
 - e. Valves, pipe and fittings:
 - 1) Valves shall be bronze construction, solder or threaded ends type, rising stem and rated at minimum 150 psi.
 - 2) Pipe, ASTM B88 Type K, Hard drawn; Fittings, ANSI B16.22.
 - f. System cabinet:
 - 1) Size to contain electrode assembly, Cyclone separator, Magnets, Flow meter, Pressure gauges and all associated plumbing, electrical wiring and controls.
 - 2) Cabinet shall be NEMA 4 rating, suitable for indoor and outdoor installations.
 - 3) Cabinet shall be provided with openings for electrical conduit and piping.
 - 4) Provide cabinet with one-inch drain at the bottom to be piped to the nearest floor drain.
 - g. Other equipment:
 - 1) A 30-gallon surge tank of corrosion-resistant construction.
 - 2) Copper test kit as manufactured by Hach Pocket Colorimeter (Catalog No. 46700-19) or approved equal.
 - 3) Conductivity meter as manufactured by Orion Quikcheck Pocket meter (Catalog No. OR914026, Model 116) or approved equal.
- C. Chilled-Water Treatment:
- 1. Pot-type chemical feeder:
 - a. Designed and constructed for 150-psig water working pressure.
 - b. Chemical feeder: Minimum capacity, 12 gallons.
 - c. In accordance with applicable codes and regulations for unfired pressure vessels.
 - 2. Chemicals: Furnish chemicals supplied for chilled-water system treatment in accordance with the following performance standards:
 - a. Corrosion inhibition:
 - 1) Carbon steel: Less than or equal to 1.0 mil per year.
 - 2) Copper and copper alloys: Less than or equal to 0.10 mil per year; chemical mixture to contain copper-corrosion inhibitor and buffering agents to maintain system pH at 7.0 to 8.5.
 - b. Scale inhibition: Maintain system free of scale deposit.
 - c. Inhibitor to be compatible with permanent glycol-based water solutions.
 - d. Containing no chromates or acids; providing colorless solution when mixed with water.
- D. Name Plates: Securely attached to each major item of equipment showing manufacturer's name, model number and serial number.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Fit equipment and appurtenances to space provided and make readily serviceable.
- B. Provide foundations, platforms and hangers for proper installation of equipment.

- C. Provide concrete subbases for equipment conforming to the requirements of Section 15070.
- D. Provide waste connections for water-treatment equipment as specified in Section 15205.
- E. Insulate piping and equipment in accordance with Section 15080
- F. Install condenser water treatment as per manufacturer's recommendation.

3.02 APPLICATION AND PERFORMANCE:

- A. Control chemical feed automatically in direct proportion to makeup-water flow as measured by water meter.
- B. Control bleed-off flow rate automatically by timer.
- C. Adjust composition of recirculated water chemically to control scale and corrosion without use of chromates or acids.
- D. Condenser water treatment capable of operating as high as 10 standard units.
- E. Capable of operation in the system with total dissolved solids ranging from 150mg/l to 10,000 mg/l.

3.03 FIELD QUALITY CONTROL:

- A. Chemical Tests:
 - 1. Perform chemical analysis of condensing and chilled-water system at startup of cooling tower.
 - 2. Determine chemical status of water in accordance with specified requirements.
 - 3. Upon approval of treatment, add chemicals and operate systems for 48 hours.
 - 4. Analyze solution at end of 48-hour operation and submit complete report.
 - 5. Report deficiencies in treatment to the Engineer.
 - 6. Perform total of six tests for condensing and chilled-water system during each operating year at intervals of not less than five weeks.

3.04 ADJUSTING AND CLEANING:

- A. Prior to testing equipment, flush piping systems with chemically treated water to remove scale, slag, dirt, oil, grease and foreign material.
- B. Remove and hand-clean low points and strainers.
- C. Install fine cloth around strainers during initial circulation to remove silt finer than normal strainer mesh.

3.05 CHEMICAL SUPPLY:

- A. Supply quantity of chemicals required for two years' operation, based upon 2,000 full-load operating hours per year for designed tonnage of refrigeration plant.

END OF SECTION

THIS PAGE NOT USED

SECTION 15205

PIPING SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing piping, fittings, valves, drains, specialties and supporting devices.
- B. Related Work Specified Elsewhere:
 - 1. Water distribution system: Section 02515.
 - 2. Sanitary sewer: Section 02535.
 - 3. Firestopping: Section 07841.
 - 4. Field painting: Section 09920
 - 5. Stray current and cathodic protection: Section 13110
 - 6. Corrosion control testing system: Section 13115.
 - 7. Fire protection, suppression and alarm: Section 13905.
 - 8. Identification of mechanical equipment and piping: Section 15075.
 - 9. Insulation: Section 15080.
 - 10. Grounding and bonding: Section 16060.

1.02 QUALITY ASSURANCE:

- A. Qualifications of Welder: Section 05120.
- B. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. The International Plumbing Code.
 - 3. The International Mechanical Code.
 - 4. ASSE Standards.
 - 5. AWWA Standards.
 - 6. ASME Code for Unfired Pressure Vessels.
 - 7. ANSI/ASME: A21.15/C115, B16.1, B16.3, B16.5, B16.9, B16.11, B16.18, B16.22, B16.39, B31.1, Z21.22.
 - 8. ANSI/AWS: A5.8, E8016, E8018.
 - 9. CISPI: HSN 85.
 - 10. FS: A-A-1192, SS-C-153C, WW-P-51F, WW-P-460D, WW-P-501, WW-U-516B, WW-U-531, WW-V-51F.
 - 11. MSS: SP-58, SP-67, SP-70, SP-80.
 - 12. PDI: WH-201.
 - 13. ASTM: A53, A74, A105, A126, A234, A276, A395, A536, B32, B61, B62, B88, B150, B280, B306, F709.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Shop Drawings:
 - a. Complete catalog information and shop drawings for material and equipment.
 - 2. Submittals include, but are not limited to, the following:
 - a. Pipes and piping layout, including locations of hangers and supports.

- b. Pipe hangers and supports.
 - c. Valves.
 - d. Cleanout deck plates and wall plates.
 - e. Escutcheons.
 - f. Gauges.
 - g. Expansion joints, guides and anchors.
 - h. Air eliminators.
 - i. Pipe sleeves.
 - j. Drains.
3. Certification:
- a. Certificates from manufacturers verifying the following:
 - 1) That pipe-joint gaskets and lubricants are satisfactory for use with pipe and fittings specified.
 - 2) That expansion joints are designed and tested as specified
 - b. Welding Certificates.

1.04 JOB CONDITIONS:

- A. Do not perform welding when the temperature of base metal is less than zero degree F.
- B. Do not perform welding when surfaces are wet from rain, snow, ice or during periods of high wind unless operator and work are properly protected.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
 - 1. In design and purchase of equipment, provide for interchangeability of items of piping equipment, subassemblies and parts.
- B. Piping:
 - 1. Cast-iron soil pipe and fittings:
 - a. Inside of or embedded within structures: ASTM A74, Class SV, uncoated.
 - b. Passing through underground structural elements or buried below or outside structures: ASTM A74, Class XH, uncoated.
 - c. Pipes, including embedded pipe crossing structural contraction joints, provided with modified bell and spigot joints with molded-neoprene elastic compression gaskets.
 - d. Gaskets: CISPI HSN 85.
 - e. Pipe and fittings manufactured with spigot ends plain and beveled.
 - f. Bells modified to receive gaskets.
 - 2. Steel pipe and fittings:
 - a. Seamless piping: ASTM A53, Types Grade B, hot-dip galvanized, Schedule40, provided for the following applications:
 - 1) Waste and drainage piping and fitting, 2-1/2 inches and smaller where embedded or otherwise inaccessible.
 - 2) Dry vents where embedded or otherwise inaccessible.
 - 3) Chilled-water and cooling tower water supply and return embedded or otherwise inaccessible.
 - 4) Heating hot water supply and return embedded or otherwise inaccessible.

- b. Fittings for chilled water, condenser water: ASTM A234 and ANSI/ASME B16.9 for dimensions and tolerances but not chemical properties.
 - c. Flanges: ASTM A105 and ANSI/ASME B16.5 for dimensions and tolerances.
 - d. Fittings and flanges furnished with properties equal to or greater than that of adjacent pipe.
3. Ductile-iron pipe and fittings:
- a. Embedded or otherwise inaccessible piping: ANSI/ASME A21.15/C115, 250-pound pressure class.
 - b. Piping for sewage-ejector discharge, drainage-pump discharge, interim pumps and for water service from point of connection to inside of structure: ANSI/ASME A21.15/C115, 250-pound pressure class, flanged.
 - 1) Flanges: ANSI/ASME B16.1.
 - c. Pipe coated on outside with bituminous coating and lined with cement mortar of twice standard thickness specified for pipe size used
 - 1) Cement-mortar lining having a seal coat of nontoxic, taste and odor-free bituminous material.
 - d. Neoprene gaskets furnished for joints.
4. Copper tubing and fittings:
- a. Copper tubing for potable water and for control air where embedded or otherwise inaccessible: ASTM B88, Type K, hard-drawn
 - b. Provide copper tubing for potable water, control air and pneumatic sewage-ejector compressed air where accessible: ASTM B88.
 - 1) Potable water and control air: Type M.
 - 2) Potable water and control air installed in conduit: Type K, annealed and lengths of piping 100 feet or less continuous without joints.
 - 3) Pneumatic sewage-ejector compressed air: Type K, hard-drawn.
 - c. Fittings for potable-water piping: ANSI/ASME B16.22.
 - 1) Fitting wall thickness after forming not less than that of adjacent piping.
 - d. Fittings for control-air piping: Wrought copper, solder joint except at apparatus connections where brass compression fittings furnished
 - e. Maximum pressure drop for high-pressure control-air mains: Five psi per 1,000 feet, with minimum 1-1/2 cubic feet per minute of 75-psi air flowing for each single station served and one cubic foot per minute for chilled-water plant.
 - 1) Minimum size for high-pressure control-air mains connecting chiller plants and underground stations: One-half inch ID, 5/8-inch OD.
 - f. Control-air piping graded to low points and each low point provided with 3/8-inch drain cock.
 - g. Solder joints: Lead-free 95.5-percent tin, 4.0-percent copper and 0.5-percent silver with non-corrosive flux; ASTM B32.
 - h. Size gas piping per NFPA 54 Fuel Gas Code.
5. Copper drainage tube (DWV) and fittings:
- a. Seamless tubing: ASTM B306, No. 122 for drainage, waste, and vent piping and fittings.
6. Copper tubing for refrigerant service:
- a. Seamless copper tubing: ASTM B280 for refrigeration service.
 - b. Fittings: Pure wrought copper, recessed solder joint, ANSI/ASME B16.18.
 - c. Solder joints: Brazing filler metal in accordance with ANSI/AWS A5.8 and the following:
 - 1) Copper to Copper - 12-percent Sil-Foss (no flux 1300F).
 - 2) Copper to Copper - 6-percent Dyna-Flow (no flux 1350F).
 - 3) Copper to Steel - 45 silver solder (white flux 1150F)

7. Condensate-drain pipes:
 - a. Hard-drawn copper: ASTM B88, Type L.
8. Unpolished stainless-steel drip pans:
 - a. Provided under water, waste or condensate-drain piping which run over transformer vaults or electric motor starters.
 - b. Each drip pan provided with one-inch drain.
9. Black-steel seamless pipe and fittings:
 - a. Exposed chilled water, cooling tower water supply and return piping: ASTM A53, Standard Weight Schedule 40.
 - b. Pipes 1-1/2 inch and smaller connected with socket-weld fittings or screwed fittings..
 - c. Pipes two inches and larger connected with welded fittings.
 - d. Pipes larger than 12 inches in diameter: Minimum 3/8-inch wall.
 - e. Threaded-pipe fittings: FS WW-P-501, Type I, Class B.
 - f. Welding fittings made of same schedule or weight classification as the pipe.
 - 1) Factory-made welding fittings.
 - 2) Mitered joint elbows and field-made reducers will not be permitted.
 - g. Butt-welded fittings larger than 1-1/2 inches: ANSI/ASME B16.9.
 - h. Socket-welding fittings: ANSI/ASME B16.11.
 - i. Flanges for welded piping system: ANSI/ASME B16.5, forged steel, welded-neck type, 150-pressure class.
 - j. Black-steel pipe and fittings for drainage in aboveground structures as specified in a., except Weight B piping furnished.
10. Unions:
 - a. 1-1/2 inch and smaller: Threaded, ASME B16.39, Type A or B to match piping.
 - b. Two inch and larger unions: ASTM A126, Class B, flanged.
 - 1) Two, 2-1/2 and three-inch union flanges: Steel, FS WW-U-531 or of cast iron, ANSI/ASME B16.1, 125-pound class.
 - c. Four inch and larger union: Forged steel, 150-pound class, slip-on weld-neck flanges, ANSI/ASME B16.5.
 - d. Nonferrous-piping unions: Brass, FS WW-U-516B.
11. Cleanouts:
 - a. For cast-iron bell-and-spigot pipe: SVCI, ferrule caulked into cast-iron fittings and extra-heavy brass tapered screw plug with recessed head.
 - b. For wrought-iron pipe: Extra-heavy brass plug in drainage fitting.
 - c. Floor cleanouts: Cleanouts turning up through architecturally finished floors made by means of a long-sweep ell or Y and adjustable ABS housing with secured, scoriated, round satin-brass cover.
 - d. Wall cleanouts: Cleanout plugs furnished with solid head tapped for 1/4-inch brass machine screw to secure coverplate. Coverplate to be polished-brass round access plate secured to plug with countersunk screw.
 - e. For threaded pipes: Bronze, FS WW-P-460D, Class A.
 - f. Furnished with adjustable recessed head in floor and where shown.
 - g. Except for test openings, cleanout plugs for pipes up to four inches to be same size as pipe.
 - h. On pipe sizes five inches and larger, cleanout plugs to be of four inches and pipe reduced to plug size with bushing

C. Valves:

1. Gate valves two inches or smaller:
 - a. MSS SP-80, Type 2, Class 150.
 - b. Bronze with threaded ends, rough bodies and finished trim.
 - c. Materials except handwheels: ASTM B61.

- d. Furnished with malleable-iron hand wheels.
- 2. Gate valves 2-1/2 inches and three inches
 - a. MSS SP-70, Type 3, Class 125, OS&Y flanged end, Type 1, Class 2, cast-iron bodies and bonnets.
 - b. Seat rings, disc, disc guide and stem furnished in bronze.
 - c. Outside stem and yoke (OS&Y), flanged-end connections and malleable-iron hand wheels.
- 3. Gate valves four inches and larger:
 - a. MSS SP-70, Type 2, Class 125, OS&Y, flanged end, cast-iron bodies and bonnets.
 - b. Seat rings, disc, disc guide and stem furnished in bronze.
 - c. Outside stem-and-yoke type and cast-iron hand wheels.
- 4. Globe, angle and check valves:
 - a. Two inches and smaller:
 - 1) WW-V-51F, Class B.
 - 2) Bronze with threaded ends, rough bodies and finished trim.
 - 3) Materials except hand wheels: ASTM B61.
 - 4) Globe and angle valves furnished with malleable-iron hand wheels.
 - 5) Check valves four inches and larger:
 - a) Swing-type valve seat, with iron or steel body and cap and flanged-end connections.
 - b) 150-pound class, renewable arm, disc assembly and seat ring with bronze trim.
 - c) Outside arm and weight for pump discharge check valves.
- 5. Valves for copper piping:
 - a. Gate valves with solder ends: MSS SP-80, Type 2, Class 150, Bronze, Type 1, Class B.
 - b. Gate valves with flanged ends: MSS SP-80, Type 2, Class 150, Bronze.
 - c. Globe, angle and check valves with solder or flanged ends: FS WW-V-51F, Bronze, Class B.
- 6. Pressure-reducing valves assembly:
 - a. Direct-acting type in which diaphragm and spring act directly on valve stem.
 - b. Constructed to ensure that delivered pressure does not vary more than one psi for each ten-psi variation in inlet pressure.
 - c. Wearing parts readily renewable.
 - d. Valves two inches and smaller designed for working pressure of 250 psi, brass construction except yoke connecting valve body to separate diaphragm chamber having brass cover and assembled with brass bolts.
 - e. Valves larger than two inches designed for minimum 125 psi, iron bodies and bronze trim.
 - f. Adjustable to any outlet pressure.
 - g. Gate valve and union on both inlet and outlet connections.
 - h. Provided with bypass one pipe-size smaller than main water line.
 - i. Stem-mounted pressure-reducing valve gauges, 3-1/2 inch dial, solid brass or stainless steel case and connections with T-handle stops.
 - j. Pressure-reducing valve strainer: Brass, removable without disconnecting piping.
 - 1) Strainers two inches and smaller: Brass, bodies designed for minimum working pressure of 250 psi.
 - 2) Strainers 2-1/2 inch and larger: Iron bodies designed for minimum working pressure of 125 psi
- 7. Pressure-temperature relief valves:
 - a. Temperature-and-pressure-actuated type, adjustable, bronze, single disc with bottom guide to ensure proper seating.

- b. Body, disc and base: Bronze, ASTM B62.
 - c. Spring and stem: Steel.
 - d. Lever: Malleable iron.
 - e. Pressure range from three psi to 250 psi rated and tested under ANSI/ASME Z21.22.
 - f. Temperature range: To 400F.
8. Automatic flow-control valve:
- a. Individually selected by manufacturer to automatically limit rate of flow to design capacity, regardless of system fluctuations
 - b. Selected to regulate flow within five percent of nameplate rating of system in which installed. Maximum operating differential between body tappings necessary for control not to exceed two psi.
 - c. Self-cleaning, cartridge-piston type with stainless-steel variable-area orifices.
 - d. Designed for minimum of 125 psi or 150 percent of system working pressure, whichever is greater.
 - e. Tamper proof with body tappings for connecting instruments for verifying flow-control performance.
 - f. Threaded or flanged connections as required for pipe fittings
 - g. Furnished with valve kit consisting of 1/8-inch by two-inch minimum size nipples, shutoff valves located outside of insulation and hose fittings for use with measuring instruments.
9. Refrigerant valves: UL listed.
10. Balancing cocks:
- a. Resilient-faced, eccentric-plug type designed for minimum of 125 psi or 150 percent of system working pressure, whichever is greater.
 - b. Six inches and under, wrench-operated; eight inches and over, operated by worm or spur gear.
11. Line Strainers:
- a. Water strainers, Y or basket-type, 1-1/2 inches and smaller: ASTM A126, Grade B, iron bodies with screwed connections.
 - b. Designed for minimum of 125 psi or 150 percent of system working pressure, whichever is greater.
 - c. Stainless-steel or Monel screens as follows:
 - 1) Perforations

Strainer size	Perforation size
3/4-inch to two-inch inclusive	1/32 inch
2-1/2 inch to six-inch inclusive	1/16 inch
Eight-inch to 12-inch inclusive	1/8 inch
Over 12 inches	5/32 inch

- 2) Free area of screen minimum three times area of strainer inlet pipe.
 - d. Strainer provided with 3/4- inch drain valve.
12. Backflow preventer:

- a. Reduced-pressure type with two check valves and automatically operated pressure-differential relief valve located between two check valves.
 - b. Relief valve and discharge port to drain intermediate chamber to level below supply-line inlet.
 - c. Moving parts and trim constructed of corrosion-resistant material.
 - d. Equipped with test cocks.
 - e. Conform to applicable section of ASSE and AWWA Standards.
13. Butterfly valves
- a. Provide extended necks or neck extenders to accommodate two inches of insulation.
 - b. Provide 10-position latch-lock handles.
 - c. Provide enclosed work screw operators, sizes eight inches and larger.
 - d. Provide chain wheels when above normal reaching area.
 - e. Provide adjustable balance-return stops for balancing service.
 - f. Meeting MSS SP-67.
 - g. Test shell at 225 psi.
 - h. Body:
 - 1) Wafer-type, cast iron, ASTM A126, Class B, or lug-type, ductile iron, ASTM A536 grade 60-40-18, or ASTM A395.
 - 2) To fit between ANSI/ASME B16.5 flanges.
 - 3) Bodies with integral flanges or full lugs drilled.
 - i. Seat:
 - 1) Provide ethylene-propylene-terpolymer (EPT) bonded to rigid ring providing noncollapsible and replaceable seat.
 - 2) Provide bubble-tight shutoff of 150 psi at temperatures between 25F and 225F.
 - 3) Provide O-ring as secondary seal between seat and stem.
 - j. Disc:
 - 1) Aluminum-bronze: ASTM B150.
 - k. Stem:
 - 1) Stainless steel: AISI Type 304, 316, 410 or 416.
 - 2) Isolate from contact with piped material.
14. Plug Valves:
- a. Bronze body with AGA stamp, with bronze plug and flat or square head.
 - b. ASME B16.38 and MSS Sp-78 cast iron for 2-1/2" and larger.

D. Portable Flow Meters:

- 1. Factory-fabricated case, carrying handle and fitted to hold meter securely to accommodate the following accessories:
 - a. Two 10-foot lengths of connecting hose with female connectors for venturi-tube pressure-tap nipples.
 - 1) Hose designed for minimum of 125 psi or 150 percent of system working pressure, whichever is greater.
 - 2) Completely assembled three-valve manifold with two block valves and vent and drain valves piped and mounted on base.
 - b. Set of curves showing flow versus pressure differential for each orifice or venturi tube.
 - c. Metal instruction plate, secured inside cover, illustrating use of meter.

E. Orifices and Venturis:

- 1. Stainless steel, square-edge type, mounted between pipe flanges with factory-made pressure taps.
- 2. Taps with shut-off valves and with quick-connection hose fittings for portable meters.

3. Orifice-throat diameter at specified flow and differential pressure in inches water gauge as follows:
 - a. Fall in 60 to 80 percent of full scale reading for square-root meters.
 - b. Twelve to 40 inches for linear-scale meters.
 4. Venturi size selected with design flow rate between 10 and 40 inches of water-pressure differential.
 - a. Permanent pressure loss: 25-percent maximum of indicated flow-rate differential pressure.
 5. Flow-metering equipment: Supplied by same manufacturer.
- F. Thermometers:
1. Dial-type, chromium-plated case, remote or direct-type bulb with accuracy of plus-or-minus one degree.
 - a. Three-inch minimum dial with white face and black digits, graduated in two-degree increments.
 2. Liquid-in-glass thermometers.
 3. Thermometer ranges suitable for service at not less than 20 degrees above controlled temperature settings.
- G. Thermometer Wells:
1. Stainless steel with portions surrounding bulbs not over 1/16-inch thick, designed to hold engraved-stem thermometer.
 2. Six inches projecting two inches into pipe with dust-excluding caps with gaskets and chains.
 3. Pipe smaller than 2-1/2 inches enlarged where wells are located.
 4. Set vertical or at angle to retain oil.
- H. Gauges:
1. ASTM F709, Class 1, 2 or 3, Style A, Type I or III with metal case.
- I. Shock Absorbers:
1. Constructed of stainless steel, precharged with nitrogen, argon or pneumatic pure glycerine and permanently sealed.
 2. Provided on cold-water supply piping to flush-valve water fixtures.
 3. Provided on hot and cold supply piping to lavatories and mop service basins.
 4. Certified to meet requirements of PDI WH-201.
- J. Expansion Joints:
1. General:
 - a. Designed for 150 psi and 200F for systems operating at 100 psi or less.
 - b. Provide expansion joint traverse with 150 percent of pipe expansion resulting from temperature variation of 80F.
 - c. Provide corrugated-bellows expansion joints for pipe expansion of 1-1/2 inches or less, minimum of 200 percent of expansion.
 - d. 1-1/2 inches and smaller, threaded ends; two inches and larger, flanged ends.
 2. Flexible ball joints:
 - a. Carbon steel, providing 360 degrees rotation plus 15 degrees minimum angular-flexing movement, furnished with asbestos-composition gaskets, steam-molded in steam-heat presses.
 3. Corrugated-bellows expansion joints:
 - a. Bellows constructed of single-ply or multiple-ply, formed, corrugated stainless steel for pipe sizes smaller than three inches.

- b. Self-equalizing type with equalizing or reinforcing rings, internal-telescoping stainless-steel or Monel sleeves, removable steel housing to protect bellows and support insulation.
 - c. Corrugated element: Seamless tubing or of single sheet of metal rolled into cylinder having one longitudinal seam for sizes up to 16 inches.
 - d. Joints 2-1/2 inches and smaller: Internal guides and limit stops.
4. Designed for a minimum life of 5,000 full-rated traverse cycles when tested at specified pressures and temperatures.

K. Supporting Devices:

- 1. Pipe hangers and supports:
 - a. Provide adjustable steel pipe hangers and supports as follows:
 - 1) Clevis and clamp, cadmium-plated or zinc-plated: MSS SP-58, Type 1 and Type 8 for steel and cast-iron piping.
 - 2) With cast-iron roller and sockets: MSS SP-58, Type 41 for chilled-water piping.
 - 3) Space not greater than six feet for pipe sizes up to and including 1-1/2 inches; 10 feet for pipe sizes two inches through six inches; 16 feet for pipe sizes eight inches and larger
 - b. Pipe hangers for copper tubing: Steel, copper-plated, clevis-type, spaced at maximum five feet for tubing sizes through 1-1/2 inches and maximum eight feet for sizes two inches and larger.
 - c. Hanger rods minimum diameter 3/8 inch, constructed of steel, cadmium-plated, threaded full-length and diameter required by pipe size and load imposed.
 - d. Hanger rod nuts and washers: Steel, cadmium-plated.
 - e. Supported from malleable-iron, hot-dip galvanized inserts in concrete slab: MSS SP-58, Type 18.
 - f. Pipe hangers and supports in tunnels and shafts: MSS-SP-58, stainless steel, ASTM A276, Type 304.
- 2. Pipe rolls, plates and stands:
 - a. Cast iron: MSS SP-58, Types 44, 45, and 46.
 - 1) Adjustable types selected for piping require grading after setting in place.
 - b. Protection saddles for support piping: MSS SP-58, Type 39, welded to pipe.
- 3. Pipe anchors:
 - a. Designed to withstand five times anchor load minimum.
 - b. Vertical pipes anchored by means of clamps welded around pipes and secured to wall or floor construction.
- 4. Pipe guides:
 - a. Factory-made cast semi-steel or heavy fabricated galvanized steel, consisting of bolted two-section outer cylinder and base with two-section guiding spiderbolted or welded tight to pipe.
 - b. Designed to clear pipe insulation and to prevent overtravel of spider and cylinder.
 - c. Guides not less than 12 inches long and spiders not less than the following:

Pipe size/ inches	Spider length/ inches
1-1/2 and smaller	2
2 to 3	2-1/2
4	3
5 and larger	3-1/2

5. Expansion bolt anchors:
 - a. Consisting of bolt, expander, star lock washer and nut.
 - b. Fabricated of stainless steel, Type 303, including expander and star lock washer.
 - c. Anchor assemblies: FS: A-A-1992, Group II, Type 4, Class 1.
6. Self-drilling anchors:
 - a. Self-drilling expansion anchors, with self-cutting annular broaching grooves.
 - b. Anchor and expander plug: FS: A-A-1992, Group III, Type 1, double-plated.
7. Pipe sleeves:
 - a. Through interior masonry-unit walls: As shown. Sleeve to be large enough to accommodate pipe and covering but not less than two sizes larger than pipe size.
 - b. Through poured-concrete interior walls, floors and ceiling: As shown.
 - 1) Sleeves minimum two sizes larger than pipe. At floors, sleeves to project four inches above finish floor.
 - c. Through exterior structural elements: Minimum two sizes larger than pipe and as shown.
 - d. Sleeves designed to allow expansion/contraction movement of pipe.
8. Escutcheon plates:
 - a. Polished brass or stainless steel, screw-fastened to wall or ceiling.
 - b. Plate collars caulked watertight with mastic.
 - c. Mastic: FS SS-C-153C, Type I.

L. Drains:

1. Area drains:
 - a. Cast iron with flashing flange and flat grate for entrance areas.
 - b. Outlets designed for connection to cast-iron soil pipe.
 - c. Drain sizes and types as shown.
 - d. Clamping devices: For securing membrane or flashing for drains installed in membrane-waterproofed floors and in floors not laid on ground.
2. Floor drains:
 - a. Cast iron with flashing flanges and bottom or side outlet as required and designed for connection to cast-iron soil pipe.
 - b. Clamping devices: For securing membranes or flashing, for drains installed in membrane-waterproofed floors and in floors not laid on ground.
 - c. Reinforced-neoprene flashing: For drains installed in floors that are not membrane-waterproofed and are not laid on ground.

- d. Flashing of reinforced sheet neoprene, secured to drain by clamping device and extending 12 inches minimum from drain to ensure watertight connection.
 - e. Area, yard and floor drains in public spaces having finished brass grates.
 - f. Floor-drain sizes and types as shown.
3. Roof drains:
- a. Cast iron having integral flange and a clamping device for securing the roof covering to make a watertight connection.
 - b. Drains for promenade roofs with removable, loose-set, round flat grate in square frame secured to non-puncturing flashing clamp collar with weep holes and for two inch or more roof fill.
 - c. Other roof drains furnished with cast-iron beehive or dome-shaped strainer.
 - d. Openings in each strainer having a combined-area minimum twice the area of drain outlet.
 - e. Each drain outlet having same size as downspout and with parts to make watertight connection to threaded pipe or cast-iron pipe as required.
 - f. Meeting requirements shown.
4. Canopy drains (Roof Drain - Type 5):
- a. Ductile iron: ASTM A536, Grade 65-45-12.
 - b. 30 square inches minimum grate free area.
 - c. Removable gratings, contoured to match opening in concrete rib and as shown.
5. Grease and Sand/Oil Interceptor:
- a. See Specification Section 15155.

M. Air Separators:

- 1. Provide in-the-pipeline air separators with tangential openings for water in and out.
- 2. Design to create low-velocity vortex for internal separation of free air from water stream.
- 3. Size according to size of connecting pipeline as shown.
- 4. Equip with two-inch blowdown connection located at bottom of separator.
- 5. Equip with 1-1/4 inch minimum compression tank connection located at top of tank.
- 6. Tank:
 - a. Size as shown and rated at 125-psi working pressure.
 - b. Construct of carbon steel and in accordance with ASME Code for Unfired Pressure Vessels and so certified and stamped.
- 7. Strainer:
 - a. Stainless steel with perforations sized for water flow.
 - b. Install in location to assist in separation of air.
 - c. Removable from bottom of separator.
 - d. Insulation: Section 15080.

N. Coal-Tar Epoxy Coating: Section 02535

PART 3 - EXECUTION

3.01 INSTALLATION

A. Welding Procedure:

- 1. Perform welding by manual metallic arc-process except for pipe sizes four inches and smaller where gas welding (oxyacetylene) may be used.
 - a. Use electrodes and rods of composition recommended for pipe by AWS.

- b. Heat surface within three inches from point where weld will start to temperature warm to the hand before welding.
 2. Weld corrosion-resistant nickel-copper alloy steel pipe by arc-process utilizing low-hydrogen electrodes of AWS E8016 or E8018 types
 3. Leave joint surfaces smooth, uniform, free from fins, tears and other defects which adversely affect proper welding.
 4. After each pass of weld on multiple-pass welding, clean weld free of slag and other deposits before applying next pass.
 5. Peen with light blows of blunt-nosed peening hammer.
 - a. Do not peen surface layers or first pass in groove welds.
 6. For groove welds, have surface pass substantially centered on the seam, smooth and free from depressions.
 7. Perform fillet-welds with minimum cutting back of outside pipe.
 - a. Leave throat of full fillet-weld not less than 0.707 of thickness of pipe.
 - b. Repair excess cutting back and undercutting of base metal in pipe adjoining weld.
 - c. Fill up craters to full cross section of weld.
 - d. Align and position accurately joints to be welded, so that pipe will not project beyond its adjoining pipe by more than 20 percent of pipe wall thickness or 1/8-inch maximum.
 - e. Install welded pipe in accordance with ANSI/ASME B31.1.
- B. Soil, Waste, Vent and Drainage-Piping Installation
1. Grade piping to 1/4 inch per foot and not less than that of main drain to which it is connected.
 2. Use reducers to change pipe sizes on vent and drain lines.
 3. Use long-sweep bends, Y-fittings, 1/8 or 1/16-bends, or combination Y and 1/8-bends to make changes in direction.
 4. Join service-weight soil pipe and fittings with service-weight gaskets and extra-heavy soil pipe and fittings with extra-heavy gaskets.
 - a. Designate and clearly identify service-weight and extra-heavy gaskets.
 - b. Use lubricant for making joints.
 - c. Make tight seal between external face of pipe and internal face of bell.
 - d. Use gaskets capable of making and maintaining tight seal with deflection not exceeding five degrees.
 - e. Assemble joints by use of tools recommended by pipe, fittings and gasket manufacturers.
 - f. Employ trained workmen experienced in installation of gasket system to install entire gasket system.
 5. Install embedded cast-iron piping at angle of 90 degrees to contraction joints with end of pipe bell coinciding precisely with centerline of contraction joint.
 6. Cut ends of screw jointed pipes squarely to seat in bottom of recess of fittings and ream after cutting so waterway is not reduced in size.
 7. Apply thread dope or compound to male thread only,
- C. Buried Ductile-Iron Pipe:
1. Install pipe with mechanical joints and neoprene gaskets and stabilize by use of thrust blocks.
 2. Thrust blocks: Section 02515.
- D. Potable-Water System Installation:
1. Connect and install service water piping, sizes as shown, to fixtures, equipment and outlets.

2. Install water meter in accordance with requirements of local water authority and provide the following valves:
 - a. Main shut-off gate valve inside service room ahead of water meter.
 - b. Drain with globe valve and hose nipple for 3/4-inch hose installed on house side of meter.
3. Pipe or tubing free from cuts, dents and other surface damage. Remove damaged pipe and replace with new pipe or tubing.
4. Cut square and ream ends of copper tubing.
5. Tubing ends to extend full depth of fitting recesses without binding.
6. Use lead-free 95.5-percent tin, four-percent copper and 0.5-percent silver solder with non-corrosive flux; ASTM B32.
7. Ream and clean ends of threaded pipes before assembling with fittings and apply approved joint compound to pipe thread only
8. Make connections to equipment and fixtures without undue strain.
9. Run horizontal piping with minimum pitch of one inch in 40 feet and arrange for drains at low points.
 - a. Install drain valves and hose nipples not smaller than 3/4 inch at low points.
10. Connect nonferrous piping to ferrous piping with dielectric couplings.
11. Install pressure-reducing valves where main water pressure exceeds 60 psi to maintain pressure of 15 psi at most remote fixture.

E. Control-Air Piping Installation:

1. Do not run piping concealed under duct insulation, inside of ducts or in direct contact with surfaces colder than normal room temperature

F. Steel-Pipe Installation:

1. Weld embedded pipe and install so that pipe will not penetrate construction joints or structural contraction joints.
2. Install horizontal piping with minimum pitch of one inch in 40 feet and arrange for drains at low points.
 - a. Install drain valves and hose nipples not smaller than 3/4 inch at low points.
3. Install high-capacity automatic air vents at high points, designed for 125 psi and suitable for operation on pressures under 125 psi.
 - a. Pipe air-vent outlet to floor drains.
4. Pipe drip pan to discharge as shown; if not shown, discharge to nearest open drain.
5. Provide flexible connections to coils, pumps and other equipment so as to eliminate undue strains in piping and equipment.
6. Install condensate-drain lines for each air-handling unit with pitch of 1/4 inch per foot in the direction of flow.
 - a. Run drain lines to nearest open drain.
 - b. Do not exceed 400 feet maximum length of pipe between anchor and expansion joint or 90-degree offset.
7. Do not support embedded pipe from reinforcing bars with metallic means.

G. Expansion-Joint Installation:

1. Field set expansion joints for position corresponding to ambient temperature at time of installation.
2. Setting based on manufacturer's calibration data furnished with expansion joints.
3. Do not use corrugated-bellows expansion joints where exposed in train tunnels.
4. Install ball joints in accordance with approved published recommendations of manufacturer.
5. Do not use shims or steel spacers.

H. Pipe Anchors:

1. Securely anchor piping where shown and where necessary for proper installation to force pipe expansion in proper direction.
- I. Expansion-Bolt Anchors:
 1. Drill holes and install expansion-bolt anchors as recommended by anchor-bolt manufacturer. Do not locate less than eight inches from concrete edge.
 - J. Pipe Sleeves:
 1. Exterior walls:
 - a. Install as shown.
 - b. For cathodically protected pipe, test in accordance with Section 13115.
 2. Interior walls:
 - a. Install as shown. Seal to maintain integrity of walls.
 - K. Plumbing-Fixture and Equipment Connections:
 1. Make connections to wall-hung water closets and urinals with adjustable flanged nipples secured to chair supports, wax rings and rubber or impregnated-felt gaskets.
 2. Face plate of carrier not more than six inches from back of finish wall.
 - L. Drains:
 1. Install floor drains with traps.
 - M. Air-Separator Installation
 1. Install air separator on suction side of chilled-water pump and as near to pump as practicable.
 2. Install dead-level in both directions and support from structure so that pipe can be removed without moving air separator.
 3. Install two-inch drain line, equipped with gate valve and union, from blowdown connection to nearest drain.
 - N. Attachments to Prestressed-Concrete Girders:
 1. Attach pipes and similar items to prestressed girders by welding to embedded plates or bolting to embedded fittings. Drilling into prestressed girders is prohibited, except as shown.
 - O. Refrigeration Copper Tubing Installation:
 1. Before heating joints, force nitrogen or carbon dioxide into the system.
 2. Sweat each copper tubing installation joint in accordance with standard accepted practice.
 - P. Bonding: In accordance with Section 16060, and with the following additional requirements:
 1. Bond mechanical joints and fittings, including valves, by exothermic-welding method.
 2. Make welds in accordance with recommendations of the manufacturer. Clean and coat with coal tar epoxy.
 3. Bond pipe using bonding strap welded to each side of joint not less than six inches from joint. Allow sufficient slack in conductor for expansion of pipe.
 - Q. Firestopping: Section 07841.
 1. Pipe penetration through fire rated partitions to be sealed with approved fireproof sealant.

3.02 PROTECTION OF PIPING AND EQUIPMENT:

- A. Protect pipe, openings, valves and fixtures from dirt, foreign objects and damage during construction.
- B. Replace damaged piping, valves, fixtures and appurtenances.
- C. Prior to testing, flush piping with chemically treated water until systems are clean and free of scale, slag, dirt, oil, grease and other foreign material.
- D. Hand-clean expansion joints and strainers.
- E. Coal-Tar Epoxy Coating for Protection of Ferrous Piping: Apply as specified in Section 02535 and test as specified in Section 13115.

3.03 FIELD QUALITY CONTROL:

- A. Water-Pressure Testing:
 - 1. Prior to burial or concealment, test affected piping in presence of the Engineer using specified procedures.
 - 2. Test entire piping systems and test until found leak-free in presence of and to satisfaction of the Engineer.
 - 3. Notify the Authority at least 36 hours in advance of making tests.
 - 4. Test piping at following pressures:
 - a. Soil, waste and vent piping: Requirements of local plumbing code but not less than equivalent to ten feet of water.
 - b. Chilled-water and condenser-water piping embedded or otherwise inaccessible: 400-psi minimum.
 - c. Ductile-iron pipe: 150 psi or 1-1/2 times maximum working pressure, whichever is greater, at lowest point in system.
 - d. Potable-water piping: 1-1/2 times operating pressure but not less than 100 psi at topmost outlet.
 - e. Chilled-water and condenser-water piping, exposed and accessible: 150 psi or 1-1/2 times maximum working pressure, whichever is greater, at lowest point in system.
- B. Test Procedures:
 - 1. Soil, waste and vent piping:
 - a. Water test to include entire system from lowest point to highest point.
 - b. After filling system, shut off water supply and allow it to stand two hours without loss or leakage.
 - c. Conduct final test by smoke test or peppermint test as prescribed by jurisdictional authority.
 - 2. Chilled-water and condenser-water piping embedded or otherwise inaccessible:
 - a. Avoid excessive pressure on safety devices and mechanical seals.
 - b. Fill entire system with water and vent air from system at least 24 hours before test pressure is applied.
 - c. Apply test pressure when water and average ambient temperatures are approximately equal and constant.
 - d. Maintain test pressure for minimum of six hours without drop after force pump has been disconnected.
 - e. Visually inspect joints while pipe is under test pressure.
 - 3. Ductile-iron pipe and black-steel piping:

- a. Use procedure specified for chilled-water and condenser-water piping embedded or otherwise inaccessible.
 - 4. Potable-water piping:
 - a. Use procedure specified for chilled-water and condenser-water piping embedded or otherwise inaccessible, except tests may be conducted in sections as long as no pipes or joints are left untested. Air Testing:
- C. Control-air piping:
 - 1. Test main air piping at minimum of 150 psi and maintain pressure for one hour without pumping.
 - 2. Test low-pressure air piping at minimum of 30 psi and maintain pressure for one hour without pumping.
 - 3. Correct leaks by remaking joints.
- D. Pressure Testing:
 - 1. Refrigerant piping: Test at 300 psi on high side and 150 psi on low side.
 - a. Maintain pressure for minimum of 12 hours.
 - b. Use electronic leak detector to check leaks, after soap-bubble test.
- E. Repair of Leaks
 - 1. Do not repair by mechanical caulking leaks in threads or welds occurring while pipeline is under test or in service.
 - 2. Introduction into piping system of material intended to stop leakage is prohibited.
 - 3. Repair leaks in threaded piping by breaking joint, cutting new threads on pipe and installing new pipe fitting.
 - 4. Remove defective welds by chipping or gas gouging from one or both sides of joint.
 - a. Reweld chipped-out places.
 - b. When base metals of fillet-weld are cut back or throat of weld is less than specified, repair defect by adding additional weld metal.

3.04 DISINFECTION:

- A. Adjust and Clean:
 - 1. Flush entire hot and cold-water piping and other piping and equipment connected downstream from the domestic-water inlet main shutoff valve with water to remove sediment after completion of tests, replacements or repairs.
 - a. Use chlorine for disinfection in form of hypochlorite solution or in form of compressed gas applied through approved chlorinator.
 - b. Operate valves and equipment during chlorination to ensure that chlorine reaches entire system.
 - c. Feed water and chlorination agent into system at rate providing for 50 ppm of chlorine and allow to stand 24 hours before flushing.
 - d. Residual chlorine at end of 24-hour retention period: Two-ppm minimum.
 - 2. Flush treated water from system completely after disinfection.
 - 3. Continue flushing until samples show that quality of water delivered is comparable with public water supply and satisfactory to jurisdictional public-health authority.
 - 4. Do not take samples from hydrants or through unsterilized hose.

3.05 FIELD PAINTING:

- A. Paint exposed soil and waste pipe lines in accordance with Section 09920.

END OF SECTION

SECTION 15410

PLUMBING FIXTURES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing plumbing fixtures, including emergency-eyewash and body-spray facilities.
- B. Related Work specified Elsewhere:
 - 1. Piping Systems: Section 15205

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. FS: WW-P-541/GEN, A-A-1154.
 - 3. ASMEA112.19.2M
 - 4. ADA.
 - 5. ANSI: Z358.1.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: Include manufacturer's data for each model indicated, including finishes, furnished specialties, and accessories.
 - 2. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, required clearances, method of field assembly, components, and location and size of each field connection.
 - 3. Certification.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Ship products securely packaged and labeled for safe handling in shipment and to avoid damage and distortion.
- B. Mark each item permanently and legibly with manufacturer's name, brand, reference specification, type, class and other pertinent information as applicable.
- C. Store products in a secure, dry storage facility.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. Plumbing Fixtures:
 - 1. General requirements:
 - a. Fixtures manufactured of twice-fired vitreous chinaware of best quality, nonabsorbent and burned so that whole mass is thoroughly fused and vitrified producing material white in color, which when fractured will show homogenous mass, close-grained and free from pores.
 - b. Brass fittings, faucets, traps and exposed piping, chrome-plated over nickel plate, with polished finish.
 - c. Brass pipe, chrome-plated over nickel plate and provided with heavy cast-brass escutcheons and set screw plated to match pipe at fixtures passing into floors, walls or partitions.
 - 2. Water closet:
 - a. Wall-hung, flush valve, siphon jet, vitreous china: ASMEA112.19.2M.
 - 3. Urinal:
 - a. Wall-hung, flush valve, washout-type, vitreous china: ASMEA112.19.2M
 - 4. Lavatory:
 - a. Vitreous china: FS WW-P-541/GEN.
- B. Fixture Supports:
 - 1. Supports for wall-hung water closets, urinals and lavatories: FS WW-P-541/GEN.
 - 2. Supports of metal, concealed in building construction. Fixtures rigidly supported from floor by means of one or more heavy extensions or feet built into floor.
- C. Mop Service Basin:
 - 1. One-piece precast terrazzo, approximate size 36 inches by 24 inches by six inches high.
 - 2. Terrazzo made of marble chips, cast in grey portland cement to produce minimum seven-day compressive strength of 3,000 psi.
 - a. Terrazzo surfaces ground with holes and pits grouted.
 - b. Excess grout removed and surfaces polished
 - 3. Stainless-steel bumpers furnished for exposed sides of basin.
 - 4. Drain body of chrome-plated brass, cast integral with basin and provided for inside neoprene joint connection two inches minimum depth to three-inch pipe.
 - 5. Chrome-plated service faucet with vacuum breaker, integral stops, adjustable wall brace, pail hook and 3/4-inch hose thread on spout.
- D. Vacuum Breakers:
 - 1. Chrome-plated brass sized to provide minimum air area equal to piping served and approved by local jurisdictional authorities
- E. Traps:
 - 1. Plain-pattern type having seal minimum of 2-1/2 inches and maximum four inches.
 - 2. 1-1/2 inch and two-inch traps: Heavy cast brass.
 - 3. All other size traps: Same material as specified for piping system to which they are connected.
 - 4. Fixture traps: As specified under plumbing fixtures, and insulated in accordance with ADA guidelines..

F. Emergency Eyewash Fountain and Body Spray:

1. In accordance with ANSI Z358.1.
 - a. Permanent type:
 - 1) Equipped with automatic pressure and volume-control devices to ensure safe and steady water flow under varying pressures.
 - 2) Wall-mounted, with functional parts constructed of corrosion-resistant materials and as follows:
 - a) Eyewash fountain: Twin chrome-plated brass eyewash heads, angled to direct flow of water into eyes and ocular area of face and mounted in stainless-steel bowl.
 - b) Body spray: Chrome-plated brass spray head and wall bracket. Spray head mounted on heavy-duty rubber hose.
 - 3) Operated by valves of the following types:
 - a) Eyewash fountain: Push-flag operating handle on stay-open valve.
 - b) Body spray: Quick-opening, chrome-plated, hand-squeeze level valve.
 - 4) Eyewash fountain and body spray equipped with pedal-operated and self-draining freeze proof valve.
 - 5) Water filter:
 - a) Made of FDA-approved polypropylene with disposable FDA-approved viscose-fiber filter media capable of removing particles larger than 20 microns.
 - b) Capable of withstanding rate of flow of seven gpm and working pressure of 200 psi at 100F.
 - 6) Shield: Fabricated as specified for toilet partition: Section 10155.
 - b. Portable type
 - 1) ASME rated 5-gallon stainless steel pressure tank.
 - 2) Equipped with built-in carrying handles, resilient bottom, pressure relief valve, tire filler valve and air pressure gauge.
 - 3) Furnished with twin chrome plated brass eye wash heads with automatic flow control and stay-open valve, with eight foot hose with hand held squeeze type valve and full size spray nozzle.
 - 4) Flow: 7-1/2 minutes from eye wash and 2-1/2 minutes from hose spray.
 - 5) Size: 25 inches tall and 26 inches circumference.
 - 6) Weight: 12 pounds empty and 42 pounds full.
 - 7) Chrome plate all metal parts.

G. Showers

1. Comply with the following applicable standards and other requirements specified for shower faucets:
 - a. Backflow Protection Devices for Hand-Held Showers: ASME A112.18.3M.
 - b. Combination, Pressure-Equalizing and Thermostatic-Control Antiscald Faucets: ASSE 1016.
 - c. Deck-Mounted Bath/Shower Transfer Valves: ASME 18.7.
 - d. Faucets: ASME A112.18.1.
 - e. Hand-Held Showers: ASSE 1014.
 - f. High-Temperature-Limit Controls for Thermal-Shock-Preventing Devices: ASTM F 445.
 - g. Hose-Coupling Threads: ASME B1.20.7.
 - h. Manual-Control Antiscald Faucets: ASTM F 444.

- i. Pipe Threads: ASME B1.20.1.
- j. Pressure-Equalizing-Control Antiscald Faucets: ASTM F 444 and ASSE 1016.
- k. Sensor-Actuated Faucets and Electrical Devices: UL 1951.
- l. Thermostatic-Control Antiscald Faucets: ASTM F 444 and ASSE 1016.
- 2. Comply with the following applicable standards and other requirements specified for miscellaneous fittings:
 - a. Atmospheric Vacuum Breakers: ASSE 1001.
 - b. Brass and Copper Supplies: ASME A112.18.1.
 - c. Dishwasher Air-Gap Fittings: ASSE 1021.
 - d. Manual-Operation Flushometers: ASSE 1037.
 - e. Plastic Tubular Fittings: ASTM F 409.
 - f. Brass Waste Fittings: ASME A112.18.2.
- 3. Comply with the following applicable standards and other requirements specified for miscellaneous components:
 - a. Flexible Water Connectors: ASME A112.18.6.
 - b. Floor Drains: ASME A112.6.3.
 - c. Grab Bars: ASTM F 446.
 - d. Hose-Coupling Threads: ASME B1.20.7.
 - e. Pipe Threads: ASME B1.20.1.
 - f. Plastic Shower Receptors: ANSI Z124.2.
 - g. Supply and Drain Protective Shielding Guards: ICC A117.1.
- 4. Shower Faucets:
 - a. Description: Single-handle thermostatic/pressure-balance valve for shower. Include hot- and cold-water indicators; check stops; and shower head, arm, and flange. Coordinate faucet inlets with supplies; coordinate outlet with diverter valve.
 - (1) Body Material: Per Wamata Standards
 - (2) Finish: Per Wamata Standards
 - (3) Maximum Flow Rate: Per Wamata Standards
 - (4) Diverter Valve: Integral
 - (5) Mounting: Wall
 - (6) Operation: Compression, manual.
 - (7) Antiscald Device: Integral with mixing valve
 - (8) Check Stops: Check-valve type, integral with or attached to body; on hot- and cold-water supply connections.
 - (9) Supply Connections
 - (10) Backflow Protection Device for Hand-Held Shower
 - (11) Shower Head Type:
 - (12) Shower Head Material:
 - (13) Spray Pattern:
 - (14) Integral Volume Control:
 - (15) Shower-Arm Flow-Control Fitting
- 5. Shower Receptors
 - a. Description: Per WMATA Standards.
 - (1) Type: Standard, residential & Handicapped/wheelchair.
 - (2) Size: per ADA
 - (3) Color: per AHJ.
 - (4) Outlet: Drains per IPC.

H. Electric Water Cooler: FS A-A-1154, minimum capacity 4.75 gallons per hour, Type 1 or Type 2 dispenser, temperature not more than 60F at 15 minute period, bubbler-style, air cooled,

wall-hung, System T, for operation on 120-volt ac, 60-Hertz power. Dispenser not exceeding 18 inches in depth, with up-front spouts and controls; and complying with the ADA.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Protection of Fixtures:

1. Protect plumbing fixtures from dirt, foreign objects and damage during construction period.
2. Do not use warped or otherwise imperfect fixtures.
3. Do not use installed fixtures for any purpose, except testing, prior to final acceptance by the Authority.
4. Replace damaged and defective fixtures.
5. Install vacuum breakers on water supply-piping connections to fixtures and equipment in accordance with requirements of jurisdictional authorities.

B. Chair supports adjusted so that heights of fixtures above finished floor are as follows:

1. Water closet: 18 inches to top of earthenware.
2. Urinal: 17 inches to top surface of lowest part of lip.
3. Lavatory: 31 inches to top of rim.
4. Handicapped lavatory: 29-1/2 inches clear under apron.

C. Emergency-Eyewash and Body-Spray Facilities:

1. Install in locations shown and as follows:
 - a. Install water-supply line connecting facilities to water service.
 - b. Install filter on water-supply line at readily serviceable location.
 - c. Install drain line connecting facilities to drainage system as shown.
 - d. Install freeze-proof valve a minimum of 42 inches below grade.
 - e. Install portable type where shown.

D. Electric Water Cooler:

1. Install in locations shown and with top of spout 36 inches above floor.

END OF SECTION

THIS PAGE NOT USED

SECTION 15445

SEWAGE EJECTORS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing complete triplex dry pit submersible vertical electric sewage ejector.
- B. Related Work Specified Elsewhere:
 - 1. Piping Systems: Section 15205
 - 2. Control Equipment: Section 15900
 - 3. Miscellaneous Pumps: Section 15135
 - 4. Grounding and Bonding: Section 16060
 - 5. Wire, Cable and Busways: Section 16120
 - 6. Conduit, Raceway and Boxes: Section 16130
 - 7. Wiring and Control Devices: Section 16145
 - 8. Motors: Section 16225
 - 9. Motor Starters and Control Devices: Section 16425
 - 10. Circuit Breakers Panelboards and Load Centers: Section 16440

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications.
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ASME code.
 - 3. ASTM: A48, E527.
 - 4. NEMA.
 - 5. P-MSHA.
 - 6. UL.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Shop Drawings:
 - a. Submit complete catalog information and shop drawings for material and equipment including wiring and control diagrams.
 - 2. Certification.
 - a. Manufacturer's certified test reports.
 - 3. Operation and Maintenance Manuals.
 - a. Submit for each drainage pumping system.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
 - 1. In design and purchase of equipment, provide for interchangeability of piping subassemblies, parts, motors, starters and relays.

B. Dry Pit Pumping System:

1. Pumps:

- a. Triplex type, vertical dry-pit, non-clog sewage water pumps and motors as shown on pump schedule.
- b. Castings fabricated of gray cast iron with stainless steel wear rings and external nuts and bolts, conforming to ASTM A48 Class 30.
- c. Impeller: One piece, single suction, fully enclosed, vane-type, conforming to an ASTM A48 Class 30, non-clog design capable of passing minimum three-inch diameter solids statically, balanced and secured directly and straight motor shaft.
- d. Seals: Tandem double mechanical seals running in oil reservoir; lower seal composed of two separate carbon or ceramic lapped face rings. Protect lower compression spring against exposure to pumped liquid.
- e. Provide a pump which rotates on a minimum of two bearings permanently lubricated but capable of being regreased, suitable for a minimum L10 bearing life of 40,000 hours.
- f. Provide a heavy duty fabricated steel base with openings for access to the suction elbow and cleanout bolted directly to the volute. Provide a base which supports the assembled weight of the pump and driver. Furnish a cast iron elbow with 1/4-inch gauge connection, contoured hand hole clean out, and a 125-pound flat faced flange conforming to ANSI drilling.
- g. Provide a volute of one piece circular design with smooth fluid passages large enough to pass any solid that can pass through the impeller, made of close-grained cast iron conforming to ASTM A48 Class 30. The volute is to be side flagged tangential discharge, and capable of rotation in 45 increments to accommodate piping orientation. The volute is to have large cleanout openings located at the impeller centerline. Provide volute priming drain and 1/4-inch minimum gauge connections. Provide 125-pound flat faced flanges in accordance with ANSI drilling. Provide for removal of the rotating assembly without disturbing the suction or discharge piping. Hydrostatically test the casing to 1.5 times the design head or 1.25 times the shutoff head, whichever is greater.

2. Pump Motors: Section 16225, with the following additional requirements:

- a. 1,750 rpm maximum; 460-volt tolerance; plus or minus 10 percent nameplate-value voltage; non-overloading at all points of pump curve with cooling characteristics for continuous operation and with thermal-overload protection.
- b. Submersible as defined by the air-filled cast iron watertight enclosure.
- c. Shaft: Alloy S41600 stainless steel in accordance with ASTM E527; the rotor dynamically balanced to meet NEMA vibration limits; hardware stainless steel.

3. Controls: Control system components to be supplied by the pump manufacturer.

- a. Liquid-level controllers of direct acting float, mercury switch sensors for pump control and HIGH level indicators. Pump controls pint elevations and fully automatic operational sequence to reach pump as shown. HIGH level alarm indication system to be independent from pump control.
- b. Panel: Triplex pump control panel, in NEMA I, wall-mounted enclosure as shown. Provide surveillance for malfunction. Provide space for each pump motor starter.
- c. Motor starter: In accordance with Section 16425, with HAND/OFF/AUTO selector switch.
- d. Provide automatic electric alternator with triplex pump control panel.
 - 1) Solid state, plug-in type.

- 2) Independent ON, common OFF operation.
 - 3) Relay rating: Heavy-duty, 10 amperes, 250 volts.
 - e. HIGH level indication relays.
 - f. Float switches: Direct automatic float switches with Alloy S31600 stainless steel in accordance with ASTM E527, 5-1/2-inch diameter housing; mounting clamps and attached cables. Capable of detecting level changes of one inch from reset position, and suitable for mounting to one-inch stainless steel vertical pipe.
 - g. Provide local high-motor-temperature indicator light.
 - 4. Sequence of operation:
 - a. As the liquid level rises in the wet well have SE-1 energize as the lead pump float switch rises, and deenergize at the off level/lowering of the float switch.
 - b. On the next cycle, have SE-2 energize and proceed as described for SE-1.
 - c. On the following cycle, have SE-3 proceed the same as described above.
 - d. Program SE-1, SE-2 and SE-3 to alternate each cycle and program the other pumps to be first lag pump on and second lag pump on. The sequence is as follows:

1st Cycle	SE-1, SE-2, SE-3
2nd Cycle	SE-2, SE-3, SE-1
3rd Cycle	SE-3, SE-1, SE-2

 Normal operation = one pump per load only.
 - e. If the water level continues to rise after the first pump has energized and due to clog or mechanical failure, have SE-2 energize and trigger alarm at the first lag pump input; and if the water continues to rise due to second pump failure, then have SE-3 energize and activate alarm at the second lag pump input.
 - f. Program two more alarm inputs for indication functions.
 - g. Make low-level and high-level alarms independent of pump control and activated as required.
 - 5. Wiring:
 - a. Wiring and conduit: Sections 16130 and 16120. Cable racking in upper room and below floor slab.
 - b. Wiring for controls and motors by pump system equipment manufacturer.
 - c. Auto transformer, pump starter control panel wired from transfer switch, as shown.
 - d. Pump-motor cables: Suitable for submersible-pump application with P-MSHA approval demonstrated by code or legend permanently embossed on cable, 25 feet per pump, strain-relieved within pump junction chamber.
 - 6. Piping, valves and fittings: Section 15205, except check valves to be swing type with outside lever and spring or outside lever and weight; steel or iron body and cap and flanged end connection.
 - 7. Thrust restraints and anchors: Provide for exposed or buried pipe.
 - 8. Provide pump access gratings and ladders.
- C. Miscellaneous Equipment: Provide the following:
- 1. Furnish 120-volt, duplex, polarized convenience outlet inside of control panel.
 - 2. Provide 120-volt accessory controls with 15-ampere single-phase circuit breaker for each item.
 - 3. Provide ground-fault protection in each combination starter or trip breaker. Field adjustable device with range to 50-amperes and factory set at 5-amperes pickup fault current.
 - 4. Automatic transfer switch in accordance with Section 16145.
 - 5. Ground bus bar in accordance with Section 16060.
 - 6. Circuit breaker in accordance with Section 16440.

- 7. Surveillance in accordance with Section 15900.
- 8. Indication loss of power.

- D. Hand propelled carrier: Provide monorail and hand propelled carrier as shown.
- E. Sump pump: Provide sump pump as specified in Section 15135.
- F. Nameplates: Securely attach to each major item of equipment showing manufacturer's name, model number and serial number as specified in Section 15075.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install complete pumping system including provision for hoisting in accordance with manufacturer's recommendation and place into operation. Follow manufacturer's recommendation for minimum separation between sensor and maximum expected material level.
- B. Fit equipment and appurtenances within space provided and make readily serviceable.

3.02 FIELD QUALITY CONTROL:

- A. Tests and inspections:
 - 1. Pump chamber: Test shop and field joints for water tightness by pressurizing with compressed air to a minimum of five inches of water gauge and applying water and soap solution to the joints. Seal leaks and retest joints until leak free.
 - 2. Make arrangements for water needed for testing.

3.03 MANUFACTURER'S ASSISTANCE AND WARRANTY:

- A. Have the manufacturer guarantee equipment and controllers for two years of operation or 30 months from date of shipment, whichever comes first, so that the equipment is free from defects in design, workmanship or materials.
- B. In the event that a component fails to perform as specified or is proven defective in service during the guarantee period, have the manufacturer promptly replace the defective part at no additional cost to the Authority.
- C. Provide support beams, concrete pads, platforms, hangars and anchor bolts necessary for proper installation of equipment as recommended by manufacturer.

END OF SECTION

SECTION 15480

DOMESTIC WATER HEATERS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing domestic electric water heaters.
- B. Related Work Specified Elsewhere:
 - 1. Concrete Pads: Sections 03100 and 03300.
 - 2. Miscellaneous Pumps : Section 15135.
 - 3. Piping Systems: Section 15205.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ASME Boiler and Pressure Vessel Code.
 - 3. UL listed.
 - 4. ASHRAE: 90.1b, Standard for Energy Efficiency.
 - 5. IPC 2003.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: Include manufacturer's technical data for each model indicated, including rated capacities, electrical characteristics, furnished specialties, and accessories.
 - 2. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, required clearances, method of field assembly, components, and location and size of each field connection.
 - 3. Certification.
 - 4. Operations and Maintenance Manuals.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
 - 1. In design and purchase of equipment, provide for interchangeability of items of equipment, subassemblies, parts, relays and other items
- B. Water-Heater Equipment; UL listed and as follows:
 - 1. Capacity of storage-type water heaters and accessories: Kitchen, Restroom and Shower room.
 - 2. Water heaters fabricated of steel in accordance with the following additional requirements:
 - a. Less than 120-gallon capacity: Applicable local plumbing code.

3. Glass-lined tanks insulated with minimum 1-1/2 inch fibrous-glass blanket, or manufacturer's standard insulation with metal jacket over insulation.
4. Heating elements of double Incoloy rod-type for operation at voltage shown.
 - a. Water heaters with capacity of 20 gallons or less equipped with single heating element.
 - b. Water heaters with capacity of more than 20 gallons equipped with two or more heating elements.
5. Furnished with complete automatic controls including temperature protector designed to shut-off power supply if water temperature in tank rises to 205F.
6. Low-water cutoff to protect system from operating when water level drops below electrical probe.
7. Immersion-type thermostats and dial-indicating temperature gauge.
8. In-line hot-water recirculating pump: Section 15135.
9. Meets ASHRAE 90.1b, Standard for Energy Efficiency.
10. Designed for 100 °F recovery.

C. Nameplates:

1. Securely attached plate on each water heater showing manufacturer's name, model number and serial number.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Fit equipment and appurtenances within space provided and make readily serviceable.
- B. Provide supports, concrete pads, hangers and anchor bolts necessary for proper installation of equipment as recommended by manufacturer.
- C. Install complete potable make-up water system as shown and in accordance with Section 15205.

END OF SECTION

SECTION 15515

WATER-TUBE BOILERS

PART 1 - GENERAL

1.01 SUMMARY

- A. This Section specifies providing packaged, water-tube boilers, trim, and accessories for generating heating hot water
- B. Related Work Specified Elsewhere:
 - 1. Insulation: 15080
 - 2. Piping Systems: 15205
 - 3. Heating Equipment: 15765
 - 4. Water Treatment System: 15186
 - 5. Vibration Isolation: 15070
 - 6. Breechings, Chimneys, and Stacks: 15550

1.02 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- B. ASME Compliance: Fabricate and label boilers to comply with ASME Boiler and Pressure Vessel Code.
- C. ASHRAE/IESNA 90.1 Compliance: Boilers shall have minimum efficiency according to "Gas and Oil Fired Boilers - Minimum Efficiency Requirements."
- D. UL Compliance: Test boilers for compliance with UL 726, "Oil-Fired Boiler Assemblies"; and UL 795, "Commercial-Industrial Gas Heating Equipment." Boilers shall be listed and labeled by a testing agency acceptable to authorities having jurisdiction.

1.03 SUBMITTALS

- A. Product Data: Include performance data, operating characteristics, furnished specialties, Nox emission certification, and accessories.
- B. Shop Drawings: For boilers, boiler trim, and accessories. Include plans, elevations, sections, details, and attachments to other work.
- C. Source quality-control test reports.
- D. Field quality-control test reports.
- E. Operation and Maintenance Data: For boilers, components, and accessories to include in emergency, operation, and maintenance manuals.
- F. Warranty: Special warranty specified in this Section.
- G. Startup service reports.

1.04 FIELD SERVICE

- A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.

1.05 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace drums, tubes, headers, cabinets, atmospheric gas burners, and pressure vessels of boilers that fail in materials or workmanship within specified warranty period.
 - 1. Warranty Period for Drums, Tubes, Headers, Cabinets, and Atmospheric Gas Burner: Five years from date of Substantial Completion, pro rata.
 - 2. Warranty Period for Pressure Vessel: 20 years from date of Substantial Completion, for thermal shock.

PART 2 - PRODUCTS

2.01 MANUFACTURED UNITS

- A. Description: Factory-fabricated, water-tube boiler with heat exchanger sealed pressure tight, built on a steel base; including insulated jacket, flue-gas vent, supply and return connections, and controls.
- B. Heat-Exchanger Design: Straight, steel tubes rolled into steel headers.
- C. Combustion Chamber: Equipped with poured refractory on floor and lap-jointed cast refractory with fiber-blanket joint seals on side walls. Combustion chamber shall have flame observation ports in front and back.
- D. Casing:
 - 1. Insulation: Insulating board and mineral-fiber insulation surrounding the heat exchanger and combustion chamber.
 - 2. Top Flue Connection: Constructed of aluminized steel.
 - 3. Jacket: Galvanized sheet metal, with screw-fastened closures and baked-enamel protective finish.
 - 4. Mounting base to secure boiler to concrete base.
 - 5. Control Compartment Enclosure: NEMA 250, Type 1A.
- E. Barometric Damper: Galvanized-steel assembly with flue-gas thermometer.

2.02 GAS-FIRED BURNER

- A. Burner: Welded construction with multivane, stainless-steel, flame-retention diffuser for natural gas. Mount burner on hinged access door to permit access to combustion chamber.
- B. Blower: Forward-curved centrifugal fan integral to burner, directly driven by motor; with adjustable, dual-blade damper assembly and locking quadrant to set air-fuel ratio.
 - 1. Motors: Comply with Section 16225.
- C. Gas Train: Control devices and control sequence.
- D. Pilot: Intermittent-electric-spark pilot ignition with 100 percent main-valve and pilot-safety shutoff with electronic supervision of burner flame.
- E. Flue-Gas Recirculation: Burner connections shall be equipped for recirculating flue gas.

2.03 OIL-FIRED BURNER

- A. Burner: Welded construction with multivane, stainless-steel, flame-retention diffuser for fuel oil. Mount burner on hinged access door to permit access to combustion chamber.
- B. Blower: Forward-curved centrifugal fan integral to burner, directly driven by motor; with adjustable, dual-blade damper assembly and locking quadrant to set air-fuel ratio.
 - 1. Motors: Comply with Section 16225.

- C. Oil Supply: Control devices and control sequence.
- D. Pilot: Intermittent-electric-spark pilot ignition with 100 percent main-valve and pilot-safety shutoff solenoid flame-safety control.
- E. Flue-Gas Recirculation: Burner connections shall be equipped for recirculating flue gas.

2.04 TRIM

- A. Include devices sized to comply with ANSI B31.9, "Building Services Piping."
- B. Aquastat Controllers: Operating, firing rate, and high limit.
- C. Safety Relief Valve: ASME rated.
- D. Pressure and Temperature Gage: Minimum 3-1/2-inch- diameter, combination water-pressure and -temperature gage. Gages shall have operating-pressure and -temperature ranges so normal operating range is about 50 percent of full range.
- E. Boiler Air Vent: Automatic piped full size to floor drain.
- F. Drain Valve: Full size of boiler connection but not less than NPS 3/4 hose-end gate valve.
- G. Tankless Heater: Carbon-steel or Bronze header with copper-tube heat exchanger, mounted in a port of upper drum and sealed with fiber gasket.
- H. Blowdown Valves: Factory-installed bottom and surface, slow-acting blowdown valves same size as boiler nozzle.
- I. Stop Valves: Boiler inlets and outlets, except safety relief valves or preheater inlet and outlet, shall be equipped with stop valve in an accessible location as near as practical to boiler nozzle and same size or larger than nozzle. Valves larger than NPS 2 shall have rising stem.
- J. Stop-Check Valves: Factory-installed, stop-check valve and stop valve at boiler outlet with free-blow drain valve factory installed between the two valves and visible when operating stop-check valve.

2.05 CONTROLS

- A. Refer to Division 15 Section "Control Equipment."
- B. Burner Operating Controls: To maintain safe operating conditions, burner safety controls limit burner operation.
- C. Building Management System Interface: Factory install hardware and software to enable building management system to monitor, control, and display boiler status and alarms.

2.06 ELECTRICAL POWER

- A. Controllers, Electrical Devices, and Wiring: Electrical devices and connections are specified in Division 16 Sections.
- B. Single-Point Field Power Connection: Factory-installed and -wired switches, motor controllers, transformers, and other electrical devices necessary shall provide a single-point field power connection to boiler.

2.07 SOURCE QUALITY CONTROL

- A. Test and inspect factory-assembled boilers, before shipping, according to ASME Boiler and Pressure Vessel Code.
- B. Burner and Hydrostatic Test: Factory adjust burner to eliminate excess oxygen, carbon dioxide, oxides of nitrogen emissions, and carbon monoxide in flue gas and to achieve combustion efficiency; perform hydrostatic test.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Before boiler installation, examine roughing-in for concrete equipment bases, anchor-bolt sizes and locations, and piping and electrical connections to verify actual locations, sizes, and other conditions affecting boiler performance, maintenance, and operations.
- B. Examine mechanical spaces for suitable conditions where boilers will be installed.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 BOILER INSTALLATION

- A. Install boilers level on concrete base. Concrete base is specified in Division 15 Section "Basic Mechanical Materials and Methods," and concrete materials and installation requirements are specified in Division 3.
- B. Vibration Isolation: Elastomeric isolator pads or mounts. Vibration isolation devices and installation requirements are specified in Division 15 Section "Vibration Isolation."
- C. Install gas-fired boilers according to NFPA 54.
- D. Install oil-fired boilers according to NFPA 31.
- E. Assemble boiler tubes in sequence and seal each tube joint.
- F. Assemble and install boiler trim.
- G. Install electrical devices furnished with boiler but not specified to be factory mounted.
- H. Install control wiring to field-mounted electrical devices.

3.03 CONNECTIONS

- A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to boiler to allow service and maintenance.
- C. Connect gas piping to boiler gas-train inlet with union. Piping shall be at least full size of gas train connection. Provide a reducer if required.
- D. Connect oil piping full size to burner inlet with shutoff valve and union.
- E. Connect hot-water piping to supply- and return-boiler tapings with shutoff valve and union or flange at each connection.

- F. Install piping from safety relief valves to nearest floor drain.
- G. Install piping from equipment drain connection to nearest floor drain. Piping shall be at least full size of connection. Provide an isolation valve if required.
- H. Connect breeching to full size of boiler outlet. Comply with requirements in Division 15 Section "Breechings, Chimneys, and Stacks" for venting materials.
- I. Ground equipment according to Division 16 Section "Grounding and Bonding."
- J. Connect wiring according to Division 16 Section "Wire, Cable and Busways."

3.04 FIELD QUALITY CONTROL

- A. Perform tests and inspections and prepare test reports.
- B. Perform installation and startup checks according to manufacturer's written instructions.
- C. Remove and replace malfunctioning units and retest as specified above.
- D. Performance Tests: Engage a factory-authorized service representative to inspect component assemblies and equipment installations, including connections, and to conduct performance testing.

3.05 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Authority's maintenance personnel to adjust, operate, and maintain boilers.

END OF SECTION

THIS PAGE NOT USED

SECTION 15550

BREECHINGS, CHIMNEYS, AND STACKS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This Section specifies providing breechings, chimneys, and stacks for fuel-fired equipment.
 - 1. Listed single and double-wall vents and chimneys.
 - 2. Listed refractory-lined breechings and stacks.
 - 3. Field-fabricated metal breechings and chimneys.
- B. Related work specified elsewhere:
 - 1. Water Tube Boilers: Section 15515.
 - 2. Insulation: Section 15080.

1.02 QUALITY ASSURANCE

- A. Source limitation: Obtain listed system components through one source from a single manufacturer.
- B. Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code - Steel," for hangers and supports and AWS D9.1, "Sheet Metal Welding Code," for shop and field welding of joints and seams in vents, breechings, and stacks.
- C. Certified Sizing Calculations: Manufacturer shall certify venting system sizing calculations.

1.03 SUBMITTALS

- A. Product Data: For the following:
 - 1. Chimney liners.
 - 2. Type B and BW vents.
 - 3. Type L vents.
 - 4. Special gas vents.
 - 5. Building-heating-appliance chimneys.
 - 6. Refractory-lined metal breechings and chimneys.
 - 7. Guy wires and connectors.
- B. Shop Drawings: For vents, breechings, chimneys, and stacks. Include plans, elevations, sections, details, and attachments to other work.
 - 1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, methods of field assembly, components, hangers and seismic restraints, and location and size of each field connection.
 - 2. For installed products indicated to comply with design loads, include calculations required for selecting seismic restraints and structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- C. Welding certificates.
- D. Warranties: Special warranties specified in this Section.

1.04 COORDINATION

- A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.
- B. Coordinate installation of roof penetrations. These items are specified in Section 07730.

1.05 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of venting system that fail in materials or workmanship within specified warranty period. Failures include, but are not limited to, structural failures caused by expansion and contraction.
- B. Warranty Period: 10, 15, or 25 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 LISTED CHIMNEY LINERS

- A. Description: Straight or Corrugated, single-wall chimney liner tested according to UL 1777 and rated for 1000 deg F continuously, or 2100 deg F for 10 minutes; with negative or positive flue pressure complying with NFPA 211 and suitable for general usage.
- B. Straight Liner Materials: ASTM A 666, Type 304 or 316 stainless steel.
- C. Corrugated Liner Materials: ASTM A 240, Type 321, ASTM A 240, Type 430, or ASTM A 959, Type 29-4C.
- D. Accessories:
 - 1. Fittings: Tees, elbows, increasers, draft-hood connectors, metal caps with bird barriers, adjustable roof flashings, storm collars, support assemblies, thimbles, firestop spacers, and fasteners; fabricated from similar or compatible materials and designs.
 - 2. Sealant: Manufacturer's standard high-temperature sealant.
 - 3. Insulating Fill: Manufacturer's standard high-temperature insulation fill material in annular space surrounding chimney liner including high-temperature, ceramic-fiber insulation required to seal chimney at top and bottom.

2.02 LISTED TYPE B AND BW VENTS

- A. Description: Double-wall metal vents tested according to UL 441 and rated for 480 deg F continuously for Type B, or 550 deg F continuously for Type BW; with neutral or negative flue pressure complying with NFPA 211 and suitable for certified gas-fired appliances.
- B. Construction: Inner shell and outer jacket separated by at least a 1/4-inch airspace.
- C. Inner Shell: ASTM B 209, Type 1100 aluminum, ASTM B 209, Type 3003 aluminum, ASTM B 209, Type 3105 aluminum, or ASTM A 666, Type 430 stainless steel.
- D. Outer Jacket: Galvanized or Aluminized steel.
- E. Accessories: Tees, elbows, increasers, draft-hood connectors, terminations, adjustable roof flashings, storm collars, support assemblies, thimbles, firestop spacers, and fasteners; fabricated from similar materials and designs as vent-pipe straight sections; all listed for same assembly.

2.03 LISTED TYPE L VENT

- A. Description: Double-wall metal vents tested according to UL 641 and rated for 570 deg F continuously, or 1700 deg F for 10 minutes; with neutral or negative flue pressure complying with NFPA 211 and suitable for low-heat appliances.
- B. Construction: Inner shell and outer jacket separated by airspace filled with high-temperature.
- C. Inner Shell: ASTM A 666, Type 304 or 316 stainless steel.
- D. Outer Jacket: Galvanized, Aluminized, or Stainless steel.
- E. Accessories: Tees, elbows, increasers, draft-hood connectors, terminations, adjustable roof flashings, storm collars, support assemblies, thimbles, firestop spacers, and fasteners; fabricated from similar materials and designs as vent-pipe straight sections; all listed for same assembly.

2.04 LISTED SPECIAL GAS VENT

- A. Description: Double-wall metal vents tested according to UL 1738 and rated for 480 deg F continuously, with positive or negative flue pressure complying with NFPA 211 and suitable for condensing-gas appliances.
- B. Construction: Inner shell and outer jacket separated by at least a 1/2-inch airspace.

- C. Inner Shell: ASTM A 959, Type 29-4C stainless steel.
- D. Outer Jacket: Aluminized or Stainless steel.
- E. Accessories: Tees, elbows, increasers, draft-hood connectors, terminations, adjustable roof flashings, storm collars, support assemblies, thimbles, firestop spacers, and fasteners; fabricated from similar materials and designs as vent-pipe straight sections; all listed for same assembly.

2.05 LISTED BUILDING-HEATING-APPLIANCE CHIMNEYS

- A. Description: Double-wall metal vents tested according to UL 103 and rated for 1000 deg F continuously, or 1700 deg F for 10 minutes; with neutral or negative flue pressure complying with NFPA 211 and suitable for dual-fuel boilers, oven vents, water heaters, or exhaust for engines.
 - 1. Construction: Inner shell and outer jacket separated by annular space filled with high-temperature insulation
 - 2. Inner Shell: ASTM A 666, Type 304 or 316 stainless steel.
- B. Description: Double-wall metal vents tested according to UL 103 and 959 and rated for 1400 deg F continuously, or 1800 deg F for 10 minutes; with positive or negative flue pressure complying with NFPA 211 and suitable for dual-fuel boilers, oven vents, water heaters, or exhaust for engines.
 - 1. Construction: Inner shell and outer jacket separated by annular space filled with high-temperature insulation.
 - 2. Inner Shell: ASTM A 666, Type 304 or 316 stainless steel.
- C. Description: Double-wall metal vents tested according to UL 103 and rated for 1000 deg F continuously, or 2100 deg F for 10 minutes; with neutral or negative flue pressure complying with NFPA 211 and suitable for fireplaces and other solid-fuel-burning appliances.
 - 1. Construction: Inner shell and outer jacket separated by at least a 1-inch , 1-1/2-inch, 2-inch, or 4-inch annular space filled with high-temperature, ceramic-fiber insulation.
 - 2. Inner Shell: ASTM A 666, Type 304, ASTM A 666, Type 316, or ASTM A 240/A 240M, Type 430 stainless steel.
- D. Outer Jacket: Galvanized, Aluminized, or Stainless steel.
- E. Accessories: Tees, elbows, increasers, draft-hood connectors, terminations, adjustable roof flashings, storm collars, support assemblies, thimbles, firestop spacers, and fasteners; fabricated from similar materials and designs as vent-pipe straight sections; all listed for same assembly.

2.06 LISTED, REFRACTORY-LINED METAL BREECHINGS AND CHIMNEYS

- A. Comply with ASME STS-1-1992.
- B. Design Wind Loads: 150 mph.
- D. Chimney Outer Jacket: Aluminized or Galvanized steel with riveted or welded seams.
- E. Refractory Lining: Tested according to UL 959 for temperature and acid resistance, and bearing the testing laboratory label.
- F. Finish: Factory-applied, high-heat-resistant paint; color as selected by Architect.
- G. Base Section: Acid-resistant-coated, cast-iron anchor lugs for securing stack to foundation with anchorage designed by manufacturer.
- H. Reinforced Cleanout Section: Smoke-tight connection, with gasketed and bolt-tightened inspection plate; neck shall be welded to stack section.
- I. T- or Y- Sections: Smoke-tight connection, with welded joints and refractory lining; finished with smooth transition and with no exposed metal on inside.

- J. Spark Screen: ASTM A 666, Type 316 stainless steel, 0.0625 inch thick, maximum 1/2-by-1/2-inch mesh, with ASTM A 666, Type 304 stainless-steel rolled angle and drawband.
- K. Guy Bands: 8-inch- wide bands of same material as jacket, with bolted fasteners.
- L. Roof Penetration: Factory-fabricated thimbles, flashings, and counterflashings.
- M. Fabricate sections, fittings, and accessories as individual pieces or in combination lengths for field handling.
- N. Fabricate components with centrifugally cast refractory lining in lengths suitable for connection with drawbands.
- O. Bond refractory to steel jacket with calcium aluminate cement to prevent separation in finished product during shipping, handling, and installation.
- P. Fabricate stacks with anchor lugs; cleanout; T-sections; flashings and counterflashings; and provisions for support, expansion, and contraction.

2.07 FIELD-FABRICATED METAL BREECHINGS AND CHIMNEYS

- A. Fabricate freestanding chimneys according to SMACNA's "Guide for Steel Stack Design and Construction."
- B. Fabricate breechings and chimneys from ASTM A 569 hot-rolled steel with continuously welded joints, complying with NFPA 211 for minimum metal thickness.
- C. Fabricate chimneys and vent connectors from galvanized steel, complying with NFPA 211 for minimum metal thickness.
- D. Fabricate chimneys and vent connectors from ASTM B 209, Type 1100 or 3003, aluminum or stainless steel, complying with NFPA 211 for the following minimum metal thicknesses:
- E. Fabricate cleanout doors from compatible material, same thickness as breeching, bolted and gasketed.

2.09 GUYING AND BRACING MATERIALS

- A. Cable: Galvanized, stranded wires.
- B. Pipe: Galvanized steel.
- C. Angle Iron: Galvanized steel.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine areas and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION OF LISTED VENTS AND CHIMNEYS

- A. Locate to comply with minimum clearances from combustibles and minimum termination heights according to product listing or NFPA 211, whichever is most stringent.
- B. Seal between sections of positive-pressure vents according to manufacturer's written installation instructions, using sealants recommended by manufacturer.
- C. Support vents at intervals recommended by manufacturer to support weight of vents and all

accessories, without exceeding appliance loading.

- D. Slope breechings down in direction of appliance, with condensate drain connection at lowest point piped to nearest drain.
- E. Connect base section to foundation using anchor lugs of size and number recommended by manufacturer.
- F. Join sections with acid-resistant joint cement to provide continuous joint and smooth interior finish.
- G. Erect stacks plumb to finished tolerance of no more than 1 inch out of plumb from top to bottom.

3.03 INSTALLATION OF UNLISTED, FIELD-FABRICATED BREECHINGS AND CHIMNEYS

- A. Suspend breechings and chimneys independent of their appliance connections.
- B. Align breechings at connections, with smooth internal surface.
- C. Slope breechings down in direction of appliance, with condensate drain connection at lowest point piped to nearest drain.
- D. Support breechings and chimneys from building structure with bolts, concrete inserts, steel expansion anchors, welded studs, C-clamps, or beam clamps according to manufacturer's written instructions.

3.04 CLEANING

- A. After completing system installation, including outlet fittings and devices, inspect exposed finish. Remove burrs, dirt, and construction debris and repair damaged finishes.
- B. Clean breechings internally, during and after installation, to remove dust and debris. Clean external surfaces to remove welding slag and mill film. Grind welds smooth and apply touchup finish to match factory or shop finish.
- C. Provide temporary closures at ends of breechings, chimneys, and stacks that are not completed or connected to equipment.

END OF SECTION

SECTION 15625

CENTRIFUGAL WATER CHILLERS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing complete factory-assembled packaged water-chilling units.
- B. Related Work Specified Elsewhere:
 - 1. Concrete pads: Sections 03100, 03200 and 03300.
 - 2. Water Treatment System: Section 15186.
 - 3. Piping systems: Section 15205.
 - 4. Insulation: Section 15080.
 - 5. Vibration isolation: Section 15070.
 - 6. Control equipment: Section 15900.
 - 7. Conduit, raceways and cabinets: Section 16130.
 - 8. Wire, cable and busways: Section 16120.
 - 9. Motors: Section 16225.
 - 10. Motor starters and control devices: Section 16425.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ASME Code.
 - 3. ARI: 550.
 - 4. ANSI: B9.1.
 - 5. ASHRAE Standards.
- B. Design Criteria:
 - 1. For single-chiller chiller plant: Select each water-chilling unit in accordance with the following criteria:
 - a. Water on evaporator: 55F.
 - b. Water off evaporator: 42F.
 - c. Water on condenser: 85F.
 - d. Water off condenser: 95F.
 - e. Net refrigeration effect, chilled-water flow rate and condenser water-flow rate: as shown on the Contract Drawings.
 - f. Control system compatible with AEMS system.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: Include manufacturer's technical data for each model indicated, including rated capacities, electrical characteristics, furnished specialties, and accessories.

2. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearance, method of field assembly, components, and location and size of each field connection.
 - a. Capacity curves for evaporator/compressor and compressor/condenser plotted on charts to ensure properly balanced refrigeration equipment under design conditions.
3. Certification:
 - a. Record of packaged water chillers in field operation for minimum of 12,000 operating hours for not less than ten individual units prior to shipment. Types that have already shown satisfactory operation for this period may have modifications, provided modifications will not increase maintenance and operating costs or decrease life of machine and complies with ARI 550.
 - b. Verification of successful use of material used for impeller wheel for centrifugal compressors, if other than aluminum alloy.
4. Operation and Maintenance Manuals.

1.04 JOB CONDITIONS:

- A. Safety Requirements:
 1. Properly guard belts, pulleys, chains, gears, couplings, projecting set screws, key and other rotating parts to prevent danger to personnel.

1.05 OPERATION AND MAINTENANCE TRAINING:

- A. In accordance with the General Requirements.

PART 2 – PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
 1. Supply chiller with full operating charge of HFC-134a Refrigerant and oil. In design and purchase of equipment, provide for interchangeability of items of piping equipment, subassemblies, parts, motors, starters and relays.
- B. Centrifugal Compressors:
 1. Single-stage, statically and dynamically balanced impeller.
 2. Driven by drive motor directly or by means of gears.
 3. Casing fabricated of cast iron, aluminum or steel plate with split sections gasketed and bolted.
 4. Impeller wheel constructed of aluminum alloy or other material that has been demonstrably successful in use.
 5. Impeller shaft fabricated of heat-treated alloy steel with sufficient rigidity for proposed operation at specified operating speeds.
 6. Shaft main bearings: Journal with bronze or babbitted liners or one-piece aluminum alloy inset.
 7. Lubrication: Forced feed to lubrication points.
 8. Differential oil-pressure cutout interlocked with compressor starter to allow compressor to operate only when recommended oil pressure is provided to bearings.
 9. Capacity reduction designed to provide automatic capacity modulation from 100 percent capacity to 10-percent capacity without cycling.
 10. Capacity-control system actuated by temperature of water leaving evaporator.

11. Transducers for remote surveillance and control by AEMS system as shown and in accordance with Section 15900.
- C. Water Cooler:
1. Removable bundle-type copper tube, constructed of seamless copper tubing minimum 0.035-inch wall thickness, plain or with integral fins individually replaceable and rolled or brazed into copper or steel-tube sheets, with baffles and tube supports of copper or steel.
 2. Complete refrigerant-feed control, designed to control feed to evaporator at each level of load range from 100 percent to 10 percent of package water-chilling capacity without use of hot-gas bypass.
 3. Performance based on water velocity of minimum three fps and maximum ten fps throughout full length of tubes and fouling factor of 0.00025 for individual machine.
 4. Water spaces in coolers designed for minimum 150-psi working pressure; tested in accordance with ASME Code.
 5. Water spaces not subject to the ASME Code due to size or other limitations, tested at pressure of not less than 1-1/2 times working pressure.
- D. Insulation:
1. Each water-chilling unit provided with insulation as specified in Section 15080.
- E. Condenser:
1. Shell-and-tube type permitting tubes to be cleaned from each end by removing water-box cover plates or head.
 2. Tubes fabricated of seamless copper tubing, minimum 0.035-inch wall thickness, with integral fins individually replaceable and rolled or brazed into copper or steel-tubed sheets.
 3. Performance based on rate of water flow specified and water velocity of 3-fps minimum and 10-fps maximum throughout full length of tubes and fouling factor of 0.0075.
 4. Water spaces in condenser designed for minimum 150-psi working pressure; tested in accordance with requirements of ASME Code.
 5. Refrigerant side of shell tested at 1-1/2 times refrigerant saturation pressure.
- F. Compressor Drive Motor, Hermetic Units:
1. Squirrel-cage induction, refrigerant gas-cooled, rated at 460 volts, three-phase and 60 Hertz and in accordance with Section 16225.
 2. Bearings: Sleeve-type.
 3. Pressure lubrication with pump and cooler.
 4. Gear cases oiltight.
 5. Motor starter conforming to recommendations of water-chiller manufacturer and as specified in Section 16425.
 6. Wiring as recommended by compressor manufacturer to provide complete automatic operation of centrifugal refrigeration system.
 7. Each centrifugal machine, driven through speed-increasing gears designed to ensure self-alignment, lubrication and minimum of unbalanced forces.
- G. Compressor Drive Motor, Open-Drive Units:
1. Dripproof, fully guarded, squirrel-cage induction and as specified in Section 16225.
- H. Controls, Control Panel and Gauges: Provide refrigerant monitors suitable for refrigerant R-134a per ASHRAE Standards.

1. Provide a microprocessor control panel which can monitor and display various chiller parameters and alarms. As a minimum, monitor the following points:
 - a. Analog points:

1)	Chilled water enter temperature	DEG F
2)	Chilled water return temperature	DEG F
3)	Condenser water enter temperature	DEG F
4)	Condenser water return temperature	DEG F
5)	Condenser water pressure	PSI
6)	Chilled water pressure	PSI
7)	Condenser refrigerant pressure	PSI
8)	Evaporator refrigerant pressure	PSI
9)	Chiller oil pressure	PSI
10)	Chiller KW demand	KW
11)	Chiller efficiency	KW/TON
 - b. Alarm points:

1)	Chiller oil temperature	DEG F
2)	Chiller bearing temperature	DEG F
 - c. In addition, for future interface with an Energy Management System, provide a 4-20 mA signal output for each analog point and a dry contact closure for each alarm point.
 2. Each water-chilling unit provided with electronic controls as specified in Section 15900.
 3. Capacity-control mechanism to be integral part of packaged water chiller maintaining leaving water temperature within 0.75 degrees F of setting temperature from 100 percent to 10 percent of chiller capacity.
 4. Control mechanism: Compressor stopped when chiller output drops below 10 percent and automatically restarted when leaving water rises to preset temperature.
 5. Timing device: Restarting unit limited to four starts per hour, minimum 15 minutes apart.
 6. Modulating chilled-water operating control having adjustable throttling range, with means of calibration by adjusting chilled-water temperature control point. Pneumatic or solid-state electronic control.
 7. Control panel provided on each unit with compressor-operating control, START/STOP switch and the following gauges and protective devices:
 - a. Suction-pressure gauge.
 - b. Condensing-pressure gauge.
 - c. Oil-pressure gauge.
 - d. Low-refrigerant-pressure cutout.
 - e. High-pressure cutout, manual reset only.
 - f. Low-oil-pressure cutout, manual reset only.
 - g. Low-water-temperature cutout, manual or automatic reset.
 - h. Motor-winding high-temperature cutout, manual reset only.
 - i. Running-time meter.
 8. Signal lights for protective devices.
 9. Alarm-circuit terminals in basic chiller-package control panel designed to actuate alarm device in event of machine cutout of protective devices.
- I. Evacuation System:
1. Manually started and stopped evacuation system when positive-pressure refrigerant is used and chiller package is not designed to permit pumpdown storage and isolation of entire charge in condenser.

2. Motor-driven, air-cooled or water-cooled reciprocating condensing unit and receiver of sufficient capacity to store entire refrigerant charge of largest water-chilling system.
 3. Receiver in accordance with ASME Code, mounted on floor brackets and provided with rupture members and dual relief valves in series.
 4. Entire system completed with valves, piping and controls so that evacuation system may be utilized for pumpout, without temporary piping or wiring.
- J. Receiver, Refrigerant:
1. Horizontal liquid receiver designed, fitted and rated in accordance with ASME Code.
 2. Each receiver having storage capacity 25 percent minimum in excess of that required for fully charged system.
 3. Inner surfaces thoroughly cleaned by sandblasting.
 4. Each receiver equipped with inlet, outlet drip pipe, drain plug, purging valve, relief valves of capacity and setting in accordance with ANSI B9.1 and two bulls-eye liquid sight glasses.
 5. Sight glasses installed in same vertical plane, 90 degrees apart, perpendicular to the axis of the receiver and not over 3-inches horizontally from drip pipe measured along axis of receiver.
 6. Receiver constructed and tested in accordance with ASME Code.
- K. Starter:
1. Motor starters: Section 16425.
- L. Tools:
1. One complete set of special tools as recommended by manufacturer for field maintenance of system.
- M. Factory Wiring:
1. In accordance with manufacturer's standard practice.
- N. Nameplates:
1. Securely attached to each chiller showing manufacturer's name, model number and serial number.

PART 3 – EXECUTION

3.01 INSTALLATION:

- A. Fit equipment and appurtenances within space provided and make readily serviceable.
- B. Provide concrete pads, platforms and hangars necessary for proper installation of equipment.
- C. Install chillers on concrete pads 6-inches minimum height in accordance with Sections 03100, 03200 and 03300.
- D. Install chillers on vibration isolators in accordance with Section 15070.
- E. Coordinate work with other trades.
- F. Mount tools on tool board in equipment room, as directed.

- G. For piping system installation, see Section 15205.
- H. For water treatment installation, see Section 15186.
- I. For conduit, raceways and cabinets installation, see Section 16130.
- J. For wire cable, and busways, installation, see Section 16120.

3.02 FIELD SERVICES:

- A. Hermetic Units: Obtain on-site services for two man-days of manufacturer's engineering representative to advise on the following:
 - 1. Pressure test on hermetic water-chilling unit for leaks.
 - 2. Evacuation and dehydration of machine to minus 12 degF wet bulb or to absolute pressure of not over 0.204-inch of mercury for 24 hours minimum.
 - 3. Charging machine with refrigerant.
 - 4. Starting machine and instructing representative of the Authority as to its proper care and operation.

- B. Open Units: Obtain on-site services for two man-days of manufacturer's engineering representative to advise on the following:
 - 1. Erection, alignment, testing and dehydrating.
 - 2. Charging machine with refrigerant.
 - 3. Starting machine and instructing Authority personnel in proper care and operation of machine.

END OF SECTION

SECTION 15626
ROTARY-SCREW WATER CHILLERS

PART 1 - GENERAL

1.02 SUMMARY

- A. This Section includes packaged, water and air-cooled, electric-motor-driven, rotary-screw water chillers with the following features:
 - 1. Motor controller.
 - 2. Microprocessor-based controls.

1.03 DEFINITIONS

- A. EER: Energy-efficiency ratio.
- B. IPLV: Integrated part-load value.

1.04 SUBMITTALS

- A. Product Data: Include refrigerant, rated capacities, operating characteristics, furnished specialties, and accessories.
- B. Shop Drawings: Complete set of manufacturer's certified prints of water chiller assemblies, control panels, sections, and elevations, and unit isolation. Include the following:
 - 1. Assembled unit dimensions.
 - 2. Operating weight and load distribution.
 - 3. Required clearances for maintenance and operation.
 - 4. Size and location of piping and wiring connections.
 - 5. Vibration Isolation Calculations and Details: Signed and sealed by a qualified professional engineer.
 - 6. Wiring Diagrams: Power, signal, and control wiring.
- D. Certificates: For certification required in "Quality Assurance" Article.
- E. Source quality-control test reports.
- F. Startup service reports.
- G. Operation and Maintenance Data: For each water chiller to include in emergency, operation and maintenance manual.
- I. Warranties: Special warranties specified in this Section.

1.05 QUALITY ASSURANCE

- A. ARI Certification: Signed by manufacturer certifying compliance with requirements in ARI 550/590, "Water Chilling Packages Using the Vapor Compression Cycle."
- B. ASHRAE Certification: Signed by manufacturer certifying compliance with ASHRAE 15 for

safety code for mechanical refrigeration. Comply with ASHRAE Guideline 3 for refrigerant leaks, recovery, and handling and storage requirements.

- C. ASME Compliance: Fabricate and label water chiller heat exchangers to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
- D. Comply with NFPA 70.
- E. Comply with UL 1995.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Ship water chillers from the factory fully charged with refrigerant or nitrogen.

1.07 COORDINATION

- A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.
- B. Coordinate installation of roof curbs and roof penetrations. These items are specified in Division 7 Section "Roof Accessories."

1.08 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of water chillers that fail in materials or workmanship.

PART 2 - PRODUCTS

2.02 PACKAGED WATER CHILLERS

- A. Description: Factory-assembled and -tested water chiller complete with casing, compressor, evaporator, condenser, controls, interconnecting unit piping and wiring, indicated accessories, and mounting frame.
 - 1. Casing: Weatherproof, constructed of hot-dip galvanized steel with factory-painted finish.
 - 2. Fans: Propeller type, statically and dynamically balanced, with vertical air discharge for high efficiency and low sound; located in its own compartment to eliminate cross flow of condenser air during fan cycling; and equipped with heavy-gage, weather-protected fan guard.
 - 3. Fan Motor: Direct drive, weatherproof, with bearings permanently lubricated, and having built-in current- and thermal-overload protection.
- D. Fabricate water chiller mounting frame and attachment to the pressure vessel with reinforcement strong enough to resist water chiller movement during a seismic event when the water chiller mounting frame is anchored to the building structure.

2.03 COMPRESSORS

- A. Description: Positive displacement, oil injected with direct-drive, hermetically sealed motor.
 - 1. Casing: Cast iron, precision machined for minimum clearance about periphery of rotors.
 - 2. Rotors: Single or Twin screw.
- B. Capacity Control: Hydraulically operated, modulating or stepped sliding valve to maintain chilled-water temperature set point without hunting within throttling range.
- C. Oil Lubrication System: Positive-displacement submersible pump with heater, oil filter, and sight glass.
- D. Refrigerant and Oil: HCFC-22, HFC-134a, R-407c, or R-410a.
- E. Refrigerant Compatibility: Seals, O-rings, motor windings, and internal water chiller parts exposed to refrigerants shall be fully compatible with refrigerants, and pressure components shall be rated for refrigerant pressures.
- F. Refrigerant Circuit: Independent circuits. Each circuit shall include a thermal expansion valve, compressor suction and discharge shutoff valves, a liquid-line shutoff valve, a replaceable-core filter drier, a sight glass with moisture indicator, a liquid-line solenoid valve, and an insulated suction line.

2.04 HEAT EXCHANGERS

- A. Evaporator:
 - 1. Description: Shell-and-tube design, ASME labeled.
 - 2. Shell Material: Carbon steel.
 - 3. Tube Construction: Copper, individually replaceable, expanded into tube sheets.
- B. Condenser:
 - 1. Description: Shell-and-tube design, ASME labeled.
 - 2. Shell Material: Carbon steel.
 - 3. Tube Construction: Copper, externally enhanced and individually replaceable, expanded into tube sheets.
 - 4. Water Box: Standard or Marine, having flanged or grooved mechanical-joint coupling water-nozzle connections with a thermistor-type temperature sensor factory installed in each nozzle.
- C. Air-Cooled Condenser: Copper tubes with mechanically bonded aluminum fins, integral subcooling circuit, leak tested at 450 psig.

2.05 INSULATION

- A. Cold Surfaces: Closed-cell, flexible elastomeric, thermal insulation complying with ASTM C 534, Type II, for sheet materials.

2.06 ACCESSORIES

- A. Pressure Relief Valve: Single- or multiple-reseating-type, spring-loaded relief valve.

2.07 CONTROLS

- A. Control Panel: Stand-alone, microprocessor based.
- B. Enclosure: Unit-mounted enclosure, hinged or lockable; factory wired with a single-point power connection and a separate control circuit.
- C. Status Display: Multiple-character liquid-crystal display or light-emitting diodes and keypad.
- E. Manually Reset Safety Controls shall shut down water chiller and require manual reset.
- F. Building Management System Interface: Factory-installed hardware and software to enable building management system to monitor and control chilled-water set point and chiller-control displays and alarms.

2.08 MOTORS

- A. Comply with requirements in Division 16 Section "Motors."
 - 1. Open-drive motors shall have flanged or flexible coupling suitable for direct connection to compressor.

2.09 MAGNETIC ENCLOSED CONTROLLERS

- A. Enclosure: Unit mounted with hinged access door with lock and key or padlock and key.
- B. Control Circuit: 120 V; obtained from integral control power transformer with a control power transformer of enough capacity to operate connected pilot and indicating and control devices.
- C. Overload Relay: Shall be sized according to UL 1995 or shall be an integral component of water chiller control microprocessor.
- D. Star-Delta Controller: NEMA ICS 2, closed transition.
- E. Solid-State, Reduced-Voltage Controller: NEMA ICS 2.
 - 1. Surge suppressor in solid-state power circuits providing 3-phase protection against damage from supply voltage surges 10 percent or more above nominal line voltage.
 - 2. Light-emitting-diode indicators showing motor and control status.
- F. Accessories: Devices shall be factory installed in controller enclosure.

2.10 SOURCE QUALITY CONTROL

- A. Factory test and rate water chillers, before shipping, according to ARI 550/590, "Water

- Chilling Packages Using the Vapor Compression Cycle." Stamp with ARI label.
- B. Factory test heat exchangers hydrostatically at 1.50 times the design pressure.
 - C. Factory test and inspect evaporator and water-cooled condenser according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1. Stamp with ASME label.
 - D. Factory test and inspect water boxes at 150 percent of working pressure.
 - E. Rate sound power level according to ARI 575 or ARI 370 procedure.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Before water chiller installation, examine roughing-in for concrete equipment bases, anchor-bolt sizes and locations, piping, and electrical to verify actual locations, sizes, and other conditions affecting water chiller performance, maintenance, and operations.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 WATER CHILLER INSTALLATION

- A. Install water chillers on concrete base. Concrete base is specified in Division 15 Section "Basic Mechanical Materials and Methods," and concrete materials and installation requirements are specified in Division 3.
- B. Concrete Bases: Anchor chiller mounting frame to concrete base.
- C. Vibration Isolation: Rubber pads, restrained spring isolators or vibration isolation equipment base. Vibration isolation devices and installation requirements are specified in Division 15 Section "Vibration Isolation."
- F. Maintain manufacturer's recommended clearances for service and maintenance.
- G. Charge water chiller with refrigerant if not factory charged.

3.03 CONNECTIONS

- A. Chilled- and condenser-water piping installation requirements are specified in Division 15 Section 15205.
- B. Install piping adjacent to chiller to allow service and maintenance.
- F. Ground water chillers according to Division 16 Section "Grounding and Bonding."
- G. Connect wiring according to Division 16 Section "Basic Electrical Materials and Methods."
- H. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.04 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.
- B. Inspect field-assembled components, equipment installation, and piping and electrical connections for proper assemblies, installations, and connections.
- C. Complete installation and startup checks according to manufacturer's written instructions.
- D. Prepare a written startup report that records results of tests and inspections.

3.05 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Authority's maintenance personnel to adjust, operate, and maintain water chillers.

END OF SECTION

SECTION 15628
RECIPROCATING/SCROLL WATER CHILLERS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This Section includes packaged, water and air-cooled, electric-motor-driven, reciprocating/scroll water chillers
- B. Related Work Specified Elsewhere
 - 1. Concrete pads: Sections 03100 and 03300.
 - 2. Water Treatment System: Section 15186.
 - 3. Piping systems: Section 15205.
 - 4. Insulation: Section 15080.
 - 5. Vibration isolation: Section 15070.
 - 6. Control equipment: Section 15900.
 - 7. Conduit, raceways and cabinets: Section 16130.
 - 8. Wire, cable and busways: Section 16120.
 - 9. Motors: Section 16225.
 - 10. Motor starters and control center: Section 16425.

1.02 DEFINITIONS

- A. EER: Energy-efficiency ratio.
- B. IPLV: Integrated part-load value.

1.03 QUALITY ASSURANCE

- A. ARI Certification: Signed by manufacturer certifying compliance with requirements in ARI 550/590, "Water Chilling Packages Using the Vapor Compression Cycle."
- B. ASHRAE Certification: Signed by manufacturer certifying compliance with ASHRAE 15 for safety code for mechanical refrigeration. Comply with ASHRAE Guideline 3 for refrigerant leaks, recovery, and handling and storage requirements.
- C. ASME Compliance: Fabricate and label water chiller heat exchangers to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
- D. Comply with NFPA 70.
- E. Comply with UL 1995

1.04 SUBMITTALS

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: Include refrigerant, rated capacities, operating characteristics, furnished specialties, and accessories.
 - 2. Shop Drawings: Complete set of manufacturer's certified prints of water chiller assemblies, control panels, sections and elevations, and unit isolation. Include the following:
 - a. Assembled unit dimensions.
 - b. Weight and load distribution.
 - c. Required clearances for maintenance and operation.
 - d. Size and location of piping and wiring connections.
 - e. Vibration Isolation Calculations and Details: Signed and sealed by a qualified professional engineer.
 - f. Wiring Diagrams: Power, signal, and control wiring.
 - 3. Certificates: For certification required in "Quality Assurance" Article.
 - 4. Source quality-control test reports.
 - 5. Startup service reports.
 - 6. Operation and Maintenance Data: For each water chiller to include in emergency, operation, and maintenance manuals.
 - 7. Warranties: Special warranties specified in this Section.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Ship water chillers from the factory fully charged with refrigerant or nitrogen.

1.06 COORDINATION

- A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.
- B. Coordinate installation of roof curbs and roof penetrations. These items are specified in Division 7 Section "Roof Accessories."

1.07 WARRANTY

- A.. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of water chillers that fail in materials or workmanship.

PART 2 - PRODUCTS

2.01 PACKAGED WATER CHILLERS

- A. Description: Factory-assembled and -tested water chiller complete with casing, compressor(s), evaporator, condenser, controls, interconnecting unit piping and wiring, indicated accessories, and mounting frame.
 - 1. Casing: Weatherproof, constructed of hot-dip galvanized steel with factory-painted finish.
 - 2. Acoustical sound blanket.
 - 3. Acoustical compressor enclosure.
 - 4. Fans: Propeller type, statically and dynamically balanced, with vertical air discharge for high efficiency and low sound; located in its own compartment to eliminate cross flow of condenser air during fan cycling; and equipped with heavy-gage, weather-protected fan guard.
 - 5. Fan Motor: Direct drive, weatherproof, with bearings permanently lubricated, and having built-in current- and thermal-overload protection.
- D. Fabricate water chiller mounting frame and attachment to the pressure vessel with reinforcement strong enough to resist water chiller movement during a seismic event when the water chiller mounting frame is anchored to the building structure.

2.02 RECIPROCATING COMPRESSORS

- A.. Description: Positive-displacement, direct drive with suction and discharge service valves, crankcase oil heater, and suction strainer. The compressor shall be capable of operating at part-load conditions without increased vibration over normal vibration at full-load operation and shall be capable of continuous operation at its lowest step of unloading.
- B. Capacity Control: Combinations of cylinder unloading and on-off compressor cycling of multiple compressors.
- C. Oil Lubrication System: Reversible, positive-displacement pump with strainer, sight glass, filling connection, filter with magnetic plug, and initial oil charge.
- D. Refrigerant and Oil: HCFC-22, HFC-134a, HFC-407c, or HFC-410a.
- E. Refrigerant Compatibility: Seals, O-rings, motor windings, and internal water chiller parts exposed to refrigerants shall be fully compatible with refrigerants, and pressure components shall be rated for refrigerant pressures.
- F. Refrigerant Circuit: Independent circuits. Each circuit shall include a thermal expansion valve, refrigerant charging connections, a hot-gas muffler, compressor suction and discharge shutoff valves, a liquid-line shutoff valve, a replaceable-core filter drier, a sight glass with moisture indicator, a liquid-line solenoid valve, and an insulated suction line.

2.03 SCROLL COMPRESSORS

- A. Description: Positive displacement, direct drive with suction and discharge service valves, crankcase oil heater, and suction strainer. The compressor shall be capable of operating at part-load conditions without increased vibration over normal vibration at full-load operation and shall be capable of continuous operation at its lowest step of unloading.
- B. Capacity Control: Hot-gas bypass.
- C. Refrigerant and Oil: HCFC-22, HFC-134a, HFC-407c, or HFC-410a.
- D. Refrigerant Compatibility: Seals, O-rings, motor windings, and internal water chiller parts exposed to refrigerants shall be fully compatible with refrigerants, and pressure components shall be rated for refrigerant pressures.
- E. Refrigerant Circuit: Independent circuits. Each circuit shall include a thermal expansion valve, refrigerant charging connections, compressor suction and discharge shutoff valves, a liquid-line shutoff valve, a replaceable-core filter drier, a sight glass with moisture indicator, a liquid-line solenoid valve, and an insulated suction line.

2.04 HEAT EXCHANGERS

- A. Evaporator:
 - 1. Description: Shell-and-tube design, ASME labeled.
 - 2. Shell Material: Carbon steel.
 - 3. Tube Construction: Copper, individually replaceable, expanded into tube sheets.
- B. Condenser:
 - 1. Description: Shell-and-tube design, ASME labeled.
 - 2. Shell Material: Carbon steel.
 - 3. Tube Construction: Copper, externally enhanced and individually replaceable, expanded into tube sheets.
- C. Air-Cooled Condenser: Copper tubes with mechanically bonded aluminum fins, integral subcooling circuit, leak tested at 450 psig.

2.05 INSULATION

- A. Cold Surfaces: Closed-cell, flexible elastomeric, thermal insulation complying with ASTM C 534, Type II, for sheet materials.

2.06 CONTROLS

- A. Control Panel: Stand-alone, microprocessor based.
- B. Enclosure: Unit-mounted enclosure, hinged or lockable; factory wired with a single-point power connection and a separate control circuit.
- C. Status Display: Multiple-character liquid-crystal display or light-emitting diodes and keypad.
- E. Manually Reset Safety Controls shall shut down water chiller and require manual reset.
- F. Building Management System Interface: Factory-installed hardware and software to enable building management system to monitor and control chilled-water set point and chiller-control displays and alarms.

2.07 MOTORS

- A. Comply with requirements in Section 16225.

2.08 MAGNETIC ENCLOSED CONTROLLERS

- A. Enclosure: Unit mounted, with hinged access door with lock and key or padlock and key.
- B. Control Circuit: 120 V; obtained from integral control power transformer with a control power transformer of enough capacity to operate connected pilot, indicating and control devices, plus 100 percent spare capacity.

- C. Overload Relay: Shall be sized according to UL 1995 or shall be an integral component of water chiller control microprocessor.
- D. Across-the-Line Controller: NEMA ICS 2, Class A, full voltage, nonreversing; include isolation switch and current-limiting fuses.
- E. Across-the-Line Combination Controller: Factory-assembled combination NEMA ICS 2, Class A, full-voltage, nonreversing controller and disconnect switch.
- F. Accessories: Devices shall be factory installed in controller enclosure.

2.09 SOURCE QUALITY CONTROL

- A. Factory test and rate water chillers, before shipping, according to ARI 550/590, "Water Chilling Packages Using the Water Compression Cycle." Stamp with ARI label.
- B. Factory test and inspect evaporator and water-cooled condenser according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1. Stamp with ASME label.
- C. Rate sound power level according to ARI 575 or ARI 370 procedure.

PART 3 - EXECUTION

3.01 EXAMINATION

- A.. Before water chiller installation, examine roughing-in for concrete equipment bases, anchor-bolt sizes and locations, piping, and electrical to verify actual locations, sizes, and other conditions affecting water chiller performance, maintenance, and operations.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 WATER CHILLER INSTALLATION

- A.. Install water chillers on concrete base. Concrete base is specified in Section 15050 and concrete materials and installation requirements are specified in Division 3.
- B. Concrete Bases: Anchor chiller mounting frame to concrete base.
- C. Vibration Isolation: Rubber pads, restrained spring isolators or vibration isolation equipment base as specified in 15070.
- F. Maintain manufacturer's recommended clearances for service and maintenance.
- G. Charge water chiller with refrigerant if not factory charged.
- H. Install separate devices furnished by manufacturer.

3.03 CONNECTIONS

- A. Chilled and condenser-water piping installation requirements are specified in Section 15205. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to chiller to allow service and maintenance.

- F. Ground water chillers according to Section 16060.
- G. Connect wiring according to Section 16120.
- H. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.04 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.
- B. Inspect field-assembled components, equipment installation, and piping and electrical connections for proper assemblies, installations, and connections.
- C. Complete installation and startup checks according to manufacturer's written instructions.
- D. Prepare a written startup report that records results of tests and inspections.

3.05 DEMONSTRATION

- A. Upon completion of installation, in accordance with the General Requirements, furnish on-site services of the manufacturer's engineering representative with specialized experience in the equipment to instruct Authority personnel in proper operation and maintenance.

END OF SECTION

SECTION 15640

COOLING TOWERS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing factory-assembled, counterflow, vertical-discharge, blow-through, cooling towers.
- B. Related Work Specified Elsewhere:
 - 1. Piping systems: Section 15205.
 - 2. Vibration isolation: Section 15070.
 - 3. Sound attenuators: Section 15825.
 - 4. Control equipment: Section 15900.
 - 5. Motors: Section 16225.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. NFPA: 214.
 - 3. CTI: Bulletin ATP-105.
 - 4. ASME: Performance Test Code PTC-23.
 - 5. ASTM: A653, B117.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: Include manufacturer's technical data for each model indicated, including rated capacities, electrical characteristics, furnished specialties, and accessories
 - 2. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 3. Certification:
 - a. Certificates stating that the sound power level of cooling tower based on 10^{-12} watts does not exceed following decibel ratings, without attenuators:

Octave Band Center Frequency/Hertz	Sound Power Level/dB
63	97
125	95
250	92
500	90
1000	86
2000	85
4000	82
8000	78

- b. Certified field test reports as specified and as directed.
4. Operation and Maintenance Manuals.

1.04 JOB CONDITIONS:

A. Safety Requirements:

1. Properly guard belts, pulleys, chains, gears, couplings, projecting set screws, keys and other rotating parts to prevent danger to personnel.

1.05 OPERATION AND MAINTENANCE TRAINING:

- A. Upon completion of installation, furnish on-site services of manufacturer's engineering representative with specialized experience in components of system for minimum of 1/2 man-day to instruct Authority personnel in proper operation and maintenance of each system.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

A. General Requirements:

1. In design and purchase of equipment, provide for interchangeability of items of piping equipment, subassemblies, parts, motor starters and relays.
2. Galvanized-steel sheets: ASTM A653; coating designation G90 with raw edges coated with a zinc-rich compound.
3. Galvanized surfaces finished with zinc-chromate primer and aluminum-paint finish coat or finished with manufacturer's standard coating, with the following additional requirements:
 - a. Coating permitting no corrosion on steel when exposed to 20-percent salt spray at 95F for a minimum of 400 consecutive hours.
 - b. Coating tested in accordance with ASTM B117.

B. Cooling Towers:

1. Each cooling tower designed to meet the following performance criteria:
 - a. Water-flow rate: As scheduled.
 - b. Cooling: From 95F to 85F minimum.

- c. Ambient temperature: 78F wet bulb.
 - d. Water-pressure drop: Not exceeding value shown.
2. Sump sections:
- a. Galvanized steel, heavy-gauge.
 - b. Provided with outlet connection, overflow, valved drain and electric water-level control consisting of magnetic-type electric float switch in moisture proof housing and control solenoid valve in makeup water line.
 - c. Outlet connections with large-area lift-out strainer with perforated openings sized smaller than spray-nozzle orifices, mounted in assembly and baffled to prevent cavitation.
 - d. Pipe drain and overflow connections as shown or to nearest drain leading to sewer.
3. Fan sections:
- a. Hot-dip galvanized steel.
 - b. Fans forward-curved, centrifugal, with one or more wheels, statically and dynamically balanced.
 - c. Designed to overcome resistance of tower, its enclosure, connecting ductwork and sound attenuators, if any, and quiet in operation.
 - d. Air inlets designed for smooth air entry.
 - e. Hot-dip galvanized bird screen at fan air inlets.
4. Fan bearings:
- a. Heavy-duty ball bearings, precision-grade, incorporating cast-iron pillow blocks and self-aligning with wide inner rings for greater load capacity.
 - b. Slip-fit bearings equipped with eccentric locking collars to provide for positive means of securing bearings to shaft.
 - c. Prelubricated bearings, ready for immediate service.
 - d. Grease-fitting for relubrication.
 - e. Lithium-base grease, waterproof, containing inhibitor and effective for temperature range of minus 65F to plus 250F.
5. Fan drives:
- a. Fan driven by electric motors through V-belt drives.
 - b. Belt guard of expanded metal, wire mesh or solid side panels.
 - c. Adjustable motor brackets.
 - d. Entire fan drive, including sheaves, belts, keys and other items manufacturer-rated for minimum of 1.5 times maximum horsepower required to drive fan.
 - e. Rating taken from manufacturer's standard catalog data.
 - f. Fan-shaft sheave-pitch diameter minimum 35 percent of fan wheel outside diameter.
6. Fan motors: Section 16225, with the following additional requirements:
- a. Four-pole, totally enclosed, fan-cooled and guarded.
7. Casings:
- a. Fabricated of heavy-gauge hot-dip galvanized steel using channel-type sheets.
 - b. Gasketed access doors for strainer.
 - c. Towers designed for live load of 40 pounds per square foot on horizontal deck surfaces and wind load of minimum 100 miles per hour for vertical surfaces.
 - d. Ladder: Aluminum or hot-dip galvanized steel for towers having water-distribution section more than eight feet above roof or grade.
8. Tower fill and drift eliminators:
- a. Tower fill (wet deck) fabricated in modular layers consisting of hot-dip galvanized, wave-formed, 26-gauge surface sheets or manufacturer's equivalent standard product.

- b. Drift eliminators fabricated of materials specified for fill but located at top of tower and assembled in easily handled removable sections to provide access to spray tree and nozzles.
 - 9. Water distribution:
 - a. Water evenly distributed over tower fill area through spray tree consisting of hot-dip galvanized steel header and removable hot-dip galvanized steel branches.
 - b. Branches and spray nozzles retained in place by means of snap-in rubber grommets to provide for ease of removal for cleaning and replacement of spray nozzles.
 - c. Plastic nozzles provided.
 - d. Spray tree and spray nozzles designed for total flow rate for each tower as specified.
 - e. Spray header with plugged tap for measurement of pressure.
 - f. Separate regulating and stop valves for complete balancing and complete shutoff for each tower.
 - 10. Makeup-water solenoid valve:
 - a. 120-volt, 60-Hertz solenoid valve installed in makeup-water line.
 - b. Maximum operating pressure-drop across valve: 10 psi.
 - c. Solenoid valve controlled by electric float switch.
- C. Nameplates:
 - 1. Securely attached plate on each cooling tower showing manufacturer's name, model number and serial number as specified in Section 15075.
- D. Sound Attenuators: Section 15825.
- E. Controls: Section 15900.
- F. Vibration Isolators: Section 15070.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Start ladders at roof or grade level.
- B. Provide support beams, concrete pads, platforms, hangers and anchor bolts for proper installation of equipment as recommended by the manufacturer.
- C. Install complete potable makeup-water system as shown and as specified in Section 15205.
- D. Mount units on vibration isolators in accordance with Section 15070.

3.02 FIELD QUALITY CONTROL:

- A. Field Tests:
 - 1. Test cooling towers in accordance with ASME Performance Test Code PTC-23 or CTI Bulletin ATP-105, using services of independent testing agency.
 - 2. Prior to commencing tests, submit name of testing agency for approval.

3. Tests will be observed by the Authority and calculations performed immediately following tests. Have tests and calculations signed by observers.
4. Submit computations to the Engineer together with six complete sets of test results.
5. Compute and test in accordance with particular test procedure employed by testing agency.
6. When the Engineer considers the performance of cooling towers unsatisfactory, the Engineer will direct that cooling towers be retested.
7. Should tests show that cooling towers are deficient, modify or replace towers to provide specified capacities.
8. If cooling tower performance is proven satisfactory, cost of tests will be borne by the Authority. If cooling tower performance is proven unsatisfactory, cost of tests will be borne by the Contractor.

THIS PAGE NOT USED

SECTION 15725

VENTILATING UNITS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing ventilating units.
- B. Related Work Specified Elsewhere:
 - 1. Concrete pads: Sections 03100, 03200 and 03300.
 - 2. Vibration isolation: Section 15070.
 - 3. Air conditioning units: Sections 15732, 15733, 15737.
 - 4. Heating equipment: Section 15765.
 - 5. Control equipment: Section 15900.
 - 6. Electrical connections: Sections 16120 and 16130.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: Include manufacturer's technical data for each model indicated, including rated capacities, electrical characteristics, furnished specialties, and accessories.
 - 2. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 3. Operation and Maintenance Manuals.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
 - 1. In design and purchase of equipment, provide for interchangeability of items of equipment, subassemblies, parts, motors, starters and relays.
- B. Ventilating Units:
 - 1. Ventilating units furnished in accordance with Sections 15732, 15733, and 15737 but without cooling-coil section in ventilating units.

2. Provide heating when required as per Section 15765.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Fit equipment and appurtenances to space provided and make readily serviceable.
- B. Mount ventilating units on concrete pads and vibration isolators in accordance with Sections 03100, 03200, 03300, and 15070.
- C. Provide supports, hangers and anchor bolts necessary for proper installation of equipment as recommended by manufacturer.
- D. Wire, cable and boxes: Sections 16120 and 16130.

END OF SECTION

SECTION 15732
ROOFTOP AIR CONDITIONERS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This Section specified providing rooftop air conditioners:
 - 1. Cooling and heating units 6 tons and smaller.
 - 2. Cooling and heating units 7-1/2 to 20 tons.
 - 3. Cooling and heating units larger than 20 tons.

- B. Related work specified elsewhere:
 - 1. Filters: Section 15865
 - 2. Conduits, Raceways and Cabinets: Section 16130
 - 3. Wire, Cable and Busways: Section 16120
 - 4. NOT USED
 - 5. Heating Equipment: Section 15765
 - 6. Water Coils: Section 15734
 - 7. Piping Systems: Section 15205
 - 8. Vibration Isolation: Section 15070
 - 9. Ductwork: Section 15810
 - 10. Control Equipment: Section 15900
 - 11. Motors: Section 16225
 - 12. Motor Starters and Control Centers: Section 16425

1.02 DEFINITIONS

- A. DDC: Direct-digital controls.

1.03 SUBMITTALS

- A. Product Data: Include manufacturer's technical data for each model indicated, including rated capacities, electrical, characteristics, furnished specialties, and accessories.

- B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection. Prepare the following by or under the supervision of a qualified professional engineer:
 - 1. Wiring Diagrams: Power, signal, and control wiring.

- C. Certification: Field quality-control test reports.

- D. Operation and Maintenance Data: For rooftop air conditioners to include in emergency, operation, and maintenance manuals.

1.04 QUALITY ASSURANCE

- A. Product Options: Drawings indicate size, profiles, and dimensional requirements of rooftop air conditioners and are based on the specific system indicated. Refer to Division 1 Section "Product Requirements."

- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

- C. Fabricate and label refrigeration system to comply with ASHRAE 15, "Safety Code for Mechanical Refrigeration."

- D. Energy-Efficiency Ratio: Equal to or greater than prescribed by ASHRAE 90.1, "Energy Efficient Design of New Buildings except Low-Rise Residential Buildings."

- E. Coefficient of Performance: Equal to or greater than prescribed by ASHRAE 90.1, "Energy Efficient Design of New Buildings except Low-Rise Residential Buildings."

- F. Comply with NFPA 54 for gas-fired furnace section.
- G. ARI Certification: Units shall be ARI certified and listed.
- H. ARI Compliance for Units with Capacities Less Than 135,000 Btuh: Rate rooftop air-conditioner capacity according to ARI 210/230, "Unitary Air-Conditioning and Air-Source Heat Pump Equipment."
- I. Sound Power Level Ratings: Comply with ARI 270, "Sound Rating of Outdoor Unitary Equipment."

1.05 COORDINATION

- A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.
- B. Coordinate installation of roof curbs, equipment supports, and roof penetrations.
- C. Coordinate size, location, and installation of rooftop air-conditioner manufacturer's roof curbs and equipment supports with roof installer.

PART 2 - PRODUCTS

2.01 ROOFTOP AIR CONDITIONERS 6 TONS AND SMALLER

- A. Description: Factory assembled and tested; designed for exterior installation; consisting of compressor, indoor and outside refrigerant coils, indoor fan and outside coil fan, refrigeration and temperature controls, filters, and dampers.
- B. Casing: Manufacturers standard galvanized-steel construction with enamel paint or powder paint finish, removable panels or access doors with neoprene gaskets for inspection and access to internal parts, minimum 1-inch thick thermal insulation, knockouts for electrical and piping connections, exterior condensate drain connection, and lifting lugs.
- C. Indoor Fan: Forward curved, centrifugal, motor.
- D. Outside Coil Fan: Propeller type, directly driven by motor.
- E. Refrigerant Coils: Aluminum-plate fin and seamless copper tube in steel casing with equalizing-type vertical distributor.
- F. Compressor: Hermetic compressor with integral vibration isolators, internal overcurrent and overtemperature protection, internal pressure relief, and crankcase heater.
- G. Refrigeration System with R-22 or 134a.
- H. Filters: Section 15865.
- I. Heat Exchanger: Aluminized steel construction for natural gas-fired burners.
- J. Electric Heat: Helix-wound, nickel-chrome, electric-resistance elements, factory wired for single-point wiring connection; with time delay for element staging, and overcurrent and overheat protective devices.
- K. Hot Water Heating Section: Section 15734.
- L. Outside-Air Damper: Linked damper blades, for 0 to 25 percent outside air, with fully modulating, spring-return damper motor and hood.
- M. Economizer: Return- and outside-air dampers with neoprene seals, outside-air filter, and hood.
- N. Power Connection: Provide for single connection of power to unit with unit-mounted disconnect switch accessible from outside unit and control-circuit transformer with built-in circuit breaker.
- O. Unit Controls: Solid-state control board and components.

- P DDC: Install stand-alone control module providing link between unit controls and DDC system. Control module shall be compatible with temperature-control system specified in Section 15900.
- Q Thermostat: Programmable, electronic; with heating setback and cooling setup with seven-day programming.
- R Roof Curb: Steel with corrosion-protection coating, gasketing, and factory-installed wood nailer; complying with NRCA standards; minimum height of 14 inches.

2.02 ROOFTOP AIR CONDITIONERS 7-1/2 TO 20 TONS

- A. Description: Factory assembled and tested; designed for exterior installation; consisting of compressor, indoor and outside refrigerant coils, indoor fan and outside coil fan, refrigeration and temperature controls, filters, and dampers.
- B. Casing: Galvanized-steel construction with enamel paint finish, removable panels or access doors with neoprene gaskets for inspection and access to internal parts, minimum 1 inch thick thermal insulation, knockouts for electrical and piping connections, exterior condensate drain connection, and lifting lugs.
- C. Indoor Fan: Forward curved, centrifugal, belt driven with adjustable motor sheaves, grease-lubricated ball bearings, and motor.
- D. Outside Coil Fan: Propeller type, directly driven by permanently lubricated motor
- E. Refrigerant Coils: Aluminum-plate fin and seamless copper tube in steel casing with equalizing-type vertical distributor.
- F. Compressor(s): One or more hermetic compressors with integral vibration isolators, internal overcurrent and overtemperature protection, internal pressure relief, and crankcase heater(s).
- G. Refrigeration System with R-22 or 134a.
- H. Filters: Section 15865.
- I. Heat Exchanger: Aluminized-steel or Stainless-steel construction for natural gas-fired burners.
- J. Electric Heat: Helix-wound, nickel-chrome, electric-resistance elements, factory wired for single-point wiring connection; with time delay for element staging, and overcurrent and overheat protective devices.
- K. Economizer: Return- and outside-air dampers with neoprene seals, outside-air filter, and hood.
- L. Power Connection: Provide for single connection of power to unit with unit-mounted disconnect switch accessible from outside unit and control-circuit transformer with built-in circuit breaker.
- M. Unit Controls: Solid-state control board and components.
- N. DDC Temperature Control: Install stand-alone control module providing link between unit controls and DDC temperature-control system. Control module shall be compatible with temperature-control system specified in Section 15900.
- O. Thermostat: Programmable, electronic; with heating setback and cooling setup with seven-day programming.
- P. Roof Curb: Steel with corrosion-protection coating, gasketing, and factory-installed wood nailer; complying with NRCA standards.
- Q.

2.03 ROOFTOP AIR CONDITIONERS LARGER THAN 20 TONS

- A. Description: Factory assembled and tested; designed for exterior installation; consisting of compressor, indoor and outside refrigerant coils, indoor fan and outside coil fan, refrigeration and temperature controls, filters, and dampers.
- B. Casing: Manufacturer's standard galvanized sheet metal construction with exterior enamel paint finish, hinged access doors with neoprene gaskets for inspection and access to internal parts, minimum 1-inch-thick thermal insulation, knockouts for electrical and piping connections, exterior condensate drain connection, and lifting lugs.
- C. Indoor Fan: Forward curved, backward inclined or airfoil, centrifugal, belt driven with adjustable fixed motor sheaves, grease-lubricated ball bearings, and motor. Mount fan and motor assembly on base with spring isolators having 2-inch deflection.
- D. Return-Air Fan: Forward curved, Airfoil, backward inclined, centrifugal, belt driven with adjustable motor sheaves, grease-lubricated ball bearings, and motor. Mount fan and motor assembly on base with spring isolators having 2-inch deflection.
- E. Outside Coil Fan: Propeller type, directly driven by permanently lubricated motor.
- F. Refrigerant Coils: Aluminum-plate fin and seamless copper tube in galvanized-steel casing with equalizing-type vertical distributor and thermal expansion valve; tested to 450 psig and leak tested to 300 psig with air under water. Insulate coil section. Provide stainless-steel drain pan under indoor coil.
- G. Compressor(s): Number as scheduled compressors with integral vibration isolators, internal overcurrent and overtemperature protection, internal pressure relief, and crankcase heaters.
- H. Refrigeration System with R-134a.
- I. Filters Section: See Section 15865.
- J. Heat Exchanger: Stainless-steel construction for natural gas-fired burners.
- K. Electric Heat: Helix-wound, nickel-chrome, electric-resistance elements, factory wired for single-point wiring connection; with time delay for element staging, and overcurrent and overheat protective devices; control in stages.
- L. Water Heating Coils: Aluminum-plate fin and seamless copper tube in galvanized-steel casing, tested to 300 psig and leak tested to 200 psig with air under water; with modulating control valve and actuator. Insulate coil section.
- M. Economizer: Return- and outside-air dampers with neoprene seals, outside-air filter, and hood.
- N. Power Connection: Provide for single connection of power to unit with unit-mounted disconnect switch accessible from outside unit and control-circuit transformer with built-in circuit breaker.
- O. Unit Controls: Solid-state control board and components.
- P. DDC Temperature Control: Install stand-alone control module providing link between unit controls and DDC temperature-control system. Control module shall be compatible with temperature-control system specified in Section 15900.
- Q. Thermostat: Programmable, electronic; with heating setback and cooling setup with seven-day programming.
- R. Roof Curb: Steel with corrosion-protection coating, gasketing, and factory-installed wood nailer; complying with NRCA standards; minimum height of 14 inches.

2.04 MOTORS

- A. Comply with requirements in Division 16 Section "Motors."

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install units level and plumb, maintaining manufacturer's recommended clearances
- B. Curb Support: Install roof curb on roof structure, level and secure, according to NRCA's standards. Install and secure rooftop air conditioners on curbs and coordinate roof penetrations and flashing with roof construction. Secure units to curb support with anchor bolts.
- C. Unit Support: Install unit level. Secure units to structural support with anchor bolts.

3.02 CONNECTIONS

- A. Piping installation requirements are specified in other Section 15205.
- B. Install piping adjacent to machine to allow service and maintenance.
- C. Duct installation requirements are specified in other Division 15 Sections.
- D. Electrical System Connections: Comply with applicable requirements in Division 16 Sections for power wiring, switches, and motor controls.
- E. Ground equipment according to Division 16 Section "Grounding and Bonding."
- F. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.03 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections. Report results in writing.
- B. Perform field quality-control tests and inspections and prepare test reports.
- C. Remove malfunctioning units, replace with new units, and retest as specified above.

3.04 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.
- B. Complete installation and startup checks according to manufacturer's written instructions.

3.05 ADJUSTING

- A. Adjust initial temperature and humidity set points.
- B. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

3.06 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Authority's maintenance personnel to adjust, operate, and maintain rooftop air conditioners.

THIS PAGE NOT USED

SECTION 15733

AIR CONDITIONING UNITS - CHILLED WATER COOLED

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing factory-built air-conditioning units with cabinet-type fan sections and coil sections.
- B. Related Work Specified Elsewhere:
 - 1. Equipment foundations: Sections 03100, 03200 and 03300.
 - 2. Water coils: Section 15734.
 - 3. Filters: Section 15865.
 - 4. Ductwork: Section 15810.
 - 5. Piping systems: Section 15205.
 - 6. Vibration isolation: Section 15070.
 - 7. Control equipment: Section 15900.
 - 8. Raceways, boxes and cabinets: Section 16130.
 - 9. Wire, cable and busways: Section 16120.
 - 10. Motors: Section 16225.
 - 11. Motor starters and control devices: Section 16425.
 - 12. Chillers: Sections 15625, 15626, 15628

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. NFPA: 90A.
 - 3. ARI: 430.
- B. Qualifications of Manufacturer:
 - 1. Furnish air-conditioning units which are the products of a manufacturer who is a member of AMCA.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: Include manufacturer's technical data for each model indicated, included rated capacities, electrical characteristics, furnished specialties, and accessories.
 - 2. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field condition
 - 3. Certification:
 - a. Each air-conditioning unit fan.
 - 4. Operation and Maintenance Manuals.

1.04 JOB CONDITIONS:

- A. Safety Requirements:
 - 1. Properly guard belts, pulleys, chains, gears, couplings, projecting set screws, keys and other rotating parts to prevent danger to personnel.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
 - 1. In design and purchase of equipment, provide for interchangeability of items of piping equipment, subassemblies, parts, motors, starters and relays.
- B. Fans:
 - 1. Class I or II: Double width, double inlet, centrifugal, meeting ARI 430 and bearing ARI seal.
 - 2. Blades backward inclined or airfoil type, with the following additional requirements:
 - a. Forward curved blades may be furnished for fan wheel diameter 24 inches or less.
 - 3. Inlets with smooth, rounded edges.
 - 4. Fan housing fabricated of zinc-coated steel sheets, heavy-gauge consistent with size and use of unit.
 - 5. Fan wheels having heavy-gauge rims, blades of heavy-gauge steel consistent with blade size and for capacity, with matching heavy-gauge backplates. Steel, painted with zinc-oxide primer or corrosion-proof plastic coating.
 - 6. Fan wheels and sheaves: Splined or keyed, fastened to shafts with set screws.
 - 7. Shafts of steel, solid or hollow, ground to tolerance on working surfaces.
 - 8. Nonworking surfaces of shafts coated with factory-applied corrosion proof plastic coating.
- C. Fan Bearings:
 - 1. Self-aligning, antifriction type, designed to prevent leakage of lubricant and entrance of dirt.
 - 2. Design life: 200,000 hours minimum.
 - 3. Extended grease fittings when bearings are located internally.
- D. Fan Operating Characteristics:
 - 1. Brake horsepower necessary to drive fan at air volume and static pressure shown.
 - 2. Fans which do not approach 25 percent of first critical speed of shaft during normal operation or while attaining speed.
 - 3. Prior to shipment, statically and dynamically balance fans on their own shafts in their own units at design speed.
- E. Fan Drives:
 - 1. Fan driven by electric motor through high-capacity, V-belt drive.
 - 2. Drives protected with belt guard of expanded-metal wire mesh or solid-metal side panels with tachometer opening.
 - 3. Adjustable motor brackets and sheaves with nominal rating at midpoint.
 - 4. Gasketed, hinged access doors with quick-opening latches or removable access panels.
 - 5. Entire fan drive, including sheaves, belts, keys and other items rated by manufacturer at minimum 1.5 times maximum horsepower required to drive fan.
 - 6. Ratings in accordance with manufacturer's standard catalog data.

7. Fan-shaft sheave-pitch diameter: 30-percent minimum outside diameter of fan wheel.
 8. Metal label riveted to unit stating size of replacement belt.
 9. Variable frequency controllers (VFC) for use with variable air volume systems.
- F. Fan Motors: Section 16225, with the following additional requirements:
1. Four-pole, dripproof, fully guarded.
 2. Compatible with VFC in variable air volume systems.
- G. Motor Starters and Control Centers: Section 16425.
- H. Unit Casings:
1. In sections to facilitate handling.
 2. Fabricated of steel sheets, manufacturer's standard heavy-gauge.
 3. Steel sheets, angles and other structural shapes used in construction of casings: Zinc-coated steel or chemically pretreated and painted with enamel primer and exterior surface finished with factory-applied enamel coating.
 4. Panels removable for access.
 5. Cadmium-plated steel bolts, screws and washers.
 6. Structural frame fabricated with members rigidly braced to hold parts in line and to prevent distortion when operating.
 7. Structural frame of welded construction; slag and splatter removed after welding.
 8. Welds painted with two coats of approved primer and one finish coat of aluminum epoxy paint.
 9. Fan sections and coil sections factory-insulated.
 - a. Insulation: Minimum one-inch thick neoprene-coated fibrous glass, 1-1/2 pounds per cubic foot density, securely adhered to panel inner surface with adhesive and weld pins on minimum two-foot centers.
 - b. Exposed edges coated with adhesive.
 - c. Insulation and adhesive: NFPA 90A.
 10. Fan section or fan-coil section connected by flexible connections as specified in Section 15820.
 11. Filters: Section 15865.
 12. Drain pan:
 - a. Drain pan under fan and coil section where cooling coil used.
 - b. Drainage connection: As shown.
 - c. Insulate entire drain pan with 1/2-inch cellular foam.
 13. Coil: Section 15734.
- I. Nameplates:
1. Securely attached plate to each air-conditioning unit showing manufacturer's name, model number and serial number.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Fit equipment and appurtenances within space provided and make readily serviceable.
- B. Provide foundations, platforms and hangers necessary for proper installation of equipment.
- C. Construct equipment foundations four inches minimum height in accordance with Sections 03100, 03200 and 03300.

- D. Install units on vibration isolators where shown as specified in Section 15070.
- E. Electrical connections: Sections 16130 and 16120.
- F. Condensate piping: Section 15205.
- G. After installation, adjust fans to operate without noticeable vibration.
- H. Arrange belt guards to permit oiling, testing and using tachometer with guards in place.

END OF SECTION

SECTION 15734

WATER COILS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing chilled water and hot water coils in factory-built air-conditioning units.
- B. Related Work Specified Elsewhere:
 - 1. Air Conditioning Units: Section 15732, 15733, 15737.
 - 2. Piping: Section 15205

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. ARI: 410.
- B. Qualifications of Manufacturer:
 - 1. Furnish water coils which are the products of a manufacturer who is a member of ARI.
- C. Source Quality Control:
 - 1. Factory test water coils at 350-psi air pressure underwater.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: Include manufacturer's technical data including rated capacities and accessories.
 - 2. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, required clearances, location and size of each field connection.
 - 3. Certification
 - 4. Operation and Maintenance Manuals.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
 - 1. In design and purchase of equipment, provide for interchangeability of items of piping equipment, subassemblies and parts.
 - 2. Coil section to interface directly with sections on sides without use of transition sections.
 - 3. Meet ARI 410.
- B. Water Coil:
 - 1. Seamless deoxidized-copper tubes, minimum 0.025-inch thick wall with aluminum fins.
 - 2. Coil casings of zinc-coated, rust-resistant steel.

3. End panels: Heavy-gauge steel.
4. Side panels: 16 gauge for tube lengths up to 90 inches; 14 gauge for tube lengths of 91 to 120 inches.
5. Top and bottom casing flanges formed into box shape for strength and durability with flat surface for coil stacking.
6. Coils with 48 to 84-inch tube lengths provided with one center tube support; for longer coils, up to 120-inch tube lengths, provided with two intermediate supports.
7. Maximum fin spacing: 12 per inch of tube.
8. Water velocity: Minimum two fps and maximum six fps throughout tube length.
9. Maximum water-pressure drop through coils: 35 feet water gauge.
10. Maximum air velocity through coil face: 550 fpm.
11. Designed with continuous circuits from inlet header to outlet header.
12. Drainable, pitched 3/16 inch per foot toward return header for complete drainage.
13. Self-venting with supply connection at bottom of supply header and return connection at top of return header.
14. Vent connection provided in supply header and drain connection in return header.

C. Nameplates:

1. Securely attached to each coil showing manufacturer's name, model number and serial number.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Support coils on rails and make readily removable.
- B. Make supply connection to header giving counter flow as shown.
- C. Use of coils to support piping is prohibited.

END OF SECTION

SECTION 15735

PACKAGED TERMINAL AIR CONDITIONING UNITS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing factory-packaged self-contained air-conditioning units with direct expansion coil, electric heating coils, air-cooled condensers and automatic controls.
- B. Related Work Specified Elsewhere:
 - 1. Filters: Section 15865.
 - 2. Conduit, raceways and cabinets: Section 16130.
 - 3. Wire, cable and busways: Section 16120.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ARI: 210.
 - 3. UL listed.
- B. Design Criteria:
 - 1. Select units in accordance with requirements shown.
- C. Factory wiring:
 - 1. In accordance with manufacturer's standard practice.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: Include manufacturer's technical data for each model indicated, including rated capacities, electrical characteristics, furnished specialties, and accessories.
 - 2. Shop Drawings: Detail equipment assemblies and indicated dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 3. Certification.
 - 4. Operation and Maintenance Manuals.

PART 2- PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
 - 1. In design and purchase of equipment, provide for the interchangeability of items of piping equipment, subassemblies, parts, motors, starters and relays.
 - 2. Each unit completely piped, wired, charged and factory-tested as a package and designed for through-wall installation.

3. Meet ARI 210.
 4. UL listed
- B. Cabinet:
1. Welded cabinet constructed of heavy-gauge steel, zinc-coated or chemically pretreated, painted with enamel primer and exterior surface finished with factory-applied enamel coating.
 2. Containing junction boxes, polarized sockets and plugs for chassis electrical connection.
 3. Discharge grilles, front panels and return air grilles assembled to be removable for cleaning and access.
 4. Interior casing lined with sound-absorbing insulation material resistant to moisture, vermin and rot.
 5. Discharge grille with adjustable louver blades, fabricated of extruded aluminum.
- C. Compressor:
1. Hermetically and semi-hermetically sealed, refrigerant-cooled, suitable for operation with refrigerant R-22.
 2. High-pressure cutout with manual reset and low-pressure cutout with automatic reset.
 3. Compressor motor protected by means of overload relays and internal-winding thermostat.
 4. Mounted on rubber-isolated spring mountings.
- D. Evaporator Coil:
1. Direct expansion, fabricated of seamless copper tubing with aluminum fins, tightly bonded to tubing.
 2. Cooling-capacity selection based on space conditions and the following as shown:
 - a. Entering wet-bulb temperature at evaporator.
 - b. Entering ambient temperature at condenser coil.
 3. Single thermal-expansion valve for refrigerant control or capillary tube.
 4. Tested at minimum 300 psig.
- E. Condenser Coil:
1. Air-cooled type, fabricated of seamless copper tubing with aluminum fins, tightly bonded to tubing.
 2. Capable of a total heat rejection based on condensing and ambient temperatures as shown.
 3. Tested at minimum 425 psig.
- F. Electric Heating Coil:
1. Consisting of finned, metal-sheathed elements, anchored to ensure noiseless expansion and contraction.
 2. Fins furnace-brazed to steel sheath.
 3. Sheath and fins coated with heavily-fired ceramic capable of resisting spalling under operating conditions.
 4. Automatic-reset, snap-action, thermal-overheat switch.
 5. Voltage: As shown.
- G. Evaporator Fan and Motor:
1. Centrifugal fan of corrosion-resistant construction.
 2. Fan wheels dynamically and statically balanced.
 3. Motors: Air-conditioning unit manufacturer's standard for intended use and location.

4. Brake horsepower selected to drive fan at air volume and static pressure shown.
- H. Condenser Fan and Motor:
1. Propeller fan of corrosion-resistant construction.
 2. Fan dynamically and statically balanced.
 3. Motors: Air-conditioning unit manufacturer's standard for intended use and location.
 4. Brake horsepower selected to drive fan at air volume and static pressure as shown.
- I. Filters:
1. Replaceable (throwaway)-type: Section 15865.
- J. Ventilation-Control Damper:
1. Ventilation-control damper furnished in one piece, rotating on oilless bearings and capable of air-tight closure.
 2. Damper fabricated from heavy-gauge galvanized steel.
- K. Chassis:
1. Complete factory-wired, packaged heating and cooling-unit chassis consisting of the following:
 - a. Electric heating bank.
 - b. Hermetically sealed compressor.
 - c. Condenser coil and fan.
 - d. Evaporator coil and fan.
 - e. Self-contained temperature controls.
 - f. Protective devices.
- L. Condensate Pan:
1. Condensate pan provided with opening for drain connection or provision for condensate drains into condenser-coil pans to be evaporated by condenser heat.
- M. Wall Sleeves:
1. Watertight, connection provided between cabinet and wall louver.
 2. Constructed from corrosion-resistant material.
 3. Baffles provided to separate flow paths of ventilating and condenser inlet and outlet air.
- N. Wall Louver:
1. Wall louver fabricated from extruded aluminum with 16-gauge enclosing frame.
 2. Louver blades fabricated from heavy-gauge aluminum.
 3. Removable louver for access.
- O. Automatic-Control Kit:
1. Automatic-control package for both cooling and heating consisting of the following:
 - a. Manual changeover-selector switch for cooling or heating.
 - b. Multiple-position thermostat for desired temperature setting.
 - c. Fresh-air control for filtered outside air.
 - d. Heating control relays for staging heating elements.
 - e. Head-pressure control to maintain proper condensing pressure at low outdoor temperature.
 - f. Compressor motor to start after evaporator fan motor starts operating.
- P. Self-Contained Unit Controls:

1. Controls capable of maintaining mechanical cooling and heating operation, factory-mounted and wired to terminal blocks in unit-control compartment.
2. Room-air thermostat.
3. Thermostat-setting dial.
4. Damper operators.
5. Heating and compressor contacts.
6. Condenser and evaporator fan contactors.
7. Interlock switch to de-energize entire unit when front panel is removed.
8. Push-button selector switch for OFF/FAN/COOLING/HEATING operations.
9. Control sequence: Room-air thermostat cycles condenser fan and compressor or heater to maintain room at thermostat setting.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Interlock heating coil with evaporator fan motor, so that heating coil will not operate when evaporator fan motor is operating.
- B. Fit equipment and appurtenances within space provided and make readily serviceable.
- C. Provide supports and hangers required for proper installation of equipment.
- D. Ensure that fans operate without noticeable vibration after installation
- E. Electrical connections: Sections 16120 and 16130.

END OF SECTION

SECTION 15737

AIR CONDITIONING UNITS - AIR-COOLED SPLIT SYSTEM

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing air-cooled split-system air-conditioning units.
- B. Related Work Specified Elsewhere:
 - 1. Concrete pads: Sections 03100, 03200 and 03300.
 - 2. Insulation: Section 15080.
 - 3. Piping systems: Section 15205.
 - 4. Filters: Section 15865.
 - 5. Wire, cable and busways: Section 16120.
 - 6. Conduit, raceways and cabinets: Section 16130.
 - 7. Heating Equipment: Section 15765
 - 8. Vibration Isolation: Section 15070
 - 9. Identification of Mechanical Equipment and Piping: Section 15075
 - 10. Water Coils: Section 15734

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ARI: 210.
 - 3. UL listed.
- B. Design Criteria:
 - 1. Select units in accordance with requirements.
 - 2. Provide completely matched combination between evaporator unit and condensing unit.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: Include manufacturer's technical data for each model indicated, including rated capacities, electrical characteristics, furnished specialties, and accessories.
 - 2. Shop Drawings: Detail equipment assemblies and indicated dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 3. Certification.
 - 4. Operation and Maintenance Manuals.

1.04 JOB CONDITIONS:

- A. Safety Requirements:
 - 1. Properly guard belts, pulleys, chains, gears and other rotating parts to prevent danger to personnel.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
 - 1. In design and purchase of equipment, provide for the interchangeability of items of piping equipment, subassemblies, parts, motors, starters and relays.
 - 2. UL listed.
 - 3. Meet ARI 210.

- B. Evaporator Unit: As shown or as specified below:
 - 1. Cabinet:
 - a. Welded, constructed of heavy-gauge steel, zinc-coated or chemically pretreated, painted with enamel primer and exterior surface finished with factory-applied enamel coating.
 - b. Interior of cabinet completely lined with sound-absorbing thermal insulation resistant to moisture, vermin and rot.
 - c. Casing provided with insulated condensate-drain pan.
 - 2. Evaporator coil:
 - a. Direct expansion, fabricated of seamless copper tubing with aluminum fins tightly bonded to tubing.
 - b. Selection of cooling capacity of coils based on space conditions and the following as shown:
 - 1) Entering dry-bulb/wet-bulb temperature at evaporator coil.
 - 2) Entering ambient temperature at condenser coil.
 - c. Factory-mounted thermal-expansion valve:
 - 1) For units of 10 tons or more: Coils double-circuited and provided with two expansion valves.
 - d. Tested at minimum 300 psig.
 - 3. Evaporator fan and motor:
 - a. Centrifugal fans of corrosion-resistant construction.
 - b. Fan wheels dynamically and statically balanced.
 - c. Fan belt drives designed for 150 percent of required fan-motor brake horsepower.
 - d. Motor mounted on adjustable base.
 - e. Brake horsepower selected to drive fan at air volume and static pressure shown.
 - f. Fan motors: Air-conditioning unit manufacturer's standard for intended use and location.
 - 4. Filters Section: See Section 15865.

- C. Air-Cooled Condensing Unit: As shown or as specified below:
 - 1. Casing:
 - a. Weatherproof suitable for outdoor installation.

- b. Fabricated of heavy-gauge steel, zinc-coated or chemically pretreated, painted with enamel primer and exterior surface finished with factory-applied enamel coating.
 - c. Removable panels provided for access to accessories
 - 2. Condenser coils:
 - a. Air-cooled, fabricated of seamless copper tubing with aluminum fins tightly bonded to tubing.
 - b. Condenser coil capable of total heat rejection based on condensing and ambient temperature shown.
 - c. Tested at minimum 425 psig.
 - 3. Condenser fan and motor:
 - a. Fan of corrosion-resistant construction.
 - b. Fans dynamically and statically balanced.
 - c. Fans protected with heavy-gauge welded-wire fan guards.
 - d. Motors: Air-conditioning unit manufacturer's standard for intended use and location.
 - 4. Compressor:
 - a. Hermetically semi-hermetic sealed, refrigerant-cooled, suitable for operation with refrigerant R-22.
 - b. Capacity control provided for compressor of 10 tons and more to permit partial operation at low-load conditions.
 - c. High and low-pressure cutouts.
 - d. Compressor motor protected by means of overload relays and internal-winding thermostat.
 - e. Compressor mounted on internal spring isolator or on rubber-in-shear mounting pads.
 - f. Number of compressors:
 - 1) For units rated up to and including 7-1/2 tons: One compressor.
 - 2) For units rated at 10 or more tons: Two compressors with two separate refrigerant circuits.
 - 5. Refrigerant piping: Section 15205.
 - 6. Refrigerant-piping insulation: Section 15080.
 - 7. Refrigeration circuits:
 - a. Provide the following components in refrigeration circuits:
 - 1) Back-seating service valves in liquid and hot-gas lines.
 - 2) Filter drier on liquid line.
 - 3) Moisture-indicating sight glass on liquid line.
 - 4) Charging valves on suction side.
 - 5) Hot-gas muffler on discharge side.
- D. Heating Section: provide as required for systems; electric, gas-fired, or hot water. See section 15765.
- E. Air-Cooled Split-System Air-Conditioning Unit Controls: As shown or as specified below:
 - 1. Stand-alone DDC controls, factory-wired in separate control cabinet remote mounted in mechanical room near air handling unit..
 - 2. Heating and compressor contactors.
 - 3. Condenser and evaporator-fan contactors.
 - 4. High-pressure cutout with automatic reset.
 - 5. Low-pressure cutout with manual reset.
 - 6. Reset relay to prevent unit from cycling on automatic resetting of safety controls.
 - 7. Noncycling pumpdown control.
 - 8. Controls provided near evaporator unit:

- a. Discharge air temperature control for systems incorporating duct mounted heaters.
 - b. Damper operators.
9. Selector switch for HAND/OFF/AUTO operations, mounted on evaporator unit.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Fit equipment and appurtenances within space provided and make readily serviceable.
- B. Provide foundation, platforms and hangers necessary for proper installation of equipment.
- C. Install equipment on concrete pads minimum of six inches in height in accordance with Section 03100, 03200 and 03300.
- D. Ensure that fans operate without noticeable vibration after installation.
- E. Arrange belt guards to permit use of tachometer, oiling and testing with guards in place.
- F. Charge refrigerant in accordance with manufacturer's recommendations.
- G. Electrical connections: Sections 16120 and 16130.
- H. Gas Connections: Section 15205.
- I. Hot Water Connections: 15205.

END OF SECTION

SECTION 15765

HEATING EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing heating equipment and electric heat tracing for piping.
- B. Related Work Specified Elsewhere:
 - 1. Vibration isolators: Section 15070.
 - 2. Water Tube Boilers: Section 15515.
 - 3. Ventilating Units: Section 15725.
 - 4. Water Coils: Section 15734.
 - 5. Control equipment: Section 15900.
 - 6. Filters: Section 15865.
 - 7. Motors: Section 16225.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. UL: 1025.
- B. Source Quality Control:
 - 1. Test electric heating coils dielectrically at 2,000 volts before shipment.
 - 2. Factory test water coils at 350 psi air pressure under water.
 - 3. Comply with ANSI Z21.47, "Gas-Fired Central Furnaces", and NFPA 54, "National Fuel Gas Code".

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: Include manufacturer's technical data for each model indicated, including rated capacities, electrical characteristics, furnished specialties, and accessories.
 - 2. Shop Drawings: Detail equipment assemblies and indicated dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 3. Certification:
 - a. Successful dielectric testing of electric heating coil at 2,000 volts.
 - b. Gas-Fired Units design and certified by and bearing label of American Gas Association.
 - 4. Operation and Maintenance Manuals.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
 - 1. In design and purchase of equipment, provide for interchangeability of items of equipment, subassemblies, parts, motors, starters and relays.

- B. Electric Heating Coils:
 - 1. Casings:
 - a. Frame members, casings, terminal box, terminal-box cover and similar sheet metal parts fabricated of minimum 18-gauge, die-formed steel with integral corrosion-resistant coating.
 - b. Casing assembled into rigid structure by means of welding or threaded fastenings.
 - c. Flanged in-line heater for inclusion in duct or ventilating unit.
 - d. Coil-section panels factory-insulated.
 - 2. Heating element:
 - a. Heating elements composed of individual flange-mounted, finned-tube heating elements with highest grade nickel-chromium alloy resistor wire centered within tubes and embedded in compacted insulating material.
 - b. Flanges and fins permanently furnace-brazed to elements for rigid support and rapid heat transfer.
 - c. Finned tubes of copper-plated or ceramic-coated steel.
 - 3. Controls:
 - a. In accordance with Section 15900, with the following additional requirements:
 - (1) Heaters provided with built-in step controllers.
 - (2) Heaters of 30 kw or less with manufacturer's standard steps.
 - (3) Heaters larger than 30 kw having six equal steps.
 - (4) An automatic-reset, snap-action, thermal-overheat switch provided to instantly de-energize heating coil when safe operating temperatures are exceeded.
 - (5) Heating coil interlocked with fan to prevent energization of heating coil while fan is not running.

- C. Electric Unit Heaters:
 - 1. Factory-assembled unit heaters consisting of heating element, fan, fan motor, housing and outlet diffuser.
 - a. Casings:
 - (1) Fabricated of galvanized steel or bonderized steel, factory-primed and finished with baked enamel.
 - (2) Parts rigidly stiffened to prevent vibration and to hold working parts in line.
 - (3) Casings for suspended-type units designed for direct attachment to hangers.
 - (4) Ceiling or wall-mounted, spring-type brackets furnished as necessary to support unit.
 - (5) Casings readily removable for access to interior parts.
 - (6) Adjustable horizontal vanes, arranged to give uniform air distribution without objectionable drafts.
 - b. Fan and fan motor:
 - (1) Propeller fan directly connected to fan motor.

- (2) Fan air throw: As shown.
- (3) Fan factory-balanced dynamically and designed for quiet operation.
- (4) Unit heater/fan motor: As standard with manufacturer.
- (5) Each unit equipped with combination fan guard/motor support resiliently mounted to absorb motor vibration.
- (6) Motor speed: 1,750-rpm maximum.
- (7) Integral transformer where fan-motor voltage differs from line voltage.
- c. Heating element:
 - (1) Resistance wire of corrosion-resistant metal surrounded by finned metal sheath, interspace filled with ceramic material or magnesium oxide.
 - (2) Each heating element wired to built-in, line-voltage, automatic-reset, thermal-overheat protection.
 - (3) Complete controls, contactors, control-circuit transformers factory-assembled and factory-wired.
 - (4) Unit heaters tested and listed under UL 1025.
 - (5) Thermostats: Built-in or remote as required.
 - (6) Disconnect switch near unit heater.
- d. Unit heaters with capacities of 10 kW or higher equipped with H.O.A. switches.

D. Electric Wall Convectors:

- 1. Factory-assembled consisting of heating element, connection boxes, controls, surface-mounted steel cabinet and wall-mounted thermostat.
- 2. Convector cabinet: Fabricated of heavy-gauge reinforced steel with inlet and outlet grilles.
- 3. Surface-mounted cabinet, chemically treated to resist corrosion and finished in baked prime coat.
- 4. Cabinets equipped with disconnect switch and automatic-reset thermal-overload protection.
- 5. Heating elements of steel-sheath or aluminum-sheath enclosed construction, nonhumming, with fins permanently brazed to tube for quick and efficient heat transfer.
- 6. Heating elements having a nonoxidizing heat-resistant finish.
- 7. Completely factory-wired, tested and UL-listed.
- 8. Capacity and operating characteristics: As shown.

E. Electric Heat Tracing for Piping:

- 1. Heat-traced pipe insulated after installation of heating tape in accordance with Section 15080.
- 2. Heating tape with single or twin heating elements embedded in impact-resistant, high-dielectric refractory material, UL-listed and with stainless-steel exterior protective sheath acting as electrical ground in case heating element touches sheath.
- 3. Heating tape rated for voltage shown and capable of producing wattage shown.
- 4. Heating tape flexible with minimum bending radius of not more than six times diameter of tape.
- 5. Heating tape compatible with pipe temperature-sensing thermostat: Section 15900.
- 6. Heating tape connected to power source and controls through nonheating leads minimum seven feet in length.

- F. Indirect-Fired Heating and Ventilating Units
1. Packaged units.
 - a. Factory-assembled, prewired, self-contained unit consisting of cabinet, supply fan, controls, filters and indirect-fired gas furnace to be installed inside the building.
 2. Cabinet.
 - a. Cabinet: Galvanized-steel panels, formed to ensure rigidity and supported by galvanized-steel channels or structural channel supports with lifting lugs. Where applicable, cabinet shall be fully weatherized for outside installation.
 - b. Access Panels: Piano hinged with cam-lock fasteners for furnace and fan motor assemblies on both sides of unit.
 - c. Internal Insulation: Fibrous-glass duct lining, comply with ASTM C1071, Type II, applied on complete unit.
 - d. Finish: Heat-resistant, baked enamel.
 - e. Discharge: Galvanized-steel assembly with diffusers incorporating individually adjustable vanes.
 - f. Roof Curb: Full-perimeter curb of sheet metal, minimum 16 inches high, with wood nailer, neoprene sealing strip, and welded Z-bar flashing
 3. Supply-Air Fan
 - a. Fan Type: Centrifugal, rated according to AMCA 210; statically and dynamically balanced, galvanized steel; mounted on solid-steel shaft.
 - b. Motor: Totally enclosed, single-speed motor.
 - c. Drive: V-belt with matching fan pulley and adjustable motor sheaves and belt assembly.
 - d. Mounting: Fan wheel, motor, and drives shall be mounted in fan casing with spring isolators.
 - 4.. Outdoor-Air Intake
 - a. Outdoor-Air Hood: Galvanized steel with rain baffles, bird screen, and finish to match cabinet; and sized to supply maximum percent outdoor air.
 5. Air Filter Section
 - a. Frame: Galvanized to comply with required filters per Section 15865.
 6. Dampers
 - a. Outdoor-Air Damper: Galvanized-steel, opposed-blade dampers with vinyl blade seals and stainless-steel jamb seals, having a maximum leakage of 10 cfm/sq. Ft. of damper area, at differential pressure of 2-inch wg.
 - b. Damper Operator: Direct couples, electronic with spring return or fully modulating as required by the control sequence.
 7. Indirect-Fired Gas Furnace
 - a. Description: Factory assembled, piped, and wired; and complying with ANSI Z21.47, "Gas-Fired Central Furnaces," and NFPA 54, "National Fuel Gas Code."
 - b. Venting: Gravity or power vent with integral, motorized centrifugal fan interlocked with gas valve.
 - c. Combustion-Air Intake: Separate combustion-air intake and vent terminal assembly.
 - d. Inside Unit External Housing: Steel cabinet with integral support inserts and removable bottom arranged to serve as drain pan.
 - e. Outside Unit External Housing: Weatherproof steel cabinet with integral support inserts and removeable bottom arranged to serve as drain pan.
 - f. Internal Casing: Aluminized steel, arranged to contain airflow, with duct flanges at inlet and outlet.
 - g. Heat Exchanger: Steel.

- h. Heat-Exchanger Drain Pan: Stainless steel.
 - i. Safety Controls.
 - 8. Controls
 - a. Factory-wired, fuse-protected control transformer, connection for power supply and field-wired unit to remote control panel.
 - b. Control Panel: Surface-mounted remote panel, with engraved plastic cover.
 - c. Refer to Section 15900 for control equipment.
 - d. Temperature Control: Operates gas valve to maintain supply-air temperature.
 - e. DDC: Stand-alone control module for link between unit controls and DDC system. Control module shall be compatible with temperature-control system specified in Section 15900.

- G. Gas-Fired Duct Heaters.
 - 1. Description: Factory assembled, piped, and wired, and complying with ANSI Z83.9, "Gas-Fired Duct Furnaces."
 - 2. Venting:
 - a. Indoor, gravity vented.
 - b. Indoor, equipped with sealed combustion-product-collection chamber, power venter, and electronic spark ignition.
 - c. Venting: Indoor, separated combustion, equipped with power venter.
 - d. Power Venter: Integral, motorized centrifugal fan interlocked with gas valve.
 - 3. Indoor External Housing: Steel cabinet with integral support inserts and removable bottom arranged to serve as drain pan.
 - 4. Internal Casing: Aluminized steel, arranged to contain airflow, with duct flanges at inlet and outlet.
 - 5. Heat Exchanger: Stainless steel.
 - 6. Burners: Stainless steel.
 - 7. Controls: Regulated redundant 24-V ac gas valve containing pilot solenoid valve, electric gas valve, pilot filter, pressure regulator, pilot shutoff, and manual shutoff all in one body.

- H. Gas-Fired Unit Heaters
 - 1. Description: Factory assembled, piped, and wired, and complying with AGA Z83.8, "Gas Unit Heaters."
 - 2. Venting: Gravity or powered.
 - 3. Housing: Steel, with integral draft hood and inserts for suspension mounting rods.
 - 4. Heat Exchanger: Stainless steel.
 - 5. Burners: Stainless steel.
 - 6. Unit Fan:
 - a. Propeller fan with aluminum blades dynamically balanced and resiliently mounted.
 - b. Steel, centrifugal fan dynamically balanced and resiliently mounted.
 - 7. Controls: Regulated redundant 24-V ac gas valve containing pilot solenoid valve, electric gas valve, pilot filter, pressure regulator, pilot shutoff, and manual shutoff all in one body.
 - 8. Discharge Louvers: Independently adjustable horizontal blades.

- I. Hot Water Cabinet Unit Heaters
 - 1. Description: A factory-assembled and -tested unit complying with ARI 440.
 - a. Comply with UL 2021.
 - 2. Cabinet: Steel with baked-enamel finish.
 - 3. Filters: 1" throwaway.

4. Hot-Water Coil: Copper tube, with mechanically bonded aluminum fins spaced no closer than 0.1 inch and rated for a minimum working pressure of 200 psig and a maximum entering-water temperature of 220 deg F. Include manual air vent and drain.
5. Fan and Motor Board: Removable.
6. Basic Unit Control.
7. Electrical Connection: Factory wire motors and controls for a single field connection.

J. Hot Water Unit Heaters

1. Description: An assembly including casing, coil, fan, and motor in vertical or horizontal discharge configuration with adjustable discharge louvers.
2. Comply with UL 2021.
3. Comply with UL 823.
4. Casing:
 - a. Cabinet: Removable panels for maintenance access to controls.
 - b. Cabinet Finish: Manufacturer's standard customer baked enamel applied to factory-assembled and -tested propeller unit heater before shipping.
 - c. Discharge Louver: Adjustable fin diffuser for horizontal units and conical diffuser for vertical units.
5. Coils:
 - a. Test and rate hot-water propeller unit-heater coils according to ASHRAE 33.
 - b. Hot-Water Coil: Copper tube, minimum 0.025-inch wall thickness, with mechanically bonded aluminum fins spaced no closer than 0.1 inch and rated for a minimum working pressure or 200 psig and a maximum entering-water temperature of 325 deg F, with manual air vent. Test for leaks to 350 psig underwater.
6. Fan:
 - a. Propeller type, aluminum wheel directly mounted on motor shaft in the fan venturi.
7. Fan Motors:
 - a. Motor Type: permanently lubricated, multispeed.
8. Controls:
 - a. Control Devices:
 - (1) Wall-mounting fan-speed switch.
 - (2) Wall-mounting thermostat.
 - (2) Unit mounted thermostat.

K. Electric Finned-Tube Radiators:

1. Description: Factory-packaged units constructed according to UL 499, UL 1030, and UL 2021.
2. Heating Elements: Nickel-chromium-wire heating element enclosed in metallic sheath mechanically bonded into fins, with high-temperature cutout and sensor running the full length of the element.
3. Rust-Resistant Front Panel: G60 galvanized steel.
4. Wall-Mounting Back Panel: Steel, full height, with full-length channel support for front panel without exposed fasteners.
5. Floor-Mounting Pedestals: Conceal conduit for power and control wiring and maximum 36-inch spacing. Pedestal-mounting back panel shall be solid panel matching front panel.
6. Support Brackets: Locate at maximum 36-inch spacing to support front panel and element.
7. Finish: Baked-enamel finish in a manufacturer's standard color.

8. Access Doors: Factory made, permanently hinged with tamper-resistant fastener, integral with enclosure.
9. Unit Controls: Integral low-voltage relay and control transformer for remote thermostat.
10. Accessories: Integral disconnect switch, filler sections, corners, relay sections and splice plates all matching the enclosure and grille finishes.

L. Hot-Water Finned-Tube Radiators

1. Heating Elements: Copper tubing mechanically expanded into flanged collars of evenly spaced aluminum fins resting on element supports. One tube end shall be belled.
2. Element Supports: ball-bearing cradle type to permit longitudinal movement on enclosure brackets.
3. Front Panel: G60 galvanized steel.
4. Wall-Mounting Back Panel: Steel, full height, with full-length channel support for front panel without exposed fasteners.
5. Floor-Mounting Pedestals: Conceal insulated piping at maximum 36-inch spacing. Pedestal-mounting back panel shall be solid panel matching front panel. Provide stainless-steel escutcheon for floor openings at pedestals.
6. Support Brackets: Locate at maximum 36-inch spacing to support front panel and element.
7. Finish: Baked-enamel finish in manufacturer's standard color.
8. Access Doors: Factory made, permanently hinged with tamper-resistant fastener, integral with enclosure.
9. Accessories: Filler sections, corners, relay sections, and splice plates all matching the enclosure and grille finishes.

M. Hot-Water Convectors:

1. Convector Elements: Seamless copper tubing mechanically expanded into evenly spaced aluminum fins and rolled into brass headers with inlet/outlet and air vent; steel side plates and supports. Factory-pressure-test element at minimum 100 psig.
2. Front and Top Panel: Steel with exposed corners rounded; removable front panels with tamper-resistant fasteners braced and reinforced for stiffness.
3. Wall-Mounting Back and End Panels: Steel.
4. Floor-Mounting Pedestals: Conceal conduit for power and control wiring at maximum 36-inch spacing. Pedestal-mounting back panel shall be solid panel matching front panel.
5. Support Brackets: Locate at maximum 36-inch spacing to support front panel and element.
6. Insulation: 1/2-inch thick, fibrous glass on inside of the back of the enclosure.
7. Finish: Baked-enamel finish in manufacturer's standard color.
8. Damper: Knob-operated internal damper.
9. Access Doors: Factory made, permanently hinged with tamper-resistant fastener, integral with enclosure.

N. Electric Radiant Heaters

1. Quartz lamp Heating Elements: Coiled tungsten-wire heating element enclosed in clear quartz tube.
2. Quartz Tube Heating Elements: Nickel-chromium-wire heating element enclosed in quartz tube.
3. Metal-Sheathed Heating Elements: Nickel-chromium-wire heating element embedded in magnesium oxide powder and enclosed in metal sheath. Comply with UL 1030.
4. Comply with UL 499 and UL 2021.

5. Enclosures: Aluminized, stainless, or painted -steel housing with anodized-aluminum reflector.
6. Unit Controls:
 - a. Line-voltage thermostat.
 - b. Enclosed contactor for remote thermostat.
 - c. Snow and ice detector and moisture sensor and integral temperature sensor.
